## PREFACE TO THE SECOND EDITION

Since the publication of the first edition of this Manual thirteen years have elapsed and the edition has become exhausted, although the book was reissued several years ago. During this time many new species and varieties have been introduced into cultivation, new hybrids have appeared and changes in nomenclature have become necessary owing to a more intensive study of certain groups and to amendments to the International Rules of Botanical Nomenclature adopted by the International Botanical Congresses in 1930 and 1935.

Therefore the issue of a new revised and enlarged edition appears to be necessary and the author has been engaged for several years in bringing the book up to date. The number of species appearing in the keys and fully described has been considerably increased and now amounts to over 2550 instead of about 2350; the number of varieties and hybrids and of species only briefly described has grown accordingly.

In the systematic arrangement of the families, the system used by Engler and Prantl has for practical reasons been retained, with the exception that the Monocotyledons have been moved to the end of the system. They certainly do not form a connecting link between the Gymnosperms and the Dicotyledons and were not derived from the Gymnosperms, as their position between these two groups seemed to imply, but they originated from a dicotyledonous group, probably the Ranales, at an early period.

The zones of hardiness within the range of this Manual have been reduced from eight to seven, these being based on the average annual minimum temperatures. The old map showing the zones of hardiness was reproduced on too small a scale and has been replaced by a larger one showing the zones much more distinctly and clearly. The planting and testing of more recent introductions in more northern gardens has in many cases shown that these introductions possess a greater hardiness than was previously credited to them and the zones have accordingly been changed in many instances.

The use of the term variety intercalated between the specific name and that of a subdivision of the species has been abandoned to avoid making unintentional and unnecessary new combinations; instead the subdivisional name follows the specific name immediately and the category as proposed by the author who first published the subdivisional name under the binomial adopted in this book, is given after the name of the author, e.g., *Cephalotaxus drupacea fastigiata* (Carr.) Pilg., f. which indicates that Pilger when making this combination, published it as *C. drupacea* forma *fastigiata*. This does not mean that the author of this Manual considers the category given as correct in all cases, for many of the subdivisional names cited with the category "var." should really be classified as "forma" and similar discrepancies occur under other categories. Since a change in the category does not involve a change in the trinomial and therefore does not alter the name of the plant, it did not seem advisable to make numerous new combinations, perhaps more properly to be called "new status," considering the fact that the book is intended chiefly for horticultural usage, where as a rule, simple trinomials are used.

## PREFACE TO THE SECOND EDITION

Also it seems more important to cite the author who first placed the variety or form under the correct binomial than a later author who only changed the rank. Since the scope and size of the Manual does not allow full citations of literature and synonymy, it is the intention of the author to follow its publication with a bibliographical supplement supplying for all the names mentioned in the Manual exact citations of their source and for trinomials the category considered to be botanically correct. This is particularly important for varieties and forms, since the source of their names is in many instances difficult to trace.

The list of authors' names cited in the book has been greatly increased, so as to include nearly every name cited as an authority of a botanical name, while in the first edition, mainly the abbreviations of the more frequently cited authors were given. For assistance in the search for biographical data appertaining to obscure and little known authorities, I am indebted to Dr. Leon Croizat, who obtained for me most of this information from the extensive collection of biographical data assembled by Dr. J. H. Barnhard of the New York Botanical Garden.

To many correspondents of the Arnold Arboretum too numerous to mention, I am indebted for additions and corrections of errors in the first edition. Acknowledgment is also due to my associates at the Arboretum for valuable assistance and suggestions. For help in the preparation of the account of the Bamboos, I am under obligation to Dr. F. A. McClure of Lingnan University and to Mr. B. A. Young of the United States Department of Agriculture.

ALFRED REHDER.

Jamaica Plain, Massachusetts.  
January, 1940.

## INTRODUCTION

The purpose of this volume is to present a systematic and descriptive enumeration of the cultivated trees and shrubs hardy in North America, exclusive of the subtropical and warm-temperate regions, and to facilitate their identification by means of analytical keys. The plan and arrangement of the work is much the same as that of the manuals dealing with the spontaneous flora of the region indicated. Thus it may serve as a supplement and companion work to these, dealing with the cultivated ligneous flora which in an ever-increasing degree caters to our economic and esthetic wants; and furthermore tends greatly to modify the aspect of the original vegetation wherever man makes his home.

The term trees and shrubs is interpreted in a wide sense, so as to include not only woody vines, but also suffruticose plants, that is, plants of which only the lower part of the stems and branches persists and becomes woody, while the upper part dies back annually, or which have stems persisting for several years without becoming truly ligneous. The distinction between a suffruticose plant or subshrub and a perennial plant, however, is not always clear and definite, but in doubtful cases plants only slightly woody have been included, particularly if they belong to a genus or family otherwise not represented. It is the intention to treat in this book all hardy or supposedly hardy woody plants known to be at present in cultivation within an area whose southern limit is an isothermal line connecting points with the mean temperature of the coldest month near the freezing point; this corresponds approximately to a line running from Virginia through western North Carolina, northern Georgia and northern Alabama, central Arkansas, central New Mexico, central Arizona and then northward through northeastern California and Oregon along the western slope of the Cascade Mountains to northwestern Washington. In the East the area nearly coincides with that of the manuals of Gray and of Britton. Whether a plant is at present in cultivation or not is often impossible to say with certainty. Although we may have the record of its introduction into American or European gardens, it may not have persisted. As a rule woody plants known to have been successfully introduced have been included in this book. It has, however, been found necessary, in order not to exceed the limits of a single volume, to omit less known and rarely cultivated varieties and garden forms; likewise in some large genera as *Salix*, *Crataegus*, *Rubus* and *Rosa* species of neither economic nor horticultural importance, and not met with except in a few special collections, have not been mentioned. As these omitted species are almost exclusively those native to North America, their descriptions, in most cases, can readily be found in American manuals and floras; foreign species, even if but rarely cultivated, are usually mentioned, since information regarding these is not so easily obtainable.

The trees, shrubs and vines described in this book belong to 486 genera distributed among 113 families. The number of species, including a small number of horticulturally important hybrids, fully described and represented in the keys is about 2535 with about 2685 varieties. Besides these there are

## INTRODUCTION

about 25 genera, 1400 species and 540 hybrids briefly described or mentioned and appended to the families, genera or species to which they are most closely related, or in the case of hybrids, to one of the parents. This cultivated ligneous flora is chiefly composed of plants introduced from the temperate and colder regions of the northern hemisphere. Only few species of the southern hemisphere and these mostly from the extreme southern part of South America and the higher altitudes of the Andes and from the high mountains of Australia and of New Zealand have proved to be hardy with us. A large percentage of this flora is native within our area and in the adjoining regions to the south. Perhaps an equal number came from eastern and central Asia, which has a very rich and varied ligneous flora. Less numerous are the contributions from Europe, western Asia and North Africa and, as stated above, from the southern hemisphere. In addition to the introduced species and varieties a large and ever-increasing number of hybrids and garden forms has originated under cultivation, and in many cases these hybrids have supplanted the original species in our gardens. Most of the foreign trees and shrubs, and even some native ones, have reached our gardens by the way of Europe, and it is only within the last 60 to 70 years that chiefly through the agency of the Arnold Arboretum and more recently through the U. S. Department of Agriculture, many plants have been introduced directly from their native countries, mostly from eastern Asia, to American gardens.<sup>1</sup> Lack of space in this work forbids the inclusion of details regarding the introduction of individual species, and only the year of the introduction into cultivation either in this country or in Europe, if known, is given. When the actual date of introduction could not be ascertained, the first record of the plant as being in cultivation is given, based either on mention in horticultural literature or on dated herbarium specimens.

The sequence of the families follows with few exceptions, the system used by Engler and Prantl in their "Natürliche Pflanzenfamilien" and in Engler's "Syllabus" which has been adopted with slight modifications in all, or nearly all modern American manuals. The chief deviation from this system consists in removing the Monocotyledons from their place between the Gymnosperms and Dicotyledons and placing them at the end of the system for reasons indicated in the Preface (p. vii). The descriptions have been made as concise as possible without omitting important matter, and in most cases characters used in the keys, and particularly in the shorter keys where the species can be referred to readily, are not repeated. Lack of space forbids the giving of full descriptions of all the species known to be in cultivation within the range of the manual, and less important and rarely cultivated ones are only briefly described in smaller type and appended to more fully described and related species. Also a selection had to be made from among the horticultural varieties and forms, very numerous in some groups, particularly in the Conifers, and only the more important and outstanding ones could find a place in the book. Similarly the hybrids, with the exception of a few horticulturally important and much cultivated ones, are not fully described, as these are usually very variable and should be recognized chiefly by their resemblances to the parent species; they are only briefly characterized and are appended to one of the parents with a reference from the other parent. In using the keys to the families and genera, it should be understood that the characters

<sup>1</sup> For dates of the introduction to North America of the more important species see: Rehder in *Mittell. Deutsch. Dendr. Gesell.* 1932: 114-128, and in *Nation. Hort. Mag.* 15: 245-257 (1936).

## INTRODUCTION

apply only to those genera of the families and those species of the genera which are described in this book, while the descriptions of families and genera include the characters of the entire group.

In regard to the botanical names, the International Rules of Botanical Nomenclature, as amended in 1935 by the VI. International Botanical Congress at Amsterdam, have been consistently followed. These Rules have now been accepted by nearly all botanists, in this country as well as abroad, and as far as botanical names are concerned are also generally followed in horticultural literature.

Authorities for the botanical names are cited, as is customary, mostly in abbreviated form. The explanation of the abbreviations with further data regarding the authorities will be found on pages 909 ff. The citation in parenthesis of the original author of a transferred specific or varietal name (epithet) is now obligatory and shows that the epithet did not originate with the author of the adopted combination, but was transferred from an older combination. Thus in *Malus baccata* (L.) Borkh. the parenthetical author indicates that the specific name was transferred by Borkhausen from *Pyrus baccata* of Linnaeus. As the author of a varietal name, the author who first placed the epithet under the accepted binomial is cited, his name being followed by the indication of the category or rank he assigned to the name, as subsp., var., f. (subspecies, varietas, forma), e.g., "*Rhododendron viscosum nitidum* (Pursh) Gray, var.," which indicates that Gray called the plant *Rh. viscosum* var. *nitidum*. If no indication of rank is given, it shows that the author published the name as a straight trinomial (ternary combination) without indication of rank. As this is the general usage in horticulture, it seems better to employ this form of citation rather than to use, as was done in the first edition, the designation "var." for every one of the several subdivisional categories and to create thereby what must be considered, according to the Rules of Nomenclature, as new combinations. In some cases the varietal designation for horticultural forms consists of two epithets, as in *Chamaecyparis pisifera plumosa aurea*, of which the second one has already been used under this species, namely in *Ch. pisifera aurea*, which is contrary to the Rules, since a subdivisional epithet can only be used under the same species. Instead of coining a new varietal name for such botanically unimportant forms, it seems preferable to treat them as garden names and indicate this by citing them in quotation marks, as *Ch. pisifera "plumosa aurea."*

The original orthography of the names has been preserved except in cases of an actual error or misprint. Thus names such as *Wisteria*, *Gleditsia*, *Pentstemon*, *Gaultheria*, *Pyrus* are adopted as spelled by the original author. Also the genitive ending of personal names, whether single or double i, is given as originally published, although for practical reasons uniformity may be preferable; it seems an unnecessary burden on the memory to remember that one and the same name may sometimes end in a single and sometimes in a double i, as in *Viburnum Sargentii* Koehne and *Populus Sargentii* Dode, or in *Picea Engelmanni* (Parry) Engelm., and *Cirsium Engelmannii* Rydb. As this is a matter of secondary importance, no strong objection could or should be raised against either of the two ways of simplification,—to have these names all end in either a single or double i. In either case, certain exceptions should be made. If the choice should be to use the double i in all latinized surnames, as recommended by the International Rules, no change should be made in Christian names which have a recognized Latin form as Augustinus, Ferdinandus, Ernestus, Alfredus, and consequently they can have only a

## INTRODUCTION

single *i* in the possessive case. On the other hand if the choice should be the use of a single *i*, as adopted by Standardized Plant Names, those surnames which end in *i* as Giral-di, Pampani-ni, Zuccarini should have a double *i*, since one *i* belongs to the original name and the other to the ending.

As an aid to the correct pronunciation, the botanical names are marked with accents, the grave (‘) to indicate the long sound of the vowel, the acute (’) to indicate the short sound. The rules of Latin quantity have been followed as closely as possible in the accentuation of the words and in the latinized forms of proper names and other words unknown to classical Latin established custom has served as a guide. In the genitive ending of personal names, the penultimate vowel has usually been treated as long except in the English and German ending *er*, e.g., Pálmeri, Èngleri, but Berlandièri, since in the French name Berlandier the last syllable is long and accented.

Only the more important synonyms are cited and chiefly those which occur frequently in horticultural and botanical literature.<sup>1</sup> English names are restricted to those which are in actual use and no attempt has been made to provide the less known and recently introduced plants with newly coined English names which would only have occupied valuable space to little purpose.<sup>2</sup> It has seemed desirable to cite illustrations; in general the references to illustrations are to the most easily accessible works, and only in cases where no other illustrations were available are rare and less readily accessible publications cited. Usually several illustrations are quoted which include colored plates and habit figures. These citations will also serve in most cases as a guide to further information and to citations of literature.<sup>3</sup>

Within the limits of one volume only very brief notes on the economic and ornamental properties of the trees and shrubs described could be given. Cultural directions had to be restricted to short hints in the case of such plants as could not be expected to thrive under ordinary conditions and to the indication of the approximate hardiness of each species, and in some instances of varieties. To this end the area has been divided into seven zones based on the annual minimum temperatures.<sup>4</sup> The average annual minimum of the temperatures of these zones are as follows:

Zone I: exceeding  $-50^{\circ}$ ; the treeless zone in extreme northern Canada. Zone II:  $-50^{\circ}$  to  $-35^{\circ}$ . Zone III:  $-35^{\circ}$  to  $-20^{\circ}$ . Zone IV:  $-20^{\circ}$  to  $-10^{\circ}$ . Zone V:  $-10^{\circ}$  to  $-5^{\circ}$ . Zone VI:  $-5^{\circ}$  to  $+5^{\circ}$ . Zone VII:  $+5^{\circ}$  to  $+10^{\circ}$ . These zones run nearly parallel to the southern boundary of the area as described above, but their boundaries are much modified by elevation, mountains, river valleys and other features, and often form considerable curves or loops; as a rule they tend to curve from the Atlantic coast southward, but beyond the  $110^{\circ}$  W. they turn rather abruptly northward and run for some distance almost parallel to the Pacific coast, extending here much farther to the north than on the Atlantic coast. A map showing these seven zones will be found opposite the title-page and with its help it can be easily ascertained to which zone a certain region belongs and which trees and shrubs described in this book may be expected to grow there. There

<sup>1</sup> It is the intention of the author to publish later a Bibliographical Supplement which is to contain the literature citations appertaining to the accepted names and of the important synonyms.

<sup>2</sup> For additional English names one may consult the new edition now in preparation of "STANDARDIZED PLANT NAMES" and for American plants the manuals covering our native flora.

<sup>3</sup> For additional illustration see INDEX LONDINENSIS TO ILLUSTRATIONS OF FLOWERING PLANTS, FERNS AND FERN ALLIES. Compiled by O. Stapf. 6 Vols. F. Oxford, 1929-31.

## INTRODUCTION

are, however, many other factors besides winter temperature which influence the hardiness and growth of certain plants, such as soil, its physical as well as chemical composition, exposure, rainfall, humidity, air drainage and shelter from cold winds. As a rule, one may say that plants stand cold better in a drier situation than in a wet one and that deciduous trees and shrubs generally do well in more exposed situations and in a climate with higher summer temperature, while evergreen plants prefer a sheltered situation and respond to a more humid climate with less extreme summer and winter temperatures; for this reason many deciduous species grow best in the East, while evergreen plants and particularly broad-leaved evergreens thrive better on the northern Pacific coast. In the case of many rarer trees and shrubs hardy at the Arnold Arboretum, owing to lack of tests farther north and farther south, the limits of hardiness are not well known and had to be deduced from their behavior under approximately similar conditions in Europe. A few examples of well known trees and shrubs characteristic for each zone, as reaching there the northern limit of hardiness may be given here:

Zone I. *Picea glauca*, *Populus tremuloides*, *Betula papyrifera*.

Zone II. *Quercus macrocarpa*, *Caragana arborescens*, *Acer Negundo*, *Viburnum Lantana*.

Zone III. *Berberis Thunbergii*, *Sorbus americana* and *S. aucuparia*, *Fraxinus americana*.

Zone IV. *Quercus coccinea*, *Cercidiphyllum japonicum*, *Robinia Pseudacacia*.

Zone V. *Fagus sylvatica*, *Ilex opaca*, *Rhus chinensis*, *Koelreuteria paniculata*.

Zone VI. *Poncirus trifoliata*, *Paulownia tomentosa*, *Abelia grandiflora*.

Zone VII. *Albizia Julibrissin*, *Firmiana simplex*, *Lagerstroemia indica*.

Under favorable conditions and with proper protection plants will survive in localities farther north than the zone to which they have been referred; but these exceptions should not change the indication of the proper zone. Such cases have been occasionally indicated by placing the zone in which the plant is not fully hardy in parenthesis, e.g., Zone (V) VI, which indicates that the plant is hardy in Zone V only precariously or under particularly favorable conditions, but is fully hardy in Zone VI.

As in most modern American floras the measurements are given in the metric system, which is understood the world over, and moreover, permits, particularly for smaller dimensions, a more exact and clearer designation than the various fractions into which an inch may be divided and which may not be indicated on the ruler at hand. Equivalents of the Metric and English systems of measurements and comparative scales of centimeters and inches are given on p. xix.

In most cases the keys will lead to the identification of the plant under consideration, but sometimes it may not be possible to arrive at a satisfactory conclusion, when either the material at hand is imperfect, or the plant represents some abnormal feature, or is very rare and only incidentally mentioned in the book or not at all. Doubtful identifications may be verified by comparing the plants with the illustrations cited or with correctly named specimens in a reliable herbarium, or if this does not lead to a definite result, by sending specimens for identification to a botanical institution.

The author hopes that the book, in spite of its imperfections, will serve the purpose for which it was written and will help to spread a more accurate knowledge of the wealth of trees and shrubs now at our command, and thus constitute a welcome contribution to the literature of botany and of horticulture.

## ABBREVIATIONS OF SIGNS

Wyo., Wyoming

? indicates doubt

§ section; see above under Sect.

× sign of a sexual hybrid, preceding the name of the hybrid, or connecting the names of the parents

+ sign of a graft-hybrid, preceding the name of the hybrid, or connecting the names of the parents

♀ pistillate flower or plant, also the seed-bearing parent of a hybrid

♂ staminate flower or plant, also the staminate parent of a hybrid

i-xii, Roman numerals (small capitals) after fl. (flowering time) and fr. (fruiting time) denote the months according to their sequence.

## APPROXIMATE EQUIVALENTS OF THE METRIC AND ENGLISH SYSTEMS OF MEASUREMENTS

1 millimeter (mm.)	≈ $\frac{1}{25}$ of an inch	5 centimeters	= 2 inches
2 millimeters	≈ $\frac{1}{12}$ of an inch	10 centimeters (or 1	
1 centimeter (cm.)	≈ $\frac{1}{2}$ of an inch	decimeter)	= 4 inches
2.5 centimeters	≈ 1 inch	30 centimeters	= 1 foot
	1 meter (m.) = $3\frac{1}{2}$ feet or 40 inches (less $\frac{1}{4}$ inch)

# SYNOPSIS OF THE ORDERS AND FAMILIES CONTAINED IN THIS BOOK

All the families treated in this book belong to the Division SPERMATOPHYTES or SEED-PLANTS (*Phanerogamae*, *Phaenogamae*, *Embryophyta siphonogama*) differing from the other Divisions of the VEGETABLE COMMUNITY chiefly in the presence of true flowers containing stamens or pistils or both and in the reproduction by seeds containing an embryo.

Subdivision I. GYMNOSPERMAE. GYMNOSPERMS. Ovules naked, not inclosed in an ovary; fls. unisexual, rarely bisexual.

- A. Lvs. fan-shaped, deciduous: fertilization by motile sperm-cells. Class I. GINKGOALES  
Fam. 1. *Ginkgoaceae*, 1
- AA. Lvs. scale-like or linear to oblong or elliptic, persistent, rarely deciduous: fertilization by passive sperm-cells.
- B. Fls. without perianth. Class II. CONIFERALES
- C. Ovules solitary or few, developing into a drupe-like or berry-like seed.
- CC. Ovules borne on scales forming a cone which becomes woody, rarely berry-like at maturity and with 1 to many seeds; seeds often winged.
- D. Each scale with 1 seed; fr. a large cone. Fam. 3. *Araucariaceae*, 7
- DD. Each scale with 2 or more seeds; fr. a cone or berry-like with 1 to many seeds; seeds often winged. Fam. 4. *Pinaceae*, 8
- BB. Fls. with a 2-4 parted perianth. Class III. GNETALES  
Fam. 5. *Ephedraceae*, 68

Subdivision II. ANGIOSPERMAE. ANGIOSPERMS. Ovules inclosed in an ovary: fls. usually with perianth, unisexual or bisexual.

Class I. DICOTYLEDONEAE. DICOTYLEDONS. Embryo normally with 2 opposite cotyledons: lvs. usually net-veined: parts of fls. mostly in whorls of 4 or 5: stem with clear distinction of bark, wood and pith; the wood forming annual layers.

Subclass I. CHORIPETALAE (*Apetalae* and *Polypetalae*). Petals wanting or free, or only some of the petals united at base.

- A. Petals wanting (except in Fam. 21): lvs. simple (except in Fam. 10).
- B. Sepals in one whorl or wanting: fls. unisexual, at least the staminate in catkins (except in some genera of Fam. 12).
- C. Ovary superior or naked: fls. dioecious (sometimes monoecious in Fam. 8).
- D. Fr. a many-seeded dehiscent caps.: fls. without perianth, dioecious.

Order I. SALICALES  
Fam. 6. *Salicaceae*, 71

- DD. Fr. a nut, drupe or berry, 1-, rarely 2-seeded.
- E. Ovary with 2 ovules; staminate fls. with 4 sepals: lvs. opposite.

Order II. GARRYALES  
Fam. 7. *Garryaceae*, 111

- EE. Ovary with 1 ovule; staminate fls. without perianth: lvs. alternate.
- F. Style with 2 stigmas: ovules orthotropous. Order III. MYRICALES  
Fam. 8. *Myricaceae*, 112

FF. Style not cleft, stigmatic at apex; ovule amphitropous.

Order IV. LEITNERIALES  
Fam. 9. *Leitneriaceae*, 114

- CC. Ovary inferior or partly so; staminate fls. with perianth; fls. monoecious.
- D. Ovary with 1 basal orthotropous ovule: lvs. pinnate. Order V. JUGLANDALES  
Fam. 10. *Juglandaceae*, 115

DD. Ovary with 2 or 6 pendulous ovules, but fr. usually 1-seeded: lvs. simple.

Order VI. FAGALES

- E. Fr. a nut or nutlet partly or wholly enclosed in a more or less leafy involucre, or nutlets disposed in a strobile or ament. Fam. 11. *Betulaceae*, 124
- EE. Fr. a nut partly or wholly enclosed in a woody, often spiny involucre.

Fam. 12. *Fagaceae*, 146

- BB. Perianth usually of 2 whorls; fls. usually not in catkins.

C. Fls. unisexual, rarely bisexual (sometimes so in Fam. 13 and 18).

- D. Fr. not a caps.: ovary 1-celled.

E. Ovary superior. Order VII. URTICALES

# SYNOPSIS

- f. Ovule pendulous; lvs. alternate.
- g. Fls. solitary or in axillary clusters or racemes: sap not milky.
  - cc. Fls. in cymes, spikes or heads: sap milky..... Fam. 13. *Ulmaceae*, 174
  - ff. Ovule erect or ascending: lvs. opposite..... Fam. 14. *Moraceae*, 137
  - ee. Ovary inferior or half-inferior: lvs. often opposite.... Order VIII. *SANTALALES*
  - f. Fr. a drupe or nut; parasitic on roots..... Fam. 16. *Santalaceae*, 193
  - ff. Fr. a berry: parasitic on brs. of trees..... Fam. 17. *Loranthaceae*, 194
  - dd. Fr. a caps.: ovary several-celled: perianth large, corolla-like.....
- Order IX. *ARISTOLOCHIALES*
- Fam. 18. *Aristolochiaceae*, 195
- cc. Fls. usually bisexual: ovary superior, 1-celled.
- d. Embryo straight or nearly so: fr. an achene: lvs. alternate; stipules usually sheathing ..... Order X. *POLYGONALES*
- Fam. 19. *Polygonaceae*, 196
- dd. Embryo coiled, rarely straight..... Order XI. *CENTROSPERMAB*
- e. Lvs. alternate: fls. without scarious bracts; petals wanting: fr. an utricle.
  - Fam. 20. *Chenopodiaceae*, 200
  - ee. Lvs. opposite: fls. with scarious bracts; petals often present: fr. a caps., rarely an utricle ..... Fam. 21. *Caryophyllaceae*, 203
- aa. Petals present or sepals petaloid (not petaloid in Fam. 26 and 32), rarely fls. apetalous or naked (in Fam. 27 and 28).
- b. Ovary superior (or sometimes half-inferior or wholly inferior in Fam. 35, 36 and 39).
- c. At least some parts of the fl. spirally arranged; perianth sometimes wanting; stamens usually many; carpels 1 to many, usually distinct..... Order XII. *RANALES*
- d. Plants without oil-cells, not aromatic.
- e. Perianth present.
- f. Fr. an achene, follicle or berry.
  - g. Anthers not opening by valves; carpels several to many.
  - h. Petals present or sepals petaloid; fls. usually bisexual: fr. an achene or follicle ..... Fam. 22. *Ranunculaceae*, 204
  - hh. Petals wanting; sepals petaloid: fls. usually unisexual: fr. a fleshy follicle or berry-like.
  - i. Carpels 3-12, many-seeded..... Fam. 23. *Lardizabalaceae*, 220
  - ii. Carpels numerous, 1-seeded, berry-like.
    - Fam. 24. *Sargentodoxaceae*, 222
  - gg. Anthers opening by valves; carpels usually solitary: fr. a berry: upright shrubs ..... Fam. 25. *Berberidaceae*, 222
  - ff. Fr. a drupe: fls. usually dioecious; petals usually small.
    - Fam. 26. *Menispermaceae*, 242
- ee. Perianth wanting.
- f. Fls. with 5 to many carpels: lvs. alternate, exstipulate.
  - Fam. 27. *Trochodendraceae*, 244
  - ff. Fls. with 1 carpel: lvs. opposite, stipulate.... Fam. 28. *Cercidiphyllaceae*, 245
- d. Plants with oil-cells, aromatic.
- e. Stamens numerous, spirally arranged, opening by pores or slits.
- f. Seeds without or with solid albumen; pistils many.
- g. Pistils usually on an elongated axis, rarely whorled; lvs. alternate.
  - Fam. 29. *Magnoliaceae*, 246
  - gg. Pistils enclosed in a hollow receptacle and developing into achenes: lvs. opposite ..... Fam. 30. *Calycanthaceae*, 255
  - ff. Seed with ruminant albumen: fr. berry-like: fls. usually with 3 sepals and 6 petals ..... Fam. 31. *Annonaceae*, 257
  - ee. Stamens 6-12, in whorls; anthers opening by valves; fr. drupaceous, 1-seeded; perianth small, not petaloid..... Fam. 32. *Lauraceae*, 257
- cc. Parts of the fl. in whorls.
- d. Fls. 4-merous, with 2 short and 4 longer hypogynous stamens: fr. a 2-celled caps., sometimes indehiscent ..... Order XIII. *RHOEADALES*
- Fam. 33. *Cruciferae*, 260
- dd. Fls. usually 5-merous, stamens 4 to many.
- e. Carpels distinct, 1 to many, sometimes united; stamens mostly epigynous or perigynous ..... Order XIV. *ROSIFLORAE*
- f. Seeds with endosperm: lvs. usually exstipulate, not compound.
- g. Fr. a caps. or berry.
  - h. Carpels as many as sepals: lvs. alternate: succulent plants.
    - Fam. 34. *Crassulaceae*, 263
  - hh. Carpels usually 2-10: plants not succulent.
    - i. Fr. a thin-walled caps. or berry; carpels 2-10: fls. usually perfect, rarely without petals: lvs. often opposite. Fam. 35. *Saxifragaceae*, 263
    - ii. Fr. a 2-celled caps. with woody or hard walls: fls. often unisexual, sometimes apetalous or naked: lvs. alternate.
      - Fam. 36. *Hamamelidaceae*, 311
    - gg. Fr. a 1-seeded samara: fls. naked: tree with milky sap.
      - Fam. 37. *Eucommiaceae*, 319
  - ff. Seed without endosperm: lvs. usually stipulate, often compound.
  - g. Fls. monoecious, in dense globose heads: lvs. large, palmnerved.
    - Fam. 38. *Platanaceae*, 320

# SYNOPSIS

- gg. Fls. perfect, rarely unisexual.
  - h. Pistils 1 to many, often distinct, developing into achenes or follicles, or connate and forming a pome or drupe: fls. regular: stamens usually perigynous or epigynous.....Fam. 39. *Rosaceae*, 522
  - hh. Pistil 1, developing into a legume: fls. usually irregular (papilionaceous); stamens hypogynous.....Fam. 40. *Leguminosae*, 452
- hh. Carpels united into a compound ovary; stamens hypogynous.
  - f. Stamens as many as sepals or fewer, rarely more than twice as many as sepals.
    - g. Stamens twice as many as sepals or as many and opposite the sepals (except in Fam. 58) or sometimes fewer.
      - h. Ovules pendulous with ventral raphe, rarely ascending and with dorsal raphe .....Order XV. GERANIALES
      - i. Fls. perfect or dioecious or polygamous: lvs. often compound.
        - j. Fls. regular.
          - k. Plants without secreting cells: fls. perfect: lvs. pinnate.
            - Fam. 41. *Zygophyllaceae*, 522
          - kk. Plants with secreting cells.
            - l. Lvs. punctate, of aromatic or pungent odor when bruised.
              - Fam. 42. *Rutaceae*, 523
            - ll. Lvs. not punctate.
              - m. Filaments distinct; fls. usually unisexual or polygamous.
                - Fam. 43. *Simaroubaceae*, 530
              - mm. Filaments usually wholly or partly united: fls. usually perfect .....Fam. 44. *Meliaceae*, 532
            - jj. Fls. irregular, papilionaceous.....Fam. 45. *Polygalaceae*, 533
          - ii. Fls. monocious, often apetalous: fr. capsular, usually of 3 carpels, rarely indehiscent .....Fam. 46. *Euphorbiaceae*, 534
        - hh. Ovules pendulous with dorsal raphe or erect with ventral raphe: disk usually conspicuous .....Order XVI. SAPINDALES
        - i. Fls. apetalous or with 3 minute petals.
          - j. Lvs. opposite: petals wanting: fr. capsular or fleshy.
            - Fam. 47. *Buzaceae*, 536
          - jj. Lvs. linear, alternate; petals present: fr. drupaceous, berry-like.
            - Fam. 48. *Empetraceae*, 538
    - ii. Fls. with petals, rarely apetalous.
      - j. Lvs. simple, pinnately veined, or if compound, plants resiniferous.
        - k. Each carpel with 1 pendulous ovule.
          - l. Carpels distinct; fr. separating into 5-8 cocci: lvs. opposite, entire .....Fam. 49. *Coriariaceae*, 539
          - ll. Carpels connate: fr. a drupe, berry or caps.: lvs. alternate.
            - m. Plant resiniferous: lvs. often compound.
              - Fam. 50. *Anacardiaceae*, 540
            - mm. Plant not resiniferous: lvs. simple.
              - n. Fr. a caps. or achene: fls. in racemes.
                - Fam. 51. *Cyrillaceae*, 545
              - nn. Fr. a drupe: fls. in cymes or solitary.
                - Fam. 52. *Aquifoliaceae*, 546
            - kk. Each carpel with 2 or more ovules: fr. a caps. or drupe.
              - Fam. 53. *Celastraceae*, 553
          - jj. Lvs. palmately veined or compound (except in Fam. 58 and in a few species of Fam. 55).
            - k. Lvs. opposite.
              - l. Fls. regular.
                - m. Fr. a bladderly caps.: lvs. pinnate.
                  - Fam. 54. *Staphyleaceae*, 563
                - mm. Fr. a samara: lvs. simple or compound.
                  - Fam. 55. *Aceraceae*, 565
              - ll. Fls. irregular: fr. a large leathery caps.
                - Fam. 56. *Hippocastanaceae*, 586
            - kk. Lvs. alternate.
              - l. Stamens opposite the sepals, or more than sepals.
                - Fam. 57. *Sapindaceae*, 591
              - ll. Stamens opposite the petals: lvs. often simple.
                - Fam. 58. *Sabiaceae*, 593
          - gg. Stamens as many as sepals and alternating, opposite the petals: carpels 2-5, each with 1-2 ascending ovules.....Order XVII. RHAMNALES
          - h. Fr. a caps. or drupe; petals involute: lvs. simple, penninerved.
            - Fam. 59. *Rhamnaceae*, 595
          - hh. Fr. a berry; petals valvate: lvs. palmately veined or compound.
            - Fam. 60. *Vitaceae*, 608
        - ff. Stamens usually numerous: disk inconspicuous or wanting.
          - g. Sepals usually valvate: placenta usually central: pubescence stellate: tissue with mucilaginous cells.....Order XVIII. MALVALES
          - h. Stamens numerous.
            - i. Anthers 2-celled; stamens fascicled or free...Fam. 61. *Tiliaceae*, 621
            - ii. Anthers 1-celled; filaments connate.....Fam. 62. *Malvaceae*, 628
          - hh. Fertile stamens as many as sepals, connate; anthers 2-celled; petals often wanting or reduced.....Fam. 63. *Sterculiaceae*, 629

# SYNOPSIS

gg. Sepals usually imbricate: placentae usually parietal.

Order XIX. PARIETALES

h. Styles usually free.

i. Seeds usually with albumen.

j. Fr. often berry-like: mostly climbing shrubs.

Fam. 64. *Actinidiaceae*, 630

jj. Fr. a caps., sometimes indehiscent: upright shrubs or trees.

k. Sepals and petals 4: lvs. opposite. Fam. 65. *Eucryphiaceae*, 632

kk. Sepals and petals usually 5: lvs. alternate.

Fam. 66. *Theaceae*, 633

ii. Seed without albumen.

j. Lvs. usually opposite: styles present. Fam. 67. *Guttiferaceae*, 636

jj. Lvs. alternate, small; style wanting or very short: seed with a

tuft of hairs. Fam. 68. *Tamaricaceae*, 642

hh. Styles united.

i. Fls. perfect: fr. capsular.

j. Stamens many. Fam. 69. *Cistaceae*, 644

jj. Stamens 5. Fam. 70. *Violaceae*, 652

ii. Fls. often unisexual: fr. often berry-like.

j. Sepals and petals usually 5. Fam. 71. *Flacourtiaceae*, 652

jj. Sepals and petals 4; stamens 8. Fam. 72. *Stachyuraceae*, 654

bb. Ovary usually inferior (except in Fam. 74, 75 and 76).

c. Sepals and petals numerous: fleshy spiny plants. Order XX. OPUNTIALES

Fam. 73. *Cactaceae*, 654

cc. Sepals and petals usually 5: plants not fleshy.

d. Ovules several or numerous in each cell (except in Fam. 75 and 76 with superior

ovaries): infl. not umbelliform. Order XXI. MYRTIFLORAE

e. Ovary free, but enclosed in a tubular or campanulate calyx-tube.

f. Ovary 1-celled, 1-ovuled; petals usually wanting.

g. Ovule pendulous: lvs. not scaly. Fam. 74. *Thymelaeaceae*, 658

gg. Ovule upright: lvs. more or less scaly. Fam. 75. *Elaeagnaceae*, 662

ff. Ovary 2-6-celled; each cell with 2 to many ovules; petals present.

Fam. 76. *Lythraceae*, 666

ee. Ovary adnate to the calyx-tube.

f. Sepals and petals usually 5.

g. Fr. with 9 carpels in 2 or 3 whorls, large, berry-like; petals 5-7.

Fam. 77. *Punicaceae*, 667

gg. Fr. with the carpels in one whorl.

h. Cells of ovary 1-ovuled: fr. drupaceous.

i. Petals imbricate, small or wanting: ovary 1- or 6-10-celled.

Fam. 78. *Nyssaceae*, 667

ii. Petals valvate, 4-10, narrow: ovary 1-2-celled.

Fam. 79. *Alangiaceae*, 669

hh. Cells of ovary 1-8-ovuled: fr. usually capsular or berry-like: aromatic

plants. Fam. 80. *Myrtaceae*, 670

ff. Sepals and petals 4 or 2; calyx-tube cylindric. Fam. 81. *Onagraceae*, 670

dd. Ovules 1 or rarely 2 in each cell, pendulous: fls. in umbels or corymbs.

Order XXII. UMBELLIFLORAE

e. Fls. 5-merous; styles 2-5: fls. umbellate.

f. Fr. a berry or drupe. Fam. 82. *Araliaceae*, 672

ff. Fr. dry at maturity; splitting into 2 mericarps. Fam. 83. *Umbelliferae*, 680

ee. Fls. 4-merous; style 1: fls. not umbellate: fr. a drupe. Fam. 84. *Cornaceae*, 681

Subclass II. SYMPETALAE Petals more or less united (free or nearly so in Fam. 85 and 86 and in some genera of Fam. 87, 94, 95 and 98).

a. Ovary superior (except in some genera of Fam. 87 and in Fam. 93).

b. Stamens usually free or adnate only to the base of the corolla, twice as many as the lobes or alternate with the lobes, sometimes inserted at the sinuses of the corolla.

Order I. ERICALES

c. Stamens free or nearly free.

d. Petals free: fr. a caps.

e. Ovary 3-celled: shrubs or trees. Fam. 85. *Clethraceae*, 689

ee. Ovary 4-6-celled: evergreen shrubs. Fam. 86. *Pyrolaceae*, 690

dd. Petals united (distinct in a few genera): fr. a caps., berry or drupe.

Fam. 87. *Ericaceae*, 691

cc. Stamens inserted at the sinuses of the corolla or connate into a tube.

Fam. 88. *Diapensiaceae*, 755

bb. Stamens borne on the corolla.

c. Stamens opposite the lobes and as many or more.

d. Ovary 1-celled; stamens as many as lobes, usually 5.

e. Ovary with 1 to many ovules, style 1: fr. a drupe or caps.

Order II. PRIMULALES

Fam. 89. *Myrsinaceae*, 756

ee. Ovary with 1 ovule; styles 5: fr. an achene. Order III. PLUMBAGINALES

Fam. 90. *Plumbaginaceae*, 757

dd. Ovary 2-5-celled; corolla-lobes often 4. Order IV. EBENALES

e. Ovary completely 2-5-celled; stamens usually as many as corolla-lobes.

Fam. 91. *Sapotaceae*, 757

## SYNOPSIS

- EE. Ovary incompletely 2-5-celled, 1-celled above.  
 F. Styles 2-3; fls. usually unisexual; stamens as many or more than corolla-lobes ..... Fam. 92. *Ebenaceae*, 758  
 FF. Style 1; fls. usually perfect.  
 G. Stamens usually many; ovary inferior or half-inferior.  
 Fam. 93. *Symplocaceae*, 760  
 GG. Stamens twice as many as corolla-lobes..... Fam. 94. *Styracaceae*, 760  
 CC. Stamens alternate with the lobes, as many or fewer.  
 D. Corolla not scarious, sometimes wanting.  
 E. Carpels 2, often distinct; corolla usually regular, the stamens usually inserted at base; lobes usually convolute: lvs. usually opposite..... Order V. *CONTORTAE*  
 F. Stamens usually 2; corolla sometimes wanting: stipules wanting.  
 Fam. 95. *Oleaceae*, 765  
 FF. Stamens as many as corolla-lobes.  
 G. Carpels connate into a usually 2-celled ovary: stipules or stipular line present: sap not milky..... Fam. 96. *Loganiaceae*, 793  
 GG. Carpels usually distinct, or often united at apex: fr. of 2 follicles: sap milky.  
 H. Carpels united at least at apex; stamens distinct; pollen granular.  
 Fam. 97. *Apocynaceae*, 797  
 HH. Carpels distinct; stamens usually connate; pollen united into waxy masses or groups of 4..... Fam. 98. *Asclepiadaceae*, 798  
 EE. Carpels 2 or 3, rarely 4 or 5, united; corolla often irregular; lobes imbricate; stamens usually adnate to the mostly elongated corolla-tube: lvs. opposite or alternate ..... Order VI. *TURIFLORAE*  
 F. Ovary 3-celled: corolla regular, convolute..... Fam. 99. *Polemoniaceae*, 800  
 FF. Ovary 2- or 4-celled: corolla with imbricate lobes.  
 G. Carpels 1-2-seeded, usually separating into 4 nutlets.  
 H. Corolla regular; stamens 5..... Fam. 100. *Boraginaceae*, 800  
 HH. Corolla irregular, rarely regular; stamens 4, usually didynamous.  
 I. Ovary not lobed, the style at apex; corolla sometimes regular.  
 Fam. 101. *Verbenaceae*, 802  
 II. Ovary 4-lobed, the style basal or nearly so; corolla 2-lipped.  
 Fam. 102. *Labiatae*, 806  
 GG. Carpels usually with many ovules, connate into a 2-celled ovary, rarely 1-celled and 1-ovuled.  
 H. Stamens 5: fls. regular: fr. a caps. or berry.. Fam. 103. *Solanaceae*, 812  
 HH. Stamens usually 2 or 4: fls. irregular.  
 I. Ovary-many-ovuled.  
 J. Seeds albuminous; placenta central.  
 Fam. 104. *Scrophulariaceae*, 815  
 JJ. Seeds without albumen, usually with large wings; placenta parietal or central: usually climbing shrubs or trees.  
 Fam. 105. *Bignoniaceae*, 819  
 II. Ovary 1- or 2-celled; cells 1-ovuled: fr. a nutlet: subshrubs.  
 Fam. 106. *Globulariaceae*, 823  
 DD. Corolla scarious, nerveless, 4-lobed; stamens 4: fr. a circumscissile caps. or a nutlet ..... Order VII. *PLANTAGINALES*  
 Fam. 107. *Plantaginaceae*, 823  
 AA<sub>2</sub> Ovary inferior.  
 B. Anthers free, rarely coherent: lvs. opposite..... Order VIII. *RUBIALES*  
 C. Stamens as many as corolla-lobes: ovary 2- or several-celled.  
 D. Lvs. with interpetiolar stipules, entire..... Fam. 108. *Rubiaceae*, 824  
 DD. Lvs. without stipules or stipules adnate to the petiole: lvs. entire, serrate or compound ..... Fam. 109. *Caprifoliaceae*, 827  
 CC. Stamens 4 or less: ovary 1-celled, 1-ovuled..... Fam. 110. *Dipsacaceae*, 876  
 BB. Anthers more or less united: fls. (in Fam. 111) aggregate on a receptacle surrounded by an involucre; ovary 1-celled and 1-ovuled..... Order IX. *CAMPANULATAE*  
 Fam. 111. *Compositae*, 876
- Class II. MONOCOTYLEDONEAE. MONOCOTYLEDONS. Embryo with one cotyledon: lvs. mostly parallel-veined: fls. usually 3- or 6-merous, not 5-merous: stem without annual layers, without clear distinction of bark, wood and pith.**
- A. Fls. without perianth or the perianth reduced to 1-3 minute scales: fr. a nutlet enclosed by scale-like bracts..... Order I. *GLUMIFLORAE*  
 Fam. 112. *Gramineae*, 885  
 AA. Fls. with a perianth: fr. a capsule or berry, 3-many-seeded..... Order II. *LILIIFLORAE*  
 Fam. 113. *Liliaceae*, 892

# ANALYTICAL KEY TO THE FAMILIES AND ABERRANT GENERA <sup>1</sup>

Ovules not enclosed in an ovary: fls. unisexual: resinous trees or shrubs (except *Ephedraceae*).

- A. Seeds solitary or rarely 2, berry- or drupe-like: embryo with 2 cotyledons: lvs. alternate.
  - B. Lvs. fan-shaped, deciduous: fr. yellow, drupe-like. .... *Ginkgoaceae*, 1
  - BB. Lvs. needle-shaped or linear, persistent. .... *Taxaceae*, 1
- AA. Seeds several or many, forming a dry cone, rarely berry-like and with 1 or several seeds.
  - B. Fr. a dry woody cone with often winged seeds between the scales or berry-like through union of the fleshy scales: fls. without perianth.
    - C. Each scale with 1 ovule: cone large woody: lvs. alternate, ovate-lanceolate, 8-20 mm. broad at base. .... *Araucariaceae*, 7
    - CC. Each scale with 2 or more ovules: fr. a cone or berry-like: lvs. alternate, opposite or ternate, scale-like or needle-shaped or linear, rarely linear-lanceolate. .... *Pinaceae*, 8
  - BB. Seeds nut-like, enclosed by the fleshy bracts, forming a small fleshy strobile: fls. with a 2-4-parted perianth: brs. virgate with scale-like lvs. in distant pairs or whorls: shrubs. .... *Ephedraceae*, 68

Ovules enclosed in an ovary.

- I. Lvs. net-veined: parts of fl. mostly in whorls of 5, sometimes of 4, rarely of 3 or 2: stems with clear distinction of bark, wood and pith. (II. See on p. xxx.)
  - 1. Fls. without corolla (2, see p. xxvi).
  - A. Fls., at least the staminate ones, in catkins.
    - B. Fls. of both sexes in catkins, without calyx; ovary superior or naked: lvs. simple, alternate.
      - C. Fr. a many-seeded caps. .... *Salicaceae*, 71
      - CC. Fr. 1-seeded.
        - D. Style with 2 stigmas: lvs. often toothed.
          - E. Each scale with a single pistillate fl.; catkins upright. .... *Myricaceae*, 112
          - EE. Each scale with 2 or 3 pistillate fls.; staminate catkins mostly pendulous. .... *Betulaceae*, 124
        - DD. Style not cleft, stigmatic above: lvs. entire. .... *Leitneriaceae*, 114
      - BB. Fls., at least one sex, with calyx, usually only those of one sex in catkins.
        - C. Ovary superior.
          - Fr. fleshy, drupaceous. (See also *Rhus* sp. 13 and 14 on p. 545.)
            - E. Pistillate fls. without perianth; those of both sexes in catkins: lvs. opposite. .... *Garryaceae*, 111
            - EE. Pistillate fls. with perianth; only staminate fls. in catkins: lvs. alternate. .... *Moraceae*, 187
          - DD. Fr. a caps.: styles and stamens 4. .... *Tetracentron*, 253
        - CC. Ovary inferior.
          - D. Lvs. pinnate. .... *Juglandaceae*, 115
          - DD. Lvs. simple.
            - E. Fr. a nut. .... *Fagaceae*, 146
            - EE. Fr. a caps.
              - F. Fls. sessile, apetalous. .... *Sinowilsonia*, 317
              - FF. Fls. pedicelled, with minute petals. .... *Fortunaria*, 316
    - AA. Fls. not in catkins.
      - B. Fls., at least staminate ones, without calyx or with indistinct calyx.
        - C. Fls. in globular heads.
          - D. Lvs. palmately lobed.
            - E. Fr. a nutlet. .... *Platanaceae*, 320
            - EE. Fr. a dehiscent 2-celled caps. .... *Liquidambar*, 312
          - DD. Lvs. ovate, not lobed: fr. a drupe: head of many staminate and 1 pistillate fl. .... *Davidia*, 669
        - CC. Fls. not in heads; carpels many.
          - D. Lvs. alternate.
            - E. Fr. drupaceous or of several 1-celled samaras. .... *Trochodendraceae*, 244
            - EE. Fr. a 2-celled samara. .... *Eucommiaceae*, 319
          - DD. Lvs. opposite: fr. a dehiscent many-seeded pod. .... *Cercidiphyllaceae*, 245
        - BB. Fls. with calyx.
          - C. Carpels distinct or nearly so, 2 or more.
            - D. Sepals petaloid.
              - E. Sepals valvate, usually 4. .... *Clematis*, 206

<sup>1</sup> The characters used in this key apply only to the genera and species treated in this book.

# ANALYTICAL KEY

- EE. Sepals imbricate, 6 or more.
  - F. Lvs. alternate.
    - G. Lvs. compound; climbing shrubs. .... *Lardizabalaceae*, 220
    - H. Carpels 3-12, many-seeded. .... *Sargentodoxaceae*, 222
    - HH. Carpels numerous, 1-seeded. .... *Magnoliaceae*, 246
    - GG. Lvs. simple. .... *Calycanthaceae*, 255
  - FF. Lvs. opposite: sepals many, spirally arranged. .... *Firmiana*, 629
- DD. Sepals not petaloid.
  - E. Lvs. simple, palmately veined; fr. a dehiscent dry pod. .... *Lardizabalaceae*, 220
  - EE. Lvs. compound; fr. a dehiscent pod or drupe.
    - F. Lvs. not dotted: climbing shrubs. .... *Rutaceae*, 523
    - FF. Lvs. with transparent dots: upright shrubs or trees. .... *Rutaceae*, 523
- CC. Carpels united into a 1-many-celled ovary.
  - D. Ovary superior, free from the calyx.
    - E. Lvs. alternate.
      - F. Cells of ovary with 1 or 2 ovules.
        - G. Fls., at least the pistillate, in globose heads or inclosed in a pyriform receptacle: fls. 4-merous.
          - H. Trees or shrubs with milky juice: heads large, solitary. .... *Moraceae*, 187
          - HH. Subshrubs without milky juice: heads small, in cymes. .... *Debreyeria*, 192
        - GG. Fls. not in heads, nor inclosed in a receptacle.
          - H. Anthers opening by pores: aromatic trees or shrubs. .... *Lauraceae*, 257
          - HH. Anthers opening by slits.
            - I. Stamens as many and alternating with the sepals. .... *Rhamnaceae*, 595
            - II. Stamens opposite the sepals or numerous.
              - J. Styles or stigmas 2 or 3.
                - K. Fls. unisexual or polygamous (bisexual only in *Ulmus*).
                  - L. Styles 2 or 1: lvs. usually serrate: fls. monoecious.
                    - M. Styles usually 2: fr. a samara, nut or drupe: trees or large shrubs. .... *Ulmaceae*, 174
                    - MM. Style 1: fr. a nutlet: subshrub. .... *Boehmeria*, 192
                  - LL. Styles 3 or 2: fr. a caps. or drupe; shrubs or subshrubs with usually entire lvs.
                    - M. Lvs. simple.
                      - N. Fls. dioecious; stamens 5-18: lvs. entire.
                        - NN. Fls. monoecious; stamens 4-6. .... *Buxaceae*, 536
                        - MM. Lvs. pinnate: fls. dioecious, stamens 3-5. .... *Pistacia*, 540
      - KK. Fls. usually bisexual: low shrubs.
        - L. Stipules not sheathing: fr. an utricle, sometimes fleshy.
          - LL. Stipules sheathing: fr. a dry achene. .... *Polygonaceae*, 196
        - JJ. Style and stigma 1: calyx campanulate to tubular.
          - K. Stamens many: fr. a long-tailed achene. .... *Cercocarpus*, 424
          - KK. Stamens as many or twice as many as calyx-lobes: fr. a berry.
            - Thymelaeaceae, 638
    - FF. Cells of ovary with several ovules.
      - G. Ovary several-celled. .... *Sterculiaceae*, 629
      - GG. Ovary 1-celled. .... *Flacourtiaceae*, 652
  - EE. Lvs. opposite.
    - F. Fr. dehiscent, of 3 2-seeded carpels: lvs. entire. .... *Buxus*, 537
    - FF. Fr. not dehiscent.
      - G. Fr. a drupe or berry. .... *Rhamnaceae*, 595
      - GG. Fr. a samara.
        - H. Samara 1-celled. .... *Oleaceae*, 765
        - HH. Samara 2-celled. .... *Aceraceae*, 585
  - DD. Ovary inferior or half-inferior or permanently inclosed in the calyx-tube.
    - E. Fr. a dehiscent caps.
      - F. Ovary 6-celled; calyx tubular, corolla-like: climbing shrubs.
        - Aristolochiaceae, 195
      - FF. Ovary 2-celled; calyx of distinct sepals; upright shrubs.
        - Hamamelidaceae, 311
    - EE. Fr. a drupe or rarely an achene; ovary 1-celled.
      - F. Plant more or less covered with petate or stellate scales. .... *Elaeagnaceae*, 662
      - FF. Plant not scaly.
        - G. Fls. in clusters on axillary peduncles; stamens 5-12: lvs. alternate: trees.
          - Nyssaceae, 667
        - GG. Fls. axillary, subsessile or in spikes: lvs. often opposite: parasitic shrubs.
          - H. Parasitic on brs. of trees: fr. a berry: lvs. opposite. .... *Loranthaceae*, 194
          - HH. Parasitic on roots: fr. drupe or achene: lvs. alternate or opposite.
            - Santalaceae, 193
  - 2. Fls. with a corolla.
    - a. Petals free (b, see p. xxviii).
  - A. Stamens numerous, at least more than 10.
  - B. Ovary superior.
    - C. Pistils several to many, distinct or united only at base.
    - D. Stamens inserted on the disk or on the axis.

    - BB. Ovary inferior.
      - C. Lvs. stipulate: fr. a pome.....*Rosaceae*, 322
    - CC. Lvs. exstipulate.
      - D. Cells of ovary several- to many-ovuled.
        - E. Style 1; fls. 4-merous.....*Onagraceae*, 670
        - EE. Styles 2-5, usually connate below: fls. usually 5-merous.....*Saxifragaceae*, 263
      - DD. Cells of ovary 1-2-ovuled.
        - E. Fr. a 2-celled caps.; styles 2: pubescence stellate.....*Hamamelidaceae*, 311
        - EE. Fr. not a caps.
          - F. Styles 2-5, sometimes connate: fls. in umbels: lvs. alternate.
            - G. Fr. dry, splitting at maturity in 2; styles 2.....*Umbelliferae*, 680
            - GG. Fr. berry-like; styles 2-5.....*Araliaceae*, 672
          - FF. Styles 1: lvs. often opposite.
            - G. Petals and stamens usually 6: lvs. usually lobed, alternate.
              - Alangiaceae*, 669
            - GG. Petals and stamens 4 or 5: lvs. never lobed, often opposite.....*Cornaceae*, 631
      - b. Petals more or less united.

# ANALYTICAL KEY

- A. Ovary superior.
  - B. Stamens twice as many as corolla-lobes or more.
    - C. Stamens free or nearly so.
      - D. Caps. 3-celled; style slender with 3 stigmas; corolla divided nearly or quite to base.....*Clethraceae*, 639
      - DD. Caps. 5-celled.
        - E. Style thick, shorter than ovary.....*Pyrolaceae*, 690
        - EE. Style slender, longer than ovary.....*Ericaceae*, 691
    - CC. Stamens attached to the tube of the corolla.
      - D. Filaments free; styles 4.....*Ebenaceae*, 758
      - DD. Filaments more or less united.
        - E. Anthers 2-celled; stamens united into fascicles.
          - F. Ovary partly inferior; pubescence stellate; fr. a dry drupe.....*Styracaceae*, 760
          - FF. Ovary superior; fr. a caps.....*Theaceae*, 633
        - EE. Anthers 1-celled; stamens united into a tube.....*Malvaceae*, 628
  - BB. Stamens as many as corolla-lobes or fewer.
    - C. Stamens as many as corolla-lobes and opposite them.
      - D. Style 1.
        - E. Ovary 2-5-celled: corolla-lobes with small appendages at base: fr. a drupe.
          - Sapotaceae, 757
        - EE. Ovary 1-celled; corolla without appendages: fr. a berry-like drupe.
          - Myrsinaceae, 756
      - DD. Styles 5; ovary 1-celled: fr. a 1-seeded utricle.....*Plumbaginaceae*, 757
    - CC. Stamens as many as corolla-lobes and alternate or fewer.
      - D. Corolla regular.
        - E. Stamens as many as corolla-lobes.
          - F. Ovaries 2, distinct, or 1 and deeply 4-lobed.
            - G. Lvs. opposite: ovaries 2.
              - H. Stamens distinct; carpels usually united at apex.....*Apocynaceae*, 797
              - HH. Stamens united: carpels distinct.....*Asclepiadaceae*, 798
            - GG. Lvs. alternate: ovary 1, deeply 4-lobed.....*Boraginaceae*, 800
          - FF. Ovary 1, not deeply 4-lobed.
            - G. Stamens 4.
              - H. Lvs. opposite.
                - I. Petioles with stipules or connected by a stipular line: fr. a caps.
                  - Loganiaceae, 793
                - II. Petioles without stipules or stipular line: fr. a drupe or berry.
                  - Verbenaceae, 802
              - HH. Lvs. alternate, linear: corolla scarious.....*Plantaginaceae*, 823
            - GG. Stamens 5; lvs. usually alternate.
              - H. Stamens free from the corolla or between the corolla-lobes.
                - I. Style present.
                  - J. Stamens free.....*Ericaceae*, 691
                  - JJ. Stamens between the corolla-lobes: low caespitose or prostrate subshrubs.....*Diapensiaceae*, 755
                - II. Style none: fr. a drupe.....*Aquifoliaceae*, 546
              - HH. Stamens attached to the corolla-tube.
                - I. Styles with 3 stigmas: fr. a caps.....*Polemoniaceae*, 800
                - II. Styles with 2 stigmas or undivided.
                  - J. Fr. a 4-seeded drupe: fls. small, whitish, in large panicles.
                    - Ehretia, 801
                  - JJ. Fr. a many-seeded berry: fls. in cymes, fascicles or solitary.
                    - Solanaceae, 812
      - EE. Stamens fewer than corolla-lobes: lvs. opposite.
        - F. Fls. not in racemes; floral lvs. opposite: fr. a drupe or caps....*Oleaceae*, 765
        - FF. Fls. in terminal or axillary racemes; floral lvs. alternate: fr. a caps.
          - Scrophulariaceae, 815
    - DD. Corolla irregular.
      - E. Fertile stamens 5: lvs. alternate.....*Ericaceae*, 691
      - EE. Fertile stamens 2 or 4: lvs. usually opposite.
        - F. Ovules solitary in each cell.
          - G. Lvs. opposite: ovary 2-4-celled.
            - H. Ovary 4-lobed, with the style between the lobes.....*Labiatae*, 806
            - HH. Ovary not lobed.....*Verbenaceae*, 802
          - GG. Lvs. alternate: ovary 1-2-celled.....*Globulariaceae*, 823
        - FF. Ovules many in each cell.
          - G. Placentae axile.....*Scrophulariaceae*, 815
          - GG. Placentae parietal: trees or climbers.....*Bignoniaceae*, 819
- AA. Ovary inferior.
  - B. Anthers distinct, rarely slightly cohering.
    - C. Stamens 8-16.
      - D. Fr. a berry or berry-like drupe: stamens free.....*Ericaceae*, 691
      - DD. Fr. a dry drupe: stamens united at base.....*Styracaceae*, 760
    - CC. Stamens 4 or 5.
      - D. Ovary 1-celled; fls. in heads: low subshrub.....*Dipsacaceae*, 876
      - DD. Ovary 2-5-celled.
        - E. Lvs. stipulate or with a stipular line.....*Rubiaceae*, 824
        - EE. Lvs. exstipulate, rarely on vigorous brs. with stipules.....*Caprifoliaceae*, 827

## ANALYTICAL KEY

ss. Anthers united into a tube inclosing the style: fls. in a dense involucrate head.

*Compositae*, 876

II. Lvs. parallel-veined: parts of fl. usually in whorls of 3: stems without clear distinction of bark, wood and pith.

- A. Fls. without perianth or the perianth reduced to 1-3 minute scales: fr. a nutlet enclosed by scale-like bracts: stems hollow.....*Gramineae*, 885
- AA. Fls. with perianth: fr. a caps. or berry, 3-many-seeded.....*Liliaceae*, 892

# DESCRIPTION OF TREES AND SHRUBS

## Subdivision I. GYMNOSPERMAE Lindl.

### GYMNOSPERMS

Trees or shrubs with needle-shaped or scale-like, rarely fan-shaped or oblong to elliptic, mostly evergreen lvs. and unisexual fls.: ovules not enclosed in an ovary.

#### 1. GINKGOACEAE Engl. GINKGO FAMILY

Resinous tree: lvs. deciduous, fan-shaped, parallel-veined: fls. dioecious, the staminate catkin-like, the anthers borne in stalked pairs on a slender axis; the fertile long-stalked with usually 2 ovules; fecundation by motile sperm-cells: fr. drupe-like, with a fleshy outer and a bony inner coat; embryo with 2 cotyledons. (Ginkgo, meaning silver fruit in Chinese.)—One monotypic genus.

**GINKGO L.** GINKGO. Characters of the family. One species.

**G. biloba L.** Tree to 40 m., glabrous: lvs. alternate, partly in clusters of 3-5 on spurs, slender-stalked, fan-shaped, more or less incised or divided at the broad summit, 5-8 cm. across: fr. obovoid or ellipsoid, about 2.5 cm. long, yellowish, consisting of an ovoid angular nut surrounded by a pulpy ill-smelling and acrid outer coat; kernel sweet. Fl.v; fr.x. S.I.1:t.5(c). E.H.1:t.21-23(h). S.N.71(h). E.N.R.13:99. (*Salisburia adiantifolia* Sm.; MAIDENHAIR-TREE.) E. China, cult. in Japan. Intr. about 1730, about 1784 to Am. Zone IV. A rather sparsely branched picturesque tree, sometimes planted as a street tree; the nuts are edible.—**G. b. fastigiata** Henry, var. Brs. ascending, forming a narrow-pyramidal or columnar head. Gn.M.31:383(h). —**G. b. pendula** Carr. Brs. pendulous. R.H.1907:272(h). M.G.16:164(h). —**G. b. laciniata** Carr. Lvs. larger, deeply incised and divided. F.S.10:119. (*G. b.* var. *dissecta* Hochst.)—**G. b. variegata** Carr. Lvs. yellowish-variegated. —**G. b. aurea** (Nels.) Beiss., f. Lvs. bright yellow.

#### 2. TAXACEAE Lindl. YEW FAMILY

Resinous trees or shrubs: lvs. persistent, alternate, rarely opposite, often 2-ranked, needle- or scale-like, rarely broad, entire, usually with a resin-duct: fls. dioecious, rarely monoecious, the staminate cone-like, with the anthers borne on peltate or apically thickened scales; ovules usually solitary, inverted or erect: fr. consisting of a seed with a bony shell, partly or wholly surrounded by a usually fleshy aril; embryo with 2 cotyledons.—Twelve genera with about

100 species in the temperate, subtropical and tropical regions of both hemispheres; sometimes divided into 3 families: TAXACEAE, CEPHALOTAXACEAE and PODOCARPACEAE.

A. Anthers 3-9-celled.

Tribe 1. TAXEAE Endl.

- B. Seed a small nut surrounded by a fleshy cup-like aril; lvs. with pale green to tawny-yellow broad bands beneath, without resin-ducts: brts. alternate.....1. *Taxus*

- BB. Seeds drupe-like; brts. opposite or subopposite.

- C. Fertile fl. of a single ovule; anthers 4-celled; lvs. sharply pointed with 2 glaucous or later fulvous lines beneath narrower than the green margin; brts. subopposite.

2. *Torreya*

- CC. Fertile fl. of several 2-ovuled carpels, but only 1 or 2 seeds developed: lvs. with 2 glaucous lines beneath broader than the green margin; brts. opposite.

Tribe 2. CEPHALOTAXEAE Pilger

3. *Cephalotaxus*

AA. Anthers 2-celled.

Tribe 3. PODOCARPEAE Endl.

- B. Seeds several, spiny-pointed, forming a small terminal head: lvs. with 2 glaucous bands beneath, 1-2.5 cm. long, midrib prominent on both sides.....4. *Sageothena*

- BB. Seeds solitary, drupe- or nut-like, on a usually fleshy stalk.....5. *Podocarpus*

1. **TAXUS** L. YEW. Trees or shrubs; bark reddish or reddish brown, scaly; brts. irregularly alternate; winter-buds with imbricate scales: lvs. spirally arranged, spreading in 2 ranks, linear, often falcate, with 2 broad yellowish or grayish green bands below, without resin-ducts: fls. axillary, dioecious, rarely monoecious, the staminate forming stalked heads of 6-14 stamens, each with 5-9 pollen-sacs; the female consisting of several imbricate scales, the uppermost bearing an ovule with a disk at base: seed ovoid, slightly angular, surrounded by a scarlet campanulate fleshy cup open at the apex; albumen uniform. (The ancient Latin name of the Yew.) About 8 species in the N. hemisphere, very closely related and often considered geographical varieties of one species.

- A. Scales of winter-buds obtuse, not keeled.

- B. Lvs. gradually acuminate: bud-scales persistent at base of brts.....1. *T. baccata*

- BB. Lvs. abruptly pointed: bud-scales deciduous.....2. *T. chinensis*

- AA. Scales of winter-buds acutish or acute, keeled: lvs. abruptly pointed.

- B. Lvs. 2-3 mm. broad, with prominent midrib above, on spreading brts. ascending, forming a V-shaped trough.....3. *T. cuspidata*

- BB. Lvs. 1.5-2 mm. broad, with slightly elevated midrib, flatly 2-ranked.

- C. Low shrub: seed broader than high.....4. *T. canadensis*

- CC. Small tree: seed ovoid.....5. *T. brevifolia*

1. **T. baccata** L. ENGLISH Y. Tree to 20 m., with broad roundish head, or shrubby; bark reddish, flaky; mature brts. greenish: lvs. abruptly narrowed into a very short greenish petiole, 1-2.5 cm. long, dark green, and lustrous above, with 2 pale green bands below: seed broad-ellipsoid, slightly compressed and slightly 2-, rarely, 4-angled, about 6 mm. long, olive-brown. FL. III-IV; FR. IX-X. H.W. 1:11(c). K.V. 131, 134(h). Eu., N. Afr., W. Asia. Cult. since ancient times. Zone VI. A well known ornamental evergreen tree or shrub with numerous garden forms.

Color forms: *T. b. variegata* West., var. Lvs. with white or whitish variegation. (*T. b. var. argentea* Loud.)—*T. b. aurea* Carr. Lvs. yellow. (*T. b. elvastonensis aurea* Beiss.)—*T. b. elegantissima* Beiss. Vigorous form of compact habit, or occasionally more open: young lvs. striped pale yellow, later whitish. (*T. b. aurea* e. Hort.)—*T. b. semper-aurea* Dallimore. Bushy with upright brs.: lvs. retaining their yellow color during the second year. (*T. b. erecta* s. Beiss.)—*T. b. lutea* Endl., var. Fruit yellow. (*T. b. fructu-lutea* Hort., f. *luteo-baccata* Pilger.)

Upright forms: *T. b. stricta* Laws. IRISH Y. Columnar form with crowded upright brs. and brts.: lvs. spirally spreading, not 2-ranked, obtusish, very dark green. H.B. 5:195(h). Gt. 85:187(h). D.H. 198(h). (*T. b. var. fastigiata* Loud., *T. b. hibernica* Loud.) Intr. 1780. Variations are: *T. b. "fastigiata*

*aurea*" Standish, with golden yellow lvs.; and *T. b. "fastigiata variegata"* Carr., with the lvs. variegated yellowish white.—*T. b. erecta* Loud., var. A bushy upright form: lvs. narrower and shorter than those of *T. b. stricta*, sometimes 2-ranked. (*T. b. pyramidalis* Laws.)

Spreading forms: *T. b. Dovastonii* Laws. DOVASTON Y. A form with upright stem, horizontal wide-spreading brs. and pendulous brts.: lvs. very dark, usually falcate. G.C.27:147(h). Gn.9:341(h). (*T. b. D. pendula* Hort.) Cult. 1800.—*T. b. pendula* Jaeg., var. With slender pendulous brs. (*T. b. gracilis pendula* Beiss.)—*T. b. expansa* Carr. A low bush with rounded top and elongated pendulous brs. in compact layers: lvs. light green, 1-2 cm. long. (*T. b. procumbens* Kent, not Loud.)—*T. b. repandens* Parsons. A low, almost prostrate form with long and wide-spreading brs. and dark bluish green, rather narrow and long lvs. partly falcate and curved upward. B.E.t.11(h). Zone IV.—*T. b. linearis* Carr. Brs. spreading: lvs. long and narrow, bright yellowish green.—*T. b. adpressa* Carr. Shrub or low tree with spreading brs.: lvs. oblong, 6-12 mm. long, obtuse and mucronulate: seed usually exceeding the cup. Gn. 35:37. S.N.285(h). (*T. b. f. tardiva* (Endl.) Pilger, *T. parvifolia* Wender., *T. brevifolia* Hort., not Nutt.) Orig. about 1828 or 1838 in England.—Variations are: *T. b. "adpressa stricta"* Carr. with upright and ascending brs. forming a columnar bush; and *T. b. "adpressa aurea"* Henry, var., with ascending brs. and yellow lvs.

2. *T. chinensis* (Pilger) Rehd. CHINESE Y. Tree to 15 m. or shrub, with fissured grayish or reddish bark; mature brts. yellowish green; bud-scales deciduous: lvs. distinctly 2-ranked, rather distant, horizontally spreading at nearly right angles from stem, usually falcate, 2-4 cm. long, very short-stalked, dark and lustrous green above and with slightly raised midrib, grayish green below: seed broad-ovoid, slightly 2-angled and slightly compressed; hilum orbicular, Fl.III-IV; fr.IX-X. C.C.43. I.S.2:t.53. S.N.35(h). (*T. baccata* var. *c.* Pilger, *T. cuspidata* var. *c.* Rehd. & Wils.) C. and W. China. Intr. 1908. Zone (V).

3. *T. cuspidata* Sieb. & Zucc. JAPANESE Y. Tree to 16 m., with reddish brown bark and spreading or upright-spreading brs.; mature brts. reddish brown; bud-scales generally ovate, the basal ones usually triangular-ovate: lvs. irregularly 2-ranked, 1.5-2.5 cm. long, abruptly contracted into a distinct yellowish stalk, dark and rather dull green above, with 2 tawny-yellow bands below about twice as broad as the green margin: seed ovoid, compressed, slightly 3-4-angled; hilum elliptic. Fl.III-IV; fr.X-XI. S.Z.2:t.62(c). S.I.1:t.15(c). M.K.t.1(c). W.C.t.5(h). Gn.M.30:214,215(h). (*T. baccata* var. *c.* Carr., *T. Sieboldii* Hort.) Japan, Korea, Manch. Intr. 1855. Zone IV. A very valuable evergreen on account of its hardness and dense dark green foliage.—*T. c. nana* Rehd., var. Low shrub, occasionally to 2 m. high or more, with wide-spreading brs. densely clothed with short brts., rather dense and compact while young; lvs. rather short, duller and more upright, not or slightly 2-ranked. B.E.t.10(h). Gn.M.30:214(h). (*T. b. brevifolia* Hort., var. *compacta* Bean.)—*T. c. Thayerae* Wils. Wide-spreading low bush: lvs. rather light green, arranged in one plane; fruiting freely. H.B.8:424(h).—*T. c. densa* Rehd., var. Dwarf compact shrub with upright and ascending brts. forming a dense broad-conical or rounded bush, scarcely exceeding  $\frac{1}{2}$  m. H.D.165,t. (h).—*T. c. minima* Slavin, f. Very dwarf, less than 30 cm. high; lvs. 4-12 mm. long, broad, shining dark green.—*T. c. aurescens* Rehd., f. Low compact form with the young lvs. yellow, changing later to green. (*T. tardiva aurea* Hort.)—*T. c. luteo-baccata* Miyabe & Tatewaki, var. Fr. yellow.

*T. c.* × *baccata* = *T. media* Rehd. Intermediate between the parents. Older brts. olive-green, often reddish above; bud-scales obtuse, slightly keeled: lvs. similar to those of *T. cuspidata*, but more distinctly 2-ranked and often horizontally spreading. H.B.3:30(h). Orig. about 1900. Zone IV.—*T. m. Hatfieldii* Rehd., f. Compact conical bush with upright brs. and radially spreading lvs. Gn.M.33:25(h). H.B.3:21(h).—*T. m. Hicksii* Rehd., f. Columnar form with upright brs. and radially spreading lvs. B.C.Ct.5(h). (*T. cuspidata* H. Hort.) Similar to the Irish Y., but hardier.

*T. c.* × *canadensis* = *T. Hunnewelliana* Rehd. Resembling *T. cuspidata*, but of slenderer habit and with slenderer and narrower lvs. partly pointing forward, the green margin beneath more than  $\frac{1}{2}$  as broad as the stomatic band, lighter green and assuming mostly a reddish tint in winter. Orig. about 1900. Zone IV.

4. *T. canadensis* Marsh. CANADA Y. Low shrub, often straggling, or with ascending brs. and occasionally 1-2 m. tall; mature brts. green, older reddish brown; bud-scales more or less lanceolate: lvs. abruptly narrowed into a fine point, 1.3-2 cm. long, very short-stalked, dark yellow-green above, with pale green bands below about as broad as the green margin, often indistinctly 2-ranked, assuming a reddish tint in winter. Fl.iv; fr.vii. B.B.1:67. Gn.M.2:11(h). (*T. baccata* var. *c.* Gray, *T. baccata* var. *procumbens* Loud., *T. minor* Brit.—GROUND HEMLOCK.) Nfd. to Va., Iowa and Man. Intr. about 1800. Zone II. The hardest of the Yews, but less handsome than the other species. —*T. c. stricta* Bailey, var. Form with stiff upright brs. Cult. 1933.

5. *T. brevifolia* Nutt. WESTERN Y. Tree to 15, rarely to 25 m., usually with horizontally spreading brs. and slightly pendulous brts.; bark reddish brown; mature brts. yellowish green, older greenish or light brown; bud-scales usually cuspidate or mucronate: lvs. distinctly 2-ranked and horizontally spreading, 1-2 cm. long, abruptly and sharply pointed, contracted into a slender yellow petiole, with glaucescent bands below broader than the green margin: seed ovoid, 2-4-angled. Fl.vi; fr.viii-x. S.S.10:514. (*T. baccata* var. *b. Koehne.*) B. C. to Calif. and Mont. Intr. 1854. Zone VI.

2. *TÓRREYA* Arn. TORREYA. Trees with fissured bark and whorled brs.; brts. subopposite; winter-buds with few decussate deciduous scales: lvs. distinctly 2-ranked, linear, rigid, pungent, slightly rounded above and lustrous, with 2 rather narrow whitish or brownish bands beneath: fls. dioecious, occasionally monoecious, axillary; staminate fls. ellipsoid to oblong, about 8 mm. long, stalked, consisting of 6-8 whorls of 4 stamens each; female fls. sessile, in pairs of which only one fl. develops: seed ovoid, drupe-like, with a thin fleshy outer coat, ripening the second season; albumen ruminant. (After John Torrey, distinguished American botanist; 1796-1875.) Syn. *Tumion* Raf. Six species in N. Am. and E. Asia.

- a. Two-year-old brs. yellowish green.
- b. Lvs. about 3 cm. long, with scarcely impressed narrow bands beneath, of fetid odor when crushed.....1. *T. taxifolia*
- bb. Lvs. about 2 cm. long, with impressed bands beneath, scarcely fetid.....2. *T. grandis*
- aa. Two-year-old brs. reddish brown; lvs. of strong aromatic odor when crushed.
- b. Lvs. 2-3 cm. long, linear-lanceolate;.....3. *T. nucifera*
- bb. Lvs. 3.5-6 cm. long, linear.....4. *T. californica*

1. *T. taxifolia* Arn. FLORIDA T. Low tree, occasionally to 18 m.: lvs. linear, spiny-pointed, rounded at base, 2.5-3.5 cm. long, dark green and lustrous above; anthers truncate at apex: fr. obovoid, 2.5-3 cm. long, purple. Fl.iii; fr.viii. S.S.10:t.512. C.B.3:63. (STINKING CEDAR.) Fl. Intr. 1840. Zone VI? A tree with spreading slightly pendulous brs. forming a rather open pyramidal head.

2. *T. grandis* Fort. CHINESE T. Tree to 25 m.: lvs. linear, 1.2-2.3 cm. long, nearly rounded at base, abruptly spine-pointed, grooved above and dark

yellow-green; fr. oblong-ellipsoid, 2-3 cm. long; albumen slightly ruminant. (*T. nucifera* var. *g. Pilger.*) C.B.61. D.J.74. G.C.90:438(h). E. China. Intr. 1855. Zone VII?

Related species: *T. Fargesii* Franch. Lvs. 1.5-2.5 cm. long, more gradually pointed, darker green above, with 2 more or less distinct grooves along the midrib, bands below slightly narrower than the green margin; fr. globose-ellipsoid, 2-2.5 cm. long, deeply ruminant almost to the middle. C. and W. China. Intr. ?

3. *T. nucifera* (L.) Sieb. & Zucc. JAPANESE T. Tree to 25 m.; bark grayish brown, on old trees shallowly fissured and flaky; brs. wide-spreading; lvs. abruptly narrowed at base and nearly sessile, tapering into a spiny point, dark lustrous green and convex above, with 2 impressed bands below; anthers cristate-dentate at apex; fr. sessile, ellipsoid-oblong, about 2.5 cm. long, green, faintly tinged with purple; albumen slightly ruminant. Fl.v; fr.ix-x. S.Z.2:t.129(c). S.I.1:t.15(c). M.D.25:16. W.C.t.3,4(h). Japan. Intr. before 1764. Zone V. Handsome tree with spreading brs. forming a pyramidal or ovoid head; seeds edible.

4. *T. californica* Torr. CALIFORNIA-NUTMEG. Tree to 20, occasionally to 35 m.; bark gray-brown, fissured into narrow ridges; brs. spreading, slightly pendulous; lvs. tapering to a slender spiny point, dark green above, with 2 narrow deeply impressed glaucous bands below; anthers truncate at apex; fr. ovoid to oblong-ovoid, 2.5-3.5 cm. long, light green, streaked with purple; albumen deeply ruminant. Fl.iii-v; fr.viii-ix. S.S.10:t.513. B.M.4780(c). S.N.294(h). (*T. Myristica* Hook.) Calif. Intr. 1851. Zone VII. Handsome tree with spreading slender brs. and drooping brts. forming a pyramidal head, round-topped in old age.

3. **CEPHALOTÁXUS** Sieb. & Zucc. PLUM-YEW. Trees or shrubs; brts. opposite; pith with a resin-duct in the centre; winter-buds with numerous imbricate persistent scales; lvs. dense, spirally arranged, but spreading in 2 planes, with 2 broad glaucous bands beneath and with a prominent midrib above; fls. dioecious, occasionally monoecious, axillary, the staminate in globose heads in the axils of lvs., the female in the axils of scales at base of the brts., consisting of several pairs of 2-ovuled carpels: seeds 1 or 2 on a stalk, ellipsoid, drupaceous, about 2.5 cm. long, greenish or purplish, ripening the second season. (Greek *kephale*, head, and *taxis*; referring to the shape of the staminate fls.) Five species in E. Asia.

A. Lvs. abruptly pointed, 2-5 cm. long, in semi-erect ranks. .... 1. *C. drupacea*  
AA. Lvs. gradually tapering to a fine point, 5-8 cm. long, in nearly horizontally spreading ranks ..... 2. *C. Fortunei*

1. *C. drupacea* Sieb. & Zucc. JAPANESE P. Small tree, to 10 m., with spreading brs.; bark gray, fissured into narrow detachable strips; lvs. linear, 2-4.5 cm. long, abruptly pointed, dark green above, with 2 grayish bands below, each with about 15 rows of stomata, 2-ranked, but semi-erect so as to form a V-shaped trough; heads of male fls. short-stalked, with the stalk 8 mm. long; fr. ovoid or obovoid, rarely globose (f. *sphaerolalis* Pilg.), 2.5-3 cm. long, 2 cm. across, green, on a stalk 6-12 mm. long. Fl.iii-v; fr.ix. B.M.8285(c). S.I.1:t.14(c). Japan. Intr. 1830. Zone (V.) In cult. usually a shrub of irregular habit with spreading brs., but at its best it is a small tree with wide-spreading brs. forming a broad round head.—*C.d. fastigiata* (Carr.) Pilger, f. With upright or ascending brs., often columnar; lvs. spirally arranged, not 2-ranked. G.C.33:229. S.N.161(h). (*C. pedunculata* f. Carr., *Podocarpus koraiana* Sieb.) Cult. in Japan. Intr. 1830. Zone VI.—*C.d. nana* (Nakai) Rehd., var. Shrub spreading by suckers, with upright or ascending stems, to 2 m. tall: fr. sub-

globose, 2 cm. long, edible. (*C. n.* Nakai.) N. and C. Japan. Intr. 1916. Zone (V.).—*C. d. pedunculata* (S. & Z.) Miq., var. Lvs. to 5 cm. long: male fls. in stalked branched heads, with the stalk 1–2 cm. long. S.Z.2:t.132(c). G.C. 33:228. S.N.159(h). (*C. p.* Sieb. & Zucc., *C. Harringtonia* K. Koch.) Cult. in Japan. Intr. 1829.—*C. d. sinensis* Rehd. & Wils., var. Shrub to 4 m.: lvs. linear-lanceolate, tapering to a sharp point. C. and W. China. Intr. 1907.

2. *C. Fórtuni* Hook. CHINESE P. Tree to 10 m., usually with several stems; bark reddish brown, peeling off in large flakes leaving pale markings: lvs. spreading nearly horizontally, linear, 5–8 cm. long, glossy green above, with 2 pale bands below, each with about 20 rows of stomata: male fls. in short-stalked heads: fr. ovoid, purple, about 2.5 cm. long. Fl.v; fr.ix. B.M.4499(c). S.N.29(h). C. China. Intr. 1849. Zone VI. In cult. usually a spreading, rather sparingly branched shrub or a tree with slender spreading brs. pendulous at the ends and forming a broad ovoid head.

Related species: *C. Olivieri* Mast. Differs chiefly in its rather stiff spreading brs. and in its very close-set rigid and spiny-pointed lvs. truncate at base and about 2.5 cm. long. H.I.1933. G.C.33:226. W. China. Intr. 1900. Zone VI?

4. *SAXEGOTHAËA* Lindl. PRINCE ALBERT YEW. Tree with whorled brs.: lvs. linear, indistinctly 2-ranked: fls. monoecious, the staminate in axillary cylindric spikes near the apex of the brts., the female with imbricate carpels, terminating short brts.: fr. subglobose, cone-like, consisting of fleshy connate carpels terminating in broad spine-like points. (After Prince Albert of Saxe-Coburg-Gotha, consort of Queen Victoria.)—One species in Chile.

*S. conspicua* Lindl. Tree to 14 m.: lvs. linear to linear-lanceolate, 2–2.5 cm. long, acute, abruptly narrowed at base into a short decurrent stalk: staminate fls. 6 mm. long: fr. 1–2 cm. across; seeds broad-ovoid, compressed, 2-edged, about 4 mm. long. B.M.8664(c). D.J.61(h). M.D.25:t.8. Chile. Intr. 1847. Zone VII? Densely branched with spreading brs. and pendulous brts.

5. *PODOCÁRPUS* Pers. Trees, rarely shrubs: lvs. alternate, sometimes opposite, linear to ovate, rarely scale-like: fls. dioecious, rarely monoecious, the staminate catkin-like, axillary, solitary or fascicled, rarely spicate, the female solitary, axillary, rarely at the end of short brts. or in spikes, consisting of 1 or 2 1-ovuled scales with several bracts at the base which usually become much thickened at maturity and form a fleshy receptacle bearing at the top the globular or ovoid, drupe- or nut-like seed. (Greek *pous*, *podos*, foot, and *karpos*, fruit; in reference to the fleshy fr.-stalks of many species.) About 60 species chiefly in the mts. of trop. and sub trop. regions.

A. Lvs. 5–10 cm. long, with a raised midrib above, usually acute: female fls. solitary.

B. Lvs. abruptly pointed or obtusish, with a prominent midrib beneath. 1. *P. macrophyllus*

BB. Lvs. gradually tapering into a fine point; midrib beneath not prominent. 2. *P. salignus*

AA. Lvs. 6–30 mm. long, obtusish or abruptly pointed; midrib not raised above.

B. Lvs. 6–12 mm. long: fls. solitary..... 3. *P. alpinus*

BB. Lvs. 8–30 mm. long: fls. in spikes..... 4. *P. andinus*

1. *P. macrophyllus* (Thunb.) Lamb. Tree to 20 m.; trunk with gray, shallowly fissured shreddy bark: lvs. linear-lanceolate, 7–10 cm. long, attenuate at the ends, dark green and glossy above, yellowish green or somewhat glaucescent beneath: staminate fls. fascicled, about 3 cm. long: fr. ovoid, about 1 cm. long, greenish or purplish, on a fleshy purple receptacle. Fl.v; fr.ix-x. S.Z.2:t.133(c). S.I.1:t.13(c). C.B.N.t.82. (*P. longifolius* Hort.) Japan. Intr. 1804. Zone VII. Tree with spreading short brs.—*P. m. Máki* Endl., var. Usually shrubby, with ascending brs.: lvs. crowded, 4–7 cm. long, obtusish.

S.Z.2:t.134(c). M.D.25:t.9. (*P. Makoyi* Bl., *P. chinensis* Endl., *P. japonica* Sieb.) China; cult. in Japan. Intr. 1840. Tenderer than the type. With some variegated forms.—*P. m. appressus* (Maxim.) Matsum., var. Low bush with spreading brs.: lvs. scarcely exceeding 3.5 cm.; midrib above indistinct. (*P. a.* Maxim.) Cult. in Japan.

2- *P. salignus* Lamb. Tree to 20 m., in cult. often shrubby; brts. green: lvs. linear-lanceolate, 5–10 cm. long, usually slightly falcate, tapering toward the apex, pointed, dark bluish green above, pale beneath: staminate fls. solitary, often crowded, 2.5 cm. long: fr. ovoid, 8 mm. long, solitary or in pairs on a stalk about 1 cm. long. Fl.iv; fr.xii-1. D.J.41. G.C.31:115(h). (*P. chilinus* Rich., *P. andina* Hort., not Poepp.) Chile. Intr. 1853. Zone VII?

3. *P. alpinus* R. Br. Dense shrub or low tree, to 5 m.: brts. slender, whorled: lvs. distinctly 2-ranked, linear-spatulate to linear-oblong, 6–12 mm. long, narrowed at base, obtuse at apex, sometimes mucronulate, dull green above, paler beneath: fls. dioecious; staminate fls. clustered, 4–8 mm. long: fr. ovoid, 5–6 mm. long, red. C.B.N.t.74. Fl.iii-iv. Tasmania, N. S. Wales. Cult. 1880. Zone VII?

4. *P. andinus* Poepp. Tree to 5 or occasionally to 15 m.; brts. green: lvs. indistinctly 2-ranked, nearly sessile, linear, 1–3.5 cm. long, tapering at base, obtuse or abruptly pointed, dark green above, with 2 glaucous bands beneath: fls. in spikes, monoecious, staminate spike about 2.5 cm. long: fr. ovoid, yellowish white, 2 cm. long, usually only one developed in a spike. E.P. IV. 5:65. G.C.63:12(h), 17. J.L.37:50,t(h). (*Prumnopitys elegans* Phil.) Chile. Intr. 1860. Zone VII? Small bushy tree with ascending and spreading much ramified brs. forming usually a dense round bush.

### 3. ARAUCARIACEAE Strasb. ARAUCARIA FAMILY.

Resinous trees with whorled brs.: lvs. persistent, broad or needle-shaped: fls. dioecious or rarely monoecious; staminate fls. cone-like, large, with numerous stamens; anthers many-celled; fertile fls. very numerous, spirally arranged, in a globose or ovoid terminal head becoming a large woody cone; scales without distinct bracts, with 1 seed each; seeds with or without wings; cotyledons 2, rarely 4.—Two genera with about 30 species in the southern hemisphere.

**ARAUCARIA** Juss. Evergreen tall trees with regularly whorled spreading brs.: lvs. alternate, decurrent, radially spreading, rarely more or less 2-ranked, closely set, awl-shaped to ovate-lanceolate, rigid: fls. usually dioecious; the male terminal and fascicled, large, cylindric; fr. a subglobose or ovoid cone falling apart at maturity, with wedge-shaped 2-edged scales and with large wingless seeds adnate to the scales; cotyledons 2, rarely 4. (Arauco, a province of S. Chile where the following species grows.) About 10 species in S. Am., Australasia and the Pacific Isls.

... *A. araucana* (Molina) K. Koch. MONKEY-PUZZLE. Tall tree to 30 m., with very stout spreading brs. in whorls of 5; brts. few, in opposite pairs, densely clothed with imbricate ovate-lanceolate, spiny pointed stiff lvs. slightly concave above, 2.5–5 cm. long, bright green on both sides, persisting for many years; male fls. 8–12 cm. long, cylindric: cone globose-ovoid, 14–20 cm. across; seeds oblong, slightly compressed, 2.5–3.5 cm. long; cotyledons 2, remaining below the soil. F.S.15:1577–80(c). G.C.III.21:288,t(h); 24:154(h). E.H.1:t.17–20(h). (*A. imbricata* Pav.) Chile. Intr. 1795. Zone VII. Tree of striking appearance. The hardest species of the genus.

## PINACEAE

### 4. PINACEAE Lindl. PINE FAMILY

Resinous trees, rarely shrubs; lvs. linear, rarely lanceolate, or scale-like, alternate or opposite, sometimes whorled, evergreen, rarely deciduous; fls. usually monoecious (dioecious in *Juniperus*), cone-like, rarely berry-like; staminate fls. consisting of numerous, rarely few scales bearing on the under side 2-6, rarely more, 2-, rarely 3-5-celled anthers; fertile fls. with few to numerous scales, each with 1 or 2, rarely more ovules on the upper side: fr. a more or less woody cone with usually winged seeds, or berry-like with fleshy coalescent scales enclosing the terete or angular seeds; embryo with 2-15 cotyledons.—Thirty-two genera distributed through both hemispheres chiefly in the temperate and subtropical regions. Sometimes divided into three families: PINACEAE, TAXODIACEAE and CUPRESSACEAE.

- A. Lvs. and cone-scales spirally arranged, the former sometimes fascicled; ovules inverted; cotyledons 2-10.
- B. Cone-scales and bracts distinct; scales with 2 usually winged seeds; lvs. linear; winter-buds distinct with scarious scales. Subfam. I. ABETINEAE Endl.
- C. Lvs. solitary.
- D. Cone upright.
  - E. Cone-scales deciduous from their axis; lvs. flattened, grooved above, usually with glaucous bands below, rarely 4-angled.....1. *Abies*
  - EE. Cone-scales persistent; lvs. flattened, keeled above, pale green below. 2. *Keteleeria*
- DD. Cone reflexed or pendulous; scales persistent.
  - E. Bracts exserted, conspicuous; brts. not roughened by lf.-bases; winter-buds elongated, pointed, not resinous.....3. *Pseudotsuga*
  - EE. Bracts not exserted; brts. roughened by persistent lf.-bases.
    - F. Lvs. flattened and stomatiferous below or on both sides, narrowed into a short petiole, with 1 resin-duct below the fibrovascular bundle; cones 1.5-7.5 cm. long.....4. *Tsuga*
    - FF. Lvs. usually quadrangular or flattened and with stomatic bands above, sessile; resin-ducts lateral; cones 2-15 cm. long.....5. *Picea*
- CC. Lvs. in fascicles or clusters of 2 or more, solitary only on shoots.
  - D. Lvs. many, clustered on short thick spurs; cone-scales flat at apex.
    - E. Lvs. deciduous; cone ripening the first season.
      - F. Bud-scales acuminate; staminate fls. clustered; cone-scales deciduous. 6. *Pseudolarix*
      - FF. Bud-scales obtuse; staminate fls. solitary; cone-scales persistent....7. *Larix*
    - EE. Lvs. evergreen; cone ripening the 2d or 3d season, 5-12 cm. long.....8. *Cedrus*
    - DD. Lvs. in fascicles of 2-5, rarely to 8, sometimes reduced to 1, sheathed at base by scarious bud-scales; cone-scales usually much thickened at apex, persistent. 9. *Pinus*
- BB. Cone-scales without distinct bracts, flat or peltate with 2-9 seeds. Subfam. II. TAXODIINEAE Endl.
- C. Lvs. connate into pairs 8-15 cm. long, in whorls of 15-25 at the end of shoots; cone-scales thick and woody, with 6-9 seeds.....10. *Sciadopitys*
- CC. Lvs. solitary, scattered.
  - D. Cone-scales peltate; lvs. dimorphic or all scale-like and appressed.
    - E. Brts. all persistent: staminate fls. solitary; cone-scales with 2-9 seeds.
      - F. Lvs. dimorphic, on lateral shoots 2-ranked and linear; winter-buds scaly; cones with 15-20 scales.....11. *Sequoia*
      - FF. Lvs. ovate to lanceolate, appressed or slightly spreading; winter-buds naked; cones with 25-40 scales.....12. *Sequoiadendron*
    - EE. Lateral brts. deciduous: staminate fls. in panicles; cone-scales with 2 seeds. 13. *Taxodium*
  - DD. Cone-scales flattened, with 2-5 seeds: lvs. of one kind.
    - E. Lvs. awl-shaped, curved; cone-scales with an upright toothed crest above the seeds.....14. *Cryptomeria*
    - EE. Lvs. lanceolate, flat, glaucous below; cone-scales with narrow serrulate line above the seeds.....15. *Cunninghamia*
- AA. Lvs. and cone-scales opposite or whorled, the former small and usually scale-like; ovules erect; cotyledons 2, rarely 5-6.....Subfamily III. CUPRESSINEAE Endl.
- B. Fr. a woody or leathery dehiscent cone.
  - C. Lvs. ternate, linear; cone-scales ternate, valvate, only 1 whorl fertile....16. *Fitzroya*
  - CC. Lvs. and cone-scales opposite; the former scale-like or sometimes needle-shaped.
    - D. Cone-scales flattened, imbricate; cone ovoid or oblong-ovoid.
      - E. Each cone-scale with 3-5 seeds; brts. much flattened, 5-6 mm. broad, with conspicuous glaucous patches beneath.....17. *Thujiopsis*
      - EE. Each cone-scale with 2 seeds; brts. narrower, with or without whitish markings beneath.
        - F. Pairs of cone-scales 6-8, the 2 upper pairs fertile.....18. *Thuja*

- FF. Pairs of cone-scales 4, the upper pair fertile.....19. *Libocedrus*  
 DD. Cone-scales peltate; cone subglobose.  
 E. Each cone-scale with many seeds; cone rather large, usually ripening the 2<sup>d</sup> year; brts. terete or quadrangular, rarely flattened.....20. *Cupressus*  
 EE. Each cone-scale with 2 seeds, rarely 3-5; brts. flattened.....21. *Chamaecyparis*  
 BB. Fr. berry-like, consisting of 2-6 fleshy connate scales enclosing 1-12 seeds; lvs. opposite or ternate, scale- or needle-shaped.....22. *Juniperus*

1. **ABIES** Mill. FR. Evergreen trees of pyramidal habit, with spreading whorled brs., bark usually smooth and thin on younger trees, often thick and furrowed on old trees; brts. smooth, or grooved in a few species; winter-buds usually resinous: lvs. often spreading in 2 ranks, linear or linear-lanceolate, contracted above the base and leaving a circular scar as they fall, usually flattened and grooved above, in most species with 2 white stomatiferous bands below, above without or rarely with stomata, with 2 or rarely 4 resin-ducts either internal (median) or marginal (external or subepidermal): male fls. pendent, oval to cylindric-oblong, with yellow or scarlet anthers: female fls. ovoid to oblong, consisting of numerous 2-ovuled imbricate scales: cone ovoid to oblong-cylindric with closely imbricated thin and leathery scales incurved at the apex, narrowed at base into a long stipe and subtended by narrow exserted or enclosed bracts; the scales falling at maturity from the persistent axis; seeds ovoid or oblong with large thin wing; cotyledons 4-10. (The ancient Latin name of the Silver Fir.) About 40 species in the temperate regions of the n. hemisphere ranging on the higher mts. s. to Guatemala, N. Afr. and the Himal.—The species of this genus are among the handsomest and stateliest Conifers; they succeed best in a cool and humid climate, but a few, particularly *A. concolor*, will stand a drier climate.

The description of the lvs. in the key and in the account of the following species refers to those of sterile lateral brs.; the lvs. of fertile brs. and of leading shoots are as a rule shorter and thicker, usually acute or acutish and often spiny-pointed and more or less upturned or ascending; in some species the resin-ducts of the lvs. of fruiting brs. are internal, while those of the lvs. of sterile brs. are marginal.

- A. Lvs. green and lustrous above, stomatiferous only below (occasionally with one or few broken lines of stomata above in Nos. 1, 17, 23 and 24).  
 B. Brts. deeply grooved, particularly on 2-year-old brts.: cones purple or violet (see also Nos. 8 and 12).  
 C. Brts. glabrous: resin-ducts internal.....14. *A. homolepis*  
 CC. Brts. with brown pubescence in the grooves: resin-ducts marginal.....15. *A. spectabilis*  
 BB. Brts. not or slightly grooved.  
 C. Lvs. with inconspicuous stomatic bands below (in nos. 10 and 12 sometimes more conspicuous).  
 D. Lvs. acutish to spiny-pointed.  
 E. Lvs. of upper ranks partly recurved; cones violet-purple: buds very resinous.  
 EE. Lvs. spreading at nearly right angles, pectinate: cone green: buds thinly resinous .....11. *A. recurvata*  
 DD. Lvs. emarginate or bifid.  
 E. Lvs. more or less pectinate: buds slightly or not resinous: cones green.  
 F. Brts. glabrous: lvs. emarginate.....10. *A. chemsiensis*  
 FF. Brts. slightly grooved, hairy in the grooves: lvs. sharply 2-pointed, rigid, on old plants obtusish.....12. *A. firma*  
 EE. Lvs. above directed forward, slender, often curved; bifid at apex: buds resinous: cone purple.....16. *A. pindrow*  
 CC. Lvs. with 2 white or glaucous bands beneath.  
 D. Brts. more or less pubescent.  
 E. Winter-buds resinous.  
 F. Lvs. more or less pectinate.  
 G. Lvs. 3-8 cm. long, distinctly pectinate; resin-ducts marginal; brts. soon glabrous .....27. *A. grandis*  
 GG. Lvs. 1.5-2.5 cm. long, less distinctly pectinate; resin-ducts internal or marginal.  
 H. Brts. not grooved, ashy-gray, short-pubescent.....24. *A. balsamea*  
 HH. Brts. slightly grooved, densely brown-pubescent; lvs. very white beneath .....8. *A. fazoniana*

- ff. Lvs. not pectinate.  
 g. Lvs. spreading upward and outward, 1.5-2.5 cm. long.  
 h. Buds thinly resinous: brts. soon glabrous, yellowish.  
 i. Lvs. 1-2 cm. long, margin flat, resin-ducts internal.... 4. *A. koreana*  
 ii. Lvs. 1.5-2.5 cm. long, margin recurved, resin-ducts marginal. 9. *A. Fabri*  
 HH. Buds very resinous: brts. pubescent, brown or grayish.  
 i. Bark of 6-year-old and older brts. flaky: resin-ducts internal. 6. *A. squamata*  
 ii. Bark not flaky.  
 j. Brts. brown, densely pubescent: resin-ducts marginal. 3. *A. Veitchii*  
 JJ. Brts. grayish: resin-ducts internal.  
 k. Lvs. with 8-12 lines of stomata in each band.... 23. *A. Fraseri*  
 KK. Lvs. with 4-8 lines of stomata in each band.... 24. *A. balsamea*  
 GG. Lvs. at least the upper ones directed forward.  
 H. Lvs. about 1.5 mm. broad, up to 3 cm. long; resin-ducts internal.  
 i. Brts. not grooved, minutely pubescent: lvs. with 4-5 lines of stomata in each band.... 1. *A. sibirica*  
 ii. Brts. slightly grooved, hairy in the grooves: each band with 7-8 lines of stomata.... 2. *A. sachalinensis*  
 HH. Lvs. at least 2 mm. broad; resin-ducts marginal or submarginal.  
 i. Pubescence of brts. rufous, dense: lvs. 1-2 cm. long.... 5. *A. Mariesii*  
 ii. Pubescence of brts. pale, short: lvs. 2-3 cm. long.... 26. *A. amabilis*  
 EE. Winter-buds not resinous: resin-ducts marginal: cone green.  
 f. Lvs. not pectinate.  
 g. Lvs. spreading outward and upward: cone 16-20 cm. long, with hidden bracts.... 20. *A. cilicica*  
 gg. Lvs. directed forward: cone 12-15 cm. long, with exserted bracts. 21. *A. Nordmanniana*  
 FF. Lvs. pectinate: bracts exserted.... 22. *A. alba*  
 DD. Brts. glabrous (see also Nos. 4 and 9): lvs. crowded, spreading, with marginal resin-ducts.  
 E. Lvs. obtuse or emarginate: cone purple or violet.  
 F. Winter-buds resinous: lvs. 1.5-3 cm. long, emarginate: resin-ducts internal on fruiting brs.... 7. *A. Fargesii*  
 FF. Winter-buds not or slightly resinous: lvs. usually obtuse, rarely acutish, stout, 1.5-2 cm. long.... 17. *A. numidica*  
 EE. Lvs. sharply pointed.  
 F. Lvs. radially spreading, 2-3 cm. long.... 19. *A. cephalonica*  
 FF. Lvs. pectinate, to 5 cm. long: buds large, pointed, not resinous: cone bristly. 29. *A. venusta*  
 AA. Lvs. stomatiferous on both sides, grayish green or glaucous: buds resinous.  
 B. Lvs. radially spreading, pointed, short and rigid: resin-ducts internal.... 18. *A. Pinsapo*  
 BB. Lvs. not radially spreading.  
 C. Lvs. flat: buds very resinous.  
 D. Lvs. 2.5-4 cm. long: resin-ducts internal: cone purple.... 25. *A. lasiocarpa*  
 DD. Lvs. 4-6 cm. long: resin-ducts marginal: cone green or purple.... 28. *A. concolor*  
 CC. Lvs. often 4-sided, blunt or acute, those in the middle of brts. curving upward from an adpressed base; resin-ducts marginal: buds slightly resinous, with free acuminate scales at base: cone purple, large.  
 D. Lvs. of sterile brs. flat or grooved above: bracts of cone exserted.... 30. *A. nobilis*  
 DD. Lvs. 4-sided: bracts hidden or exserted.... 31. *A. magnifica*

1. *A. sibirica* Ledeb. SIBERIAN F. Tree to 30 m.; bark smooth; buds globose; brts. gray, minutely pubescent: lvs. crowded above and directed forward, linear, slender, to 3 cm. long, rounded and entire or bifid at apex, shining bright green and grooved above, often with 2-3 short lines of stomata near apex, with narrow grayish bands beneath: cones cylindric, 5-8 cm. long, bluish before maturity; scales about 1.5 cm. high with denticulate margin; bracts hidden, about half as long as scales. Forbes, Pin. Wob. t.39(c). C.B.2:27. S.N.73(h). Act. Hort. Berg. 6:t.86(h). (*A. pichta* Forb., *A. Semenovii* Fedtch.) N. Russia to Kamch., s. to Turkestan and Manch. Intr. 1920. Zone II. Not satisfactory in the E. States; it demands a cool, moist climate and is apt to suffer from late frosts.

Closely related species: *A. nephrolepis* Maxim. Bark of trunk rough; brts. more pubescent; lvs. shorter: cones smaller; scales about 1 cm. high, with narrower bracts about  $\frac{2}{3}$  as long as scales. V.G.257 Act. For. Fenn. 24:t.18(h). (*A. sibirica* var. *n.* Trautv., *A. gracilis* Komar.) E. Siberia, N. China. Intr. 1908.—*A. n. chlorocarpa* Wils., f. Cone green or nearly so. Intr. 1918.

2. *A. sachalinensis* Mast. SAGHALIN F. Tree to 40 m.; bark smooth,

gray; buds small; brts. slightly grooved, pubescent in the grooves: lvs. similar to those of *A. sibirica*, but broader and to 4 cm. long, without stomata above and with 7-8 lines of stomata in each band below: cone blackish brown or blackish blue, cylindric, about 7 cm. long; scales with entire margin, densely pubescent on back; bracts exserted and reflexed. G.C.II.12:588. S.I.1:t.6(c). M.K.t.2(c). W.C.t.44,45(h). (*A. Veitchii* var. s. F. Schmidt.) N. Japan, Saghal., Kurile Is. Intr. 1878. Zone II.—*A. s. nemorënsis* Mayr, var. Cones smaller, to 6 cm. long, with hidden bracts. M.K.t.4(c). (*A. Wilsonii* Miy. & Kudo.) Intr. 1914.—*A. s. Mayriana* Miyabe & Kudo, var. Lvs. shorter, 1.5-2.5 cm. long; bands beneath with 4-5 lines of stomata; cone-scales strongly auriculate. M.K.t.4(c). (*A. M.* Miyabe & Kudo.) N. Japan. Cult. 1929.

3. *A. Veitchii* Lindl. VEITCH F. Tree to 25 m.; bark smooth, grayish; buds purplish, very resinous; brts. brown, rather densely pubescent: lvs. crowded, directed forward and partly upward, nearly pectinate below, linear, 1-2.5 cm. long, truncate and notched at apex, lustrous dark green above, beneath with chalky white bands: cone cylindric, 4.5-6.5 cm. long, bluish purple while young; bracts slightly exserted and reflexed; seed with a broad wing scarcely as long as body. G.C.II.13:275. S.I.1:t.5(c). W.C.t.43(h). C. Japan. Intr. 1865. Zone III. Desirable species; thriving well in the E. States.—*A. V. olivacea* Shiras., var. Cone green while young, grayish brown when ripe. Act. Hort. Berg. 6,4:t.1,f.9(c). Intr. 1914.—*A. V. nikkoënsis* Mayr, var. Cone smaller, with scarcely visible bracts.

4. *A. koreana* Wils. KOREAN F. Tree to 18 m.; bark of older trees rough; brts. sparingly pubescent, yellowish, becoming glabrous and purplish; buds thinly resinous: lvs. crowded, 1-2 cm. long, usually broader toward the apex and rounded or emarginate, on young plants pointed, lustrous above, with whitish bands beneath: cone cylindric, 4-7 cm. long, about 2.5 cm. thick, violet-purple before maturity; scales about 2 cm. broad; bracts as long as scales, slightly exserted and recurved. G.C.69:77. V.G.214. S.N.149(h, as *A. holophylla*). Korea. Intr. 1908. Zone V.

5. *A. Mariësii* Mast. MARIËS F. Tree to 26 m.; bark smooth, pale gray, on old trees rough at base; buds small; brts. densely rusty-pubescent: lvs. crowded above, the middle ones directed forward and nearly appressed, the outer ones longer and spreading outward, linear, slightly broader above the middle, rounded or bifid at apex, 0.8-2 cm. long, shining green and grooved above, with white bands below: cone ovoid or oblong-ovoid, 4-9 cm. long, violet-purple while young; scales about 2.5 cm. wide; bracts hidden; seed-wing twice as long as body. G.C.II.12:788; III.69:103. S.I.1:t.4(c). W.C.t.40, 41(h). Japan. Intr. 1879. Zone V. This tree does not do well in the E. States, though it is hardy.

The closely related *A. Kawakamii* (Hayata) Ito differs chiefly in the slightly longer and narrower lvs. with faint bands below, in the cylindric cone and black seeds and wings. C.B.N.t.15. V.G.211. (*A. Mariësii* var. K. Hayata.) Formosa. Cult. 1930. Zone VII?

6. *A. squamata* Mast. FLAKY F. Tree to 40 m.; bark purplish brown, exfoliating in thin flakes; buds subglobose, reddish brown, very resinous; brts. densely brownish pubescent: lvs. densely crowded and ascending, linear, 1.5-2.5 cm. long, obtuse or acutish, bluish green and grooved above, with white bands below: cone oblong-ovoid, 5-6 cm. long, violet; scales about 1.5 cm. wide; bracts slightly exserted. G.C.39:299. V.G.351. W. China. Intr. 1910. Zone V? Remarkable for its flaky bark, beginning to show on brs. about 6 years old, the inner bark purplish red even on young brs.

7. *A. Fargesii* Franch. FARGES F. Tree to 35 m.; buds resinous; brts. glabrous, reddish brown or purplish, slightly grooved; lvs. pectinate below, crowded above, spreading at nearly right angles, the middle ones upright or sometimes reflexed, linear, sometimes falcate, emarginate or bifid at apex, 2-3 cm. long, dark green and grooved above, with white bands beneath: cones ovoid-oblong, 5-8 cm. long, purple or red-brown; scales 1.5-2 cm. wide; bracts slightly exserted and recurved. C. China. C.B.N.t.26. V.G.161. Gn.88:167 (h). S.N.142(h). Intr. 1901. Zone V. One of the most satisfactory and promising of the Chinese firs.

The closely related *A. sutchuenensis* (Franch.) Rehd. & Wils. differs chiefly in its stouter and shorter ascending lvs. 1.5-2.5 cm. long, with distinct yellow petiole: cones 5-6 cm. long, with hidden bracts. (*A. Fargesii* var. *s.* Franch.) W. China. Intr. 1911.

8. *A. Faxoniana* Rehd. & Wils. FAXON F. Tree to 40 m.; bark dark gray, furrowed: buds ovoid, purple, very resinous; brts. densely ferrugineous-pubescent, slightly grooved; lvs. crowded and irregularly spreading in 2 ranks, the upper shorter, linear, obtuse or emarginate, slightly revolute, 1.5-2.5 cm. long, shining dark green above, with white bands below; resin-ducts median or sub-marginal: cone ovoid-oblong, truncate at apex, 5-8 cm. long, violet-purple before maturity; scales 1.5-2 cm. wide; bracts somewhat exserted, upright or reflexed; seed-wings scarcely as long as body. C.B.N.t.5. V.G.165. (*A. Delavayi* var. *F.* A. B. Jacks.) W. China. Intr. 1911. Zone V?

Related species: *A. Georgei* Orr. Tree to 25 m.; brts. densely reddish pubescent; lvs. nearly pectinate, 1.5-2 cm. long; resin-ducts marginal: cone ovoid, 9 cm. long; bracts distinctly exserted beyond its scale. C.B.N.t.10-12. W. China. Intr. 1923. Zone VI?

9. *A. Fabri* (Mast.) Craib. Tree to 40 m.; young brts. minutely pubescent, glabrescent, yellowish to brown; buds slightly resinous: lvs. crowded, 1.5-2.5 cm. long, rounded or subtruncate to slightly notched at apex, with acutish recurved margin, slightly pectinate below, the middle ones above smaller and nearly upright: cone oblong-cylindric, 6-8 cm. long, 3.5-4.5 across, bluish black; scales 2.2-2.4 cm. broad; bracts spatulate, with exserted and recurved appendage. B.M.9201, f.1-7,9(c). G.C.39:2.13 and C.B.N.t.3,4 (as *A. Fargesii*). (*Keteleeria* F. Mast., *A. Delavayi* Mast., not Franch., *A. Fabri* Craib.) W. China. Intr. 1901. Zone VI.

Related species: *A. Forréstii* Craib. Tree to 20 m.; brts. dark reddish brown: lvs. to 4 cm. long, rounded or truncate, notched, very white beneath: cone to 9 cm. long, violet-purple; bracts short-exserted. B.M.9201, f.8(c). C.B.N.t.7,8. G.C.80:427(h). (*A. Delavayi* var. *F.* A. B. Jacks.) W. China. Intr. about 1910. Zone VII?—*A. Ernéstii* Rehd. Tree to 60 m.; brts. yellowish, rarely slightly puberulous: lvs. crowded, 1.5-3 cm. long, acute or obtuse, rarely slightly emarginate, sometimes stomatiferous above near apex, with pale or glaucescent bands beneath: cone peduncled, gray-brown at maturity; scales half as long as bracts, hidden. V.G.97. (*A. Beissneriana* Rehd. & Wils., not Mottet.) W. China. Intr. 1904. Zone VII?—*A. Delavayi* Franch. with the lvs. strongly revolute at the margin is not in cult.

10. *A. chensiensis* Van Tiegh. Tree to 70 m.; buds ovoid, slightly resinous; brts. glabrous, yellowish gray, the older dark gray: lvs. horizontally spreading and more or less 2-ranked, linear, broader above the middle, 1.5-3.4 cm. long, usually rounded and emarginate at apex, rarely acutish, bifid and sharply pointed on young plants, shining dark green above, with grayish green or sometimes glaucescent bands beneath; resin-ducts marginal, on fruiting brs. internal: cones ovoid-oblong, 7-10 cm. long, green while young, finally cinnamon-brown; scales about 3 cm. broad, erose at margin and tomentose outside; bracts hidden. C.B.N.t.2,26. V.G.131. C. China. Intr. 1907. Zone V.

11. *A. recurvata* Mast. Tree to 40 m., bark dark gray or reddish brown, rough; buds ovoid, very resinous; brts. glabrous, lustrous, pale yellowish gray; lvs. pectinate below and spreading, more or less recurved above, linear, 1.5-3.5 cm. long, acutish or sharply pointed, bright shining green or bluish green above, paler green beneath; resin-ducts marginal: cones oblong-ovoid, 5-10 cm. long, slightly resinous, violet-purple before maturity, finally grayish brown; scales 1.5 cm. broad; bracts hidden. B.J.48:642. C.B.N.t.21,22. W. China. Intr. 1910. Zone V.

12. *A. firma* Sieb. & Zucc. MOMI F. Tree to 50 m., with broad-pyramidal head; bark soon scaly, fissured on old trees: buds small, slightly resinous; brts. brownish gray, slightly grooved, short-pubescent in the grooves; lvs. pectinate, firm, to 3.5 cm. long, broadest about the middle, sharply bifid at apex in young plants, obtuse and emarginate on older plants, with 2 grayish bands beneath: resin-ducts sometimes 4, 2 marginal and 2 internal: cones cylindric, 10-12 cm. long, yellowish green before maturity; scales about 2.5 cm. wide; bracts exserted, not reflexed. S.Z.2:t.107(c). P.I.26(c,h). S.N. 145(h). W.C.t.35,36(h). (*A. momi* Sieb., *A. bifida* Sieb. & Zucc.) Japan. Intr. 1861. Zone (V), VI.

13. *A. holophylla* Maxim. NEEDLE F. Tree to 30 m.; buds slightly resinous; brts. glabrous, slightly grooved, yellowish gray; lvs. pectinate below, spreading above at nearly right angles outward and upward, 2-4 cm. long, entire at apex, obtusish or acute, spiny-pointed in young plants, lustrous bright green above, with 2 pale or slightly whitish bands beneath; resin-ducts internal: cone cylindric, about 14 cm. long, light brown at maturity; scales 3-5 cm. wide, entire; bracts hidden. S.N.144(h, as *A. koreana*). V.G.199. C.B.N. t.13,14. Manch., Korea. Intr. 1905 to Am. Zone V. Handsome fir doing well at the Arnold Arboretum.

14. *A. homolepis* Sieb. & Zucc. NIKKO F. Tree to 30 m.; bark scaly; buds ovoid, resinous; brts. glabrous, grayish, deeply grooved, particularly on 2- and 3-year-old brs.: lvs. pectinate below, except a few small ones in the middle ranks, crowded above, spreading outward and upward and forming a V-shaped depression, the outer ones 2-3 cm. long, the middle ones shorter, rounded or pointed and slightly bifid at apex, lustrous dark green above, with broad white bands below: cones cylindric, slightly narrowed at base and apex, about 10 cm. long, purple before maturity: scales thin, 2 cm. wide, entire; bracts hidden. S.Z.2:t.108(c). S.I.1:t.3(c). B.E.t.25(h). W.C.t.37,38(h). (*A. brachyphylla* Maxim.) Japan. Intr. 1861. Zone IV. One of the most ornamental firs thriving well in the E. States.—*A. h. Tomomi* (Bobbink & Atkins) Rehd., var. A more sparingly branched form with shorter lvs. (*A. t.* Bobbink & Atkins.)—*A. h. umbellata* (Mayr) Wils., var. Cone green while young. S.I.2:t.2(c). (*A. u.* Mayr, *A. umbilicata* Mayr.)

15. *A. spectabilis* (Don) Spach. HIMALAYAN F. Tree to 50 m., with wide spreading brs. forming a broad-pyramidal head; bark scaly, rough; buds large, globose, resinous; brts. reddish brown, deeply grooved, pubescent in the grooves; lvs. arranged as in no. 14, but larger, 2.5-6 cm. long, rounded and bifid at apex, lustrous dark green above, with broad white bands below: cones cylindric, 14-18 cm. long, violet-purple before maturity; scales 1.5-2 cm. broad; bracts hidden or slightly exserted. B.M.8098(c, as *A. Mariesii*). G.C. III.25:788. P.I.21(c,h). (*A. Webbiana* Lindl., *A. densa* Griff.) Himal., Sikkim and Bhotan. Intr. 1822. Zone VII.—*A. s. brevifolia* (Henry) Rehd., var. Lvs. shorter, not exceeding 3 cm., with grayish bands below; brts. less grooved; bark smooth. (*A. Webbiana* var. *b.* Henry.) N.W. Himal. Zone VI or VII.

16. **A. Pindrow** Royle. **PINDROW** F. Tree to 60 m., with short brs. forming a narrow pyramid; bark smooth and gray on young trees, grayish brown on old trees; buds large, resinous; brts. smooth and glabrous, gray: lvs. nearly pectinate below, crowded above, those in the middle shorter and directed forward, narrowly linear, 3-6 cm. long, bifid and acute at apex (entire on young plants), lustrous dark green, with gray bands below: cone cylindric, 10-14 cm. long, deep purple while young; scales 3 cm. wide; bracts hidden. P.I.22(c,h). C.B.2:23. (*A. Webbiana* var. *p.* Brandis.) Himal. Intr. 1837. Zone VI.—**A. P. brevifolia** Dallimore & Jackson, var. Brts. reddish brown; lvs. 2-3.5 cm. long, rigid, acute, paler green. C.B.N.t.9. V.G.185. (*A. Gamblei* Hick.) Himal. Cult. 1923. Zone VII.—**A. P. intermedia** Henry, var. Intermediate between nos. 15 and 16, possibly a hybrid: lvs. up to 5.5 cm., convex below. Orig. unknown. Cult. about 1870.

17. **A. numifolia** Carr. **ALGERIAN** F. Tree to 20 m.; bark gray, smooth, scaly and fissured on old trees; buds ovoid, large, not or slightly resinous; brts. glabrous and lustrous: lvs. pectinate below, much crowded above, spreading outward and upward, on stronger brts. backward, on weaker ones with a V-shaped depression in the middle, 1.5-2 cm. long, 2 mm. broad, often broadest above the middle, rounded at apex and bifid or entire, dark green above, often only faintly grooved and often stomatiferous near apex, with white bands beneath: cones cylindric, 12-18 cm. long; scales 3 cm. wide, entire; bracts hidden. F.S.17:t.1717(c). V.G.283. P.I.20(c,h). B.E.t.26(h). (*A. Pinsapo* var. *baborensis* Coss., *A. baborensis* Letourneux.) N. Afr. Intr. 1862. Zone VI or (V).—**A. n. glauca** Beiss. Lvs. shorter and broader, bluish, with more stomatic lines above. P.I.t.20,f.8,9,12,13(c).

Related species: **A. Pärdei** Gaussen. Brts. pubescent; lvs. 1.5-2.8 cm. long, rounded or subacute at apex: cone 18-20 cm. long; bracts slightly exserted. V.G.287. Orig. unknown. Cult. 1912.

18. **A. Pinsapo** Boiss. **SPANISH** F. Tree to 25 m.; bark smooth, fissured on old trees; buds ovoid, resinous; brts. glabrous, brownish: lvs. spreading radially at nearly right angles, thick, rigid, 1.5-2 cm. long, acute or obtusish, dark green, slightly convex and stomatiferous above, with pale bands beneath: cones cylindric, purplish brown, 10-12 cm. long; scales 2.5 cm. wide, entire; bracts small, hidden. P.I.19(c,h). G.C.III.3:140. E.H.4:t.212-3(h). Spain. Intr. 1837. Zone VI. A handsome fir of striking appearance thriving well in the E. States.—**A. P. argentea** Beiss. With silvery white foliage.—**A. P. glauca** Carr. With glaucous foliage.—**A. P. pendula** Beiss. With pendulous brs. S.N.147(h). M.D.1913:337(h).

**A. P. × cephalonica** = **A. Vilmorinii** Mast. J.L.26:107. Vilmorin, Hort. Vilm. t.12(h). Raised in 1868.—**A. P. × Nordmanniana** = **A. insignis** Carr. B.H.128(h).129. Raised in 1872. Of this cross several forms are known: **A. i. Beissneriana** (Mottet) Rehd. (*A. B. Mottet*); **A. i. Kentiana** (Mottet) Rehd. (*A. K. Mottet*); **A. i. Mastersiana** (Mottet) Rehd. (*A. M. Mottet*); **A. i. speciosa** Bailly) Rehd. (*A. Nordmanniana s. Bailly*).

Closely related species: **A. marocana** Trabut. Lvs. 1-1.5 cm. long, nearly flat above with 1 or 2 irregular lines of stomata, resin-ducts marginal: cone about 15 cm. long; bracts about ½ as long as scale. V.G.238,239. Morocco. Cult. ?

19. **A. cephalonica** Loud. **GREEK** F. Tree to 30 m.; bark grayish brown, smooth, fissured on old trees; buds ovoid, reddish, resinous; brts. lustrous, red-brown, glabrous: lvs. radially spreading and slightly directed forward, the middle ones above shorter, 1.5-2.8 cm. long, stiff, gradually narrowed into a sharp point, shining deep green above, with white bands beneath: cone cylindric, 12-16 cm. long and 4-5 cm. across, brownish; scales 3-3.5 cm. wide, undulate or entire; bracts exserted and reflexed. P.I.18(c,h). G.C.II.22:592.

D.J.92,t(h). (*A. panachaica* Heldr., *A. Reginae Amaliae* Heldr.) Greece. Intr. 1824. Zone V. Handsome tree distinct in its spreading, sharply pointed lvs.—*A. c. Apóllinis* (Link) Beiss. Brts. yellowish: lvs. more crowded above, only a few below spreading downward and forward, thicker and broader, slightly acute or sometimes obtusish.

*A. c. × Pinsapo*; see under No. 18.

Related species: *A. Borisii-régis* Mattf. Tall trees; brts. densely short-pubescent; buds resinous: lvs. to 3 cm. long, acute and subpungent, sometimes rounded or slightly emarginate: cones conical-cylindric, 15 cm. long; bracts exserted; scales 3–3.5 cm. wide. M.D.1925:t.1,f.7,t.4,5. Balkan Pen. Cult. 1883. Zone V.—*A. Bornmülleriana* Mattf. Tall tree; brts. glabrous; buds resinous: lvs. to 3.5 cm. long, rounded or emarginate: cone 12 cm. long, cylindric; bracts exserted; scales 2.5–3 cm. wide. M.D.1925:t.2,f.9,t.6,7(h). Asia Minor. Intr.? *A. nebrodensis* Mattei. Intermediate between Nos. 19 and 22.: brts. with short brown hairs: lvs. 1.2–2 cm. long, stiff, rounded or slightly emarginate at apex: cone about 8 cm. long. C.B.N.t.18,19. V.G.247. Sicily. Cult. 1930. Zone VII?

20. *A. cilicica* (Ant. & Kotschy) Carr. CILICIAN F. Tree to 30 m.; bark ashy gray, smooth, scaly on old trees; buds small, not or slightly resinous, with few keeled scales free at the tips; brts. grayish brown, with scattered short hairs: lvs. above spreading upward and forward, on weaker brts. outward and upward, leaving a V-shaped depression, slender, 2–3 cm. long, rounded or acute and slightly bifid at apex, shining bright green above, with narrow whitish bands below: cones cylindric, 16–20 cm. long, reddish brown; scales 3.5–4 cm. wide, entire; bracts hidden. P.I.17(c,h). C.B.2:10. B.E.t. 27(h). Asia Minor, Syria. Intr. 1855. Zone V.

21. *A. Nordmanniana* (Steven) Spach. NORDMANN F. Tree to 50 m.; bark grayish brown, slightly fissured on old trees; buds ovoid, acute, not resinous, with slightly keeled acute scales; brts. gray, loosely or densely short-hairy: lvs. pectinate below, above directed forward and densely covering the brts., 2–3.5 cm. long, rounded and bifid at apex, lustrous dark green above, with whitish bands beneath: cones cylindric, 12–15 cm. long, reddish brown; scales 3–4 cm. wide; bracts exserted and reflexed. B.M.6992(c). P.I.16(c,h). S.N.50,137(h). Cauc., Asia Minor. Intr. 1848. Zone IV. Handsome and desirable fir.—*A. N. aurea* Beiss. Lvs. yellow.—*A. N. tortifolia* Rehd., f. Lvs. of the middle ranks above falcate and twisted.

*A. N. × pinsapo* = *A. insignis*; see under No. 18.

22. *A. alba* Mill. SILVER F. Tree to 50 m.; bark grayish, smooth, scaly on old trees; buds small, not resinous, with few obtuse scales; brts. gray, with short brown hairs: lvs. pectinate, those of the upper ranks shorter and pointing outward and upward, 1.5–3 cm. long, rounded and bifid at apex, lustrous dark green above, with white bands beneath: cones cylindric, 10–14 cm. long, green while young, finally reddish brown; scales 2.5–3 cm. wide, tomentose outside; bracts exserted and reflexed. H.W.1:87(h)–94,t.2(c). E.H.4:t.208–11 (h). (*A. pectinata* DC., *A. Picea* Lindl., not Mill.) Mts. of C. and S. Eu. Long cult. Zone IV. This species is not doing well in the E. States.—*A. a. compácta* (Parsons) Rehd., f. A dwarf compact bushy form with ascending crowded brs. and lustrous lvs. about 1.5 cm. long.—*A. a. pendula* (Carr.) Aschers. & Graebn., l. With pendulous brs. G.W.19:466(h). (*A. pectinata* p. Carr.)—*A. a. pyramidális* (Carr.) Voss, f. With ascending brs. forming a columnar head. (*A. pectinata* p. Carr., *A. alba* l. *fastigiata* Aschers. & Graebn.)—*A. a. columnaris* (Carr.) Rehd., f. With short spreading brs. of nearly equal length forming a columnar head. (*A. pectinata* c. Carr.)

23. *A. Fräseri* (Pursh) Poir. SOUTHERN BALSAM F. Tree to 25 m.; bark smooth, reddish and scaly on old trees: buds small, subglobose, very resi-

nous; brts. yellowish gray, densely covered with short reddish hairs: lvs. spreading upward and forward, pectinate below, 1.5–2.5 cm. long, rounded and bifid at apex, lustrous dark green above, with broad white bands beneath: cones oblong-ovoid or ovoid, 3.5–6 cm. long, purple before maturity; scales 2 cm. wide, usually auriculate; bracts exserted and reflexed. S.S.12:t.609. G.C.III.8:684. G.F.2:475(h). Alleghany Mts., W. Va. to N. C. and Tenn. Intr. 1811. Zone IV.—*A. F. prostrata* Rehd., f. Low, depressed shrub with horizontally spreading brs. Morton Arb. Bull. 4:56(h).

24. *A. balsamea* (L.) Mill. BALSAM F. Tree to 25 m.; bark grayish brown, scaly on old trees: buds reddish, very resinous: brts. ashy gray, short-pubescent: lvs. spreading upward, pectinate below, on weaker brts. pectinate, 1.5–2.5 cm. long, rounded and slightly bifid at apex, dark green above and often with a few stomatic lines near apex, with narrow whitish bands beneath: cones oblong, 5–7 cm. long, violet-purple before maturity; scales 1.5 cm. wide; bracts enclosed or sometimes exserted (f. *phanerolépis* Fern.). S.S.12:t.610. G.C.III.17:422. Act. Hort. Berg. 6:t.87(h). Lab. to W. Va., w. to Minn. and Iowa. Intr. 1698. Zone III. In the E. States not satisfactory outside of its natural habitat.—*A. b. hudsónia* (Jacques) Sarg., var. Dwarf depressed form with dark green shorter and broader lvs. (*A. b. hudsonica* Kent.) Intr. before 1810.—*A. b. nana* (Nels.) Carr. Dense subglobose form with short dark green lvs. (*A. b. globosa* Beiss. & Jaeg.)—*A. b. macrocarpa* Kent, var. Lvs. longer and cones to 8.5 cm. long. Intr. from Wisc. about 1884. It forms a transition to the following species.

25. *A. lasiocarpa* (Hook.) Nutt. ROCKY MOUNTAIN F. Tree to 30 or occasionally to 50 m.; bark smooth and silvery gray, fissured on old trees; buds small, ovoid, resinous; brts. ashy gray, with short rufous pubescence: lvs. much crowded above and directed forward and upward, 2.5–4 cm. long, rounded or acutish at apex, rarely emarginate, pale bluish green, stomatiforous and slightly grooved above, with broad pale bands beneath: cones oblong-cylindric, 6–10 cm. long, truncate or depressed at apex; scales 2–2.5 cm. wide; bracts hidden. S.S.12:t.611. G.F.4:382(h). (*A. subalpina* Engelm.) Alaska to Ore., Utah, and n. N. Mex. Intr. 1863. It does not thrive in the E. States.—*A. l. compacta* (Beiss.) Rehd., f. A dwarf compact form. (*A. l.* var. *cònica* Hornibr., *A. subalpina* c. Beiss.) Orig. 1873.—*A. l. arizònica* (Merriam) Lemm., var. ARIZONA F. Bark creamy white, thick and corky: lvs. whiter beneath and emarginate at the apex, more distinctly pectinate. G.C.29:134. S.N.154(h). M.G.40:289(h). (*A. a.* Merriam.) N. Ariz. and n. N. Mex. Intr. 1901.

26. *A. amabilis* (Dougl.) Forb. Tree to 80 m.; bark silvery white or pale, at the base of old trees thick and furrowed; buds globose, very resinous; brts. gray, densely pubescent: lvs. pectinate below, crowded above, the lower ranks spreading, the upper stouter and directed forward, linear, 2–3 cm. long, often broadest above the middle, truncate or bifid at the apex, shining dark green above and grooved, with broad white bands below: cones oblong, 8–14 cm. long, purple before maturity, puberulous; scales 2.5–2.8 cm. wide; bracts hidden. S.S.12:t.614. G.C.III.3:754. D.J.80,t(h). B. C. and Alb. to Ore. Intr. 1830. Zone V.

27. *A. grandis* Lindl. GIANT F. Tree to 100 m. tall and to 5 m. in girth; buds ovoid, resinous; brts. olive-green or olive-brown, minutely pubescent, soon nearly glabrous: lvs. pectinate, linear, 3–6 cm. long and 2–2.5 mm. wide, flexible, rounded and bifid at the apex, shining dark green and grooved above, with white bands below: cones cylindric, 5–10 cm. long, bright-green; scales

2.5-3 cm. wide; bracts hidden. S.S.12:t.612. B.C.2:14. E.H.4:t.217-8(h). (*A. Gordoniana* Carr., *A. amabilis* Murr., not Forbes.) Vancouver Isl. to n. Calif., east to Mont. Intr. 1831. Zone VI.

28. *A. concolor* (Gord.) Engelm. COLORADO F. Tree to 40 m.; bark smooth, gray, on old trees deeply fissured and scaly; buds globose, resinous; brts. yellowish green, minutely pubescent or nearly glabrous; lvs. irregularly arranged, mostly spreading outward and curving upward, some of the middle ranks above directed forward, linear, 4-6 cm. long, acute or rounded at apex, bluish green, slightly convex and stomatiferous above, convex below and with pale bands: cones cylindric, 7-12 cm. long, narrowed at the ends, greenish or purplish before maturity; scales about 2.5 cm. wide, bracts hidden. P.I.29 (c,h). S.S.12:t.613(partly). G.C.III.8:748. W.A.82:t(h). Colo. to s. Calif., n. Mex. and N. Mex. Intr. 1872. Zone IV. This species is one of the best firs for the E. States; the var. *Lowiana* is less satisfactory.—*A. c. violacea* (Roehl) Beiss. Lvs. bluish white.—*A. c. Wattèzii* Beiss. Lvs. first pale yellowish, changing to silvery white.—*A. c. aurea* Beiss. Young lvs. golden yellow.—*A. c. brevifolia* Beiss. Lvs. short and thick, obtuse, twice as broad as in the type.—*A. c. globosa* Niemetz. Of globose habit, with short brs.—*A. c. conica* Slavin, f. Dwarf pyramidal form with lvs. 2-4 cm. long.—*A. c. pendula* Beiss. With strongly pendulous brs. forming a narrow columnar head.—*A. c. Lowiana* (A. Murr.) Lemm., var. Tree to 80 m.; buds smaller; lvs. more pectinately arranged, 5-7 cm. long, rounded and bifid at the apex, shallowly grooved above. P.I.30(c,h). C.B.2:16. G.C.III.13:8. S.N.146(h). (*A. L.* A. Murr., *A. Parsonsiana* Barron, *A. lasiocarpa* Mast., not Nutt.) Ore. to Calif. Intr. 1851. Zone VI.

29. *A. venusta* (Dougl.) K. Koch. Tree to 50 m., the lower brs. pendulous; bark smooth, brown, fissured at the base of old trees; buds elongated, acute, 1.5-2.5 cm. long, not resinous; brts. greenish, glabrous; lvs. pectinate, linear to linear-lanceolate, 3-6 cm. long, rigid, spiny-pointed, shining green above, not grooved, with broad white bands below: cones ovoid, 7-10 cm. long, purplish brown, resinous, with the exserted bracts ending in rigid spines 2.5-5 cm. long, giving the cone a bristly appearance. S.S.12:t.615,616. E.H.4:t.224 (h). (*A. bracteata* Nutt.) Calif. Intr. 1853. Zone VII?

30. *A. nobilis* Lindl. NOBLE F. Tree to 80 m., with a girth to 8 m.; bark on old trees reddish brown and deeply fissured; buds resinous above; brts. minutely rusty-pubescent; lvs. pectinate below, crowded above, the lower ranks spreading outward, those of the middle ranks much shorter, appressed to the brts. near the base, then curving upward, linear, 2.5-3.5 cm. long, 1.5 mm. wide, rounded and entire or slightly notched at the apex, bluish green, stomatiferous and grooved above, with narrow pale bands below: cone cylindric-oblong, slightly narrowed toward the apex, 14-25 cm. long, green before maturity, finally purplish brown; scales 3-3.5 cm. broad; bracts much exserted and reflexed. S.S.12:t.617. G.C.II.25:652. E.H.4:t.225(h). Wash. to n. Calif. Intr. 1830. Zone (V). This fir thrives well in the E. States.—*A. n. glauca* Beiss. With glaucous lvs.

31. *A. magnifica* A. Murr. RED F. Tree to 70 m. and to 10 m. in girth; buds and brts. like those of the preceding species; lvs. less crowded, longer, up to 4 cm. long, quadrangular in section, rounded and entire at apex, keeled and stomatiferous above, with 2 pale bands below: cones cylindric-oblong, 14-22 cm. long, pubescent, purplish violet before maturity; scales 3-3.5 cm. wide; bracts hidden. S.S.12:t.618,619. G.C.II.24:652. E.H.4:t.222-3(h). (*A. nobilis* var. *m.* Kellogg.) Ore. to Calif. Intr. 1851. Zone V. A handsome fir of

regular habit doing well in the E. States but less hardy than the preceding species.—*A. m. glauca* Beiss. With deep glaucous lvs.—*A. m. argentea* Beiss. With bluish white lvs.—*A. m. shastensis* Lemm., var. Bracts exserted and usually reflexed, covering nearly half the scales. S.S.12:t.620. G.C.II.24:652; III.41:114. (*A. s.* Lemm.) Ore. to Calif.

2. **KETELEËRIA** Carr. Evergreen trees with spreading whorled brs., pyramidal while young, flat-topped in old age: buds ovoid or globose, not resinous: lvs. linear, rigid, flat or keeled and lustrous above, keeled and pale green below, on young trees usually spiny pointed, on old trees obtuse: male fls. clustered; female fls. composed of numerous 2-ovuled scales subtended by small bracts: cone upright, ovoid to cylindric-oblong, with broad, woody, persistent scales, ripening the first year; bracts half as long as scale; seeds 2, their wings as long or nearly as long as the scales; cotyledons 2, remaining below ground. (After J. B. Keteleer, a French nurseryman, born in Belgium; 1813–1903.) Two or 3 species in China and Formosa.—Trees of the aspect of firs, but with the lvs. keeled or flat, not grooved above and pale green below. Better suited for a drier climate than the firs.

- A. Young brts. orange-red: lvs. spiny-pointed to obtusish: cone-scales suborbicular, slightly inflexed at apex.....1. *K. Fortunei*  
 AA. Young brts. yellowish gray: lvs. on old plants obtuse or emarginate: cone-scales ovate, recurved at apex.....2. *K. Davidiana*

1. *K. Fortunei* (A. Murr.) Carr. Tall tree to 30 m.; bark corky; young brts. glabrous or with scattered hairs: lvs. linear, keeled on both sides, spiny pointed on young plants, obtusish on old trees, 2–3 cm. long: cone ovoid to ovoid-cylindric, 8–18 cm. long, purple while young. R.H.1904:130. I.S.t.12. G.C.II.21:348; III.90:327(h). G.W.3:125(h). (*Abies* F. A. Murr.) S. E. China. Intr. about 1845. Zone VII?

2. *K. Davidiana* (Franch.) Beiss. Tree to 35 m.; bark dark gray, furrowed; young brts. short-pilose or glabrous: lvs. linear, keeled on both sides, on mature trees obtuse or emarginate, 2.5–5 cm. long: cone cylindric-oblong, 12–20 cm. long, greenish, while young. G.C.III.33:84. R.H.1904:131. S.N.30(h). (*Abies* D. Franch., *Abies sacra* David.) W. China. Intr. 1888 and 1901. Zone VII. Probably harder than the preceding species.

*K. Evelyniana* Mast. with smaller cones and oblong-ovate scales (G.C. 33:194) and *K. formosana* Hayata are probably varieties or synonyms of *K. Davidiana*.

3. **PSEUDOTSUGA** Carr. Evergreen trees with irregularly whorled brs.; brts. nearly smooth, marked with oval scars after the lvs. have fallen: buds ovate, acute, glabrous, not resinous: lvs. spirally arranged, spreading into 2 opposite rows, linear, flattened, green and grooved above, with 2 stomatic bands below, and with 2 marginal resin-ducts and 1 vascular bundle: male fls. axillary, cylindric; female terminal on short brts. and consisting of numerous spirally arranged 2-ovuled scales: fr. a pendulous, ovoid to ovoid-oblong cone with rounded concave rigid scales subtended by exserted bracts 3-lobed at the apex with the middle lobe long and narrow; seeds 2 under each scale, winged; cotyledons 6–12. (Greek *pseudos*, false and *tsuga*; alluding to its relationship.) Five species in W. N. Am. and in E. Asia.

- A. Lvs. entire at apex: 2-year-old brts. reddish brown, usually pubescent.....1. *P. taxifolia*  
 AA. Lvs. emarginate: brts. pale yellowish gray, glabrous.....2. *P. japonica*

1. *P. taxifolia* (Poir.) Britt. DOUGLAS-FIR. Tree to 100 m.; trunk to 12 m. in girth; bark smooth, on old trees thick and corky, deeply fissured into scaly ridges; brts. pubescent, rarely glabrous, pale orange at first, changing to

reddish brown and later to grayish brown: lvs. straight, rarely curved, 2-3 cm. long, obtuse to acute, dark or bluish green above, with grayish or whitish bands beneath; cone ovoid, 5-10 cm. long; scales slightly concave, about 2 cm. wide; bracts exserted, upright or sometimes reflexed, green while young, light brown at maturity. S.S.12:t.607. E.H.4:t.227-31(h). (*P. Douglasii* Carr., *P. mucronata* Sudw., *Abies mucronata* Raf., *A. Douglasii* Lindl., *Abietia Douglasii* Kent.) B. C. to Calif., Mont., Colo., w. Tex. and n. Mex. Intr. 1827. Very variable and recently split into about 10 species.—The typical form of the coast region has been distinguished as *P. t. viridis* (Schwer.) Aschers. & Graebn. (*P. Douglasii* subsp. *mucronata* Schwer.) It is a taller tree, with the young brs. spreading, larger green lvs., larger cones with upright and accumbent bracts. M.D.1909:79t. Zone VI. Here belong the following three forms: *P. t. caesia* (Schwer.) Aschers. & Graebn. Lvs. bluish green.—*P. t. fastigiata* (Knight) Sudw. A pyramidal form with upright brs.—*P. t. pendula* (Neumann) Sudw. Form with pendulous brs. M.D.1918:t.57(h); 1921:t.24(h).—*P. t. glauca* (Mayr) Schneid., var., is the Rocky Mountain form. Tree of slower growth and more compact habit, with ascending young brs.: lvs. shorter and more or less bluish green: cone about 5 cm. long, with spreading or finally reflexed bracts. M.D.1909:79t. M.G.20:124(h). S.N. 271(h). (*P.g.* Mayr, *P. Douglasii* var. *g.* Mayr, *P. Douglasii* subsp. *glaucescens* Schwer.) Zone IV. The Rocky Mountain form is doing well in the E. States and forms a handsome dense pyramidal tree, but is of slower growth than the tenderer typical form which on account of its more rapid growth and larger size is more valuable as a timber tree.—To this var. belong the following forms: *P. t. argentea* (Koster) Sudw. Lvs. bluish white.—*P. t. "glauca pendula"* (Beiss.) Schneid., f. With pendulous brs. and bluish green lvs. (*P. Douglasii glauca pendula* Beiss.) M.D.40:t.75(h).—*P. t. compacta* (Carr.) Sudw. Compact conical form with short crowded lvs.—*P. t. globosa* (Lutz) Aschers. & Graebn. Dwarf globose form, rather loosely branched.—*P. t. pumila* (Beiss.) Schwer., f. Dwarf compact globose form.

2. *P. japonica* (Shiras.) Beiss. Tree to 30 m.; bark fissured, dull reddish brown, becoming grayish brown; brts. glabrous, pale yellowish gray, with a conspicuous dark brown line around the apex of the pulvini: lvs. directed more or less forward, linear, often slightly curved, emarginate, 1.5-2.5 cm. long, shining bright green above and grooved, with 2 whitish bands below: cone ovoid, 4-5 cm. long, dark violet while young; scales very concave, rigid, 2-3 cm. wide; bracts exserted and reflexed. S.I.2:t.7(c). C.B.1:59. G.C.76:337. W.C.t.33,34(h). (*Tsuga j.* Shiras.) Japan. Intr. 1898. Zone VI.

Closely related species: *P. sinensis* Dode from W. China differs chiefly in the pubescent brown brts., longer lvs., to 3 cm. long and more distinctly pectinately arranged, larger cones, about 6 cm. long, with puberulous scales and upright or reflexed bracts. I.S.t.10. Intr. about 1914.—*P. Wilsoniana* Hayata (*P. Forrestii* Craib) from Formosa and S.W. China is probably not hardy.

4. **TSUGA** Carr. **HEMLOCK**. Evergreen trees with cinnamon-red furrowed bark and horizontal, often pendulous brs. irregularly ramified; brts. with prominent leaf-cushions; buds globose or ovoid, not resinous: lvs. spirally arranged, usually more or less 2-ranked, linear, usually flattened and grooved above and with 2 white stomatic bands below, rarely rounded above and stomatiferous on both sides, with one resin-canal below the vascular bundle: fls. solitary; male fls. globose, axillary, the female terminal on lateral shoots with imbricated 2-ovuled scales: fr. a usually small cone consisting of concave woody scales subtended by short, rarely exserted bracts and persisting

after the escape of the seeds; seeds 2 under each scale, small, winged; cotyledons 3-6. (*Tsuga* is the vernacular Japanese name.) About 10 species in temp. N. Am., Japan, China and Himal.

- A. Lvs. flat, grooved above, with 2 white or pale bands below, pectinately arranged: cones small, 1.5-3 cm. long.
- B. Margin of lvs. entire.
  - c. Brts. glabrous, grayish or yellowish brown: lvs. 8-25 mm. long, notched. 1. *T. Sieboldii*
  - cc. Brts. pubescent.
    - d. Lvs. 8-14 mm. long, notched; brts. pubescent throughout, reddish brown. 2. *T. diversifolia*
    - dd. Lvs. 8-25 mm. long; brts. light yellowish brown or gray, pubescent chiefly in the grooves.
      - E. Lvs. notched at the apex, with inconspicuous bands below: cone-scales sub-orbicular ..... 3. *T. chinensis*
      - EE. Lvs. entire or obscurely notched at the apex, with conspicuous white bands: cone-scales oval-oblong ..... 4. *T. caroliniana*
  - BB. Margin of lvs. serrulate: brts. pubescent.
    - c. Lvs. beneath with well defined narrow bands and a distinct green margin: buds ovoid, pointed ..... 5. *T. canadensis*
    - cc. Lvs. beneath with broad ill defined bands and indistinct green margin: buds globose. 6. *T. heterophylla*
- AA. Lvs. rounded or keeled above, rarely slightly grooved, stomatiferous on both sides: cones cylindric-oblong, 5-7 cm. long. .... 7. *T. Mertensiana*

1. *T. Sieboldii* Carr. Tree to 30 m., with horizontally spreading brs. forming an oval head, in cult. usually small tree or shrub; buds ovoid, acutish, with glabrous ciliate scales: lvs. linear, 6-22 mm. long, to 3 mm. broad, emarginate at apex, glossy dark green above, with narrow white bands below: cone ovoid, 2-2.5 cm. long, stalked, with orbicular scales. S.Z.2:t.106(c). S.I.2:t.4(c). W.C.29,30(h). S.N.100,297(h). (*T. Araragi* (Sieb.) Koehne.) Japan. Intr. 1850. Zone (V).

2. *T. diversifolia* (Maxim.) Mast. JAPANESE H. Tree, rarely to 30 m., with horizontal brs. forming a pyramidal head; buds obovoid, flattened, minutely pubescent and ciliate: lvs. crowded, linear-oblong, 5-15 mm. long, 2.4 mm. broad, emarginate at apex, very glossy and dark green above, with narrow white bands below: cones subsessile, ovoid, 2 cm. long; scales orbicular-ovate, lustrous, with slightly thickened bevelled margin. S.I.2:t.4(c). W.C.31, 32(h). S.N.298(h). (*T. Sieboldii nana* Carr.) Japan. Intr. 1861. Zone V. Graceful species doing well in the E. States.

3. *T. chinensis* (Franch.) Pritz. CHINESE H. Tree to 50 m.; buds ovoid, obtuse, glabrous; brts. yellowish, later pale yellowish gray, hairy only in the grooves: lvs. linear, 1.5-2.5 cm. long, 2-3 mm. broad, emarginate, glossy dark green and slightly grooved above, with broad whitish bands beneath becoming inconspicuous: cones ovoid, 1.5-2.5 cm. long; scales suborbicular, lustrous yellowish brown, with slightly bevelled margin. B.M.9193(c). C.B.N.t.91. C.C.21. W. China. Intr. 1901. Zone (V). Handsome promising species.

Closely related species: *T. yunnanensis* (Franch.) Mast. Differs chiefly in the more densely pubescent brts., shorter and narrower, obtuse, not emarginate lvs. 7-18 mm. long, deeply grooved above, always very white below, and in the dull cones with fewer scales slightly recurved at apex. G.C.39:236. C.B.N.t.93. W. China. Intr. 1908. Zone VI?

4. *T. caroliniana* Engelm. CAROLINA H. Tree, occasionally to 25 m., with often pendulous brs. forming a compact pyramidal head; buds globose-ovoid, obtuse, pubescent; brs. orange-brown, slightly pubescent: lvs. linear, 8-18 mm. long, lustrous dark green above, with white bands beneath: cones short-stalked, ovoid-oblong, 2-3.5 cm. long; scales oblong-ovate, rounded, thin, puberulous outside. S.S.10:t.604. G.C.II.26:780. B.E.t.31(h). W.A.78,t(h). Mts. of S. W. Va. to Ga. Intr. 1881. Zone IV. Very desirable tree of more

compact habit than the common H.—*T. c. compácta* Hornibr., var. Slow-growing round-topped and denser form. H.D.186,t(h).

5. *T. canadensis* (L.) Carr. COMMON H. Tree, occasionally to 30 m., with long and slender often pendulous brs. forming a broad pyramidal head; buds acute, slightly puberulous; brts. yellow-brown, pubescent; lvs. linear, 8–18 mm. long, rounded, rarely emarginate at apex, lustrous dark green and slightly grooved above, with narrow white bands beneath; cones short-stalked, ovoid, 1.5–2 cm. long, with roundish obovate scales. S.S.10:t.603. G.C.48:350–1(h). E.H.2:t.70–1(h). (*T. americana* (Mill.) Farwell.) N. S. to Minn. and Ill., s. on the mts. to n. Ga. and n. Ala. Intr. about 1736. Zone IV. Handsome ornamental tree; also timber-tree of some importance and bark used for tanning.—*T. c. albo-spica* Beiss. Tips of young shoots white.—*T. c. microphýlla* Sénécl. Lvs. 3–5 mm. long and 1 mm. broad. (*T. c. parvifolia* Beiss.)—*T. c. Jenkínsii* Bailey, var. Narrow-pyramidal graceful form with slender pendent brs. and small lvs. 1 cm. or less long. Cult. 1932.—*T. c. compácta* Sénécl. Dwarf conical form with short brs. and short lvs. B.E.t.32(h).—*T. c. grácilis* Carr. Slow growing form with spreading sparingly ramified brs. drooping at the ends: lvs. 6–8 mm. long.—*T. c. péndula* Beiss. Low form with pendulous brs. forming a dense hemispherical bush broader than high. M.G. 15:367–8,491(h). Gn.39:81(h). G.C.75:107(h). Jour. N. Y. Bot. Gard. 40:156–164(h). (*T. c. Sargentiana* Kent, var. *Sargenti pendula* Bean.)

6. *T. heterophýlla* (Raf.) Sarg. WESTERN H. Tree to 70 m., with short usually pendulous brs. forming a narrow-pyramidal head; buds globose-ovoid, obtuse; brts. yellow-brown changing to dark red-brown, pubescent for 5 or 6 years and with long pale hairs while young; lvs. linear, 6–18 mm. long, rounded at apex, shining dark green and grooved above, with broad white bands beneath: cone sessile, 2–2.5 cm. long; scales obovate, longer than broad, puberulous outside. S.S.10:t.605. G.C.III.12:11. B.S.2:604,t(h). D.J.t.29(h). (*T. Mertensiana* auth., not (Bong.) Carr., *T. Albertiana* (A. Murr.) Sénécl.) S. Alaska to Idaho and Calif. Intr. 1851. Zone VI. Handsome tree of rapid growth in humid soil, not doing well in the climate of the E. States.

Related species: *T. dumosa* (D. Don) Eichl. Tree to 40 m.; buds globose, pubescent; lvs. 1.5–3 cm. long, tapering to an acute apex, silvery white below, with scarcely any green margin: cone-scales suborbicular, striate. G.C.II.26:72, 500. E.H.2:t.72(h). (*T. Brunoniana* Carr.) Himal. Intr. 1838. Zone VII?

7. *T. Mertensiana* (Bong.) Carr. MOUNTAIN H. Tree to 30 or occasionally to 50 m., with slender pendent brs. forming an open pyramidal head; buds ovoid, acute; brts. reddish brown, pubescent for 2 or 3 years: lvs. radially spreading, 5–25 mm. long, flattened, entire, bluntly pointed, usually bluish green: cones sessile, cylindric-oblong, 3–7.5 cm. long; scales suborbicular, thin, puberulous outside, usually bluish purple before maturity. S.S.10:t.606. G.C. III.21:150–1. G.F.10:6,7(h). E.H.2:t.67(h). (*T. Hookeriana* Carr., *T. Pattoniana* Sénécl., *Hesperopeuce Pattoniana* Lemm.) S. Alaska to n. Mont., Idaho and Calif. Intr. 1854. Zone (V).—*T. M. argétea* (Beiss.) Sudw. Lvs. bluish white. S.N.302(h).—To avoid confusion one has to bear in mind that *T. heterophylla* was known for a long time as *T. Mertensiana* and is still not infrequently called so.

*T. M.* × *heterophylla* = *T. Jéffreyi* (Henry) Henry. Buds ovoid, acute: lvs. radially spreading and directed outward, green and grooved above, with stomata near apex, minutely serrulate. C.B.N.92. (*T. Pattoniana* var. *Jéffreyi* Henry.) Intr. 1851.

5. **PÍCEA** A. Dietr. SPRUCE. Evergreen pyramidal trees with scaly bark and whorled brs.; brts. with prominent leaf-cushions (pulvini) separated by

incised grooves and produced at the apex into a peg-like stalk bearing the leaf; buds ovoid or conical, with or without resin: lvs. spirally arranged, on the under side of the brts. usually pectinate, linear, usually 4-angled and stomatiferous on all 4 sides or compressed and stomatiferous only on the upper (ventral or inner) side which appears by twisting of the lvs. to be the lower one; with 2 marginal resin-ducts, rarely without: male fls. axillary, catkin-like, yellow or red, consisting of numerous spirally arranged anthers; female fls. terminal, green or purple, consisting of numerous 2-ovuled bracted scales: fr. an ovoid to oblong-cylindric pendulous or sometimes spreading to nearly upright cone, with persistent, suborbicular to rhombic-oblong scales subtended by small bracts; seeds 2 under each scale, small, compressed, winged. (The ancient Latin name, derived from *piz*, pitch.) About 40 species in the cooler and temperate regions of the n. hemisphere, from the arctic circle to the high mts. of the warm-temp. regions.

- A. Lvs. quadrangular or slightly compressed, stomatiferous on all sides.
- B. Lvs. nearly equally stomatiferous on all 4 sides, in cross-section about as high as broad or higher than broad.
- C. Brts. glabrous (sometimes pubescent in No. 7 and in a var. of No. 15).
- D. Lvs. at least of the upper ranks more or less pointing forward.
- E. Winter-buds resinous; lvs. radially arranged.
- F. Brts. gray, pendulous; lvs. 2-4 cm. long.....1. *P. Smithiana*
- FF. Brts. yellowish to brown; lvs. 1-2 cm. long.....6. *P. asperata*
- EE. Winter-buds not resinous.
- F. Lvs. radially arranged, 2-3.5 cm. long; brts. gray.....2. *P. Schrenkiana*
- FF. Lvs. more or less pectinate below and imbricate above, 1-2.5 cm. long.
- G. Winter-buds pointed, acute or acutish; lvs. acute: cones 4-15 cm. long.
- H. Brts. gray or whitish, with scarcely raised petioles.....3. *P. Wilsonii*
- HH. Brts. usually reddish or yellowish, with prominent petioles.....7. *P. Abies*
- GG. Winter-buds obtuse: lvs. usually glaucous, obtusish or acutish: cones 3.5-5 cm. long.....15. *P. glauca*
- DD. Lvs. more or less radially spreading at nearly right angles.
- E. Winter-buds very resinous: lvs. 8-15 mm. long.....4. *P. Maximowiczii*
- EE. Winter-buds not or slightly resinous: lvs. up to 2.5 cm. long.
- F. Bud-scales firmly appressed, dark brown; lvs. in cross-section higher than broad.....5. *P. polita*
- FF. Bud-scales revolute at apex, light yellow-brown: lvs. as high as broad: cone with loosely appressed scales.....17. *P. pungens*
- CC. Brts. pubescent (leading shoot glabrous in No. 10).
- D. Terminal winter-buds without subulate scales at base.
- E. Brts. yellowish to grayish.
- F. Lvs. 1-1.8 cm. long, spreading: cone 6-12 cm. long, with obovate entire stiff scales.....6. *P. asperata*
- FF. Lvs. 1.5-2.5 cm. long, often glaucous, pointing forward, cone 3.5-7 cm. long, with rhombic erose flexible scales.....18. *P. Engelmannii*
- EE. Brts. brown: lvs. dark green: cone-scales entire, stiff.
- F. Lvs. pointed, 8-20 mm. long, spreading.
- G. Leading shoot glabrous or nearly so: lvs. with more numerous stomata above than beneath.....10. *P. Koyamai*
- GG. Leading shoot like other brts. pubescent: lvs. equally stomatiferous on all sides.....8. *P. obovata*
- FF. Lvs. obtuse, 6-12 mm. long, more or less appressed, dark green, very lustrous.....9. *P. orientalis*
- DD. Terminal winter-bud with a ring of conspicuous subulate scales at base: lvs. often with more stomata above than beneath: cones 1.5-3 cm. long.
- E. Lvs. lustrous green: cones green when young, falling soon after maturity.....13. *P. rubens*
- EE. Lvs. glaucous or dull bluish green: cones purple when young, persisting for several years.....14. *P. mariana*
- BB. Lvs. in cross-section broader than high, with at least twice as many stomatic lines above as below (see also Nos. 13, 14).
- C. Lvs. with about twice as many stomata above as below, slightly compressed: brts. at least partly glabrous.
- D. Leading shoot glabrous, the lateral brts. pubescent: lvs. 1-1.5 cm. long.....10. *P. Koyamai*
- DD. Leading shoot pubescent, lateral brts. glabrous: lvs. 1-2 cm. long.....11. *P. bicolor*
- CC. Lvs. with only 1-2, rarely 3-4, often broken rows of stomata on each side beneath, with conspicuous stomatic bands above, compressed.
- D. Brts. reddish brown, pubescent: cone-scales orbicular, stiff.....12. *P. Glehnii*
- DD. Brts. yellow or grayish: cone-scales rhombic, thin, denticulate.....18. *P. likiangensis*

AA. Lvs. flattened, with white bands above and without or occasionally with only a broken row of stomata beneath (see also *P. purpurea* under No. 19).

B. Lvs. not radially spreading, more or less pectinate below: brts. short, not or slightly pendent.

C. Brts. glabrous: cone-scales flexible, thin, erose-denticulate.

D. Lvs. not pungent, though often pointed, 1-2 cm. long.....19. *P. jezoensis*

DD. Lvs. pungent, 1.5-2.5 cm. long.....20. *P. sitchensis*

CC. Brts. pubescent or the leading shoots glabrous: cone-scales stiff, appressed before maturity.

D. Brts. yellow to orange-brown, the leading shoots usually glabrescent: winter-buds dark brown, without subulate scales at base: lvs. above usually without distinct green midrib.....21. *P. brachytyla*

DD. Brts. brown, all pubescent: winter-buds with subulate scales at base: lvs. above with distinct green midrib.....22. *P. Omorika*

BB. Lvs. more or less radially spreading: brts. long and pendulous.

C. Brts. pubescent: lvs. obtuse or obtusish.....23. *P. Breweriana*

CC. Brts. glabrous: lvs. pungent.....24. *P. spinulosa*

Sect. I. *EUPICEA* Willk. Lvs. quadrangular, stomatiferous on all 4 sides: cone-scales firm, closely appressed before maturity, usually entire and rounded at apex. (Sect. *Morinda* Mayr.)

1. *P. Smithiana* Boiss. HIMALAYAN S. Tree to 50 m., with spreading brs. and pendulous glabrous gray and lustrous brts.; buds to 8 mm. long, ovoid, acute, dark-colored: lvs. radially spreading, slender, 2-4 cm. long, acute, straight or incurved, usually higher than broad, bright or dark green: cones cylindric, 12-18 cm. long, lustrous brown, green at first; scales broad-obovate, rounded and entire at apex. P.I.39(c,h). G.C.35:325;38:395. F.E.16:705(h). H.E.6:t.345(h). (*P. Morinda* Link, *P. Khutrow* Mast.) Himal. Intr. 1818. Zone VI.—Handsome tree of broad-pyramidal habit with pendulous brts.

2. *P. Schrenkiana* Fisch. & Mey. Tree to 35 m. or more, with pendulous brts.: buds subglobose, the terminal one with acuminate, keeled pubescent scales at base: brts. glabrous, gray: lvs. nearly radially arranged, pointing forward, 2-3.5 cm. long, or on young plants often slightly shorter, finely pointed, straight or curved, dull green: cones cylindric-oblong, 7-10 cm. long; scales obovate, rounded and entire at apex. C.B.2:48. M.D.1910:227,229(h). (*P. obovata* var. *S. Mast.*) C. Asia. Intr. 1877. Zone V.

3. *P. Wilsónii* Mast. Pyramidal tree to 25 m., with short spreading brs.; buds ovoid, brown, lustrous, not resinous; brts. glabrous, pale or whitish gray, with scarcely raised lf.-stalks: lvs. slender, 1-2 cm. long, scarcely 1 mm. broad, acute or acuminate, dark green: cones cylindric-oblong, 4-6 cm. long, brown; scales suborbicular or broad-obovate, entire. G.C.33:133. C.B.N.t.66. Gn.88:167(h). (*P. Watsoniana* Mast.) C. and W. China. Intr. 1901. Zone V. Handsome spruce of dense habit with slender brts.

4. *P. Maximowiczii* Reg. Tree to 25 m., occasionally to 40 m., with horizontal brs. ascending at the ends: buds 3-4 mm. long, resinous, with firmly appressed scales; brts. glabrous, yellowish or reddish brown: lvs. spreading, rigid, 8-15 mm. long, acute, dark green: cones oblong, 3-6 cm. long, lustrous brown, green before maturity; scales rounded, entire. G.C.58:99,118-27. W.C.21,22(h). (*P. excelsa* var. *obovata japonica* Beiss., *P. Tschonoskii* Mayr.) Japan. Intr. 1865. Zone IV. In cult. usually a small bushy tree, without particular ornamental merit.

5. *P. polita* (Sieb. & Zucc.) Carr. TIGERTAIL S. Tree to 30 or occasionally to 40 m., with slender brs. of moderate length; bark gray, rough; buds dark brown, acute, 6-10 mm. long, their scales long persistent as blackish sheath at base of brts.; brts. stout, pale yellow, glabrous: lvs. radially spreading, rigid, 1.5-2 cm. long, spiny pointed, often curved, lustrous dark green: cones oblong, 8-10 cm. long, brown, yellowish green before maturity; scales broad, rounded, irregularly denticulate. S.Z.2:t.111(c). S.I.2:t.2(c). G.C.III.21:251. W.C.t.19,20(h). (*P. Torano* Koehne, *P. Thunbergii* Aschers. & Graebn.) Japan.

Intr. 1861. Zone V.—Very distinct tree with rigid spiny lvs. and conspicuous winter-buds.

6. *P. asperata* Mast. Tree to 25 m.; bark grayish brown, peeling off in thin flakes; buds ovoid or conical, yellowish brown; brts. yellowish, pubescent or sometimes glabrous, with spreading petioles: lvs. 1–1.8 cm. long, acute, often curved: cones cylindric-oblong, 8–10 cm. long, fawn-gray, finally chestnut-brown; scales obovate, rounded and entire at apex. C.C.17. C.B.N.t.62. Gn.88:166(h). S.N.32,208(h). W. China. Intr. 1910. Zone V. The most vigorous of the Chinese spruces; similar in general appearance to the Norway S.—*P. a. notabilis* Rehd. & Wils., var. Lvs. 1.2–2 cm. long: cones 9–12 cm. long, with rhombic-obovate scales narrowed toward the apex.—*P. a. ponderosa* Rehd. & Wils., var. Bark thicker; brts. nearly glabrous: cones 12–15 cm. long.—*P. a. heterolepis* (Rehd. & Wils.) Cheng, var. Brts. reddish or yellowish brown: lvs. bluish green, often glaucescent: cone-scales rhombic-ovate, the lower ones deeply emarginate. (*P. h.* Rehd. & Wils.) W. China. Intr. 1910.

Closely related species: *P. aurantiaca* Mast. Brts. yellow, changing to orange, glabrous, often slightly bloomy: lvs. sharply pointed, pectinately arranged below: cone-scales slightly erose. W. China. Intr. 1908. Zone V.—*P. Meyeri* Rehd. & Wils. Brts. yellowish or light brown, pubescent, rarely nearly glabrous (a brt. may be densely pubescent one year and its continuation nearly glabrous the next year); lvs. obtusish, bluish green, often curved. N. China. Intr. 1910. Zone V.—*P. retroflexa* Mast. Tree to 45 m.; bark gray, peeling off in thin flakes; brts. yellow, glabrous or nearly so: lvs. 1–2.5 cm. long, abruptly acuminate and pungent: cone-scales broadly rhombic to rounded. W. China. Intr. 1911. Zone V.

7. *P. Abies* (L.) Karst. NORWAY S. Tree to 50 m., with spreading brs. and usually pendent brts.; bark reddish brown; buds reddish or light brown, without resin, scales often with spreading tips, the terminal bud with a few acuminate keeled pubescent scales at base: brts. usually brown, glabrous or minutely pubescent: lvs. 1–2, rarely to 2.5 cm. long, acute, dark green and usually lustrous: cones pendulous, cylindric, 10–15 cm. long, light brown, purple or green before maturity; scales thin, rhombic-ovate, with a truncate, erose-denticulate or emarginate apex. H.W.1:54–61,t.1(c). F.E.15:t.50(h). S.N.15(h). (*P. excelsa* Link, *P. rubra* A. Dietr., *Pinus Abies* L., *P. Picea* Du Roi.) N. and C. Eu. Long cult.; occasionally escaped in E. N. Am. Zone II.—Early intr. to Am. and much planted as an ornamental tree and also for shelters and wind-breaks. It is a rapidly growing pyramidal tree of graceful habit with dark green foliage, but like other spruces and firs it loses much of its beauty when growing older.—The typical form distinguished as *P. A. erythrocarpa* (Purkyne) Rehd., f., has the cones violet-purple before maturity and the lvs. usually spreading, while *P. A. chlorocarpa* (Purkyne) Th. Fries has the young cones green and the lvs. usually more or less appressed and obtusish and leaf later. Another spontaneous form is *P. A. nigra* (Loud.) Th. Fries (*P. excelsa* var. *n.* Willk.), a densely branched pyramidal tree with crowded falcate obtusish and dark green lvs.—A large number of garden forms is in cult.

Forms differing in color of lvs.: *P. A. argentea* (Berg) Rehd., f. Lvs. variegated with white. (*P. exc. variegata* Beiss.)—*P. A. argenteo-spica* (Beiss.) Rehd., f. Tips of young brts. white. S.N.221,223.—*P. A. finedonensis* (Gord.) Nash, var. Lvs. pale yellow at first, changing to bronzy-brown and finally to green. (*P. exc. f.* Beiss.)

Columnar and narrow-pyramidal forms: *P. A. pyramidata* (Carr.) Rehd., f. Brs. ascending at an acute angle, the lower ones long, decreasing toward the

apex, forming a narrow slender pyramid. Gt.74:340(h). S.N.120(h). (*P. exc. f. pyramidalis* Voss.)—*P. A. cuprèssina* (Thomas) Rehd., f. Tree with ascending densely ramified brs. forming a dense broad column. M.D.1909:t. 8(h).—*P. A. columnàris* (Jacques) Rehd., f. With very short horizontal or slightly pendulous much ramified brs. forming a narrow column. Conwentz, Beob. Waldb. Westpreuss. t.3(h). (*P. exc. c. Carr.*)

Pendulous or sparingly branched forms: *P. A. pèndula* (Jacq. & Herincq) Nash, var. With pendulous brs. and brts. Gt.52:434(h).—*P. A. invèrsa* (Beiss.) Nash, var. Similar to the preceding, with the brs. densely ramified and more closely appressed to the stem: lvs. thickish and lustrous. G.C.29:363(h). F.E.22:765(h). S.N.211(h).—*P. A. viminalis* (Alstroem) Th. Fries. Brs. almost horizontal in remote whorls with very long and slender brts. often to 3 m. long. H.W.1:64(h). S.N.218(h).—*P. A. virgàta* (Jacques) Th. Fries. Sparingly branched, with much elongated straight or curved brs. destitute of brts., usually the upper ones ascending, the lower pendent. R.H.1854:102(h). M.G.9:31(h). (*P. exc. var. v. Casp.*, *P. exc. Cranstoni* Carr.)—*P. A. mon-stròsa* (Loud.) Rehd., var. A form destitute of all brs., consisting of a single thick stem clothed with thick rigid lvs. Zeitschr. Forst. Jagdwes. 25:228(h). (*P. exc. m. Schroet.*, *P. exc. monocaulis* Noerdl.)

Dwarf forms: *P. A. cònica* (Endl.) Th. Fries. Dense conical form with ascending brs. and light brown slender brts.: lvs. radially spreading, thin and pointed. (*P. exc. c. Carr.*)—*P. A. èlegans* (Forbes) Rehd., f. Slender conical form similar to the preceding with very short crowded brts. densely clothed with short pointed laterally compressed lvs. (*P. exc. e. Beiss.*)—*P. A. Remóntii* (R. Smith) Rehd., f. Dense pyramidal or ovoid form with short crowded light yellow brts. and radially spreading fine light green lvs. F.E.16:491(h). M.G.21:556(h). (*P. exc. R. Beiss.*)—*P. A. pygmaea* (Loud.) Rehd., f. Dense small pyramidal form with ascending brs. and bright green lvs. (*P. exc. p. Carr.*)—*P. A. Bárryi* (Beiss.) Nash, var. Conical form with thick brs. and rather distant short brts. S.N.47(h). (*P. exc. B. Beiss.*)—*P. A. Ellwangeriàna* (Beiss.) Rehd., f. Broad-pyramidal form with crowded slender brts. and small slender acute lvs.—*P. A. mucronàta* (Loud.) Rehd., f. Broad-pyramidal shrub, with ascending or sometimes spreading brs., stout reddish yellow brts. and rather distant dark green pungent lvs. 0.8–2 cm. long. (*P. exc. m. Carr.*)—*P. A. nàna* (Carr.) Schroet., l. Conical or subglobose form with short crowded ascending brs. and orange-yellow brts. partly swollen and irregular: lvs. stiff, appressed, about 1 cm. long and abruptly pointed. H.D.117,t.(h).—*P. A. parvifórmis* (Maxwell) Rehd., f. Broad-pyramidal form with slender regularly arranged brts. and crowded very short, acute, bright green lvs. (*P. exc. p. Beiss.*)—*P. A. microspérma* (Hornibr.) Rehd., var. Dense conical or subglobose form with crowded ascending brs. and gray-brown brts.: lvs. bright green, close-set and pointing forward, thick, slightly curved and bluntly pointed. B.E.t.34(h). H.D.116,t.(h).—*P. A. compácta* (Kirchn.) Nash, var. Subglobose dense form with slender brts. and acute lvs. F.E.16:t.65(h).—*P. A. Clanbrasilàna* (Loud.) Th. Fries. Compact, subglobose, rather flat-topped bush, rarely exceeding 2 m. with very short crowded thin whitish brts.: lvs. nearly radiate and pointing forward or pectinate beneath, thin, 4–8 mm. long, slender-pointed, lustrous bright green. H.D.90,t.(h). (*P. exc. C. Carr.*)—*P. A. Gregoryàna* (Gord.) Nash, var. Dwarf subglobose or conical form, rarely exceeding 75 cm. in height, with short crowded spreading brs. and very crowded thin whitish to gray-brown brts. slightly pubescent in the grooves: lvs. radially arranged, 6–12 mm. long, gray-green. (*P. exc. G.*

Beiss.)—**P. A. Veitchii** (Hornibr.) Rehd., var. Similar to the preceding, but less compact and more conical, with longer brts. inclined to droop: lvs. of lateral brts. thinner and flatter and pectinate beneath. H.D.98,t.(h). B.E.t. 34(h, as var. *Clanbrasiliana*).—**P. A. Parsónsii** (Hornibr.) Rehd., f. Similar to var. *Gregoryana*, but of looser more straggling habit, with spreading brs. and pendulous brts.: lvs. thinner and flatter, more distant, pectinate below on most brts. H.D.99,t.(h). (*P. exc. Gregoryana* f. *P. Hornibr.*)—**P. A. Mérkii** (Beiss.) Rehd., f. Dense low roundish form with rather fine yellowish white brts., and very thin, lustrous grass-green lvs. pectinate below. (*P. exc. M. Ohlendorff.*)—**P. A. pumila** (R. Smith) Voss, f. Dwarf and dense, depressed-globose form with red-brown thick and stiff brts. and thin lvs. tapering to a blunt point, either dark green (*P. A. f. pumila nigra* Voss, *P. exc. p. n.* Beiss.), or bluish green (*P. A. f. pumila glauca* Voss, *P. exc. pumila glauca* Beiss.) S.N.43,219(h).—**P. A. Maxwellii** (R. Smith) Nash, var. Low dense flat form, the brs. often with fascicled short brts.: lvs. bright green, radially arranged, rigid, finely pointed. H.D.103,t.(h). (*P. exc. M. Beiss.*)—**P. A. procumbens** (A. Murray) Rehd., f. Prostrate form with horizontal brs. and numerous short bright yellow brs. and pointed yellow-green thin lvs. (*P. exc. p. Carr.*, var. *prostrata* Schneid.)—**P. A. tabuliformis** (Carr.) Th. Fries. Prostrate form with slender horizontally spreading brs. and rather distant yellow-brown brts.: lvs. very thin, yellow-green, blunt.

8. **P. obovata** Ledeb. SIBERIAN S. Tree to 30 or occasionally to 50 m., similar to *P. Abies*; buds conical, not resinous, with closely appressed scales, the terminal buds with keeled, acuminate, ciliate scales at base; brts. brown, minutely pubescent: lvs. 1-1.8 cm. long, acute, slightly higher than broad in cross-section, deep green: cones cylindric-ovoid, 6-8 cm. long, brown, purple before maturity; scales obovate, with thin rounded and entire margin or slightly produced and sometimes emarginate. C.B.2:42 (*P. Abies* var. *o.* (Ledeb.) Voss). N. Eu. to Kamchatka and Manch. Intr. about 1852? Zone II. A smaller, more graceful tree than the Norway Spruce.—**P. o. fénica** (Reg.) Henry, var. Lvs. dark green: cone-scales rounded, finely denticulate. (*P. exc. var. médiocrima* Willk.) N. Eu.—**P. o. alpestris** (Bruegger) Henry, var. Slow growing compact tree; brts. densely short-pubescent: lvs. obtuse or acutish, 1-1.5 cm. long, bluish or grayish green: cones 8-12 cm. long. Swiss Alps, at high altitudes. Resembles somewhat *P. glauca*.

9. **P. orientalis** (L.) Link. ORIENTAL S. Tree to 40 or occasionally to 60 m., with ascending or spreading brs. and slightly pendulous brts.; bark brown, scaly; buds acute, brown, not resinous, the terminal buds with a few keeled acuminate scales at base; brts. pale brown, short-pubescent: lv. stout, straight, 6-10 mm. long, obtuse, lustrous dark green, crowded and appressed to the brt.: cones cylindric-ovoid, 6-9 cm. long, brown, violet before maturity; scales obovate, rounded and entire. P.I.41(c,h). G.C.III.3:754. S.N.16(h). C.L. 11:311(h). Cauc., Asia Minor. Intr. 1837. Zone IV. Graceful compact tree with dark glossy foliage; of slow growth.—**P. o. aureo-spicata** Beiss. Young lvs. yellow, changing later to green.—**P. o. aurea** Hesse. Lvs. bronzy-golden.—**P. o. nana** Carr. Low broad-pyramidal form, with the lower brs. horizontal and wide-spreading.

10. **P. Koyamài** Shiras. Narrow-pyramidal tree to 20 m.; bark grayish brown, scaly; buds conical, brown, resinous; brts. reddish brown and slightly bloomy, the lateral ones glandular-pubescent, the primary nearly glabrous: lvs. slightly compressed, 8-12 mm. long, acute or obtuse, straight or curved, with 2 white bands above each with 5-8 rows of stomata, those below with

2-4 rows and inconspicuous: cones cylindric-oblong, 4-10 cm. long, pale brown, green before maturity; scales broad, rounded, denticulate, very firm. G.C.58:98. C.B.N.t.63. W.C.t.23(h). S.N.207(h). (*P. koraiensis* Nakai, *P. moramomi* Hort.) Japan, Korea. Intr. 1914. Zone IV.

11. *P. bicolor* (Maxim.) Mayr. ALCOCK S. Broad-pyramidal tree to 25 m.; bark pale gray to gray-brown, fissured into thin flakes: buds ovoid or conical, brown, slightly resinous; brts. lustrous, yellow or reddish brown, the lateral shoots glabrous, the primary ones hairy: lvs. slightly compressed, 1-2 cm. long, acuminate, dark green, the stomatic bands above each with 5-6 rows, those below with 2 rows of stomata: cones cylindric-oblong, 6-12 cm. long, brownish, purple before maturity; scales obovate, rounded or somewhat narrowed at apex, slightly denticulate. S.I.1:19(c). G.C.II.13:212. S.N.14(h). W.C.t.19,20(h). (*P. Alcockiana* Carr.) Japan. Intr. 1861. Zone IV.—*P. b. aciculâris* Shiras. & Koyama, var. Brts. finely pubescent: lvs. curved: cone-scales entire. G.C.58:98. Cult. 1923.—*P. b. refléxa* Shiras. & Koyama, var. Brts. pubescent: lvs. curved, 1-1.5 cm. long: cone-scales nearly entire, slightly attenuate and recurved at apex. G.C.58:98. Cult. 1923.

12. *P. Gléhnnii* (Fr. Schmidt) Mast. SAGHALIN S. Tree to 40 m., with slender short brs.; bark red-brown, fissured into thin flakes; buds ovoid or conical, resinous, chestnut-brown, the terminal buds with subulate scales at base; brts. reddish brown, densely short-pubescent: lvs. slightly compressed, 6-12 mm. long, obtuse or on young plants pointed, deep green, with 2 bands of stomata above and 1 or 2 broken lines on each side below: cones cylindric-oblong, 5-8 cm. long, lustrous brown, violet, rarely green before maturity; scales suborbicular, rounded or slightly produced in the middle, entire or slightly erose. B.M.9020(c). K.M.t.5(c). W.C.25,26(h). Saghalin, Japan. Intr. before 1891. Zone III. Handsome narrow-pyramidal tree.

*P. G. × jezoensis hondoensis*; see under No. 19.

13. *P. rubens* Sarg. RED S. Tree to 30 m., with short and slender brs. forming a narrow-pyramidal head; bark red-brown, fissured; buds ovoid, acute, the terminal buds with pubescent subulate scales at base; brts. brown, pubescent: lvs. 1-1.5 cm. long, acute and mucronulate, lustrous dark or bright green, with about 6 stomatic lines above and 3 below: cone oblong, 3-4 cm. long, reddish brown, green or purplish green before maturity: scales obovate, rounded and entire or slightly denticulate at margin, rigid. S.S.12:t.597. B.M. 9446(c). P.I.44(c,h). Am. For. 22:705(h). (*P. rubra* (Dur.) Link, not A. Dietr., *P. australis* Small.) N. S. to the high peaks of N. C. Intr. before 1750. Zone II. A handsome tree of narrow-pyramidal habit, requiring a cool and moist climate.—*P. r. virgâta* (Rehd.) Fern. & Weatherby, f. Sparingly branched form with long brs. nearly destitute of brts. G.F.8:45(h).

14. *P. mariâna* (Mill.) B.S.P. BLACK S. Tree to 18 or occasionally to 30 m., with slender often pendulous brs. forming a narrow, often irregular head; bark, brts. and buds similar to *P. rubens*: lvs. 6-18 mm. long, obtusish, dull dark or bluish green, with the stomatic bands broader above than below: cones ovoid, 2-3.5 cm. long, dull grayish brown, dark purple before maturity; scales rigid, rounded and finely denticulate at the margin. S.S.12:t.596. P.I.43(c,h). Bot. Gaz. 55:452(h). (*P. nigra* (Ait.) Link, *P. brevifolia* Peck.) Lab. to Alaska, s. to Wisc. and Mich. and in the mts. to Va. Intr. 1700. Zone II. Usually a small tree of thin habit, but the following vars. are more ornamental.—*P. m. Douméti* (Carr.) Schneid., var. Dense conical form with ascending crowded brs.—*P. m. Beissneri* Rehd., var. Similar to the preceding, but broader at the base and the lvs. of lighter bluish green. G.C.III.11:80(h).

B.H.263(h). (*P. nigra Mariana* Beiss., *P. m.* var. *Beissneriana* Rehd.)—*P. m. fastigiata* (Carr.) Rehd., f. Columnar form with ascending brs. and short acute lvs. (*P. m. pumila* (Knight & Perry) Sudw.)—*P. m. ericoides* (Mast.) Rehd., f. Conical slow-growing form with very slender brts., the leading shoot glabrescent: lvs. very thin, blue-green and finely pointed. (*P. e.* Mast.) *P. m.* × *jezoensis*; see under No. 25.

15. *P. glauca* (Moench) Voss. WHITE S. Tree to 30 m., with ascending brs. and usually pendent brts.; bark grayish, scaly; buds ovoid, obtuse, with glabrous loosely imbricated scales rounded and bifid at apex; brts. glabrous, grayish or pale brown: lvs. 8–18 mm. long, acute or acutish, slightly curved, more less bluish green, of strong disagreeable odor when bruised: cones cylindric-oblong, 3.5–5 cm. long, pale brown and glossy, green before maturity; scales suborbicular, with rounded and entire margin, thin and flexible; bracts spatulate, rounded at apex. S.S.12:t.598. P.I.42(c,h). F.E.29:81(h). S.N. 40(h). (*P. canadensis* (L.) B.S.P., not Link, *P. alba* Link.) Lab. to Alaska, s. to Mont., Minn. and N. Y. Intr. 1700. Zone II. Dense pyramidal tree with light bluish green lvs.—*P. g. coerulea* (Nels.) Rehd., f. Of dense habit and with glaucous lvs. (*P. alba c.* Carr.)—*P. g. aurea* (Nels.) Rehd., f. With yellow lvs. (*P. alba a.* Beiss.)—*P. g. nana* (Jacques) Rehd., f. Dwarf dense form to 2 m. high, with ascending brs. and brts.: lvs. shorter, mostly radially spreading. (*P. alba nana* Carr.)—*P. g. parva* (Victorin) Fernald & Weatherby, f. Low depressed form with horizontally spreading brs.: lvs. crowded. G.W.38:206(h). (*P. g. f. tabuliformis* Slavín, *P. g. f. procumbens* F. Mey.)—*P. g. densata* Bailey, var. BLACK HILLS SPRUCE. Slow growing compact tree: lvs. bright to bluish green. S. Dak. Cult. 1920.—*P. g. albertiana* (S. Br.) Sarg., var. Tree to 50 m., of narrow pyramidal habit; buds with entire scales, slightly resinous; brts. with more prominent lf.-stalks; cones shorter, with stiffer scales; bracts shorter, narrowed at apex or acute. B.T.58. M.G.20: 117(h). S.N.206(h). (*P. a.* S. Br., *P. alba a.* Beiss., *Abies arctica* A. Murr.) Alaska and B. C. to Mont. Intr. 1904.—*P. g. conica* Rehd., f. Dwarf form of the preceding var., of dense narrow-conical habit, with very thin, radially spreading lvs. G.C.75:107(h). B.C.C.t.27(h). N.H.17:217(h).

SECT. II. CASICTA MAYR. Lvs. quadrangular and with stomata above and below, or compressed and beneath without or with fewer lines of stomata than above: cone-scales loosely appressed before maturity, at maturity thin and flexible, usually rhombic, with erose and wavy margin.

16. *P. Engelmanni* (Parry) Engelm. ENGELMANN S. Tree to 50 m., with slender, spreading brs. in close whorls; bud brownish yellow, its scales usually revolute at apex; brts. pale brownish yellow, minutely glandular-pubescent: lvs. slender, 1.5–2.5 cm. long, acute, straight or slightly curved, usually bluish green, without resin-ducts, of disagreeable odor when bruised: cones cylindric-oblong, 3.5–7.5 cm. long, light brown, green and tinged with red before maturity; scales rhombic-oblong, narrowed and usually truncate at the erose apex. S.S.12:t.599. P.I.46(c,h). B.E.t.38(h). (*P. columbiana* Lemm.) B. C. and Alb. to Ore., Ariz. and N. Mex. Intr. 1862. Zone II. Desirable tree of dense pyramidal habit.—*P. E. glauca* (R. Sm.) Beiss. Lvs. glaucous.—*P. E. argentea* Beiss., var. Lvs. silvery gray: M.G.21:557(h).—*P. E. Fendleri* Henry, var. Brts. pendulous: lvs. slender, to 2.8 cm. long, with 2 bands of 4 rows of stomata above and half as many beneath.—*P. E. microphylla* Fitschen, var. Dwarf globose form with shorter lvs.

17. *P. pungens* Engelm. COLORADO S. Tree to 30 or occasionally to 50 m., with horizontal stout brs. in rather remote whorls; buds with brownish yellow

usually reflexed scales; brts. glabrous, bright yellowish brown: lvs. rigid, 2-3 cm. long, spiny pointed, incurved, bluish green, rarely dull green: cones cylindric-oblong, 6-10 cm. long, light brown; scales thin, flexible, rhombic-oblong, narrowed and erose at apex. S.S.12:t.600. B.E.283,t.38(h). Gng.7:49(h). (*P. Parryana* Sarg., *Abies Menziesii* Engelm., not Lindl.) Colo. to N. Mex., Utah and Wyo. Intr. 1862. Zone II. Favorite tree for planting on lawns, particularly in its bluish and silvery white forms; for dry climates perhaps the best of all spruces.—*P. p. viridis* Reg., var. Lvs. green. (*P. commutata* Hort., not A. Murr.)—*P. p. glauca* Reg., var. Lvs. bluish green. Gn.63:280(h). Gn.M.2:26(h).—*P. p. coerulea* Beiss. Lvs. bluish white. G.W.1:357(h).—*P. p. argentea* Rosenthal. Lvs. silvery white. Gt.53:493. M.G.16:178(h). (*P. p. Kosteri* Beiss., var. *Kosteriana* Hort.)—*P. p. Kosteriana* Henry, var. With pendulous brs. and bluish lvs. (*P. p. glauca pendula* Beiss.)—*P. p. compacta* Rehd., f. Dwarf compact rather flat-topped form with the brs. in almost horizontal layers and with rigid dark green lvs. H.D.128,t(h). Gn.M.32:39(h).—*P. p. Hunnewelliana* Hornibr., var. Dwarf form of dense pyramidal habit, with rather slender flexible lvs. 1.5-2 cm. long.

18. *P. likiangensis* (Franch.) Pritz. Tree to 30 m. with horizontal brs.; bark gray, deeply furrowed; brts. pale yellow to brownish yellow or orange, more or less pubescent, rarely glabrous, with spreading yellow lf.-stalks about 1 mm. long; buds conic-ovoid, acute, resinous: lvs. compressed, 8-15 mm. long, acute or obtuse, with 2 white bands above, green beneath with bands of 1 or 2, rarely 3-4 broken rows of stomata; cones cylindric-oblong, 5-8 cm. long; scales rhombic-ovate to rhombic-oblong, thin, acutish or truncate at apex, erose and undulate at the margin. D.J.335. C.B.N.t.64. J.L.49:t.7(h). W. China. Cult. 1910. Zone (V).—*P. l. Balfouriana* (Rehd. & Wils.) Cheng, var. Brts. densely villous: lvs. usually obtuse: cones violet-purple when young; scales narrowly rhombic-ovate. Gn.88:124(h). (*P. B. Rehd. & Wils.*) W. China. Intr. 1910.

Closely related species: *P. purpurea* Mast. Tree to 30 m.; bark fissured into thin scaly flakes; brts. pale yellow-gray, densely pubescent: lvs. 5-12 mm. long, obtuse, much compressed, with 1-2 broken lines beneath or without: cones violet purple, 4-6 cm. long; scales rhombic-oblong. C.B.N.t.65. D.J.336. (*P. likiangensis* var. *p.* Dallim. & Jacks.) W. China. Intr. 1910. Zone (V).—*P. montigena* Mast. Tree to 30 m.; brts. pubescent: lvs. 8-15 mm. long, obtuse or acutish, beneath with inconspicuous bands of 2-3 rows of stomata each, bluish green: cones cinnamon-brown; scales rhombic-obovate, rounded at apex, slightly erose, not undulate. G.C.39:146 (excl. cones). W. China. Intr. 1908. Zone (V).

19. *P. jezoensis* (Sieb. & Zucc.) Carr. YEDDO S. Tree to 50 m., with spreading slender brs.; bark gray, scaly, deeply fissured on old trees; buds conical, lustrous, resinous; brts. glabrous, lustrous, yellowish brown or greenish yellow, with slightly swollen pulvini and recurved petioles: lvs. compressed, 1-2 cm. long, acute, slightly curved, slightly keeled on both sides, with white bands above, dark green and lustrous beneath: cones cylindric-oblong, 4-7.5 cm. long, light brown, green tinged with brown before maturity; scales rhombic-oblong, erose and denticulate. S.I.2:t.3(c). K.M.t.6(c). G.C.III.3:53. W.C.27:t.28,29(h). (*P. ajanensis* Fisch., *Abies Alcockiana* Veitch, partly.) Manch., Saghalin, N. Japan. Intr. 1878. Zone IV.—The typical form is not doing well in the E. States and suffers often from late frosts owing to early leafing; the var. is more satisfactory.—*P. j. hondoensis* (Mayr) Rehd., var. Tree to 30 m.; brts. usually light reddish brown, with the pulvini much swollen: lvs. shorter, more obtuse, duller bluish green. B.M.6743(c). S.I.1:t.5(c). S.N.225,228(h). (*P. h. Mayr, P. ajanensis* var. *microsperma* Beiss., not Mast.) C. Japan. Intr. 1860. Zone V.

*P. j. × mariana* = *P. Möseri* Mast. Brts. glabrous, olive-brown: lvs. quadrangular, slightly compressed, glaucous above, green beneath. Orig. before 1900.—*P. j. × glauca* = *P. Saaghyi* Gayer. Winter-buds resinous: lvs. triangular, glaucous above, green beneath, about 9 mm. long, pungent, spreading. Orig. about 1917.—*P. j. hondoensis* × *Glehnii* = *P. notha* Rehd. Brts. pilose, brown: lvs. with a few stomatic lines beneath: cone-scales broader, less undulate. Orig. 1894.

20. *P. sitchénsis* (Bong.) Carr. СИТКА S. Tree to 40 or occasionally to 60 m., with slender horizontal brs. forming a broad-pyramidal tree while young; bark red-brown; buds conical, acutish, light brown, resinous; brts. glabrous, light brownish yellow: lvs. compressed, 1.5–2.5 cm. long, spiny-pointed, slightly keeled and silvery white above, rounded and lustrous bright green beneath: cones cylindric-oblong, 6–10 cm. long, pale yellowish or reddish brown: scales rhombic-oblong, rounded and erose at apex. S.S.12:t.602. G.C. II:25:728,729. S.N.229(h). (*Abies Menziesii* Lindl., ? *P. falcata* (Raf.) Suring.—TIDELAND S.) Alaska to Calif. Intr. 1831. Zone VI. Highly ornamental tree with handsome foliage, but it demands a cool humid climate and is not satisfactory in the E. States.—*P. s. speciosa* Beiss. Of compact habit and slower growth with more ascending brs. and shorter more rigid lvs.

Sect. III. OMORICA Willk. Lvs. compressed, with glaucous bands above, green beneath: cone-scales closely appressed before maturity, firm, broad and usually entire or nearly so at apex.

21. *P. brachýtyla* (Franch.) Pritz. Tree to 25 m., with horizontal and ascending brs. and pendulous brts; bark grayish brown, darker, deeply fissured on old trees; buds ovoid, brown, not resinous, with obtuse firmly appressed scales; brts. yellow or orange-brown, glabrous or somewhat hairy, with short petioles: lvs. compressed, pectinately arranged below, 1–2.4 cm. long, about 1–1.5 mm. broad, obtusish or acute, white above, keeled and green beneath: cones cylindric-oblong, 6–12 cm. long, dull brown, greenish before maturity; scales broadly obovate, rounded and entire at apex. (*P. pachyclada* Patschke, *P. Sargentiana* Rehd. & Wils.) C. and W. China. Intr. 1901. Zone (V). A variable spruce of which several species were described based on unstable characters.—*P. b. rhombisquamea* Stapf, f. Cone-scales narrowed toward the emarginate and erose apex. G.C.39:147 (fig. in upper right-hand corner). (*P. ascendens* Patschke.) W. China. Intr. 1910.—*P. b. complanata* (Mast.) Cheng, var. Bark pale gray, separating into thin irregular plates: lvs. 1–2.5 cm. long, sharply pointed: cones brown or purple-brown before maturity; scales truncate or rounded at apex. G.C.39:147 (excl. cone in upper right corner). B.M.8969(c) and D.J.320, as *P. brachytyla*. (*P. c.* Mast.) W. China. Intr. 1903. Zone (V).

22. *P. Omórika* (Pančić) Purkyne. SERBIAN S. Tree to 30 m., with rather short spreading and ascending brs. forming a narrow-pyramidal head; buds dark brown, not resinous, the terminal bud with long subulate scales at base; brts. brown, pubescent: lvs. compressed, 8–18 mm. long, keeled on both sides, about 2 mm. wide, obtuse and mucronulate, with 2 broad white bands above, lustrous dark green beneath: cones ovoid-oblong, 3–6 cm. long, lustrous cinnamon-brown; scales suborbicular, finely denticulate. P.I.49(c,h). G.C. III.21:153. W.A.84,t.(h). E.H.1:t.28(h). (*Pinus O.* Pančić.) S. E. Eu. Intr. about 1880. Zone IV. Desirable spruce of slow growth, forming a dense narrow pyramidal tree; hardy and very satisfactory in the E. States.

23. *P. Breweriana* S. Wats. Tree to 40 m., with spreading brs. and whip-like pendulous brts. often 2.5 m. long; buds conical, chestnut-brown; brts. reddish brown, pubescent, with long and spreading petioles: lvs. radially spreading, slightly compressed, 2–2.5 cm. long, obtuse, straight or slightly

curved, nearly flat and with white bands above, rounded and dark green below: cones cylindric-oblong, 6-12 cm. long, light orange-brown, purplish before maturity; scales obovate, entire. B.M.9543(c). S.S.12:601. G.F.3:66, 67:5:595. S.N.224(h). R.H.1922:49(h). S. Ore. and N. Calif. Intr. 1893. Zone (V). Remarkable for its whip-like brts., rare in cult.

24. *P. spinulosa* (Griff.) Henry. Tree to 60 m., with long and slender pendulous brts.; buds ovoid, obtuse, scarcely resinous; brts. glabrous, yellowish gray: lvs. imperfectly radially spreading, slender, slightly compressed, 2-3.5 cm. long, acute, pungent, keeled on both sides, with 2 glaucous bands above, green below: cones cylindric-oblong, 6-10 cm. long; scales suborbicular, entire or slightly denticulate. B.M.8169(c). G.C.39:218. S.N.222(h). (*P. morindoides* Rehd.) Himal. Intr. about 1878. Zone VII? Handsome spruce of rather loose, broad-pyramidal habit.

6. *PSEUDOLARIX* Gord. GOLDEN LARCH. Deciduous tree with horizontal whorled brs.: lvs. linear, spirally arranged and scattered on the long shoots, fasciated on the lateral spurs: fls. monoecious, terminal; staminate fls. catkin-like, slender-stalked and clustered on short spurs; female fls. solitary: cone ovoid, short-stalked, with ovate-lanceolate scales separating from the axis at maturity and with lanceolate bracts about half as long as scales; seeds 2 under each scale, with membranous wings nearly as long as the scale; cotyledons 5-6. (Greek *pseudos*, false, and *larix*.) Syn. *Laricopsis* Kent.—One species in China.

*P. amabilis* (Nels.) Rehd. Tree to 40 m., with reddish brown bark, fissured into narrow scales: lvs. linear, 3-7 cm. long, 2.5-3.5 mm. broad, acuminate, soft, light green, bluish beneath: male fls. yellow, about 6 mm. long: cones ovoid, reddish brown, 6-7.5 cm. long and 4-5 cm. across; scales cordate at base, emarginate at apex, woody; seeds about 8 mm. long. B.M.8176(c). G.C.II.19:88. Gn.29:397(h). B.E.t.39(h). (*P. Kaempferi* Gord., *P. Fortunei* Mayr, *Larix a. Nelson*, *L. Kaempferi* Carr., *Abies Kaempferi* Lindl., in part.) E. China. Intr. 1854. Zone V. Tree of broad-pyramidal habit with light green feathery foliage turning bright yellow in fall; it dislikes limestone soil.

7. *LÁRIX* Mill. LARCH. Deciduous trees with horizontal brs.; bark thick, scaly; buds small, subglobose, with imbricate scales, the inner ones accrescent: lvs. spirally arranged and remote on the long shoots, densely clustered on the lateral short spurs, linear, flattened, rarely nearly quadrangular: fls. monoecious, solitary, terminal; male fls. globose to oblong, stalked or sessile, yellow, consisting of numerous short-stalked spirally arranged anthers; female fls. subglobose, consisting of few or many 2-ovuled scales borne in the axils of larger usually scarlet bracts: cone subglobose to oblong; scales suborbicular to oblong, persistent on the axis, maturing the first year; seeds 2 under each scale, nearly triangular, with large membranous wing; cotyledons usually 6. (The ancient Latin name.) About 10 species in the cooler regions of the n. hemisphere, chiefly in the mts.; in Asia s. to the Himal.

A. Bracts conspicuous, exceeding the scales.

B. Lvs. keeled on both sides.....1. *L. Potaninii*

BB. Lvs. rounded above, keeled only below.....2. *L. occidentalis*

AA. Bracts shorter than scales, usually concealed: lvs. flat or rounded above.

B. Cone-scales recurved at apex: lvs. with 2 conspicuous white bands below.

3. *L. leptolepis*

BB. Cone-scales straight or incurved at apex: lvs. very narrow, without white bands.

C. Cone-scales puberulous or tomentulose outside, 30-50.

D. Cone-scales not incurved at apex, straight; bracts about half as long as scale.

4. *L. decidua*

- dd. Cone-scales slightly incurved at apex, longitudinally convex; bracts  $\frac{1}{2}$  as long as scale ..... 5. *L. sibirica*  
 cc. Cone-scales glabrous outside, lustrous, striate, 12-40.  
 d. Brts. usually pubescent, reddish brown or yellowish: lvs. exceeding 3 cm.: cones 1.5-3 cm. long, with 20-40 scales ..... 6. *L. Gmelini*  
 dd. Brts. glabrous, brown, often glaucous: lvs. to 3 cm. long; cones about 1.5 cm. long, with 12-15 scales ..... 7. *L. laricina*

1. *L. Potaninii* Batal. CHINESE *L.* Tree to 30 m., with gray or grayish brown bark and rather short horizontal brs.; brts. pendulous, glabrous, lustrous, orange-brown or reddish brown, the buds of similar color but darker: lvs. compressed, slender, 1.5-3 cm. long, acute, grayish green, with stomatic bands on both sides each of 1 or 2 rows: cones ovoid-oblong, 3-4.5 cm. long, at maturity violet-purple changing to grayish brown; scales suborbicular, slightly incurved, entire; bracts long-acuminate, exserted, upright, purple. G.C.39:178. I.S.t.2 S.N.196(h). (*L. chinensis* Beiss., *L. tibetica* Franch.) W. China. Intr. 1904. Zone V.

Related species: *L. Masteriana* Rehd. & Wils. Brts. pale yellowish brown, slightly pubescent when young: lvs. bright green, with 2 pale stomatic bands beneath: cone pale brown, with long acuminate purple bracts exserted and reflexed. W. China. Intr. 1908.—*L. Lyallii* Parl. Tree to 25 m., with remote long brs.; brts. stout, brown-tomentose: lvs. 4-angled, rigid, 2.5-3.5 cm. long: cones ovoid-oblong, 3.5-5 cm. long; scales pubescent, spreading at maturity and finally reflexed; bracts exserted, upright. S.S.12:t.595. S.N.(198)(h). High mts. of B. C. and Alb. to Wash. and Mont. Intr. 1904, but not successful in cult.

2. *L. occidentalis* Nutt. WESTERN *L.* Tree to 50 m., occasionally to 80 m., with short horizontal or sometimes elongated brs.; bark dark-colored, cinnamon-red on old trunks; buds dark, chestnut-brown; brts. pubescent when young, soon glabrous, orange-brown: lvs. triangular, 2.5-4 cm. long, rigid, sharply pointed, rounded above, keeled below, pale green: cones ovoid-oblong, 2.5-3.5 cm. long, with numerous suborbicular nearly entire scales tomentulose outside below the middle, spreading at maturity; bracts long-acuminate, exserted, upright. B.M.8253(c). S.S.12:t.594. M.D.1914:197,t(h). B. C. to Mont. and Ore. Intr. 1881. Zone V.

Related species: *L. Griffithii* Hook f. Tree to 20 m., with pendulous brs.; brts. dull reddish brown: lvs. flat above, obtuse: cones oblong, 7-10 cm. long; bracts lanceolate, reflexed. B.M.8181(c). G.C.41:130(h). Gn.82:445(h). (*L. Griffithiana* Carr.) Himal., S. W. China. Intr. 1848. Zone VII?

3. *L. leptolepis* (Sieb. & Zucc) Gord. JAPANESE *L.* Tree to 30 m., with short horizontal brs.; bark scaling off in narrow strips leaving red scars; brts. yellowish or reddish brown and usually bloomy, glabrous or slightly pubescent: lvs. flattened, 1.5-3.5 cm. long, rather broad, obtuse, light or bluish green, white bands below each with 5 rows of stomata: cones ovoid, 1.5-3.5 cm. long, with numerous truncate or slightly emarginate scales; bracts concealed. S.I. 1:t.2(c). W.C.t.15,16(h). (*L. Kaempferi* Sarg., not Carr., *L. japonica* Carr.) Japan. Intr. 1861. Zone IV. One of the handsomest and most rapidly growing larches.—The dwarf form of the high mts. of Japan (*L. K.* var. *minor* Sarg.) reverts under cult. to the normal form.

*L. l. × decidua* = *L. eurólepis* Henry. Differs from *L. leptolepis* chiefly in the less bloomy brts. yellow or grayish yellow the second year and the shorter and narrower lvs. with fewer rows of stomata. Proc. Irish Acad. 35B:t.11. C.B.N.51. Trans. Scott. Arb. Soc. 29:t.15(h). (*L. Henryana* Rehd., *L. hybrida* Farquhar, not Schroed.) Orig. about 1900. *L. l. × sibirica* = *L. marschlinisii* Coaz. Lvs. bluish green, to 3.5 cm. long: cones subglobose to ovoid; scales not recurved at apex. Orig. 1901.

4. *L. decidua* Mill. EUROPEAN *L.* Tree to 35 m., with a pyramidal, later often irregular head; bark dark grayish brown; brts. slender, glabrous, yellowish: lvs. flattened, 2-3 cm. long, keeled below, soft, bright green: female

fls. purple: cones ovoid, 2-3.5 cm. long, with 40-50 suborbicular scales, loosely appressed at maturity, the uppermost closing the apex; wings of seed extending to the upper margin of the scale. H.W.1:108-12,t(c). F.E.29:117(h). M.G.23:316,317(h). (*L. europaea* DC., *L. Larix* Karst.) N. and C. Eu. Long cult. Zone II.—*L. d. pëndula* (Laws.) Henk. & Hochst. With pendulous brs. Gt.20:t.684,f.5(h). G.C.III.3:430,t(h). (*L. europaea* var. *pendulina* Reg., *L. europaea* var. *p.* Laws.)—*L. d. polònica* (Racib.) Ostenf. & Syrach, var. With smaller cones resembling those of *L. sibirica*; scales more rounded and less emarginate. Poland. Cult. 1910.

5. *L. sibirica* Ledeb. SIBERIAN *L.* Tree to 40 m., with straight stem and rather short ascending brs.; brts. light yellowish gray; buds brown, at base very dark to nearly black: lvs. similar to those of the preceding species, 2.5-3.5 cm. long: female fls. usually green, sometimes whitish or brownish: cones ovoid, usually 3.5 cm. long, with about 30 scales truncate or rounded and entire at the margin, finely striate and tomentulose on the back, half-spreading at maturity; seed-wings not extending to the upper margin of the scale. Gt.20:t.684,f.1-2. G.W.18:390(h). S.N.46(h). (*L. decidua* var. *s.* Reg., var. *rossica* Henk. & Hochst.) N. E. Russia to Siberia. Intr. 1806. Zone II.

6. *L. Gmelini* (Rupr.) Litvin. DAHURIAN *L.* Tree to 30 m., with rather long horizontal brs. fairly regular on young, but usually irregular on old trees and wide-spreading; brts. yellowish or reddish, usually pubescent; buds yellowish brown, darker or nearly black at base: lvs. flattened, about 3 cm. long, bright green: cones ovoid, 2-2.5 cm. long, with about 20 scales or more, thin, truncate or emarginate; bracts rounded at apex, with inconspicuous mucro. Gt.20:t.684,f.9,10. I.S.t.2. M.D.1914:191(h). (*L. dahurica* Turcz., *L. Cajan-deri* Mayr.) E. Siberia. Intr. 1827. Zone II.—*L. G. japònica* (Reg.) Pilger, var. Young brts. bluish red, often gloomy, pubescent, sometimes pale. S.I.2: t.1(c). K.M.t.7(c). W.C.t.17,18(h). G.W.6:499(h). (*L. kurilensis* Mayr, *L. kamtschatica* Carr.) Saghalin, Kurile Isls. Intr. 1888. Zone II.—*L. G. Principis-Ruppréchtii* (Mayr) Pilger, var. Cones larger, to 3.5 cm. long, with 30-40 scales truncate at apex; bracts at least the lower ones more than half as long as the scales. Mayr, Fremdl. Wald & Parkb. 309. B.D.1923: t.21(h). N. China, Korea. Intr. 1903. Zone IV.—*L. G. olgénsis* (Henry) Ostenf. & Syrach, var. Brts. strongly pilose: lvs. 1-2 cm. long; cones larger with broader scales. (*L. olgénsis* Henry, *L. koreensis* Rafn.) E. Manch. Cult. 1920.

7. *L. laricina* (DuRoi) K. Koch. AMERICAN *L.* Tree to 20 m., with horizontal short brs. forming a narrow-pyramidal head; bark reddish brown; brts. glabrous, reddish yellow, usually bloomy, buds reddish brown: lvs. 2.5-3.5 cm. long, obtuse, light bluish green: cone globose-ovoid, 1.5-2 cm. long, with 12-15 suborbicular scales glabrous and striate outside, minutely crenulate and bevelled at the margin; bracts  $\frac{1}{4}$  as long as scale. S.S.12:t.593. Em. 106,t(c). (*L. americana* Michx., *L. microcarpa* Desf., *L. alaskensis* W. F. Wight.—TAMARACK, HACKMATACK.) Alaska and Can. s. to Minn., Ill. and Pa. Intr. 1737. Zone I.

*L. l. × decidua* = *L. pëndula* Salisb. It differs from *L. laricina* chiefly in its larger cones about 2.5 cm. long, with 20-30 scales pubescent below the middle: brts. usually pink, rarely glaucous. Lambert, Pinus t.36(c). G.C.58:178(h). (*L. americana* var. *p.* Loud.) Orig. before 1800. It has been confused with *L. laricina* and with *L. dahurica*.

8. CÉDRUS Trew. CEDAR. Tall evergreen trees with spreading irregularly arranged brs.; bark dark gray, smooth on young, fissured and scaly

on old trees; buds minute, ovoid, with few scales: lvs. spirally arranged and scattered on the long shoots, densely fascicled on the spurs, acicular, usually triangular, rigid, pointed: fls. monoecious, terminal, solitary; staminate fls. cylindric, upright, about 5 cm. long; female fls. ovoid, purplish, 1-1.5 cm. long, consisting of numerous suborbicular, 2-ovuled scales subtended by small included bracts: cone upright, ovoid to ellipsoid-oblong, with numerous closely appressed very broad scales tomentose outside, maturing the second or third year: seeds irregularly triangular, with a membranous broad wing: cotyledons 9-10. (*Kedros* is the ancient Greek name of a resinous tree.)—Four closely related species sometimes considered races of one species.

A. Leading shoot stiff, upright or spreading; brts. usually not pendulous: cones truncate, often concave at apex.

B. Brts. short-pubescent: lvs. usually less than 2.5 cm. long: cone 5-7 cm. long.

BB. Brts. glabrous or slightly pubescent: lvs. usually 2.5-3 cm. long: cone 8-10 cm. long.

AA. Leading shoot and brts. pendulous, densely pubescent: lvs. to 5 cm. long: cones rounded at apex

1. *C. atlantica*

2. *C. libani*

3. *C. deodara*

1. *C. atlantica* Manetti. ATLAS C. Tree to 40 m., with upright leading shoot: lvs. bluish green: cone 5-7 cm. long, about 4 cm. across; scales 3.5 cm. wide, light brown. C.B.1:69. D.J.t.10(h). G.F.9:417(h). B.D.1925:69,t.(h). (*C. Libani* var. *a.* Hook. f.) N. Afr. Intr. before 1840. Zone VI.—*C. A. glauca* Carr. Lvs. glaucous. G.C.76:227,t. Gg.8:275(h). Gs.1:198(h).—*C. A. argentea* Murr., var. Lvs. nearly silvery-white; scarcely different from the preceding.—*C. A. pendula* Carr. Form with pendulous brs. and brts., sometimes nearly columnar in outline. G.C.66:287(h). M.D.1932:t.54(h).—*C. A. fastigiata* Carr. Form of narrow-pyramidal or nearly columnar habit with ascending or upright brs. R.H.1890:32(h).

2. *C. libani* Loud. CEDAR OF LEBANON. Tree to 40 m., with upright or spreading leading shoot: lvs. dark or bright green: cones 8-10 cm. long, 4-6 cm. across, brown; scales about 5 cm. wide. B.C.1:71. B.E.294:t.40(h). G.F.2:149;8:335(h). G.C.34:265;71:111,233(h). (*C. libanotica* Link. *C. libanotica* (Trew) Pilger, *C. Cedrus* Huth.) Asia Minor, Syria. Intr. 1638. Zone V.—Beautiful and stately tree of characteristic appearance; also of interest for its scriptural and historical associations.—*C. l. glauca* Carr. Lvs. bluish white. (*C. Libani argentea* Gord.)—*C. l. nana* Loud., var. Dwarf compact, usually broad-pyramidal form, with thinner lvs. 1-2 cm. long.—*C. l. pendula* Carr. Brs. pendulous: lvs. slender and rather long. (*C. Libani* var. *Sargentii pendula* Hornibro.)

Closely related species: *C. brevifolia* (Hook. f.) Henry, differing chiefly in the much shorter glaucous lvs. usually 5-6 mm. long and the smaller cones, about 7 cm. long and 4 cm. wide and with a short umbo in the apical depression. B.N.328. C.B.N.t.42. R.H.1920:85(h). (*C. Libani* var. *b.* Hook. f.) Cyprus, Intr. 1881. Zone VII?

3. *C. Deodara* (Roxb.) Loud. DEODAR C. Tree to 50 m.: lvs. dark bluish green, 2.5-5 cm. long, as high as broad: cones 7-10 cm. long, 5-6 cm. across, reddish brown; scales 5-6 cm. wide, less tomentose. C.B.1:70. B.E.t.41(h). G.C.III.25:139; 34:400(h). (*C. Libani* var. *D.* Hook. f.) Himal. Intr. 1831. Zone VII? Graceful tree of pyramidal outline.—*C. D. argentea* Nelson. Lvs. bluish or silvery white.—*C. D. aurea* Nelson. Lvs. yellow. G.W.11:87(h).—*C. D. robusta* Carr. With stouter brs. and more rigid lvs. about 5 cm. long.

9. *PINUS* L. PINE. Evergreen trees with whorled spreading brs., rarely shrubby; bark furrowed or scaly; buds conspicuous, with numerous imbricated

scales: lvs. of 2 kinds, the primary lvs. spirally arranged and usually reduced to small scarious bracts bearing in their axils the acicular, semiterete or triangular secondary lvs. borne on an undeveloped brt. in clusters of from 2-5, rarely as many as 8 or reduced to 1, surrounded at base by sheaths of 8-12 bud-scales; only on young seedling plants and occasionally on shoots from the old wood the primary lvs. are subulate and green: fls. monöcious, the male fls. axillary, clustered at the base of the young shoot, catkin-like, yellow, orange or scarlet, composed of numerous spirally arranged 2-celled anthers; female fls. lateral or subterminal, consisting of numerous spirally arranged 2-ovuled scales, each subtended by a small bract: cone subglobose to cylindric, symmetrical or oblique, with woody scales closely appressed before maturity. The apex of the scales usually much thickened and the exposed part (apophysis) usually rhombic in outline, transversely keeled and in the middle usually with a prominent boss or umbo mostly terminated by a spine or prickle; in some species the apex of the scale is flat and bears the spineless umbo at the end; seeds usually with long articulate or adnate wing, rarely with short wing or wingless: cotyledons 4-15. (The ancient Latin name of the tree.) About 80 species distributed throughout the n. hemisphere from the arctic circle to Guatemala, to the W. Indies, N. Af. and the Malayan Archipelago.

The most important characters in the grouping of the species are the shape of the cone-scales and the structure of the lvs. which contain either one or 2 vascular bundles and usually 2 or more resin ducts which are either marginal (situated beneath the epidermis) or medial (enclosed by the tissue of the lf.) or internal (close to the fibrovascular bundle); in some species the lvs. have resin-ducts of 2 kinds. The fibrovascular bundles and the resin-ducts can easily be seen with a fairly strong lens in thin cross-sections made with a sharp razor from the middle of the lf. and placed on a glass plate. The shoot which develops in spring (spring-shoot) from the terminal winter-bud produces in most species only one internode with one whorl of brts. and is therefore called uninodal and bears the cones at the end of the shoot (subterminal), while in other species the spring-shoot produces 2 or more, often incomplete whorls of brts. (multinodal shoots) and bears the cones partly in the middle of the shoot (lateral); occasionally summer-shoots appear at the end of uninodal shoots and change it to an incompletely multinodal shoot.

Sheaths of lf.-clusters deciduous; base of bracts not decurrent; lvs. with 1 fibrovascular bundle.

- A. Lvs. 5 in 1 fascicle.
- B. Lvs. serrulate.
- C. Brts. pubescent or tomentose.
- D. Lvs. without conspicuous white lines on back, dark green.
- E. Brts. tomentose: cone indehiscent.
- F. Lvs. bright green: cones 9-14 cm. long, with often recurved apophyses.
  - 1. *P. koraiensis*
- FF. Lvs. dark green: cone 5-8 cm. long, with appressed apophyses. 2. *P. Cembra*
- EE. Brts. pubescent: cone dehiscent.
- F. Bark of trunk smooth: cone 5-10 cm. long, with thickened convex scales: lvs. 2-8 cm. long. .... 7. *P. parviflora*
- FF. Bark of trunk fissured: cones 12-25 cm. long, with thin appressed scales: lvs. 4-10 cm. long. .... 10. *P. monticola*
- DD. Lvs. with conspicuous white lines on back: cone 25-50 cm. long. 6. *P. Lambertiana*
- CC. Brts. glabrous or only slightly pubescent at first.
- D. Brts. bloomy: lvs. 12-20 cm. long. .... 9. *P. Griffithii*
- DD. Brts. not bloomy: lvs. 7-12 cm. long.
- E. Winter-buds cylindric, chestnut-brown: cone-scales much thickened; seed wingless. .... 5. *P. Armandi*
- EE. Winter-buds ovoid; cone-scales thin; seeds winged.
- F. Cone-scales convex, thickish: tree with ascending brs. .... 8. *P. Peuce*
- FF. Cone-scales thin, flat: trees with horizontal brs.
- G. Brts. pubescent at first: lvs. stiff: cones usually 12-25 cm. long.
  - 10. *P. monticola*
  - 11. *P. Strobus*
- GG. Brts. glabrous or slightly puberulous: lvs. slender: cones usually 5-12 cm. long
- BB. Lvs. entire: cones short-stalked.
- C. Sheaths deciduous the first year: lvs. with stomatic lines on back, rarely without, 3-7 cm. long.

- d. Cones indehiscent, 5-7 cm. long: brts. glabrous or puberulous: lvs. stout.  
3. *P. albicaulis*
- dd. Cones dehiscent, 6-25 cm. long: brts. puberulous when young: lvs. slender, 1 mm. thick  
4. *P. flexilis*
- cc. Sheaths deciduous the 2d or 3d year: lvs. without stomatic lines on back, 2-4 cm. long.  
d. Brts. dark orange-brown, puberulous: cone-scales short-mucronate.  
14. *P. Balfouriana*
- dd. Brts. light orange, glabrous or nearly so: cone-scales aristate: lvs. resin-dotted.  
15. *P. aristata*
- AA. Lvs. 1-4.  
B. Lvs. entire, 1-4, 2-5 cm. long.....12. *P. cembroides*
- BB. Lvs. serrulate, 8, 5-10 cm. long.....13. *P. Bungeana*
- Sheaths of lf.-clusters persistent; base of bracts decurrent: lvs. with 2 fibrovascular bundles, serrulate.
- A. Lvs. usually 3, rarely 4 or 5 (partly 2 in a var. of No. 24 and in No. 38).  
B. Brts. bloomy: lvs. 12-30 cm. long: cones 15-35 cm. long.  
C. Lvs. bluish green.  
D. Lvs. stiff, 12-18 cm. long: seed-wing membranous, much longer than seed.  
25. *P. Jeffreyi*
- DD. Lvs. slender, 20-30 cm. long: seed with thick wing shorter than seed.  
39. *P. Sabiniana*
- CC. Lvs. dark green, stiff, 15-30 cm. long: seed-wing thick, longer than seed.  
40. *P. Coulteri*
- BB. Brts. not bloomy (sometimes slightly so in No. 27).  
C. Lvs. with internal resin-ducts, 20-45 cm. long: buds large, with white-fringed scales, not resinous .....26. *P. palustris*
- CC. Lvs. with medial or marginal resin-ducts: buds usually brown.  
D. Lvs. 15-30 cm. long: cones deciduous, prickly.  
E. Buds ovoid, acuminate, resinous: lvs. dark or yellow green, 2-5.24. *P. ponderosa*
- EE. Buds oblong-ovoid, not or slightly resinous: lvs. bluish green, 3.....27. *P. Taeda*
- DD. Lvs. 7-18 cm. long: cone persistent.  
E. Lvs. dark green: tips of bud-scales slightly spreading: cone symmetrical.  
32. *P. rigida*
- EE. Lvs. bright or bluish green, slender: tips of bud-scales appressed: cone oblique.  
F. Bark on upper part of trunk and on brs. smooth: prickles of cone-scales stout.  
37. *P. attenuata*
- FF. Bark rough: lvs. sometimes 2: prickles of cone-scales minute....38. *P. radiata*
- AA. Lvs. 2 (partly 3 in Nos. 23, 24, 28, 29, 33).  
B. Spring-shoots uninodal, with only 1 whorl of brts.  
C. Bark of 2-year-old brts. divided into sharply defined plates (the decurrent base of the bracts), each peeling off as a whole.  
D. Brts. grayish white: winter-buds not resinous.....20. *P. Heldreichii*
- DD. Brts. orange to brown or grayish yellow.  
E. Winter-buds brown.  
F. Young brts. not bloomy: winter-buds resinous.  
G. Lvs. with medial resin-ducts, not breaking when bent: conelet mucronate; cone falling off as a whole.  
H. Lvs. always 2: cone with obtuse umbo.....21. *P. nigra*
- HH. Lvs. often 3: cones with prickly umbo.....24. *P. ponderosa* var.
- GG. Lvs. with marginal resin-ducts on the flat surface, the others often medial, breaking when bent: conelet mutic; cone leaving a few basal scales on the stem .....16. *P. resinosa*
- FF. Young brts. bloomy: winter-buds not resinous: lvs. sometimes 3.  
23. *P. tabulaeformis*
- EE. Winter-buds grayish white, cylindric-oblong, with conspicuously fimbriate scales .....22. *P. Thunbergii*
- CC. Bark of 2- to 4-year-old brts. not conspicuously divided into plates, peeling off rather irregularly.  
D. Lvs. 2-8 cm. long: cone deciduous: winter-buds resinous.  
E. Lvs. bluish or grayish green: cone-scales with obtuse umbo: usually a tree.  
18. *P. sylvestris*
- EE. Lvs. bright green: cone with a more or less prickly umbo: usually a shrub.  
19. *P. Mugo*
- DD. Lvs. 7-25 cm. long: winter-buds not resinous.  
E. Young brts. bloomy: lvs. slender, bright green: cone deciduous..17. *P. densiflora*
- EE. Young brts. not bloomy: cones persistent.  
F. Lvs. with marginal resin-ducts, 6-18 cm. long: bark formation late.  
29. *P. halepensis*
- FF. Lvs. with medial or internal resin-ducts, 12-25 cm. long: bark formation early .....30. *P. Pinaster*
- BB. Spring-shoots multinodal, with more than one whorl of brts.  
C. Young brts. glaucous: resin-ducts medial.  
D. Winter-buds not, or little, resinous: lvs. 7-12 cm. long, sometimes 3: cones deciduous .....28. *P. echinata*
- DD. Winter-buds resinous: lvs. 4-8 cm. long: cones persistent.....31. *P. virginiana*

- cc. Young brts. not glaucous (sometimes slightly so in No. 30): cones persistent.  
 d. Resin-ducts marginal: lvs. 7-15 cm. long: umbo obtuse.....29. *P. halepensis*  
 dd. Resin-ducts medial.  
 e. Lvs. 1-7 cm. long.  
 f. Lvs. 1-3.5 cm. long: cone not prickly, curved.....34. *P. Banksiana*  
 ff. Lvs. 3-7 cm. long: cone prickly.  
 g. Lvs. slightly twisted, with 2-5 resin ducts: cone symmetrical.  
 gg. Lvs. strongly twisted, with 1-2 resin-ducts: cone unsymmetrical.  
 33. *P. pungens*  
 ee. Lvs. 10-25 cm. long.  
 f. Winter-buds not resinous: lvs. 12-25 cm. long: cone symmetrical.  
 30. *P. Pinaster*  
 ff. Winter-buds resinous: lvs. 10-15 cm. long: cones unsymmetrical.  
 35. *P. contorta*  
 36. *P. muricata*

Subgen. I. HAPLOXYLON Koehne. SOFT PINES. Lvs. with one fibrovascular bundle, entire or serrulate, usually without stomata on back: bracts of lf.-fascicles not decurrent; sheaths deciduous: wood soft, with little resin.

Sect. I. CEMBRA. Umbo of cone-scales terminal; scales of young cone unarmed: lvs. in fascicles of 5.

Ser. 1. *Cembrae*. Cone indehiscent; seed wingless.

1. *P. koraiensis* Sieb. & Zucc. KOREAN P. Pyramidal tree to 30 m.; bark scaly, gray-brown or gray; brts. with yellow-brown tomentum: buds oblong-ovoid, dark chestnut-brown: lvs. dark green, straight, 6-12 cm. long, serrulate; resin-ducts medial: cones short-stalked, 9-14 cm. long, conic-ovoid or conic-oblong, yellow-brown; scales with recurved obtuse apex. S.Z.2:t.116(c). S.I.1:t.2(c). F.E.18:333;25:35(h). W.C.t.6,7(h). (*P. mandshurica* Rupr.) Japan, Korea. Intr. 1861. Zone III. Hardy pine of slow growth and dense habit.

2. *P. Cembra* L. SWISS STONE P. Tree to 25 or occasionally to 40 m., with usually short brs. forming a narrow-pyramidal, in old age often broad round-topped head; brts. densely brown-tomentose; buds globose-ovoid, acuminate: lvs. straight, 5-12 cm. long, serrulate, dark green; resin-ducts medial: cones short-stalked, ovoid, 5-8 cm. long, light brown; scales often slightly reflexed at apex. H.W.1:174-7,t.8(c). B.S.2:176,t(h). E.H.5:t.275(h). Alps of C. Eu., N. E. Russia and N. Asia. Long cult. Zone IV. Handsome hardy Pine of slow growth and dense habit.—*P. C. columnaris* Beiss. Of columnar habit. M.G.32:34(h). G.W.2:209(h).—*P. C. sibirica* Loud., var. Taller tree with shorter lvs. and larger cones. S.N.48, 51(h). (*P. s. Mayr.*) N. E. Russia to Siberia.

Closely related species: *P. pumila* Reg. Shrub to 3 m., with prostrate stems: lvs. 4-7 cm. long, obscurely serrulate, with usually marginal resin-ducts: cones ovoid, 3-4.5 cm. long. S.I.2:t.1(c). K.M.t.9(c). G.C.46:193. W.C.t.8(h). N. E. Siberia, Japan. Intr. 1817. Zone III?

3. *P. albicaulis* Engelm. WHITE-BARK P. Tree to 10, rarely to 20 m., with widespreading brs., sometimes shrubby; brts. puberulous or glabrous, brown or orange, tough and flexible: lvs. rigid, 4-7 cm. long, with stomata on back, entire: cone subsessile, ovoid or globose-ovoid, 5-7 cm. long, dull purple, finally brown; scales much thickened, often with stout-pointed umbo; seeds 8-12 mm. long. S.S.11:t.548. G.C.II.24:9. E.H.5:t.276(h). B. C. to Calif. and Wyo. Intr. 1852. Zone III.

Ser. 2. *Flexiles*. Cone dehiscent; seed wingless.

4. *P. flexilis* James. LIMBER P. Tree to 15 or 25 m., narrow-pyramidal while young, broad and round-topped in old age; brts. puberulous at first, soon glabrous, tough and pliant; buds broad-ovoid, pointed: lvs. slender, 3-9 cm. long, with stomata on back, usually entire: cone short-stalked, ovoid to cylindric-ovoid, 7-15 cm. long, yellowish to light brown, lustrous; scales rounded at apex, with an obtuse dark umbo, the lower ones elongated and re-

flexed. B.M.8467(c). S.S.11:t.546,547. F.E.29:47(h). Alb. to Calif., w. to Mont. and w. Texas. Intr. 1861. Zone IV.

5. *P. Armándi* Franch. Tree to 20 m., with widespreading horizontal brs.; brts. glabrous; buds cylindric, chestnut-brown: lvs. slender, 8-15 cm. long, serrulate, bright green, without stomata on back: cones peduncled, conic-oblong, 10-20 cm. long, yellowish brown; scales much thickened, rounded at apex or tapering to an acute point, sometimes slightly recurved, umbo small, obtuse; seed ovoid, compressed, with a sharp edge all around. B.M.8347(c). G.C.33:34 (as *P. koraiensis*), 66. Gn. 85:181. R.H.1910:425(h). J.L.48:f.45 (h). (*P. scipioniformis* Mast., *P. Mastersiana* Hayata.) C. and W. China, Formosa, Korea. Intr. 1895. Zone V. Handsome pine of rather loose habit, with widespreading brs.

Ser. 3. *Strobi*. Cone dehiscent; seed with long adnate wing.

6. *P. Lambertiæna* Dougl. SUGAR P. Tree to 60 m., rarely taller, with spreading, somewhat pendulous brs. forming an open narrow pyramid; brts. brown, pubescent: buds oblong-obovate, apiculate: lvs. stout, 7-10 cm. long, sharply pointed, serrulate, with white lines on back: cones stalked, pendent, cylindric, 30-50 cm. long, light brown, lustrous; scales with rounded apex or tapering to a blunt slightly reflexed tip; seed about 1 cm. long, dark brown. S.S.11:t.542-3. E.H.5:t.272(h). M.G.20:126(h). Ore. to L. Calif. Intr. 1827. Zone (V).

The related *P. Ayacahuite* Ehrenb. is probably not hardy within our area. Tree to 40 m.; brts. glabrous or pubescent: lvs. 10-20 cm. long; cones 25-45 cm. long; scales elongated reflexed or revolute at apex. Shaw, Pines Mex. t.4. Mex. Intr. 1840.

7. *P. parviflora* Sieb. & Zucc. JAPANESE WHITE P. Tree to 30 m., with slender brs., of dense pyramidal habit; bark of young trees smooth, of older trees fissured into thin flaky scales, red-brown beneath; brts. greenish brown, puberulous or glabrous; buds ovoid, scarcely resinous, the scales free at the tips: lvs. slender, 2-8 cm. long, serrulate, bluish green, conspicuously whitened on the ventral surface: cones ovoid to oblong-ovoid, 5-10 cm. long, nearly sessile; scales abruptly convex near the apex or irregularly warped, the umbo confluent with the thin margin; seed about 1 cm. long, with short broad wing. S.Z.2:t.115(c). K.M.t.8(c). A.G.14:212(h). W.C.t.9,10(h). (*P. pentaphylla* Mayr.) Japan. Intr. 1861. Zone V. As usually cult. it is grafted and forms a low tree with widespreading brs., the short usually twisted lvs. forming brush-like tufts at the end of the brts. and the rather small ovoid cones usually profusely produced; the wild form has been distinguished as var. *pentaphylla* Henry.—*P. p. glauca* Beiss. has pale bluish green lvs.

8. *P. Peuce* Griseb. MACÉDONIAN P. Tree to 20 m., with short ascending brs. forming a narrow dense pyramid; bark grayish brown, finally fissured into small plates; brts. greenish, glabrous; buds ovoid: lvs. straight, 7-10 cm. long, serrulate: cones short-stalked, sub-cylindric, 8-15 cm. long, tawny yellow; scales abruptly and prominently convex below the apex, with the umbo pressed against the scale beneath; seed small, with long wing. P.I.99(c,h). B.J.59:t.13(h). B.N.345(h). (*P. excelsa* var. *p.* Beiss.) Balkan Mts. Intr. 1863. Zone IV. Ornamental Pine of dense narrow-pyramidal habit and of slow growth.

9. *P. Griffithii* McClelland. HIMALAYAN P. Tree to 50 cm., of broad and open pyramidal habit; bark grayish brown, fissured into small plates; brts. bloomy, glabrous; buds cylindric-obovate, acute, very resinous: lvs. slender, drooping, 10-18 cm. long, serrulate, grayish or bluish green: cones cylindric,

15-25 cm. long, tawny-yellow, on stalks 2-5 cm. long, the apophysis prominently convex, its umbo pressed against the scale beneath. P.I.69(c,h). F.E. 13:t.8(h). Gn.M.6:290(h). (*P. excelsa* Wall., not Lam., *P. nepalensis* De Chambray, not Forbes, *P. Wallichii* A. B. Jacks.) Himal., w. to Afghan. Intr. 1827. Zone (V). Handsome pine with widespread brs. and drooping lvs.

*P. G.* × *Ayacuahuite* = *P. Holfordiana* A. B. Jacks. Brts. usually hairy: cones broader; scales acute or acutish. C.B.N.t.68,69. Cult. 1906.—*P. G.* × *Strobos* = *P. Schwerinii* Fitschen. Brts. bloomy, short-pilose: lvs. slender, pendulous, 8-13.5 cm. long; cones 8-15 cm. long, on stalk 2-2.5 cm. long; scales convex on back. Orig. about 1905.

10. *P. monticola* Lamb. MOUNTAIN WHITE P. Tree to 30 or occasionally to 50 m., with slender brs. forming a narrow open pyramid; bark on old trees deeply divided into scaly plates, purplish; brts. yellowish or reddish brown, puberulous; buds ovoid, acute: lvs. stiff, 4-10 cm. long, serrulate, often slightly so, without or with few stomata on the back, bluish green: cones short-stalked, cylindric, tapering, sometimes curved, 10-25 cm. long, yellowish brown, their phyllotaxis 8/21; apophysis thin, apex sometimes slightly prolonged and re-flexed. P.I.100(c,h). S.S.11:t.540-1. F.E.31:293(h). S.N.239(h). B. C. to Idaho and Calif. Intr. 1851. Zone V. Similar to the following species, but of narrower and denser habit.

11. *P. Stróbus* L. WHITE P. Tree to 30 or occasionally 50 m., with a symmetrical pyramidal head, in old age usually broad and often very picturesque; bark thick, deeply fissured into broad scaly ridges, purplish; brts. greenish or light greenish brown, pubescent at first, soon glabrous; buds ovoid, acuminate, slightly resinous: lvs. slender, soft, 6-14 cm. long, serrulate, bluish green: cones narrow-cylindric, often curved, 8-20 cm. long, brown, their phyllotaxis 5/13; apophysis thin. H.W.1:183-5,t.9(c). S.S.11:t.538-9. Am. For. 19:613; 22:387; 26:223(h). Gn.M.33:352(h). (*Strobos* S. Small, *Leucopitys* S. Nieuwl.) Nfd. to Man., s. to Ga., Ill. and Iowa. Intr. about 1705. Zone III. Important timber tree and also very ornamental.—*P. S. glauca* Beiss. Lvs. light bluish green.—*P. S. fastigiata* Beiss. Form with ascending brs. forming a narrow-pyramidal head. Gn.M.31:384(h). (*P. S. pyramidalis* Hort.)—*P. S. nana* Carr. Dwarf round or somewhat conical compact bush with short lvs.—*P. S. umbraculifera* Carr. Dwarf umbrella-shaped bush with short lvs. R.H. 1869:38. Gn.M.32:39(h). H.D.142,t(h). (*P. S. nana* Gord., not Carr.)—*P. S. prostrata* Beiss. Dwarf decumbent form with diffuse trailing brs.

Sect. II. PARACEMBRA Koehne. Cone-scales with dorsal umbo; scales of cone-let mucronate or aristate: lvs. with marginal resin-ducts.

Ser. 4. *Cembroides*. Seed wingless: lvs. 1-4, rarely 5, entire.

12. *P. cembroides* Zucc. NUT P. Small tree, usually not more than 7 m. tall, with stout spreading brs. forming a round-topped head; bark shallowly fissured into large red-brown scales; brts. dark orange, pubescent at first: lvs. usually 3 or 2, slender, much incurved, 2-5 cm. long, dark green, with stomata on all sides: cone subglobose, 2.5-5 cm. broad; apophysis pyramidal, strongly keeled, lustrous brown, with broad obtuse umbo; seed oblong-obovoid, 1-2 cm. long, dark brown, with very narrow wing. Shaw, Gen. Pinus, t.13, f.130-2. Am. For. 29:159(h). S. Ariz. to L. Calif. and Mex. Intr. 1830. Zone VII?—*P. c. monophylla* (Torr. & Frém.) Voss, var. Tree to 15 m.: lvs. usually solitary, 2-3.5 cm. long, rigid, pungent, glaucous-green: cone broad-ovoid, 3.5-5 cm. long; umbo with minute incurved prickle. S.S.11:t.551. H.B.3:25 (h). S.N.264(h). (*P. m.* Torr. & Frém.) Calif. to Colo. and Ariz. Intr. 1848. Zone V.—*P. c. edulis* (Engelm.) Voss, var. Tree to 15 m.: lvs. 2-3, rigid, 2-3.5 cm. long; dark green, without stomata on back: cone broad-ovoid;

umbo with minute incurved tip. S.S.11:t.552. F.E.29:205(h). S.N.263(h). (*P. e.* Engelm., *Caryopitys e.* Small.) S. Wyo. to Ariz., Tex. and n. Mex. Intr. 1848. Zone IV. In cult. like the preceding, a slow-growing round bush.—**P. c. Parryana** (Engelm.) Voss, var. Lvs. 3–5, usually 4, rigid, 3–4 cm. long; cone subglobose; umbo with recurved prickle. S.S.11:t.549. M.G.18:97(h). (*P. P.* Engelm.) Calif. Intr. about 1885. Zone VII?

Ser. 5. *Gerardiana*. Seed with very short articulate wing: lvs. 3, serrulate.

13. **P. Bungeana** Zucc. LACE-BARK P. Tree to 25 or 30 m., with long and slender brs.; bark exfoliating in large scales, leaving particolored areas, on old trees chalky-white; brts. grayish green, glabrous: lvs. rigid, 5–10 cm. long, with stomata on back, light green: cones subsessile, conic-ovoid, 5–7 cm. long, light yellowish brown; apophysis broad, keeled, the umbo forming a spine with broad base; seed broad-ovoid, with short wing. B.M.8240(c). P.I.89(c,h). Gn.89:165(b). B.D.1923:t.18(h). N. W. China. Intr. 1846. Zone IV. Slow-growing and bushy in cult. with rather sparse light green lvs.; remarkable for its exfoliating bark.

Ser. 6. *Balfouriana*. Seed with long articulate wing: lvs. 5, entire, without stomata on back and with marginal resin-ducts: sheath gradually deciduous.

14. **P. Balfouriana** A. Murr. FOXTAIL P. Tree to 15, occasionally to 30 m., narrow-pyramidal while young, in old age with an irregular and open head; bark on young trees milk-white, on old trees deeply ridged, dark red-brown; brts. dark brown, puberulous at first: lvs. crowded, rigid, usually incurved, persistent for many years, 2–4 cm. long, dark green: cones short-stalked, pendulous, subcylindric, 7–12 cm. long, dark brown; apophysis tumid; umbo with short prickle. S.S.11:t.553. E.H.5:t.277(h). Calif. Intr. 1852. Zone (V).

15. **P. aristata** Engelm. HICKORY P. Bushy tree, occasionally to 15 m., sometimes a prostrate shrub; brts. glabrous or puberulous at first, light orange: lvs. stout or slender, 2–4 cm. long, dark green, usually with conspicuous whitish exudations of resin: cones cylindric-ovoid, 4–9 cm. long; apophysis tumid, umbo with slender curved spine to 8 mm. long. S.S.11:t.554. G.C.III.20:719. M.D.1904:t.5(h). Gt.74:430(h). (*P. Balfouriana* var. *a.* Engelm.) Calif. to Colo. and Ariz. Intr. 1861. Zone V. In cult. usually a handsome low shrub with ascending brs. densely clothed with appressed lvs. sprinkled with white grains of resin.

Subgen. II. DIPLOXYLON Koehne. PITCH PINES. Lvs. with 2 fibrovascular bundles, and with dorsal and ventral stomata, serrulate; bracts of lf. fascicles decurrent; sheaths persistent, rarely deciduous; cones with dorsal umbo: wood hard, with dark resinous bands and clearly defined annual rings.

Sect. III. PINASTER. Lvs. with persistent sheaths; seed-wings long and articulate: spring-shoots uninodal or multinodal.

Ser. 7. *Laricoides*. Lvs. 2–3; spring-shoots uninodal: cones dehiscent at maturity: ray-cells of wood with large pits.

16. **P. resinosa** Ait. RED P. (NORWAY P.). Tree to 25, occasionally to 50 m., with stout spreading, sometimes pendulous brs. forming a broad pyramidal head; bark red-brown, shallowly fissured and scaly; buds ovoid, acuminate, light brown, resinous: lvs. 2, flexible, 12–17 cm. long: conelet mutic; cone subsessile, conic-ovoid, symmetrical, 4–6 cm. long, nut-brown, falling the 3d year, leaving a few basal scales on the br.; apophysis conspicuously keeled, with an obtuse small dark umbo. P.I.69(c,h). S.S.11:t.550–1. A.G.12:645(h). F.L.5:152(h). N. S. to Man., s. to Pa., Mich. and Minn. Intr. 1756. Zone II.—**P. r. globosa** Rehd., f. Dwarf and dense form of globose habit. H.D.133,t.(h). N.H.13:250(h).

17. **P. densiflora** Sieb. & Zucc. JAPANESE RED P. Tree to 35 m., with hori-

zontal brs. forming an irregular, rather broad head; bark orange-red, thin, scaly; brts. orange-yellow, bloomy; buds oblong-ovoid, chestnut-brown: lvs. 2, slender, 8-12 cm. long, bright bluish green; conelets conspicuously mucronate; cones short-stalked, conic-ovoid to oblong, symmetrical, 3-5 cm. long, dull tawny-yellow; apophysis flattened, the small umbo with a short prickle or obtuse. S.Z.2:t.112(c). S.I.1:t.1(c). Gn.M.2:22(h). W.C.t.11(h). Japan. Intr. 1854. Zone IV.—*P. d. aurea* Mayr, var. Lvs. yellow.—*P. d. oculus-draconis* Mayr, var. Each lf. marked with 2 yellow zones. Mayr, Abiet. Jap. t.7.f.c.-d(c).—*P. d. pendula* Mayr, var. With pendulous or prostrate brs. N.H.13:137(h).—*P. d. globosa* Mayr, var. Dwarf globose form with short lvs. N.H.13:251(h).—*P. d. umbraculifera* Mayr, var. JAPANESE UMBRELLA P. (TANYOSHO P.) Low form with spreading brs. forming an umbrella-like head, ultimately to 4 m. tall. H.D.134,t(h). Bull. N. Y. Bot. Gard. 14:22(h). (*P. d. tabulaeformis* Hort.)

The closely related *P. Massoniana* Lamb. differs chiefly in the longer lvs., in the partly mutic, partly tuberculate or mucronulate conelet and the subultrous nut-brown cone. Shaw, Gen. Pinus, t.20,f.176-8. I.S.t.6. S. China.—Confused with *P. densiflora* and *P. Thunbergii*; probably not in cult. and too tender.

18. *P. sylvestris* L. Scots P. Tree to 25, or occasionally to 40 m., with spreading brs., pyramidal when young, round-topped and irregular when old: bark red or red-brown, rather thin and smooth on the upper part of the trunk, darker and fissured below; brts. dull grayish yellow; buds oblong-ovoid, brown, resinous: lvs. 2, rigid, usually twisted, 3-7 cm. long, bluish green: conelet reflexed, minutely mucronate; cone short-stalked, reflexed, conic-oblong, symmetrical or sometimes oblique, 3-6 cm. long, dull tawny-yellow; apophysis flat, sometimes pyramidal; umbo small, with a minute prickle or its remnant. H.W.1:121-6,t.4(c). F.E.29:157(h). E.H.3:t.160-9(h). Eu. to Siberia. Long cult. Zone II.—One of the most important timber trees of Eu.; naturalized in e. N. Am.—*P. s. argentea* Stev., var. Lvs. light bluish green and of silvery hue.—*P. s. aurea* Beiss. Young lvs. golden-yellow, changing to green in summer. F.E.13:t.14(h).—*P. s. fastigiata* Carr. Of columnar habit with ascending brs. N.H.13:133(h). (*P. s. pyramidalis* Hort.)—*P. s. Watereri* Beiss. Low dense pyramidal form with steel-blue lvs. N.H.13:257(h).—*P. s. pendula* Laws, var. With pendulous brs.—*P. s. nana* Carr. Low dense and round bush with thick, very twisted lvs. about 2 cm. long. H.D.144,t(h). (*P. s. pygmaea* Beiss.)—*P. s. parvifolia* Heer. Lvs. 1.5-2.5 cm. long.

The following are geographical varieties or races: *P. s. rigensis* Loud., var. Bark very red; stem straight and tall. Silviculturally the most important race.—*P. s. scotica* Beiss. Bark redder: lvs. shorter, about 3.5 cm. long; cones shorter, about 3.5 cm. long.—*P. s. lapponica* Hartm., var. Of narrower pyramidal habit: lvs. broader and shorter, remaining alive for 4-7 years: cones more yellowish. Skogsvard. För. Tidskr.17:35, 37, 47(h). (*P. l.* Mayr.) N. Eu.—*P. s. engadinensis* Heer. A slow growing pyramidal form with grayish green, thick and rigid lvs. 2.5-3.5 cm. long persisting for 7 or 8 years: cones oblique with partly convex apophyses. Tyrol.

19. *P. Mugo* Turra. MOUNTAIN P. Usually low, often prostrate shrub, sometimes a pyramidal tree to 12 m.; brts. brownish: lvs. 2, crowded, stout, 3-8 cm. long, bright green: conelets mucronate; cones subsessile, ovoid or conic-ovoid, 2-7 cm. long, tawny-yellow or dark brown, lustrous; apophysis pyramidal or flattened, the umbo bordered by a dark ring and bearing the remnant of a mucro. H.W.1:140-3,t.5(c). (*P. montana* Mill.) Mts. of C. and S. Eu. Intr. 1779. Zone II.—As seen in a cross-section under the microscope

the cells of the epidermis of the lf. are much higher than broad with a dash-like space in the centre, while in *P. sylvestris* the cells are about as high as broad with a dot-like space in the centre.—This very variable species is usually divided into 4 vars. of which the first is the type. *P. M. Mughus* (Scop.), Zenari, var. Cone symmetrical, conic-ovoid, with usually prickly umbo, not bloomy before maturity, yellowish brown, cinnamon-brown when ripe; apophysis sharply keeled, the prickly umbo in the middle: usually a prostrate shrub. M.D.1921:t.1. (*P. montana* var. *M. Willk.*, *P. M. Scop.*) E. Alps to Balkan Pen.—Here belongs *P. M. Slavini* Hornibr., f. Low spreading form with erect brts. G.C.81:146(h).—*P. M. pumilio* (Haenke) Zenari, var. Cone symmetrical, subglobose to ovoid, glaucous and usually violet purple before maturity, yellowish or dark brown when ripe; upper part of apophysis convex, lower part concave, the umbo below the middle, impressed: usually a prostrate shrub. M.D.1912:147–148(h); 1921:t.1. (*P. montana* var. *p. Willk.*, *P. mont.* var. *prostrata* Tubeuf, *P. p.* Haenke, *P. carpatica* Hort.) Alps to C. Eu. and to Balkan Pen. Here belongs *P. M. compacta* Slavini, f. Dense globose form: lvs. 2.5–3.5 cm. long, dark green. B.C.C.t.9(h). N.H.13:255(h).—*P. M. rotundata* (Link) Hoopes. Cone oblique and asymmetrical, conic or ovoid, spreading or bent downward, with the lower and occasionally the middle scales of the outer side ending in a short and blunt, usually slightly reflexed apophysis: usually a tree to 10 m., with several stems. R.I.11:f.1128(c). (*P. montana* var. *r. Willk.*, *P. obliqua* Saut.) Mts. of C. Eu., Alps.—*P. M. rostrata* (Ant.) Hoopes. Cones asymmetrical and very oblique, conic-ovoid, 5–6 cm. long, directed downward; scales of the outer side strongly developed, the elongated pyramidal apophysis ending in a hook-like process directed toward the base of the cone: usually a tree with a single stem, sometimes to 25 m. Shaw, Gen. Pinus, t.21.f.186(cone), 190(h). S.N.257(h). (*P. montana* var. *r. Ant.*, var. *arborea* Tubeuf, *P. uncinata* Ramond.) Pyrenees to W. Alps.

*P. m.* × *sylvestris* = *P. rhaetica* Bruegg. Occasionally with the parents. (*P. digenea* Beck, *P. Gelakovskiorum* Aschers. & Graebn.)

20. *P. Heldreichii* Christ. Tree to 20 m., of pyramidal habit; bark gray, broken into angular plates; brts. brownish and usually bloomy when young, later grayish and somewhat rough: buds oblong-ovoid, not resinous, the scales brown with white tips or nearly grayish white: lvs. more or less incurved, 3–6 cm. long, stiff, pungent or obtusish, bright green, the vascular bundles separated by 1–2 rows (in *P. nigra* by several rows) of cells: cone ovoid, about 8 cm. long, similar to that of *P. nigra*, but yellowish or light brown, scarcely lustrous. K.V.18:t.39(h). Balkan Pen. Cult. 1891. Zone V.—*P. H. leucodermis* (Ant.) Markgraf ex Fitch, var. Tree of slower growth, with smoother more whitish bark; young brts. bloomy, grayish white and smooth when older: lower cone-scales with pyramidal apophysis and recurved umbo. H.W. 1:158–61. Gn. 89:184(h). E.H.2:t.119(h). M.D.43:t.27(h). (*P. l. Ant.*) Balkan Pen., s. Ital. Introd. 1865. Zone V.

21. *P. nigra* Arnold. AUSTRIAN *P.* Tree to 30, or occasionally to 50 m., with spreading brs. forming a pyramidal, in old age sometimes flat-topped, head; brts. usually light brown; buds ovoid or oblong-ovoid, light brown, resinous: lvs. stiff, 9–16 cm. long, dark green: conelets mucronate: cones subsessile, symmetrical, ovoid, 5–8 cm. long, yellowish brown, lustrous; apophysis strongly keeled; umbo usually with short prickle. C. and S. Eu., Asia Minor. Intr. 1759. Zone IV. A variable species with several geographical vars. of which the first is identical with the type.—*P. n. austriaca* (Hoess) Aschers.

& Graebn. Tall tree with dark gray bark and a broad ovoid head; brts. grayish or yellowish brown: lvs. rigid, 8-10 cm. long, dark green. H.W.1:151(h), t.6(c). F.E.18:t.84(h). B.E.t.42(h). (*P. Laricio* var. *a.* Loud., *P. a.* Hoess, *P. nigricans* Host.) Austria to Balkan Pen. Handsome Pine of vigorous growth.—*P. n. caramánica* (Loud.) Rehd., var. CRIMEAN *P.* Tree to 30 m., with long and stout ascending brs. forming a broad pyramidal head: lvs. dark green, lustrous: cones light brown, 8-10 cm. long, the upper and middle apophyses obtusely keeled. G.C.II.20:785;21:481. E.H.2:t.116-8(h). (*P. n. Pallasiana* Aschers. & Graebn., *P. Pallasiana* Lamb.) Asia Minor.—*P. n. Poiretiana* (Ant.) Aschers. & Graebn. CORSICAN *P.* Tall tree to 50 m., with shorter ascending brs. forming a narrower head; bark gray; brts. reddish or light brown: lvs. lighter green, 10-14 cm. long, less crowded and usually curved; cone with the middle and upper apophyses obtusely keeled. R.H. 1897:355, 357(h). G.C.III.4:693,705. E.H.2:t.114(h). (*P. Laricio* Poir., *P. Laricio* var. *corsicana* Loud., var. *calabrica* Loud.) S. Eu.—*P. n. cebennensis* (Gren. & Godr.) Rehd., var. Tree to 20 m.: brts. orange: lvs. slender, to 16 cm. long: cones 5-6 cm. long. B.E.318. (*P. n. tenuifolia* Aschers. & Graebn., *P. Salzmanni* Dun., *P. monegasensis* Salzm. *P. pyrenaica* Carr., not Lapeyr.) Pyrenees and S. France.—Garden forms are: *P. n. pendula* (Carr.) Rehd., var., with pendulous brs.—*P. n. pyramidalis* Slavín, f., a narrow pyramidal form with ascending curved brs. and bluish green lvs. to 12.5 cm. long. N.H. 13:132(h).—*P. n. Hornibrookiiana* Slavín, f. Low compact bush with stiff lustrous dark lvs. 5-6 cm. long. B. C. C.t.9(h). N.H.13:253(h).—*P. n. pygmaea* (Gord.) Rehd., var. Dwarf globose form.—*P. n. prostrata* (Beiss.) Rehd., var. Prostrate form.

22. *P. Thunbergii* Parl. JAPANESE BLACK *P.* Tree to 30 m., with spreading, often slightly pendulous brs. forming a broad-pyramidal, often irregular head; bark blackish gray, fissured into irregular plates; brts. orange-yellow; buds oblong, whitish, not resinous, with fimbriate scales free at the tips: lvs. stout, 6-11 cm. long, sharp-pointed, bright green, resin-ducts medial; conelet mucronulate; cones short-stalked, conic-ovoid, 4-6 cm. long, nut-brown; apophysis flattened, with small depressed, usually prickly umbo. S.Z.2:t.113 (c). S.I.1:t.1(c). W.C.t.13,14(h). (*P. Massoniana* Sieb. & Zucc., not Lamb.) Japan. Intr. 1855.—*P. T. oculus-draconis* Mayr., var. Lvs. with 2 yellow zones.

23. *P. tabulaeformis* Carr. CHINESE *P.* Tree to 25 m.: bark dark gray and fissured, on the limbs red; brts. pale orange or pale grayish yellow, slightly bloomy when young, often less conspicuously divided into plates; buds oblong, light brown, scarcely resinous: lvs. 2-3, mostly 2, stout, 10-15 cm. long, often glaucescent, resin-ducts marginal or marginal and medial: conelets mucronate; cones sessile, ovoid, symmetrical or oblique, 4-9 cm. long, pale tawny yellow, changing to dark brown, persistent for several years; apophysis strongly keeled, with an obtuse or mucronate umbo. Shaw, Gen. Pinus, t.23.f.201-7. B.D.1923:t.20(h). S.N.34(h). (*P. sinensis* Mayr, not Lamb., *P. Henryi* Mast., *P. Wilsonii* Shaw, *P. leucosperma* Maxim., *P. funebris* Komar., *P. mongolica* Hort.) N. to W. China. Intr. 1862. Zone V.—*P. t. densata* (Mast.) Rehd., var. Lvs. usually 2, rigid: cones ovoid, 5-6 cm. long, oblique, the posterior apophyses tumid and prominent. Shaw, Gen. Pinus, t.23.f.201. (*P. prominens* Mast.) W. China. Intr. 1909.

A closely related species is *P. yunnanensis* Franch. Bark broken into large plates; lvs. slenderer, 10-18, rarely to 25 cm. long, usually in 3's: cone 6-9 cm. long, with flattened apophyses. (*P. sinensis* var. *y.* Shaw.) W. China. Intr. 1909. Zone VI.

Ser. 8. *Australes*. Cones dehiscent at maturity: spring-shoots uninodal or multinodal: ray-cells of wood with small pits.

24. *P. ponderosa* Laws. WESTERN YELLOW P. Tree to 50 or occasionally to 75 m., with stout spreading or often pendent brs. forming a narrow-pyramidal head; bark usually cinnamon-red or dark brown to nearly black, fissured into ridges or on old trees into large plates; brts. orange-brown, fragrant when broken: buds oblong to ovoid, resinous: lvs. 2-5, usually 3, generally rigid, 12-26 cm. long, dark green: conelets mucronate; cones sessile, often in clusters, ovoid-oblong or conic-ovoid, symmetrical, 8-15 cm. long, light reddish or yellowish brown, lustrous, usually leaving a few basal scales on the br. when falling; apophysis depressed-pyramidal or flattened, the umbo with a stout usually recurved prickle. S.S.11:t.560-1. G.C.III.8:557(h).569. S.N. 244, 246, 249(h). (*P. Benthamiana* Hartw.—BULL P.) B. C. to Mex., e. to S. D. and Tex. Intr. 1827. Zone V. One of the tallest pines and most important timber trees of the W. States.—*P. p. pendula* H. W. Sarg. A form with pendulous brs. G.C.II.10:37(h). G.F.1:391(h).—*P. p. scopulorum* Engelm., var. Smaller in every part: bark nearly black, furrowed: lvs. sometimes 2, 12-16 cm. long: cones ovoid, smaller. S.S.11:t.564. C.B.N.t.70. S.N.246(h). (*P. s. Lemm.*) S. D. to Mex. and Tex. Zone IV.

25. *P. Jeffreyi* A. Murr. JEFFREY'S P. Tree to 40 or occasionally 60 m., with short spreading or often pendent brs. forming an open or sometimes narrow-pyramidal head; bark cinnamon-red, broken into large plates; brts. bloomy; buds oblong-ovoid, not resinous: lvs. usually 3, stout, 12-20 cm. long, pale bluish green: conelets mucronate; cones conic-ovoid, 14-26 cm. long, light brown; apophysis depressed; umbo with a slender recurved prickle. B.M.8257(c). S.S.11:t.562-3. Gn.89:329(h). G.F.5:185(h). S.N.250(h). (*P. ponderosa* var. *J. Vasey.*) Ore. to Calif. Intr. 1853. Zone V. Distinct ornamental pine remarkable for its long pale bluish lvs.

26. *P. palustris* Mill. LONGLEAF P. Tree to 30 or 40 m., with ascending brs. forming an oblong open head; bark light orange-brown, separating into large thin scales; brts. orange-brown; buds oblong, whitish, fringed, not resinous: lvs. 3, crowded and forming tufts at the end of the brts., 20-45 cm. long, dark green: conelet short-mucronate: cones sessile, cylindric, 15-20 cm. long, dull brown; apophysis keeled; umbo with a short reflexed prickle. S.S. 11:t.589-90. G.F.10:115(h). Am. For. 21:895(h). (*P. australis* Michx.—SOUTHERN P.) Va. to Fla. and Miss., along the coast. Intr. 1727. Zone VII. The most important timber tree of the S. E. States, also yielding excellent resin; brs. imported into n. cities for decoration.

27. *P. taeda* L. LOBLOLLY P. Tree to 30 or occasionally to 55 m., with spreading brs., the upper ones ascending, forming a compact round-topped head; bark bright red-brown, fissured into scaly ridges; brts. yellowish brown, sometimes slightly bloomy; buds oblong, resinous: lvs. 3, slender but stiff, 12-25 cm. long, bright green; conelets spinulose; cones sessile, conic-ovoid, symmetrical, 6-10 cm. long, dull, pale reddish brown; apophysis distinctly keeled; umbo elongated into a stout triangular spine. S.S.11:t.577-8. F.L. 3:25,(h). (OLD FIELD P., FRANKINCENSE P.) N. J. to Fla. and Tex. Intr. 1713. Zone VI.—Important timber tree.

28. *P. echinata* Mill. SHORT-LEAF P. Tree to 40 m., with slender, often pendent brs. in regular whorls; bark light cinnamon-red, broken into large scaly plates, scaly on the brs.; brts. dark red-brown, bloomy at first: buds oblong-ovoid, brown: lvs. 2-3, slender, 7-12 cm. long, dark bluish green: conelet mucronate; cones short-stalked or subsessile, conic-ovoid, 4-6 cm. long,

dull brown; apophysis flattened or slightly thickened along the keel; umbo elevated, with a short prickle. P.I.71(c,h). S.S.11:t.587. Am. For. 22:513(h). (*P. mitis* Michx.—SPRUCE P.) N. Y. to Fla., w. to Ill. and Tex. Intr. 1726. Zone V. Handsome tree with broad ovoid head.

Ser. 9. *Insignes*. Cones tenaciously persistent, often serotinous (remaining closed after maturity for years); seed-wing articulate, long; ray-cells of wood with small pits.

29. *P. halepensis* Mill. ALEPPO P. Tree to 20 m., with short brs. forming an open round-topped head; bark gray, smooth for a long time, finally brown; brts. slender, yellowish brown or light greenish brown; buds small, cylindric, not resinous: lvs. 2, rarely 3, slender, 6–15 cm. long, light green; conelet obscurely mucronate near the apex; cones short-stalked, spreading or deflexed, conic-ovoid, symmetrical or nearly so, 8–12 cm. long, yellowish brown, lustrous, often serotinous; apophysis flattened or depressed-pyramidal, keeled; umbo obtuse. H.W.1:162–5,t.7(c). G.W.9:469,471(h). E.H.5:t.287–8(h). (*P. alepensis* Poir., *P. maritima* Mill. sensu Lamb., *P. pityusa* Stev.) Mediterr. Reg. Intr. 1683. Zone VII. Recommended for seaside planting; of little ornamental value.—*P. h. brutia* (Ten.) Henry, var. Lvs. 10–16, rarely to 20 cm. long, more rigid, darker green: cone sessile, erect, usually in whorls of 2–6, 5–11 cm. long. H.W.1:172–3. G.C.III.4:268. R.H.1867:150–1. (*P. brutius* Ten., *P. pyrenaica* David, *P. eldarica* Medwed.) S. Eu., W. Asia.

*P. h.* × *Pinaster* = *P. halepensis*-*Pinaster* Saporta. Pyramidal tree; bark gray; lvs. 10–15 cm. long, slenderer than in no. 30, stiffer than in no. 29. Orig. in France before 1839.

30. *P. Pinaster* Ait. CLUSTER P. Tree to 30 m., with spreading, sometimes pendent brs. forming a pyramidal head; bark deeply fissured into narrow scaly ridges, brown; brts. bright reddish brown; buds oblong, brown, not resinous: lvs. 2, stout and rigid, 10–20 cm. long, lustrous green: conelets minutely mucronate; cones short-stalked, clustered, conic-ovoid, symmetrical or nearly so, 9–18 cm. long, light brown, lustrous, sometimes serotinous; apophysis pyramidal, conspicuously keeled with prominent prickly umbo. H.W.1:168–9. Gn.14:20;83:388(h). G.W.9:470(h). (*P. maritima* of Dur., not Mill.) Mediterr. Reg., near the coast. Intr. before 1660. Zone VII. Recommended for seaside planting.

31. *P. virginiana* Mill. SCRUB P. Bushy tree to 15 or sometimes to 30 m., with slender horizontal or pendent brs. in remote irregular whorls; bark shallowly fissured into scaly plates, smooth on the brs.; brts. bloomy; buds oblong, dark brown, very resinous, with appressed scales: lvs. 2, rigid, usually twisted, 4–8 cm. long: conelets with tapering sharp scales: cones conic-ovoid to oblong, symmetrical, 4–6 cm. long, reddish brown, lustrous, dehiscent at maturity; apophysis somewhat elongated along the keel; umbo prominent, ending into a slender prickle. S.S.11:t.581. (*P. inops* Ait.—JERSEY P.) N. Y. to Ga., w. to Ohio and Ala. Intr. before 1739. Zone IV. Small tree with wide-spreading brs., valuable for planting on dry and barren soil.

32. *P. rigida* Mill. PRCH P. Tree to 25 m., with horizontal brs. forming an open irregular head; bark red-brown, deeply fissured into broad scaly ridges, on young stems thin and scaly; brts. light brown; buds ovoid or oblong-ovoid, chestnut-brown: lvs. 3, rigid, spreading, 7–14 cm. long, dark green: conelets with spiny scales; cones subsessile, often clustered, conic-ovoid, symmetrical, 3–7 cm. long, light brown, lustrous, dehiscent at maturity, rarely serotinous; apophysis somewhat elevated along the keel; umbo prominent, ending in a sharp slender prickle. Add.9:t.311(c). S.S.11:t.579. G.F.4:402(h).

E.H.5:t.286(h). N. B. to Ga., w. to Ont. and Ky. Intr. before 1759. Zone IV. Valuable for planting on dry and rocky soil. Old trees are often very picturesque.—*P. r. seròtina* (Michx.) Loud. POND P. Smaller tree, with shallowly fissured bark, lvs. to 20 cm. long and serotinous cones. S.S.11:t.580. (*P. s. Michx.*) N. J. to Fla. and Ala. Intr. 1713. Zone VII.

33. *P. pungens* Lamb. TABLE MOUNTAIN P. Tree to 10, occasionally to 20 m., with stout spreading brs. forming a broad open head; bark dark brown, thick, broken into scaly plates, on upper part of trunk and on brs. separating into thin scales; brts. light orange; buds oblong, obtuse, dark chestnut-brown: lvs. 2 or sometimes 3, rigid, twisted, 3-7 cm. long, dark green: male fls. red: scales of conelet prolonged into an acute triangle: cones conic-ovoid, symmetrical or nearly so, 5-9 cm. long, light brown, lustrous or sublustrous; apophysis much elongated along the keel; umbo conical, ending in a stout curved spine. P.I.73(c,h). S.S.11:t.584. (POVERTY P.) N. J. to Ga. and Tenn. Intr. 1804. Zone V.

34. *P. Banksiana* Lamb. JACK P. Tree to 25 m., but usually lower, sometimes shrubby, with slender spreading brs. forming an open broad head; bark dark brown, slightly tinged with red, fissured into narrow ridges covered with thick scales; brts. purplish to yellowish brown; buds oblong-ovoid, light brown, very resinous: lvs. 2, rigid, twisted, spreading, 2-4 cm. long, acute or obtusish, bright or dark green: male fls. yellow: conelet minutely mucronate; cone erect, conic-ovoid, oblique and usually much curved, 3-5 cm. long, tawny-yellow, lustrous, serotinous; apophysis flat or convex; umbo small and unarmed. S.S.11:t.588. S.N.256(h). E.H.5:t.289(h). (*P. divaricata* Dum.-Cours.) Huds. B. to n. N. Y. and Me., w. to Mackenzie River and Minn. Intr. before 1783. Zone II. For planting on dry and sandy soil.

35. *P. contòrta* Loud. SHORE P. Tree to 10 m., with rather stout brs. forming a round-topped, usually dense head; bark deeply fissured into small scaly plates, dark red-brown, tinged with purple or orange; brts. light orange or orange-brown; buds ovoid, dark chestnut-brown, resinous: lvs. 2, rigid, twisted, 3-5 cm. long, acutish, dark green: conelet long-mucronate; cones sessile, conic-ovoid, very oblique, 2-5 cm. long, light yellowish brown, lustrous, serotinous; apophyses on the upper side of cone elevated; umbo dark, with a slender fragile prickles. S.S.11:t.567. G.C.II.19:45. D.J.384,t.(h, as *P. c. Murrayana*). (*P. Bolanderi* Parl., *P. inops* Bong., not Ait.) Alaska to Calif., the var. e. to Mont. and Colo. Intr. 1855. Zone VII?—*P. c. latifòlia* S. Wats., var. LODGEPOLE P. A slenderer pyramidal tree to 25 or occasionally to 50 m.: lvs. 3.5-8 cm. long, lighter green: cones less oblique. S.S.11:t.518. E.H.5:t.292(h). D.J.44,t(h). (*P. c. var. Murrayana* Engelm., *P. Murrayana* Balf., *P. Boursieri* Carr.) The most common coniferous tree of the n. Rocky Mts., often forming forests of great extent.

36. *P. muricàta* D. Don. BISHOP P. Tree to 15, occasionally to 30 m., with stout brs., pyramidal while young, finally usually round-topped; bark dark brown, tinged with red, broken into scaly plates on the lower, into thin loose scales on the upper part of the trunk; brts. orange-brown; buds ovoid, dark brown, resinous: lvs. 2, rigid, usually twisted, 10-15 cm. long, dark green: scales of conelet prolonged into a triangular spine; cones sessile, usually clustered, reflexed, conic-ovoid, oblique, 5-9 cm. long, chestnut-brown, lustrous, serotinous; apophyses of the upper side of cone much larger, conical, terminated by a stout spine. S.S.11:t.585-6. G.F.10:235(h). G.C.45:t.259(h), 60-61. B.S.1:104,t(h), (PRICKLE-CONE P.) Calif. Intr. 1846. Zone VII? Handsome pine of regular pyramidal habit.

37. *P. attenuata* Lemm. KNOB-CONE P. Tree to 10, occasionally to 30 m., with slender horizontal brs. ascending at the ends; bark at base of trunk dark brown, shallowly fissured into large loose scales, smooth and pale brown above; brts. dark orange-brown; buds oblong-ovoid, dark brown; lvs. 3, rarely 2, slender, 7-18 cm. long, pale yellowish or bluish green; scales of conelet prolonged into a triangular spine; cones short-stalked, usually clustered, oblique, conic-oblong, reflexed, 8-15 cm. long, tawny-yellow, lustrous, serotinous; apophyses on the upper side of cone prominent, conical, ending in a small incurved spine. S.S.11:t.575-6. G.C.II.24:784(h), 785. For. & Irr. 8:246 (h). (*P. tuberculata* Gord., not Don, *P. californica* Hartw., not Lois.) Ore. to Calif. Intr. 1847. Zone VII?

38. *P. radiata* Don. MONTEREY P. Tree to 30 m., with stout spreading brs. forming an irregular open head; bark of brs. and upper trunk rough, deeply furrowed below into broad scaly ridges, dark red-brown; brts. brown; buds ovoid, bright chestnut-brown; lvs. 2 or 3, slender, 10-15 cm. long, bright green; conelet mucronate; cones short-stalked or sessile, clustered, reflexed, conic-ovoid, oblique, 7-14 cm. long, nut-brown, lustrous, serotinous; apophyses of the upper side of cone prominent, rounded, with minute prickle. S.S.11:t.573-4. G.C.III.9:341 (as *P. attenuata*). E.H.5:t.282-4(h). Gn.87:264(h). (*P. insignis* Dougl., *P. montereyensis* Hort.) S. Calif. Intr. 1833. Zone VII. Handsome pine with bright green lvs., of rapid growth when young.

Ser. 10. *Macrocarpae*. Wing-blades of seed thick; cone large: lvs. 3-5, long; ray-cells of wood with small pits.

39. *P. Sabiniæna* Dougl. DIGGER P. Tree to 15 or occasionally to 25 m., with short crooked brs. forming a round-topped head; bark dark brown, thick, deeply fissured into scaly ridges; brts. bloomy: lvs. 3, rather slender, 20-30 cm. long, pale bluish green; conelet large, the scales tapering to a sharp point; cones stalked, reflexed, ovoid, slightly oblique, 15-25 cm. long, red-brown, persistent; apophysis prominent, conical, sharply keeled, tapering into the umbo and ending in a sharp point; seed-wing very thick; not uniformly colored on the dorsal surface. S.S.11:t.569. G.C.III.4:43;5:45(h). E.H.5:t.280 (h). Calif. Intr. 1832. Zone VI. Very distinct pine of loose habit and with sparse and long pale lvs.

Related species is *P. Torreyana* Carr. SOLEDAD P. Tree to 15 or in cult. to 30 m.: lvs. 5, stiff, 20-30 cm. long, dark green; cone 10-15 cm. long; nut spotted. S.S.11:557-8. B.E.t.43(h). S.N.242(h). S. Calif. Intr. 1853. Zone VII?

40. *P. Coulteri* Don. Tree to 25 m., with stout brs. forming an open pyramidal head; bark dark brown or nearly black, deeply fissured into rounded scaly ridges; brts. bloomy; buds oblong-ovoid, resinous: lvs. 3, very stout, 15-20 cm. long, dark bluish green; conelet very large, scales tapering to a long sharp point; cones reflexed, ovoid or oblong-ovoid, somewhat oblique, 25-35 cm. long, yellowish brown, persistent; apophysis elongated, pyramidal, with a large umbo forming a stout curved spine; seeds long-winged. S.S.11:t.571-2. G.C.III.4:765(h). E.H.5:t.279(h). (*P. macrocarpa* Lindl.) Calif. Intr. 1832. Zone VII? Tree of loose habit with sparse foliage.

10. **SCIADOPITYS** Sieb. & Zucc. UMBRELLA-PINE. Evergreen tree with short and slender horizontally spreading brs. ascending at the ends; bark nearly smooth, separating in long thin shreds: lvs. of two kinds, small and scale-like, scattered on the shoots, crowded at the ends and bearing in their axils a whorl of 20-30 linear flat lvs. grooved on each side, more deeply beneath, and consisting each of two connate lvs. borne on undeveloped spurs

like the fascicled pine lvs.: male fls. in dense clusters at the end of the brts., consisting of spirally arranged 2-celled anthers; female solitary, terminal, consisting of numerous spirally arranged scales bearing 7-9 ovules and subtended by a small bract: fr. an ovate-oblong cone with thick woody broadly orbicular scales, ripening the second season; seeds ovoid, compressed, narrowly winged; cotyledons 2. (Greek *skias*, *skiados*, umbrella, and *pitys*, pine; alluding to the position of the lvs.) One species in Japan.

**S. verticillata** (Thunb.) Sieb. & Zucc. Tree to 40 m. with a trunk often 3 m. in girth and with a narrow-pyramidal head becoming thin in old age: lvs. linear, obtuse and emarginate, dark green and glossy above, with 2 white bands beneath, 8-12 cm. long; cone 8-12 cm. long; seeds 1.2 cm. long. S.Z.2; t.101,102(c). B.M.8050(c). F.E.21:t.115(h). W.C.t.46,47(h). C. Japan. Intr. 1861. Zone V. Handsome slow-growing tree of dense pyramidal habit.

11. **SEQUOIA** Endl. Tall evergreen tree; bark 15-25 cm. thick, furrowed into ridges with fibrous scales, reddish brown; winter-buds with acute imbricate scales: lvs. dimorphic, alternate, those of shoots scale-like, spirally arranged, appressed or slightly spreading, with stomatic bands on the ventral side, those of lateral shoots 2-ranked, petioled, linear to linear-lanceolate, with or without few broken rows of stomata above, with 2 white stomatic bands beneath: fls. monoecious, the staminate terminal and axillary, stipitate, with numerous spirally arranged stamens; pistillate terminal, with 15-20 scales, bearing 3-7 erect ovules in one row: cones pendulous, ovoid; scales obliquely shield-shaped, ridged, with a flattened, often deciduous mucro; seeds 2-5, near margin of scale, with 2 spongy wings slightly narrower than seed, ripening in one season; cotyledons 2. (After Sequoia, inventor of the Cherokee alphabet; 1770-1843.) One species on the Pacific coast.

**S. sempervirens** (Lamb.) Endl. REDWOOD. Tree attaining 110 m., trunk up to 25 m. in girth: lvs. of leading shoots ovate-oblong, about 6 mm. long, with incurved callous tip, of lateral shoots linear to linear-oblong often falcate, 6-18 mm. long, dark or bluish green and slightly grooved above, with stomatic bands and a conspicuous midrib beneath: staminate fls. about 1.5 mm. long: cone ovoid, 2-2.5 cm. long, brown, ripening the first year; scales abruptly enlarged into a disk about 8 mm. long; seeds elliptic-oblong, 1.5 mm. long, light brown. S.S.10:t.535. B.S.2:510(h). B.E.t.23(h). S. Oreg. to Calif., near the coast. Intr. about 1843. Zone VII. The tallest of trees; demands a moist and cool climate; it suckers from the base and is occasionally seen in cult. as a bush of stöol-shoots after the main trunk has died.—**S. s. adpressa** Carr. Lvs. shorter, 6-8 mm. long, young tips creamy white. (*S. s. albo-spica* Hort.)—**S. s. glauca** R. Sm. Lvs. glaucous.—**S. s. pendula** Rovelli. Brs. spreading and pendulous. S.N.276(h).

12. **SEQUIADÉNDRON** Buchholz. Tall evergreen tree with deeply furrowed spongy bark 25-50 cm. thick; winter-buds naked: lvs. spirally arranged, appressed or slightly spreading, scale-like, sharply pointed, with 2 stomatiferous bands above: staminate fls. sessile, terminal on short brts.; pistillate terminal, with 25-40 scales terminated by a long terete spine and bearing 3-12 or more erect ovules in 2 rows: cone ellipsoid, maturing the second year and remaining for many years on the tree, very woody; scales wedge-shaped, with 3-9 seeds in a single or double row; seeds with 2 thin wings broader than seed; cotyledons usually 4 (3-5). (*Sequoia* and Greek *dendron*, tree.) Syn.: *Wellingtonia* Lindl., not Meissn. One species in Calif.

**S. giganteum** (Lindl.) Buchholz. BIG-TREE (GIANT SEQUOIA). Tree to 100 m. tall, occasionally 30 m. in girth above the enlarged and buttressed base, in old age free of brs. up to 50 m.: lvs. ovate to lanceolate, 3-6 mm. or on the main axis to 1.2 cm. long, convex below, concave above; staminate fls. 4-8 mm. long: cone 5-8 cm. long, 4-5.5 cm. in diam.; scales thickened into a disk to 2.5 cm. long and 0.6-1 cm. wide, pitted in the middle and when young with a slender spine; seeds oblong, 3-6 mm. long, light brown. S.S.10:536. P.I.112 (c,h). E.H.6:t.196(h). G.C.78:107(h). (*Wellingtonia gigantea* Lindl., *Sequoia gigantea* Dcne., not Endl., *S. Wellingtonia* Seem., *S. Washingtoniana* Sudw.) Calif., at 1450-2000 m. alt. Intr. 1853. Zone VI. The most massive of trees; in cult. when young, narrow-pyramidal, usually clothed to the ground with spreading brs.—**S. g. pendulum** (Carr.) Rehd., f. Brs. strongly deflexed and appressed to the stem so as to form a very narrow column. M.G.17:133 (h). R.H.1906:395(h). G.C.31:383(h); 78:105(h).

**13. TAXODIUM** Rich. Deciduous or evergreen trees with light brown, furrowed and scaly bark or upright or spreading brs.; brts. of two kinds, those near the apex of the shoot persistent and with axillary buds, those on the lower part of the shoot without axillary buds and deciduous; winter-buds globose, scaly: lvs. alternate, subulate or flat and linear with two stomatic bands below, those of the deciduous brts. usually spreading in two ranks, those of the persistent brts. spreading radially: the staminate fls. ovoid, consisting of 6-8 stamens and forming terminal long and drooping panicles, the female ones scattered, near the ends of the brs. of the preceding year, subglobose, consisting of 2-ovuled scales: fr. a short-stalked globose or ovoid cone ripening the first year and consisting of many thick, coriaceous peltate scales dilated from a slender stipe into an irregularly 4-sided, often mucronate, disk; each fertile scale with 2 unequally 3-angled seeds with 3 thick wings: cotyledons 4-9. (Greek; similar to *Taxus*.) Three species in e. N. Am. and Mex.

A. Lvs. linear, spreading, 2-ranked: brts. horizontal.....1. *T. distichum*  
 AA. Lvs. subulate, appressed: brts. upright.....2. *T. ascendens*

**1. T. distichum** (L.) Rich. BALD CYPRESS. Tree occasionally 50 m. tall, with a tapering trunk strongly buttressed at the base, pyramidal while young, in old age usually spreading with broad rounded head; young brts. green, becoming brown the first winter; the 2-ranked lvs. linear-lanceolate, apiculate, 1-1.5 cm. long, soft bright green, yellowish green or whitish below, turning dull orange brown before falling: panicle of staminate fls. 10-12 cm. long: cone globose or obovoid, about 2.5 cm. across; disk of scales rugose, usually without mucro. S.S.10:t.537. G.F.3:7(h). S.N.21&t.10(h). M.G.11:303(h). (*Cupressus disticha* L.) Del. to Fla., w. to s. Ill., Mo., Ar. and La.; in swamps and on banks of streams. Particularly in wet and occasionally inundated situations the roots produce woody cylindrical projections sometimes 2 m. high and 30 cm. in diam. known as "cypress-knees." Intr. 1640. Zone IV. A handsome ornamental tree with feathery light green foliage.—**T. d. pendens** Rehd., f. Brs. nodding at the tips and brts. drooping. H.B.3:446(h). N.H.12:50(h). (*T. d. nutans* Carr., not Ait., *T. d. pendulum* Horsey, not Carr.)

**2. T. ascendens** Brongn. POND CYPRESS. Tree to 25 m.; trunk much enlarged at base; bark thick, furrowed: brs. spreading; brts. upright: lvs. appressed and incurved, subulate, 5-10 mm. long: fls. and frs. similar to those of *T. distichum*. B.M.5603(c). G.C.66:258,259. Jour. N. Y. Bot. Gard. 21:t. 246(h). (*T. imbricarium* Harper, *T. distichum* var. *imbricarium* Croom.)

Va. to Fla. and Ala.; in lakes, ponds and small rivers, usually over clay subsoil. Cult. 1789. Zone V. Less handsome than the preceding species, with a narrower and thinner head.—*T. a. nutans* (Ait.) Rehd. With pendulous brts. B.N.468. (*T. a. pendulum* Schneid., *T. distichum* var. *n.* Sweet, *Glyptostrobus pendulus* Endl.) Cult. 1789.

A closely related genus from China is *Glyptostrobus* Endl. which differs chiefly in its elongated, not peltate scales. The only species, *G. pensilis* (Staunt.) K. Koch (*G. heterophylla* Endl., *G. sinensis* Loder), is not hardy within our area. Also the Mexican *Taxodium mucronatum* Ten. (*T. distichum* var. *m.* Henry) with persistent lvs. is not hardy, but is occasionally planted in Calif.

**14. CRYPTOMERIA** D. Don. **CRYPTOMERIA.** Evergreen tree with reddish brown bark peeling off in long shreds, pyramidal, with spreading brs.: buds minute: lvs. spirally arranged in 5 vertical ranks, decurrent, directed forward and curved inward, awl-shaped, laterally compressed: staminate fls. oblong, composed of numerous imbricate stamens, sessile, forming short spikes at the end of brts.; female fls. globular, solitary at the end of short brts.: fr. a brown, subglobose cone ripening the first year, but persistent after shedding the seeds; scales 20-30, woody, wedge-shaped, enlarged above into a disk with a recurved mucro in the middle and with 3-5 pointed rigid processes on the upper margin; seeds 2-5 to each scale, triangular-oblong and slightly compressed, narrowly winged; cotyledons 2-3. (Greek *kryptos*, hidden, and *meros*, part; meaning obscure.) One species in Japan.

*C. japonica* (L. f.) D. Don. Tree to 50 m. and to 6-10 m. in girth: lvs. linear-subulate, acutish, curved inwards, laterally compressed, keeled above and below, with stomata on both sides, 6-8 mm. long, bright green: staminate fls. about 6 mm. long: cone globose, 1.5-2.5 cm. across; seeds dark brown, 5-6 mm. long. S.Z.2:t.124(c). P.I.114(c,h). W.C.t.48(h). E.H.1:t.42(h). Japan, China. The typical form is *C. j. japonica* (L. f.) Henry, var. Pyramidal tree with stout dark green lvs.: cone-scales with long-acuminate processes and long-pointed bracts, giving the cone a spiny appearance. Japan. Intr. 1861. Zone (V).—*C. j. sinensis* Sieb. & Zucc., var. Tree of looser habit, with deflexed brs. and slender brts.: lvs. longer and slenderer: cone-scales about 20, with shorter mucro and shorter less pointed processes; seeds often only 2. H.I.7:668. (*C. Fortunei* Hooibrenk, *C. Kawaii* Hayata.) S. China. Intr. before 1840. Tenderer than the type.

The following are garden forms of the Japanese plant: *C. j. Lobbii* Carr. Narrow-pyramidal tree with short and densely ramified brs.: lvs. rather short and lighter green. Intr. 1845. It differs scarcely from the type.—*C. j. compacta* Beiss. Compact conical form with bluish green short and stiff lvs.—*C. j. pungens* Carr. Compact form with stiff and spreading, sharply pointed dark green lvs.—*C. j. araucarioides* Henk. & Hochst. Brs. deflexed, with long and distant pendulous brts.: lvs. short, stout and stiff, incurved at apex, bright green. S.Z.2:t.124b,f.2,3.—*C. j. dactyloides* Carr. Brs. slender: lvs. 6-8 mm. long, close, stiff, brownish green, partly smaller and scale-like. Cult. 1867.—*C. j. spiralis* Sieb. & Zucc., var. Slender shrub: lvs. strongly falcate and twisted spirally around the brts.—*C. j. nana* Carr. Dwarf and dense, spreading or procumbent form with short stiff lvs.—*C. j. elegans* (Henk. & Hochst.) Mast., var. Densely branched bushy tree; lvs. spreading and often recurved, soft and slender, flattened, grooved, 1-2.5 cm. long, glaucous green, changing in winter to a reddish bronze color. D.J.181g. B.E.t.24(h). Intr. 1861. Juvenile form, rather short-lived and rarely bearing cones.

15. **CUNNINGHAMIA** R. Br. ex Richard. CHINA-FIR. Evergreen trees with spreading brs. pendulous at the ends: lvs. spirally arranged, decurrent, linear-lanceolate, serrulate, spreading in 2 ranks: staminate fls. cylindric-oblong, in terminal clusters: female fls. globose, 1-3 at the end of the brs.: cone subglobose with coriaceous, broad-ovate pointed and irregularly serrate scales, persisting after escape of the seeds: each scale with 3 narrow-winged seeds; cotyledons 2. (After J. Cunningham who discovered the following species in 1702.) Two species in E. Asia.

**C. lanceolata** (Lamb.) Hook. Tree to 25 m.; bark brownish, scaling off in irregular plates and exposing the reddish inner bark: lvs. crowded, linear-lanceolate, with broad decurrent base, sharply pointed, 3-6 cm. long, lustrous above, with 2 broad white bands below: cone globose-ovoid, 2.5-5 cm. long. B.M.2743(c). S.Z.2:t.104,105(c). B.S.1:441,t.(h). (*C. sinensis* Richard.) S. and W. China. Intr. 1804. Zone VII. Handsome tree of broad-pyramidal habit; it sprouts from the roots and the stump if cut back.

The second species is *C. Konishii* Hayata from Formosa with smaller and narrower lvs. and smaller cones. Intr. in 1918; tenderer.

16. **FITZROYA** Hook. f. FITZROYA. Evergreen tree, irregularly branched; brts. angled: lvs. ternate, decurrent, their free part spreading: fls. dioecious, the staminate axillary, solitary, cylindric, consisting of 15-24 stamens in ternate whorls: cone small, globose, with 3 ternate whorls of valvate scales, the lower whorl small and sterile, the middle one sterile or fertile and the upper one fertile; each fertile scale with a prominent compressed umbo on back and with 2-6 seeds 2- or 3-winged; cotyledons 2. (After Capt. R. Fitzroy of the British Navy; died in 1855.) One species in Chile.

**F. cupressoides** (Molina) Johnston. Tree to 15 m., in cult. often shrubby; bark thick, reddish, deeply furrowed: lvs. ternate or occasionally opposite, spreading or somewhat imbricate, ovate-oblong to narrow-oblong, with incurved mucronate tip, about 3 mm. long, concave above and with 2 narrow stomatic lines, with 2 white bands beneath: cones globose, 8 mm. across. B.M. 4616(c). D.J.288,t.13(h). (*F. patagonica* Hook. f., *Pinus c.* Molina.) S. Chile. Intr. 1849. Zone VII.

17. **THUJOPSIS** Sieb. & Zucc. Tree of pyramidal habit with spreading brs. and frond-like arranged brts. spreading in horizontal planes; brts. much flattened, broad: lvs. opposite, the lateral ones somewhat spreading, ovate-lanceolate and curved (hatchet-shaped), acutish, the facial ones ovate-oblong, obtuse: staminate fls. cylindric with 6-10 pairs of stamens; pistillate fls. with 4-5 ovules under each scale: cone subglobose; scales 6-8, woody, flat, imbricate, usually with a boss or mucro below the apex; the upper pair sterile, the fertile ones with 3-5 winged seeds; cotyledons 2. (Thuja and Greek *opsis*, likeness.) One species in Japan.

**T. dolabrata** (L. f.) Sieb. & Zucc. HIBA ARBOR-VITAE. Pyramidal tree to 15 m., with irregularly whorled or scattered horizontally spreading brs. nodding at the ends; brts. 5-6 mm. broad: lvs. glossy dark green above, with conspicuous white patches below, 4-6 mm. long: cone broad-ovoid, 1.2-1.5 cm. long; scales with a prominent often curved boss below the apex. (*T. d.* var. *australis* Henry, *Thuja d.* L. f.) S.Z.2:t.119,120(c). S.I.1:t.11(c). C. Japan. Intr. 1853, 1861 to Am. Zone VI. A handsome ornamental tree, of slow growth in cult.; not doing well in a dry climate.—*T. d. variegata* Otto. Tips of brts. creamy-white.—*T. d. nana* Endl., var. A dwarf and slow-growing form with slenderer brs. and smaller, lighter green lvs. (*T. d.* var. *laetevirens* Mast.,

*T. laetevirens* Lindl.)—*T. d. Hondai* Makino, var. Tree to 30 m.: brts. more closely set, partly overlapping: lvs. smaller: cones globose, 1.5–1.8 cm. across; the scales with a short mucro or only with a narrow ridge. M.K.t.10(c). W.C. t.50,51(h). (*T. H. Henry*.) N. Japan. Intr. 1915. This variety may prove harder and more satisfactory in the Eastern States than the type.

18. **THÛJA L. ARBOR-VITAE.** Trees with scaly bark and short spreading or erect brs. forming a pyramidal head: brts. flattened, disposed in one plane: lvs. decussate, scale-like, the lateral lvs. nearly covering the facial ones: fls. monoecious, staminate ovoid, with 6–12 decussate stamens: cones ovoid-oblong or ovoid; scales 8–12, with a thickened ridge or a boss at the apex, the 2 or 3 middle pairs fertile; seeds 2 or 3 under each scale, thin and with broad wings or thick and wingless; cotyledons 2. (Ancient Greek name.) Six species in N. Am. and E. Asia. All the species except *T. setchuensis* Franch. from W. China are in cult.

A. Brts. disposed in horizontal planes: cone-scales thin; seeds thin, winged.

Subgen. I. **EUTHUJA**

B. Lvs. of primary axes widely spaced, ending in a long point parallel to the axis.

C. Primary axis flattened: lvs. conspicuously glandular, yellowish or bluish green below.

CC. Primary axis nearly terete: lvs. not or inconspicuously glandular, usually with whitish markings below. 1. *T. occidentalis*

BB. Lvs. of primary axes close, ending in a short spreading point; brts. with white markings below. 2. *T. plicata*

C. Lvs. glandless, slightly or not concave below: brts. thickish, compressed, but scarcely flattened. 3. *T. Standishii*

CC. Lvs. glandular, concave or grooved below and with conspicuous white markings: brts. much flattened. 4. *T. koraiensis*

AA. Brts. in vertical planes, green on both sides: cone-scales thick; seeds ellipsoid, wingless. 5. *T. orientalis*

Subgen. II. **BIOTA**

1. ***T. occidentalis* L. AMERICAN ARBOR-VITAE.** Tree to 20 m., with stout buttressed trunk and short spreading brs. forming a pyramidal head; bark reddish brown, fissured into narrow ridges covered with elongated scales: lvs. abruptly pointed, dark green above, those of the main axes conspicuously glandular, on the brts. sometimes inconspicuously so: male catkins globose, with 3 pairs of stamens: cone oblong, 8 mm. long, light brown; scales 8–10, usually 4 fertile, with a minute mucro at apex; seeds 3 mm. long. S.S.10:t.532. G.C.III.21:213. S.N.287(h). N. S. to Man., s. to N. C., Tenn., and Ill. Intr. about 1536. Zone II. Ornamental pyramidal tree of rather slow growth in cult., with numerous mostly shrubby horticultural forms.

Forms distinguished by color: *T. o. alba* Gord. Tips of young brts. white. (*T. o. albo-spicata* Beiss., *T. o. "Queen Victoria"* Hort.)—*T. o. variegata* West., var. Brts. variegated with white. (*T. o. argentea* Carr., *T. o. albo-variegata* Beiss.)—*T. o. "Columbia"* Parsons. Columnar form: foliage with silvery variegation, more pronounced in winter. B.E.t.20(h).—*T. o. Vervaeana* Gord. Smaller and denser than the type; brts. slenderer, yellowish bronzy in winter. S.N.t.9(hc).—*T. o. aureo-variegata* Henk. & Hochst. Lvs. variegated with golden yellow. (*T. o. aurea-maculata* Hort., *T. o. Wareana aurea* Hort.)—*T. o. lutescens* Hesse. A form of *T. o. robusta* with yellow lvs. (*T. o. Wareana lutescens* Hesse.)—*T. o. aurea* Nels. Broad bushy form with deep yellow lvs.—*T. o. semperæurea* Rehd., var. A vigorous form with golden-yellow lvs.—*T. o. lutea* Kent, var. Pyramidal form with bright yellow lvs. (*T. o. elegantissima* Hort., *T. o. "George Peabody golden."*)

Pyramidal or fastigate forms: *T. o. robusta* Carr. Pyramidal form, denser than the type; brts. stouter, bright green. R.H.1908:79(h). (*T. o. Wareana* Nels., *T. o. densa* Gord., *T. o. sibirica* Hoopes, *T. caucasica* and *T. tatarica* Hort.)—*T. o. Rivérsii* Beiss. Compact pyramidal form with yellowish green

lvs.—**T. o. viridis** Beiss. Compact narrow-pyramidal form with lustrous dark green lvs. (*T. o. erecta viridis* Nichols.)—**T. o. Rosenthälii** Beiss. Columnar form with lustrous dark green lvs.—**T. o. "Douglasii pyramidalis"** Spaeth. Dense columnar form with crowded frond-like arranged brts., often cristate at end of brs.—**T. o. filicoides** Beiss. Narrow-pyramidal form with the short ultimate brts. pinnately arranged.—**T. o. theodonensis** Beiss. Compact pyramidal form with thicker and broader brts. and dark green lvs. (*T. o. magnifica* Hort.)—**T. o. compacta** Carr. Pyramidal form of denser habit and slower growth than the type.—**T. o. Buchanani** Parsons. Graceful narrow-pyramidal form with slender brts. and rather remote and irregularly arranged thin brts., grayish green. B.E.t.20(h).—**T. o. fastigiata** Jaeg., var. Columnar form with short brts. Gt.45:508(h). (*T. o. var. columnaris* Mast., *T. o. stricta* Hort., *T. o. pyramidalis* Hort.)—**T. o. Mastérsii** Rehd., f. Pyramidal tree, darker and denser than the type; brts. short, rigid, much flattened, disposed in vertical planes: lvs. distinctly glandular, brownish dark green above, bluish green beneath. G.C.III.21:258. (*T. plicata* Parl., not Lamb., *T. o. var. plicata* Mast., not Hoopes.)

Globose or dwarf forms: **T. o. globosa** Gord. Compact globose form with bright green lvs. B.E.t.21(h). (*T. o. Spihlmannii* P. Smith, *T. o. globosa Speelmannii* Hort., *T. o. Froebeli* Hort., *T. o. compacta* Beiss., not Carr., *T. o. "Tom Thumb"* Hort.)—**T. o. Woodwardii** Spaeth. Dense globose form with deep green lvs. B.E.t.21(h).—**T. o. Hóveyi** Hoopes, var. Dwarf globose-ovoid form with rather light green lvs.—**T. o. pumila** Beiss. Dwarf dense form with dark green lvs. (*T. o. "Little gem"* Hort.)—**T. o. umbraculifera** Beiss. Dwarf dense form with umbrella-like top; brts. thin, dark green. S.N.288(h).

Pendulous or irregular forms: **T. o. péndula** Gord. Brs. bending downward and brts. tufted and pendulous.—**T. o. filifórmis** Beiss. Low bushy form with long and slender sparingly ramified brts., nodding at the tips, partly 4-angled and clothed with sharply pointed appressed lvs. B.C.C.t.38. M.G.16:357(h). (*T. o. var. Douglasii* Rehd.)—**T. o. Ohlendórfii** Beiss. Bushy form with two kinds of lvs., the upper brts. mostly similar to those of *T. o. filiformis*, the lower to those of *T. o. ericoides*. B.E.225. (*T. o. Spaethii* P. Smith.)—**T. o. cristata** Carr. Irregular dwarf pyramidal form with crowded stout often recurved brts.

Juvenile forms: **T. o. ericoides** Hoopes, var. Dwarf broad-pyramidal or bushy form with slender brts. clothed with spreading linear soft lvs. dull green above, grayish green beneath and assuming a brownish tint in winter. R.H.1880:93,94. B.C.3336. (*Retinispora dubia* Carr., *R. ericoides* Hort., not Zucc.)—**T. o. Ellwangeriana** Beiss. Low broad pyramid, with slender brts. clothed with two kinds of lvs., adult scale-like and juvenile linear and spreading lvs. R.H.1880:93. B.C.3336. A form with yellow lvs. is **T. o. "Ellwangeriana aurea"** Beiss.

2. **T. plicata** Lamb. GIANT A. Tall tree, to 60 m., with stout buttressed trunk and short horizontally spreading brs. pendulous at the ends and forming a narrow pyramidal head; bark cinnamon-red, fissured into scaly ridges; brts. slender, regularly and closely set: lvs. bright green and glossy above, with whitish marks below, those of the main axes ovate, acuminate and usually glandular, those of the lateral brts. acute and mucronate and not or scarcely glandular: cones oblong, 1.2 long; scales 10-12, usually 6 fertile; seeds often 3 to each scale, notched at apex. S.S.10t.533. G.C.III.21:215. S.N.292(h). (*T. gigantea* Nutt., *T. Menziesii* Dougl., *T. Lobbii* Hort.) Alaska to N. Calif. and Mont. Intr. 1853. Zone V. Ornamental tree of rapid growth with lustrous

bright green lvs.—*T. p. atrovirens* (Gord.) Sudw. Lvs. dark green. (*T. Lobbi* a. Hort.)—*T. p. fastigiata* (Carr.) Mast., var. Columnar form. G.C. 41:200(h). (*T. gigantea* var. *pyramidalis* Bean.)—*T. p. pendula* (Beiss.) Schneid., var. Brs. slender, pendulous.

3. *T. Standishii* (Gord.) Carr. JAPANESE A. Tree to 18 m., with spreading or somewhat ascending brs. forming a broad pyramid; bark reddish brown, thin, separating into small scales leaving pale gray blotches; brts. rather thick, compressed: lvs. bright green above, with triangular white marks below, glandless, those of the lateral brts. ovate, obtuse: cones ovoid, 8–10 mm. long, dark brown; scales 10–12, broad-ovate, the 2 middle pairs fertile; seeds 3 to each scale, with narrow wings, not notched at apex. S.I.1:t.11(c). G.C. III.21:215. W.C.52,53(h). (*T. japonica* Maxim., *Thujopsis* S. Gord.) Japan. Intr. 1860. Zone V. Handsome tree with broad head, quite different in habit from the preceding species.

4. *T. koraiensis* Nakai. KOREAN A. Low spreading shrub, usually with decumbent brs., rarely a slender, narrow-pyramidal tree to 8 m. with spreading brs. ascending at the ends; bark thin, scaly, chocolate-brown; brts. much flattened: lvs. of lateral brts. deltoid or rhombic, acutish or obtuse, bright green above, glaucous beneath, glandular: cones elliptic-ovoid, about 8 mm. long, light brown; scales 8, those of the 2 middle fertile pairs oval to narrow-obovate; seeds emarginate at apex. C.B.N.t.90. Korea. Intr. 1918. Zone V.

5. *T. orientalis* L. ORIENTAL A. Pyramidal or bushy tree, with spreading and ascending brs. and with the trunk branching from near the base; bark thin, reddish brown, separating into papery scales; brts. very slender: lvs. bright green, nearly alike on both sides, those of the main axes glandular, ending in a free, rather spreading point, those of the lateral brs. closely appressed, glandular: cones ovoid, 1.5–2.5 cm. long, fleshy and bluish before ripening; scales usually 6, thick, ovate, obtuse, produced below the apex into a hooked boss; seeds 2 to each scale, ovoid, brown. S.Z.2:t.118(c). B.N.518. S.N.65(h). (*Biota o.* Endl.) N. and W. China, Korea; much cult. in Japan. Intr. before 1737. Zone V or VI. Ornamental tree; its garden forms more often planted than the type.—*T. o. elegantissima* (Gord.) Vos. Of compact pyramidal habit, bright yellow in spring, greenish yellow later. S.N.t.11(hc).—*T. o. beverleyensis* Rehd., var. Pyramidal form with golden yellow lvs.—*T. o. conspicua* Berkmans. Of compact fastigate habit, golden yellow, suffused with green. Berkmans Cat. 1915–16:54(h).—*T. o. aurea* Dauvesse. Bushy subglobose form, golden yellow in spring, changing later to yellowish green. (*Biota o. aurea nana* Sénécl.)—*T. o. semperauréscens* Nichols. Dwarf subglobose form retaining its golden yellow color throughout the year.—*T. o. Sieboldii* (Endl.) Laws., var. Low compact subglobose form with bright green lvs. (*Biota o.* var. *S.* Endl., var. *japonica* Sieb., *B. o. compacta* Beiss.—*T. o. stricta* Loud., var. Dense pyramidal form with ascending brs. and bright green lvs. (*Biota o.* var. *pyramidalis* Endl., *T. pyramidalis* Ten., *T. tatarica* Lodd.)—*T. o. flagelliformis* Jacques. Pyramidal form with sparingly ramified thread-like pendulous brts. with distant and acuminate lvs. C.B.3:77. S.N.291(h). (*T. o.* var. *pendula* Mast., *Biota o. filiformis* Henck. & Hochst., *T. filiformis* Lindl., *T. pendula* Lamb.)

Juvenile forms: *T. o. decussata* (Beissn. & Hochst.) Mast., var. Dwarf bushy form with spreading stiff linear-lanceolate and acute bluish green lvs. (*Retinospora juniperoides* Carr.)—*T. o. meldonensis* (Beissn. & Hochst.) Mast., var. Of narrow-pyramidal, somewhat irregular habit: lvs. partly like those of *T. o. decussata*, partly passing into the normal form.

*Microbiota decussata* Komar. from e. Manch. is probably only a variation of *Thuja orientalis* retaining the juvenile foliage up to the fruiting stage.

**19. LIBOCÉDRUS** Endl. Trees with scaly bark, spreading or erect brs. and compressed or rarely 4-angled brts. arranged in one plane: lvs. decussate, scale-like, decurrent at base, with or without gland: fls. monoecious, the two sexes on different brts., rarely dioecious; male fls. oblong, with 12-16 decussate stamens; female oblong; fertile scales with 2 ovules: cones oblong, with 4-6 woody, flat scales mucronulate at the apex, the lower pair short, reflexed and sterile; the middle pair oblong and fertile, the upper pair, if present, connate into an erect partition; seeds with one short and one long wing nearly equaling the scale; cotyledons 2. (Greek *libas*, drop, tear, and *cedrus*, referring to the resinous character of the trees.) Eight species in western N. and S. America, N. Zeal., N. Caledonia, N. Guinea, Formosa and S. W. China. Only the following species is hardy within our area, though possibly *L. chilensis* Endl. may survive in sheltered positions along the southern limit.

**L. decurrens** Torr. INCENSE CEDAR. Tree to 45 m., with spreading short brs. forming a narrow-pyramidal head, irregular in old age; bark cinnamon-red, broken into irregular scaly ridges; brts. much flattened, bright green on both sides: lvs. oblong-ovate, acuminate, closely adnate to the brts., free at the apex, the lateral ones as long as and nearly covering the obscurely glandular facial ones, 3 mm. long on the lateral brts.: cones oblong, 2-2.5 cm. long, pendulous, light reddish brown; scales mucronate below the apex; the upper sterile pair connate; seeds oblong-lanceolate, 8-12 mm. long. S.S.10:534. B.S.2:25,t.(h). E.H.3,t.142(h). G.C.44:338(h). (*L. Craigana* Gord., *Heyderia* d. K. Koch, *Thuja gigantea* Carr., not Nutt.) Ore. to w. Nev. and L. Calif. Intr. 1853. Zone (V). Handsome tree of remarkably columnar habit with dark green foliage. A few garden forms as *L. d. compacta* Beiss., *L. d. glauca* Beiss. and *L. d. aureo-variegata* Beiss. are known.

**20. CUPRÉSSUS** L. CYPRESS. Trees, rarely shrubs, aromatic; brts. densely clothed with small appressed lvs., 4-angled or terete, rarely somewhat flattened: lvs. opposite, scale-like, minutely denticulate-ciliate, only on young plants or shoots subulate and spreading: fls. solitary, terminating short brts.: staminate fls. ovoid to oblong, yellow, the stamens with 2-6 pendulous globose anther-cells; female fls. subglobose: cone globose or nearly so, ripening the second season, consisting of 6-12 ligneous peltate scales, usually with a mucro at the flattened apex; each scale with numerous compressed and angled narrowly winged seeds; cotyledons 3-4. (The classical name of *C. sempervirens*.) About 12 species in the warmer temperate and subtropical regions; in America from Ore. to Mexico, in the Old World from the Medit. Reg. to China and Himal.—The majority of the species is tender, but the following which are the hardiest, will succeed at least in sheltered situations of the warmer parts of our area.

- A. Lvs. obscurely glandular, dark or bright green: cone-scales 8-12.
- B. Brts. rather stout, 1-1.5 mm. thick: boss of cone-scales thick.....1. *C. macrocarpa*
- BB. Brts. slender, scarcely 1 mm. thick: boss of cone-scales thin.....2. *C. sempervirens*
- AA. Lvs. with conspicuous, usually resinous gland on back: cone-scales 6-8.
- B. Lvs. dark or bright green, obtuse or acutish: cone-scales 6.....3. *C. Bakeri*
- BB. Lvs. bluish green, acute: cone scales 6-8.....4. *C. arizonica*

**1. C. macrocarpa** Gord. MONTEREY C. Tree to 25 m., pyramidal when young, with a broad crown in old age: bark separating into broad scaly ridges: brts. terete or slightly 4-angled: lvs. uniform, rhombic, obtuse, dark green: staminate fls. ovoid, 4 mm. long: cone globose or broad-ellipsoid,

short-stalked, 2.5–3.5 cm. long; scales with a short ridge-like boss in the centre. S.S.10:t.525. G.C.III.22:53. G.F.7:245(h). Am. For. 29:270,271(h). (*C. Lambertiana* Gord.) Calif., s. of Monterey. Intr. 1838. Zone VII.—*C. m. fastigiata* Carr. Brs. ascending forming a dense fastigiata head.—*C. m. lutea* Webster. Narrow pyramidal form with yellow lvs. S.N.111(h). Gn.68:237(h).—*C. m. Crippsii* R. Smith. A juvenile form with stiff brs. and spreading subulate lvs.—*C. m. pygmæa* A. B. Jacks., f. Very dwarf and dense, to 10 cm. high, with dimorphous lvs. Cult. 1936.

*C. m.* × *Chamaecyparis nootkatensis* = *Cupressocyparis Leylandii*; see below.

2. *C. sempervirens* L. ITALIAN C. Tree to 25 m. with erect or horizontal brs. and thin fissured bark; brts. terete or slightly 4-angled: lvs. uniform, rhombic, obtuse, dark green; staminate fls. oblong-cylindric, 4–5 mm. long: cone subglobose or ellipsoid, 2–3 cm. across; scales 8–14, contracted into a small point, sometimes flat or slightly impressed and mucronulate in the middle. H.W.1:196. C.B.2:73. S. Eu. and W. Asia. Planted since ancient times. Zone VII?—*C. s. stricta* Ait., var. COLUMNAR ITALIAN C. With erect or ascending brs. forming a columnar head. Gn.33:3(h). G.W.9:127(h). (*C. s.* var. *pyramidalis* Nym., *C. s. fastigiata* Hansen, *C. fastigiata* DC.)—*C. s. indica* Parl., var. Of columnar habit: cone globose, with 10 acutely mucronate scales.—*C. s. horizontalis* (Mill.) Gord. With horizontally spreading brs. forming a broad-pyramidal head. (*C. h.* Mill.)

Closely related species: *C. Duclouxiana* Hickel. Tree with spreading brs.; brts. usually slightly compressed: lvs. about 1 mm. long, obtusish, glaucescent: cones globose, 2–3 cm. across; scales usually 8, flat. Camus, Cypres, 92. C.B.N. t.43. (*C. torulosa* Rehd. & Wils., not D. Don.) W. China. Intr. about 1900. Zone VII?

3. *C. Bakeri* Jeps. MODOC C. Tree to 10 or sometimes 30 m.; bark thin, reddish, separating in thin plates: brts. slender, 4-angled: lvs. obtuse to acutish, keeled, with a conspicuous resin-gland, dark or bright green: cones subglobose, 1.5–2 cm. in diam., gray; scales 6, abruptly contracted into a short straight mucro, often an additional small pair at apex. Eliot, For. Tr. Pacific Coast, f.101–103. Ore. Intr. 1917. Zone (V). The hardest of the true Cupresses.

Related species: *C. Macnabiana* A. Murr. Shrub or tree to 10 m.; bark gray, slightly furrowed: brts. subterete: lvs. convex on back: cones 2–2.5 cm. long, with 6–8 scales, the upper ones with prominent incurved bosses. S.M.72. G.C. 56:411. S.S.10:t.528. B.C.2:915(h). S.N.178(h). Calif. Intr. 1854. Zone VII.

4. *C. arizonica bonita* Lemm., var. Tree to 12, occasionally to 25 m.; bark red-brown, separating in large thin flakes or on older trees fissured and separating into long shreds: brts. rather stout: lvs. acute, thick, keeled, with conspicuous resinous gland, more or less glaucous: fr. subglobose to broad-ellipsoid, 2.5–3 cm. across; scales 6–8, flat or slightly depressed on back and abruptly contracted into a short mucro. I.T.3:t.145. G.C.57:315. M.D.13:t.4(h). (*C. glabra* Sudw.) C. and s. Ariz. Intr. 1882. Zone VII?—*C. a. compacta* Schneid., var. Low roundish bush. S.N.179(h).—*C. a. glauca* Woodall. Juvenile form of intensely silvery gray color.—The typical *C. arizonica* Greene from s. Ariz. differs chiefly in the usually glandless lvs. and in the smaller cones with larger, more prominent bosses.

20a. × **CUPRESSOCÝPARIS** M. L. Green. Hybrid between *Cupressus* and *Chamaecyparis*; only the following cross known.

*C. Leylandii* (A. B. Jacks.) M. L. Green (*C. macrocarpa* × *Ch. nootkatensis*). Similar in habit, brts. and lvs. to *Ch. nootkatensis*: cones to 2 cm. across, with about 5 seeds to each scale. K.B.1926:114,t(h). Orig. 1888

**21. CHAMAECYPARIS** Spach. CYPRESS. Pyramidal trees; leading shoots nodding; brs. spreading; brts. mostly frond-like arranged, usually flattened: lvs. opposite, scale-like (only in the juvenile state subulate), ovate to rhombic, acuminate to obtuse, entire: staminate fls. ovoid to oblong, yellow, rarely red; stamens with 2-4 anther-cells: fr. globose, ripening the first season, with 6-12 peltate scales pointed or bossed in the middle; seeds 2, rarely up to 5, slightly compressed, with thin broad wings; cotyledons 2. (Greek *chamai*, on the ground, and *kyparissos*, cypress; in allusion to its affinity.) Syn. *Retinispora* Zucc., *Retinospora* Carr. Six species in N. Am. and in Japan and Formosa.

- A. Lvs. green on both sides or somewhat paler below, the lateral not much larger than the facial ones.
- B. Brts. compressed, slender, not distinctly 2-ranked: lvs. glandular, bluish green: cone about 6 mm. across.....1. *C. thyoides*
- BB. Brts. nearly 4-sided, stout: lvs. dark green, not glandular: cone nearly 1.2 cm. across.....2. *C. nootkatensis*
- AA. Lvs. with glaucous or whitish marks below: brts. arranged in horizontal planes.
- B. Lvs. closely appressed, obtuse to acute, the lateral much larger than the facial ones: cones 8-12 mm. across.
- C. Lvs. acute or acutish, glandular, the white markings below sometimes indistinct: staminate fls. red.....3. *C. Lawsoniana*
- CC. Lvs. obtuse, not glandular, lustrous dark green, the white markings distinct.....4. *C. obtusa*
- BB. Lvs. loosely appressed, acuminate, the lateral not much larger than the facial ones: cones 6-8 mm. across.....5. *C. pisifera*

1. *C. thyoides* (L.) B.S.P. WHITE CEDAR. Tree to 25 m., with reddish brown bark fissured into flat connected ridges; brs. upright-spreading or horizontal, forming a narrow spire-like head; brts. slender, rather irregularly arranged; lvs. closely appressed or on vigorous brts. spreading at the apex, keeled, conspicuously glandular, dark bluish or light green: cones globose, finally bluish purple, bloomy; scales with acute, often reflexed bosses; seeds 1 or 2 on each scale, with wings as broad as the seed. S.S.10:t.529. B.N.529(h). M.G. 11:301(h). (*C. sphaeroidea* Spach, *Cupressus t. L.*) Me. to Fla., w. to Miss.; in cold swamps. Intr. 1727. Zone III. The least attractive, but hardiest species.—*C. t. glauca* (Endl.) Sudw. Compact shrub with glaucous or nearly silvery white lvs. (*C. sphaeroidea* var. *kewensis* Hort.)—*C. t. variegata* (Loud.) Sudw. Brts. variegated with yellow.—*C. t. ericoides* (Carr.) Sudw. Low compact pyramidal bush: lvs. linear, spreading, with 2 glaucous lines beneath, usually changing to reddish brown in winter. B.C.5:2922. B.N.532. (*Retinispora e.* Gord.)—*C. t. andelyensis* Schneid., var. Of upright habit, with loosely appressed subulate lvs.; often part of the brts. like those of the type and others like those of the preceding form. B.C.5:2922. R.H.1880:36, 37(h). (*C. t. leptoclada* Sudw., *C. sphaeroidea a.* Carr., *Retinispora leptoclada* Gord., not Zucc.)

2. *C. nootkatensis* (Lamb.) Spach. NOOTKA C. Tree to 40 m., with brownish gray irregularly fissured bark separating into large thin scales; brs. ascending or spreading, forming a narrow pyramid; brts. usually pendulous, terete or 4-angled, on the upper part of the tree arranged on vertical planes: lvs. closely appressed, or on vigorous shoots spreading, acute, keeled or rounded on back and usually not glandular: staminate fls. bright yellow: cones subglobose, about 1 cm. across, dark red-brown, bloomy; scales 4-6, with erect pointed bosses and often with resinous glands; seeds 2-4 on each scale, with broad wings. S.S.10:t.530. F.E.25:543(h). H.B.4:27(h). (*C. nutkatensis* Spach, *C. nutkaensis* Lindl. & Gord., *C. nootkatensis* Sudw., *Cupressus n.* Lamb., *Thuyopsis borealis* Hort.—SITKA C., YELLOW CEDAR.) S. W. Alaska to Ore. Intr. 1853. Zone IV. Handsome narrow-pyramidal tree with dark

green lvs.—*C. n. glauca* Beiss. Lvs. very glaucous (*Cupressus nutkatensis* g. Reg.)—*C. n. lutea* Beiss. The young shoots light yellow changing finally to green. Gn.50:68(h). J.L.27:427(h).—*C. n. compacta* Beiss. Dwarf compact form. S.N.166(h).—*C. n. pendula* (Beiss.) Schneid., var. A form with spreading brs. and long pendulous brts. S.N.166(h). B.N.F.535(h).

*C. n.* × *Cupressus macrocarpa* = *Upressocyparis Leylandii*; see p. 56.

3. *C. Lawsoniana* (A. Murr. Parl. LAWSON C. Tree to 60 m., in cult. usually a narrow-pyramidal tree furnished to the ground with brs.; bark reddish brown, divided into round scaly ridges: brts. flattened, frond-like arranged in horizontal planes: lvs. closely appressed, acute or acutish, glandular, bright green to glaucous, marked below with often indistinct white streaks: staminate fls. crimson: cone globose, 8 mm. across, reddish brown and bloomy; scales 8, with thin, acute, reflexed bosses; seeds 2-4 on each scale, broadly winged. S.S.10:t.531. F.E.23:309(h);33:559(h). P.I.t.32(c,h). B.S.1:444(h). (*C. Boursieri* Decne., *Cupressus* L. A. Murr.) S. W. Ore. to n. w. Calif. Intr. 1854. Zone (V). One of the most handsome Conifers, but not thriving well in a dry climate; it is very variable and about 80 garden forms are known in Eu.—*C. L. glauca* (Jaeg.) Beiss. With steel-blue lvs. M.G.31:310(h). Here belongs "Triomphe de Boskoop."—*C. L. argentea* (Gord.) Beiss. With nearly silvery white lvs.; here belongs "Silver Queen."—*C. L. lutea* (R. Smith) Beiss. Of compact pyramidal habit; young growth bright yellow. S.N.t.5(hc).

Columnar forms: *C. L. erecta* (Gord.) Sudw. Columnar dense form with the brts. arranged in vertical planes, bright green. (*C. L. erecta viridis* Beiss., *Cupressus* L. *erecta viridis* Waterer.) G.C.58:272(h). S.N.168(h). A form of this with glaucous foliage is *C. L. "erecta glauca"* (R. Smith) Beiss.—*C. L. Allumi* (R. Smith) Beiss. Columnar form with bluish or steel-blue foliage. G.W.20:581(h).—*C. L. Fraseri* Beiss. Similar to the preceding, but less narrow in habit and with dark bluish foliage. M.G.33:250(h).—*C. L. Fletcheri* (Fletcher) Hornibr., var. Slow growing dense columnar form with ascending brs.: lvs. intermediate between the juvenile and adult form, glaucous. Gn.77:274(h). H.D.32,t(h).

Spreading and pendulous forms: *C. L. pendula* Beiss. With more or less spreading brs. and pendulous brts. F.E.27:187(h). A form of this with the brs. as well as the brts. pendulous is *C. L. "pendula vera"* Hesse.—*C. L. gracilis* Bailey, var. A graceful form with pendulous brts.: lvs. bright green with slightly spreading tips. (*C. L. gracilis pendula* Hort.)—*C. L. filiformis* (Nichols.) Beiss. Brs. spreading or slightly pendulous, the terminal brts. much elongated and with few short lateral brts., pendulous. Gs.6:231.—*C. L. intertexta* (R. Smith) Beiss. Pyramidal form with remote arching brs. and distant thickish brts., bluish green. B.N.550(h).

Dwarf forms: *C. L. nana* (Dauvesse) Beiss. Dwarf globose or ovoid form with stiff short brts., dark green. B.N.553(h). A form of this with bluish green lvs. is *C. L. "nana glauca"* Beiss.—*C. L. "minima glauca"* (R. Smith) Beiss. is a dwarf and compact conical form with dark steel-blue lvs. S.N. 132(h).

4. *C. obtusa* (Sieb. & Zucc.) Endl. HINOKI C. Tree to 40 m., with broad-pyramidal head: bark reddish brown, rather smooth, peeling off in thin strips: brts. arranged in horizontal planes: lvs. closely appressed, obtuse, dark green above, with white marks below, the facial ones more acutish, often keeled, not glandular: cones globose, 8-10 mm. across, orange-brown; scales 8, rarely 10, depressed on back and with a small mucro: seeds 2-5 on each scale, narrowly winged. S.Z.2:t.121(c). S.I.1:t.10(c). W.C.t.54,55(h). (Re-

*tinispora* o. Sieb. & Zucc., *Cupressus* o. K. Koch.) Japan, and in a slightly differing var. in Formosa (var. *formosana* Hayata). Intr. 1861. Zone III. An ornamental tree of rather slow growth; it does not do well in a dry climate and dislikes lime.

Forms differing in color: *C. o. albo-spica* Beiss. Young shoots at first creamy white, changing to pale green. (*C. o. albospicata* Beiss.)—*C. o. aurea* (Gord.) Henk. & Hochst. With golden yellow lvs. S.N.t.6(hc). Gn.M.2: 27(h).—*C. o. Crippsi* (Cripps) Rehd., var. With pale yellow lvs.—*C. o. "gracilis aurea"* (R. Smith) Nichols. A graceful form with slender slightly pendulous brts. golden yellow at first, changing to greenish yellow. (*C. o. aurea Youngii* Bobbink & Atkins.)—*C. o. "tetragona aurea"* (Barron) Nichols. A dwarf broad-pyramidal form, with crowded irregular brt. systems; brts. more or less 4-angled and partly golden-yellow. (*C. o. tetragona* Rehd.) H.D.43,t.(h). The green form, *C. o. tetragona* (Gord.) Hornibr., var., is not now in cult.

Forms differing in habit: *C. o. breviramea* (Maxim.) Reg., var. Tree of narrow-pyramidal habit, with short brs.; brts. rather thin, close, regularly arranged, the lateral ones overtopping the terminal one: cones slightly smaller. (*C. b.* Maxim.) Japan. Intr. 1919.—*C. o. magnifica* (R. Smith) Beiss. Vigorous form with stout brts. and lustrous bright green lvs.—*C. o. erecta* Beiss. Fastigate form with ascending brs. and bright green lvs.—*C. o. gracilis* Rehd., var. Compact pyramidal form, dark green; brts. with slightly pendulous tips.—*C. o. filicoides* (R. Smith) Hartw. & Ruempl., var. Usually shrubby, of slow growth, with crowded and short brts. of nearly equal length on elongated brs., forming long and narrow frond-like brt.-systems; brts. keeled above. G.C.II.5:235. K.V.221 (*Retinospora f. Veitch.*)—*C. o. lycopodioides* (Gord.) Carr. Dwarf shrubby form, with irregularly ramified brs., the ultimate brts. crowded, not arranged in one plane, partly fasciated, not or scarcely compressed; lvs. appressed, elongated acute, spirally arranged or indistinctly 4-ranked, dark green. Gs.6:231.—*C. o. compacta* (Gord.) Hartw. & Ruempl., var. Dwarf broad-conical form with much crowded short brts. at the end of short brs. G.C.78:37(h). B.E.t.18(h, as var. *nana*).—*C. o. nana* Carr. Low form of slow growth, with spreading brs. and short dark green brts. R.H. 1882:102. A form of this with the young growth golden yellow is *C. o. "nana aurea"* Carr.—*C. o. pygmaea* (Gord.) Henk. & Hochst. Very dwarf form with horizontal almost creeping brs. and short close-set brts. R.H.1889: 376(h). Interesting form for rockeries.

Juvenile form: *C. o. ericoides* Boehmer. Dense broad-conical or subglobose bush with rather stout brts. and spreading linear obtuse lvs. 3-5 mm. long, thickish and bluish gray. G.C.33:f.107(h). H.D.42,t(h). (*Juniperus Sanderi* Hort., *Retinospora Sanderi* Sander, *Cupressus pisifera* var. *Sanderi* Dallim. & Jacks.)

5. *C. pisifera* (Sieb. & Zucc.) Endl. SAWARA C. Tree to 50 m., with horizontally spreading brs. forming a narrow-pyramidal head; bark red-brown, rather smooth, peeling off in thin strips; brts. flattened, 2-ranked and arranged in horizontal planes; lvs. appressed, acuminate, ovate-lanceolate, with slightly spreading tips, obscurely glandular, dark green above, with whitish lines beneath: cones globose, 6 mm. across, dark brown; scales 10, sometimes 12, with a small mucro at the depressed centre; seeds 1-2, broadly winged. S.Z.2:t. 122(c). P.I.t.34(c,h). W.C.t.56,57(h). (*Retinispora p.* Sieb. & Zucc., *Cupressus p.* K. Koch.) Japan. Intr. 1861. Zone III. A narrow-pyramidal tree of fairly rapid growth and rather loose habit; it is apt to become soon thin and

to lose its lower brs.—*C. p. aurea* (Gord.) Henk. & Hochst. Foliage golden-yellow. G.W.20:581(h).—*C. p. sulphurea* (Kent) Schelle. Foliage light yellow.—*C. p. filifera* (Sénécl.) Hartw. & Ruempl., var. Pyramidal shrub or small tree with spreading and elongated pendulous thread-like brs. and with short and remote lateral brts.: lvs. subulate, distant, sharply pointed. (*Retinisporea* f. Gord., *C. p. filifera pendula* Hort.) G.C.II.5:237. B.N.572,571(h). S.N.62(h). Forms of this variety are *C. p. "filifera aurea"* Beiss. with the young growth golden yellow and *C. p. "filifera aureo-variegata"* Voss, f., with the brts. variegated with yellow but less elongated.

Juvenile forms: *C. p. plumosa* (Carr.) Otto, var. A transition between the type and var. *squarrosa*. Of dense conical habit: brs. ascending; ultimate brts. frond-like arranged, feathery: lvs. slightly spreading, subulate, 3-4 mm. long, bright green outside, whitened on the inner face. B.C.2:731. Gn.M.2:27(h). S.N.108(h). (*Retinisporea* p. Veitch.) Intr. 1861. Color forms of this var. are: *C. p. "plumosa argentea"* (Sénécl.) Otto, var., with the tips of the brts. whitish; *C. p. "plumosa aurea"* (R. Smith) Otto, var., with the young growth golden yellow. B.E.215; *C. p. "plumosa flavescens"* Beiss. with the tips of the young brts. yellowish.—*C. p. squarrosa* (Endl.) Beiss. & Hochst. Dense bush or small tree; brts. irregularly arranged, not frond-like, feathery: lvs. spreading, flat, linear, about 6 mm. long, rather soft, glaucous. B.E.215. B.C.2:731. M.G.24:44(h). Intr. 1843. A form with yellow foliage is *C. p. "squarrosa sulphurea"* (Nichols.) Beiss.—*C. p. minima* Hornibr. Low shrub of dense irregular habit with very crowded short brts.; lvs. 3-5 mm. long, partly recurved. (*C. p. var. squarrosa minima* Hornibr.)

**22. JUNÍPERUS L. JUNIPER.** Trees or shrubs with usually thin, shreddy, rarely scaly bark: lvs. opposite or ternate, acicular or scale-like, on young plants always acicular, on old plants either all acicular and ternate, or all scale-like or both: fls. dioecious or monoecious, axillary or terminal, the staminate yellow, consisting of numerous opposite or ternate stamens forming an ovoid or oblong catkin, the female of 3-8 pointed scales, some or all bearing 1 or 2 ovules; the scales become fleshy and unite into a berry-like indehiscent and usually succulent strobile subtended by scaly bracts, ripening the first, 2d or 3d year; seeds 1-12 usually ovoid, terete or angled, often grooved, brown, with a conspicuous hilum at base: cotyledons 2 or 4-6. (The ancient Latin name.) Including *Sabina* Spach. About 40 species widely distributed through the n. hemisphere from the arctic zone to the mts. of the tropics.

- A. Lvs. all acicular, ternate, spreading, joined at base, with 2 white, often confluent bands above: winter-buds distinct: fls. axillary, dioecious: seeds usually 3.
  - B. Fr. large, 2-2.5 cm. across; seeds connate into a 3-celled stone: lvs. decurrent, 3-4 mm. broad ..... Sect. I. *CARYOCEDRUS* Endl.
    1. *J. drupacea*
  - BB. Fr. smaller; seeds not connate: lvs. 1.5-3 mm. broad, not decurrent.
    - Sect. II. *OXYCEDRUS* Endl.
- C. Lvs. with the white band above separated by a green midrib.
  - D. White bands scarcely as broad as the green margin; lvs. spreading, sharply pointed: brts. spreading.
    - E. Lvs. very rigid, 1.2-2 cm. long, tapering from the middle..... 2. *J. Oxycedrus*
    - EE. Lvs. less rigid, 2-2.5 cm. long, tapering from the base..... 3. *J. macrocarpa*
  - DD. White bands broader than the green margin; lvs. directed forward: tree with pendulous brs. .... 4. *J. formosana*
- CC. Lvs. with the white bands confluent.
  - D. White band narrower than the green margin; lvs. sulcate above.
    - E. Upright shrub or tree: fr. 8-8 mm. across..... 5. *J. rigida*
    - EE. Procumbent shrub: fr. 8-12 mm. across..... 6. *J. conferta*
    - DD. White band broader than the green margin; lvs. concave above... 7. *J. communis*

- AA. Lvs. all or partly scale-like, less often all acicular, but not jointed at base, decurrent; without distinct winter-buds: fls. terminal, dioecious or monoecious: fr. with 1-6 seeds. Sect. III. SABINA Endl.
- B. Lvs. always ternate and acicular.
- C. Brs. recurved and pendulous; tree: lvs. loosely appressed, channeled on the back near the base, without green midrib above: fr. 1-seeded.....8. *J. recurva*
- CC. Brs. prostrate or spreading; shrubs or tree: lvs. appressed or spreading, with a green midrib above, channeled from base to near apex.
- D. Brts. green and lvs. green below: procumbent shrub or tree: fr. 1-seeded.
- DD. Brts. glaucous on the edge of the pulvini: lvs. glaucous beneath spotted with white: procumbent shrub: fr. 2-3-seeded.....10. *J. procumbens*
- BB. Lvs. at least on mature plants wholly or partly scale-like, usually opposite or opposite and ternate on the same plant.
- C. Lvs. minutely denticulate (under a strong lens).
- D. Acicular lvs. usually ternate.
- E. Fr. reddish brown or yellow, rather large, fibrous, dry.
- F. Scale-like lvs. obtuse or obtusish, opposite: seeds 3-6.
- G. Bark shreddy: fr. shining yellow.....11. *J. phoenicea*
- CC. Bark scaly: fr. reddish brown, bloomy.....12. *J. pachyphloea*
- FF. Scale-like lvs. acute: seed 1.....13. *J. utahensis*
- EE. Fr. blue or blue-black, usually bloomy, juicy.
- F. Brts. stout; scale-like lvs. usually ternate, conspicuously glandular: seeds 2-3.....14. *J. occidentalis*
- FF. Brts. slender; scale-like lvs. opposite, rarely ternate, glandless or obscurely glandular: seed usually 1.
- G. Fr. globose or ellipsoid, bloomy, 3-6 mm. long.....15. *J. monosperma*
- CC. Fr. ovoid, broadest at base, not bloomy, 8-12 mm. long.....16. *J. Wallichiana*
- DD. Acicular lvs. opposite; scale-like lvs. acute: fr. blue; seeds 2-4.....17. *J. thurifera*
- CC. Lvs. entire: fr. blue-black, small, (brown or purplish brown and larger in Nos. 18 and 19).
- D. Acicular lvs. often ternate; scale-like lvs. obtuse: fr. brown, bloomy, seeds 2-3.
- DD. Acicular lvs. opposite, ternate only on leading shoots: scale-like lvs. acute.
- E. Fr. dark purplish brown, bloomy, about 1 cm. across, with about 6 seeds: acicular lvs. rarely present; tree.....18. *J. excelsa*
- EE. Fr. blue-black, 5-6 mm. across, with 1-4 seeds.
- F. Fr. erect or nodding; seeds 1-2; trees, rarely shrubby.
- G. Fr. ripening the first season: male fls. with 10-12 stamens.....20. *J. virginiana*
- CC. Fr. ripening the second season: male fls. with 6 stamens.....21. *J. scopulorum*
- FF. Fr. pendulous; seeds 1-4, usually 2: shrubs, often prostrate.
- G. Lvs. dark green, obtuse or acutish, of strong disagreeable odor when bruised.....22. *J. Sabina*
- CC. Lvs. bluish green or steel-blue, acute or cuspidate, of aromatic, less strong odor: prostrate shrub.....23. *J. horizontalis*

1. *J. drupacea* Labill. SYRIAN J. Tree to 20 m., of pyramidal habit, in cult. usually columnar; brts. triangular, with prominent ridges: lvs. linear-lanceolate, widest near base, sharply pointed, above with 2 white bands and a broad green midrib, 1.5-2 cm. long: fr. brown or bluish, bloomy, ripening the 2d season. G.C.III.19:519. B.C.3:14. S.N.114,205(h). M.D.1916:t.33(h); 1931:t.30(h). Greece, Asia Minor. Intr. 1853. Zone VII. Handsome ornamental tree of columnar habit; thrives well on limestone soil.

2. *J. Oxycedrus* L. PRICKLY J. Shrub or small tree to 10 m.: brts. angular, rather slender: lvs. linear, tapering from the middle to a spiny point, 12-18 mm. long and 1-1.5 mm. broad: fr. globose, 6-12 mm. across, reddish brown, without or with partial bloom. H.W.1:193. C.B.3:22. Medit. Reg. to Cauc. and Persia. Cult. 1740. Zone VII? In cult. usually a compact shrub.

3. *J. macrocarpa* Sibth. PLUM J. Bushy shrub or small tree to 4 m., of dense pyramidal habit: lvs. linear, tapering from the base, sharply pointed, 1.8-2.5 cm. long, 2 mm. broad: fr. globose, 1.2 cm. across, dark brown, glaucous. C.B.3:16. (*J. neaboriensis* Gord.) Medit. Reg. Intr. 1838. Zone VII.

4. *J. formosana* Hayata. FORMOSAN J. Tree to 12 m., usually dividing into several stems, with spreading or ascending brs. and pendulous brts.: lvs. more or less directed forward, linear, spiny-pointed, 1.2-2.5 cm. long and 1.5-2 mm. wide, with two broad white bands above coalescent near apex, keeled below: fr. subglobose or broadly ovoid, 8 mm. across, reddish or orange brown.

J.C.25,19:t.38. C.B.3:17. S.N.31(h). (*J. taxifolia* Parl., not Hook. & Arn., *J. oblonga pendula* Knight & Perry.) Formosa, China. Intr. probably 1844. Zone V. Handsome tree with pendulous brts.

5. *J. rígida* Sieb. & Zucc. NEEDLE J. Shrub or tree to 10 m., pyramidal or columnar, with ascending brs. and pendulous brts.: young brts. slender, triangular: lvs. spreading, linear-subulate, tapering from the middle into a spiny point, 1.2-2.5 cm. long, about 1 mm. wide, deeply sulcate above and with a narrow white band, prominently keeled below: fr. globose, 6-8 mm. across, brownish black, bloomy, finally slightly shining, ripening the second year. S.I.1:t.12(c). W.C.58(h). Japan, Korea, to N. China. Intr. 1861. Zone V. Graceful pyramidal tree or shrub with pendulous brts.

6. *J. conférta* Parl. Procumbent shrub: lvs. crowded, about 1.2 cm. long, bluish green, tapering to a spiny point, deeply sulcate above, keeled below: fr. globose 8-12 mm. across, black and bloomy. C.B.3:18. W.C.t.59(h). Gn. 88:142(h). (*J. litoralis* Maxim.) Saghal., Japan. Intr. 1915. Zone V.

7. *J. communis* L. COMMON J. Shrub or tree of pyramidal habit, to 12 m.; bark reddish brown, peeling off in papery shreds: lvs. linear-subulate to linear-lanceolate, tapering from the base to a spiny point, about 1.5 cm. long, concave above and with a broad white band sometimes divided at base by a green midrib, bluntly keeled below: fls. rarely monoecious: fr. globose or broadly ovoid, 5-6 mm. across, short-stalked, bluish or black, slightly bloomy, ripening the 2d or 3d year; seeds usually 3. H.W.1:t.10(c). S.S.1:t.516. E.H.6:t.348(h). N. Am., s. to Pa., Ill., N. M. and n. Calif.; Eu. to W. Himal. and N. E. Asia. Cult 1560. Zone II. A very variable species with some garden forms and several geographical varieties; the typical upright form (*var. erecta* Pursh) is common in Eu. and occasionally found in n. e. North Am.—*J. c. aurea* Nichols. Brts. drooping; young growth golden yellow, changing later to green. (*J. c. aureo-variegata* Beiss.)—*J. c. suècica* Ait., var. SWEDISH J. Columnar form with rather spreading, light bluish green lvs.; brts. with nodding tips. B.N.621(h). G.W.20:579(h). (*J. c. var. fastigiata* Parl., *J. s. Mill.*)—*J. c. hibernica* Gord. IRISH J. Similar to the preceding, but lvs. shorter, less spreading, dark green; tips of brts. upright. B.N.623(h). (*J. c. stricta* Carr.)—*J. c. pëndula* Carr. Shrub with spreading and recurving brs. and pendulous brts.—*J. c. oblóngo-pëndula* Sudw. Broad-columnar shrub with pendulous brts. and thin and slender lvs. Am. For. 35:576(h). (*J. c. var. oblonga pendula* Loud.)—*J. c. compréssa* Carr. Slow growing dwarf fastigate shrub with very short crowded brts. and thin lvs. 3-6 mm. long. H.D.70,t(h).

The following are geographical varieties: *J. c. depréssa* Pursh, var. PROSTRATE J. Low shrub, rarely exceeding 1.5 m., forming broad patches with numerous stems ascending from a procumbent base: lvs. somewhat shorter and broader. B.E.t.12(h). (*J. c. var. canadensis* Loud., *J. c. nana canadensis* Carr., *J. canadensis* Burgsd.) E. N. Am.—A variation with the young growth yellow is *J. c. aureo-spica* Rehd., var. (*J. nana canadensis aurea* Beiss., *J. canadensis aurea* Hort.)—*J. c. saxatilis* Pall., var. MOUNTAIN J. Spreading prostrate shrub, rarely over 60 cm. high: lvs. crowded, linear-oblong, 4-8 mm. long and 1-2 mm. broad, abruptly pointed, usually curved and very concave above: fr. globose, glaucous; seeds 1-3. E.B.8:t.1383(c). M.G.25:123(h). (*J. c. var. montana* Ait., *J. c. var. nana* Loud., var. *alpina* Gaud., *J. nana* Willd., *J. sibirica* Burgsd.) Arctic reg. and high mts. of Eu. and N. Am. Cult. 1789.—*J. c. Jáckii* Rehd., var. Prostrate shrub with flagelliform trailing brs. often to 1 m. long and nearly unbranched except a few clusters of short brts.:

lvs. linear-lanceolate, incurved. Ore., n. Calif. Intr. 1904.—*J. c. nippōnica* Wils., var. Similar to var. *saxatilis*, but lvs. deeply sulcate above and keeled below. High mts. of Japan. Intr. 1915.

8. *J. recurva* Buch.-Ham. Tree to 10 m., usually broad-pyramidal with spreading curved brs. and pendulous brts.: bark brown, peeling off in thin flakes: lvs. ternate, densely imbricated and loosely appressed, linear-lanceolate, 3-6 mm. long, sharply pointed, very concave above and whitish, dull green beneath and grooved below the middle: fls. monoecious: fr. ovoid, 8-10 mm. long, dark purple-brown, ripening the 2d year, 1-seeded. G.C.II.19:574. B.S.1:674,t(h). (*Sabina* r. Ant.) Himal.: Sikkim and Bhutan.; S. W. China. Intr. 1830. Zone VII?—A graceful tree with dull foliage.

Related species: *J. Coxii* A. B. Jacks. Large tree: lvs. about 1 cm. long, more acuminate, with 2 greenish white bands above, convex below: fr. ovoid, black, slightly bloomy. N.F.5:33. C.B.N.t.50. S. W. China, Burma. Intr. 1920. Zone VII?

9. *J. squamata* Lamb. Shrub with long decumbent brs. and ascending brts.; young brts. green: lvs. ternate, crowded and loosely appressed or slightly spreading, linear, finely pointed, 3-4 mm. long, concave above and whitened, convex below and grooved from base to near apex, green: fr. ellipsoid, 6-8 mm. long, changing from reddish brown to purplish black, 1-seeded. C.B.3:29. S.N.192(h). (*J. recurva* var. s. Parl., *J. densa* Gord., *Sabina* s. Ant.) Himal., W. and C. China, Formosa. Intr. 1836 or before. Zone IV.—*J. s. prostrata* Hornibrook, var. Prostrate form with horizontally spreading brs. F.R.N.8:f.66(h). Intr. 1909.—*J. s. Fargèsii* Rehd. & Wils., var. Tree 5-20 m., with upright-spreading brs.: lvs. narrower and longer, usually 8 mm. long, acuminate, pale or bluish green: fr. ovoid, 5-6 mm. long. Not. Syst. Herb. Ross. 5:31. S.N.193(h). Gn.88:141(h). (*J. F. Komar.*, *J. Lemeana* Lévl. & Blin.) W. China. Intr. 1907. Zone V.—*J. s. Wilsōnii* Rehd., var. Upright shrub to 2 m., with short crowded brts. recurved at the tips: lvs. shorter and broader, crowded, broad-lanceolate, about 4 mm. long. W. China. Intr. 1909. Zone V.—*J. s. Meyeri* Rehd., var. Upright much branched shrub with ascending brs. and short straight brts.: lvs. narrow-lanceolate, straight, 6-8 mm. long, very glaucous on back. B.D.1923:t.20(h). H.B.1:76(h) China. Intr. 1914. Zone IV. Handsome with its dense habit and bluish white lvs.

10. *J. procumbens* (Endl.) Sieb. & Zucc. Low spreading shrub, with ascending brts., to 75 cm. high; brts. glaucous: lvs. ternate, linear-lanceolate, 6-8 mm. long, spiny-pointed, concave above and glaucous with a green midrib, bluish below, with 2 white spots near the base from which 2 glaucous lines run down the edges of the pulvini: fr. subglobose, 8-9 mm. across, 2-3 seeded. S.Z.2:t.127,f.3. C.B.3:25. (*J. chinensis* var. *p.* Endl.) Cult. in Japan. Intr. 1843. Zone V. Handsome low shrub, often planted as a ground-cover.

11. *J. phoenicea* L. PHOENICIAN *J.* Shrub or tree to 6 m., with upright or ascending brs. forming a pyramidal head: lvs. usually scale-like, in 3's or opposite, rhombic-ovate, 1 mm. long, obtuse, rounded on the back, dark or bluish green: fls. usually monoecious: fr. variable, but usually globose, 8 mm. across, shining yellow or reddish brown, 3-6-seeded. B.S.1:673. C.B. 3:13. (*Sabina* p. Ant.) Mediter. Reg. Intr. 1683. Zone VII.

12. *J. pachyphloea* Torr. ALLIGATOR *J.* Tree to 20 m., with a short trunk and stout spreading brs. forming a broad-pyramidal or round-topped head; bark dark brown, broken into small, closely appressed scales; brts. slender: lvs. usually scale-like, opposite, bluish green, rhombic-ovate, 1.5 mm. long, rounded or apiculate at the apex, obscurely keeled on the back and glandular;

acicular lvs. 3-6 mm. long, spiny-pointed, in 3's or in pairs, usually bluish green: fr. globose or broadly ellipsoid, 1.2 cm. long, tuberculate, reddish brown, bloomy, ripening the second year, usually 4-seeded. S.S.10:t.520. C.B. 3:23. M.D.1921:t.17(h). For. & Irr. 12:150(b). (*Sabina p. Ant.*) Ariz. and New Mex. to s. w. Tex. and Mex. Cult. 1873. Zone VII. One of the handsomest American Junipers, remarkable for its checkered bark; the acicular foliage of young plants is usually glaucous or nearly silvery white. Some named juvenile forms have been offered in Eu., e.g., *J. p. ericoides* Beiss., with glaucous lvs. R.H.1914:343.

13. *J. utahensis* (Engelm.) Lemm. УТАН J. Bushy tree, rarely exceeding 6 m., with short trunk and erect or ascending brs. forming a roundish open head; bark shreddy; brts. slender: lvs. usually scale-like, opposite or occasionally in 3's, rhombic-ovate, acute or acutish, about 2 mm. long, rounded on the back and usually glandless: acicular lvs. usually in 3's: fr. subglobose or broadly ellipsoid, 6-10 mm. long, marked by the tips of the scales, reddish brown, bloomy, 1- or rarely 2-seeded. S.S.10:t.518. Contr. U. S. Nat. Herb. 25:t.13(h). (*J. californica* var. *u.* Engelm., *Sabina u.* Rydb.) Wyo. to Calif., Ariz. and New Mex. Intr. about 1900. Zone VII. Little known in cult. and of no particular ornamental value.—*J. u. megalocarpa* (Sudw.) Sarg., var. Tree to 18 m., with a single tall trunk; scale-like lvs. in 3's: fr. 1.2-1.5 cm. across. For. & Irr. 13:307(h). (*J. m.* Sudw.) Ariz., N. Mex. Intr. 1916.

Related species: *J. Pinchottii* Sudw. Shrubby tree to 6 m.; lvs. usually in 3's, acute, about 2.5 mm. long, conspicuously glandular-pitted: fr. subglobose, 6-9 mm. long, reddish brown, with 1-2 seeds. For. & Irr. 11:203(h), 204. Texas. Intr.?

14. *J. occidentalis* Hook. Tree to 15, rarely to 20 m., with short trunk and spreading brs. forming a low broad head, or a shrub with several stems; brts. stout, about 2 mm. thick: lvs. usually scale-like, in 3's, closely appressed, rhombic-ovate, acute or acuminate, about 3 mm. long, grayish green, glandular: fr. subglobose or ellipsoid, 6-8 mm. long, bluish black, bloomy, 2-3-seeded. S.S.10:t.521. C.B.3:21. S.N.191(h). (*Sabina o.* Rydb.) Wash. to s. Calif. Intr. 1840. Zone VII.

15. *J. monosperma* (Engelm.) Sarg. Tree, occasionally to 18 m., with short stout brs. forming an irregular head, or branching from the base and shrubby: brts. slender, about 1 mm. thick: lvs. mostly scale-like, opposite, rarely in 3's, acute or acuminate, often slightly spreading at the apex, 2 mm. long, rounded on the back and conspicuously glandular, grayish green; acicular lvs. in 3's, often 1 cm. long: fr. globose or ovoid, 3-6 mm. long, dark blue, bloomy, 1-seeded, rarely 2-3-seeded; seeds with 2 or 3 ridges, sometimes more or less exerted (f. *gymnocarpa* Rehd.) S.S.10:t.522. (*J. occidentalis* var. *m.* Engelm., *Sabina m.* Rydb.) Colo. to w. Tex., n. Mex. and Nev. Intr. about 1900. Zone VII. Of little ornamental value.

Related species: *J. mexicana* Schlechtend. Usually shrubby tree, occasionally to 30 m.; brts. 4-angled: lvs. opposite, scale-like, ovate, acute, dark gray-green, usually without gland, keeled, on primary brs. in 3's, subulate, 3-4 mm. long: fr. globose-ovoid, 6-8 mm. long; seed 1, rarely 2, broad-ovoid, without ridges. S.S.10:t.523. S.M.87. (*J. tetragona* Schlechtend., *J. Ashei* Buchh.) S. Mo. and Okla. to c. Mex. Intr. about 1925. Zone VII.

16. *J. Wallichiana* Hook. f. ex Brandis. Tree to 20 m. with spreading brs. or shrub; brts. slender: lvs. usually of 2 kinds; the scale-like lvs. opposite, closely appressed, narrowly ovate, acute, 1.5 mm. long, bright green, furrowed and glandular on the back; the acicular lvs. in 3's, whitened above, 4 mm. long: fls. dioecious: fr. erect, at the end of short curved brts., ovoid, 1 cm. long, dark, purplish brown, finally blue, 1-seeded. C.B.3:32. (*J. Pseudo-*

*sabina* Hook. f., not Fisch. & Mey.) Himal., S. W. China. Intr. 1849. Zone VII. Little known in cult.

Related species: *J. pseudosabina* Fisch. & Mey. Low shrub with less acute lvs. and smaller recurved, often globose fr. Altai Mts., Turkestan. Cult. 1900. Zone V.—*J. saltuaria* Rehd. & Wils. Tree to 15 m.; lvs. acute or obtusish, obscurely glandular; fls. monoecious: fr. ovoid or subglobose, 5–6 mm. long, black. N. W. China. Intr. 1904. Zone VI or VII?—*J. glaucescens* Florin. Small tree with spreading or pendent brs.: scale-like lvs. opposite, triangular-ovate to lanceolate, acute, conspicuously glandular, on shoots ternate, subulate: fr. pale blue, bloomy, ovoid to subglobose, 6–8 mm. long; seed obovoid with about 6 slight grooves on each side. N. W. China. Intr. 1926. Zone V?—*J. distans* Florin. Shrub to 2 m. with horizontal distant brs. and drooping brts.: lvs. ternate, on leading brs. triangular-lanceolate, to 6 mm. long, toward the apex and on lateral brts. scale-like, shorter, appressed, glandular; fr. red-brown, 8–12 mm. long; seed obovoid, obtuse or apiculate, acute at base, sulcate. N. W. China. Intr. 1926. Zone V?—*J. tibetica* Komar. Tree to 30 m. with dense yellowish green head; lvs. opposite, deltoid, with a conspicuous oblong or linear dorsal gland: fr. dark brown, lustrous, 15 mm. diam.; seed at apex obtusely 4-angled, grooved and gibbous on the sides. E. Tibet, N. W. China. Intr. 1926. Zone V.

17. *J. thurifera* L. Tree to 12 m., narrow-pyramidal in cult.; brt.-systems pinnately divided and mostly in one plane: brts. slender: lvs. often of 2 kinds, always opposite, the scale-like ovate, free at the acuminate apex, 1.5 mm. long, with a glandular depression on the back; the acicular lvs. 3–4 mm. long, glaucous above with a green midrib: fls. dioecious: fr. subglobose, about 8 mm. across, dark blue, slightly bloomy; seeds 2–4. C.B.3:11,4. (*J. hispanica* Mill., *J. sabinoides* Endl., partly, *Sabina* t. Ant.) S. W. Eu., N. Afr. Intr. before 1750. Zone VII?

18. *J. excelsa* Bieb. Tree to 20 m., with upright or spreading brs., forming a narrow-pyramidal head: bark brown, peeling off in strips: brts. very slender: lvs. usually scale-like, opposite, rhombic-ovate, closely appressed, with incurved acute apex, glandular on back, on the leading shoots ternate; acicular lvs. opposite, 5–6 mm. long, with 2 glaucous bands above; fr. globose, about 8 mm. across, dark purplish brown, covered with bluish bloom, 4–6-seeded. Gt.46:t.26. C.B.2:75. S.N.78(h). (*Sabina* e. Ant.) S. W. Eu., Asia Minor, Cauc. Intr. 1836. Zone VII.—*J. e. stricta* Gord. Columnar form with juvenile glaucous foliage. (*J. e. Perkinsii* Gord., *J. e. venusta* Gord.)

A related species is *J. foetidissima* Willd. Tree; brts. thicker, distinctly 4-angled, of fetid odor when crushed: lvs. loosely appressed, acute to acuminate: fr. globose or ovoid, 6–12 mm. long, sometimes nearly black, bloomy; seeds 1–3. Antoine, Cupress.-Gatt.t.66–70. (*J. sabinoides* Griseb.) Greece, Asia Minor. Intr. 1910. Zone VII?

19. *J. chinensis* L. CHINESE *J.* Tree to 20 m., usually with ascending brs. forming a pyramidal head, or shrub, sometimes procumbent; brts. slender: lvs. often of 2 kinds, the scale-like narrowly rhombic, closely appressed, obtuse, 1.5 mm. long, the acicular ones usually ternate, spiny pointed, with 2 white bands above: fls. dioecious, the staminate yellow, with about 8 pairs of stamens, often on brs. with juvenile foliage: fr. subglobose, 6–8 mm. across, brown with a thick mealy bloom, ripening the second year; seeds 2–3. S.Z.2:t.126,127(c). S.I.1:t.12(c). B.N.603(h). (*J. sinensis* Hort., *Sabina* c. Ant.) China, Mong., Japan. Intr. before 1767. Zone IV. A variable species with many garden forms.—*J. c. variegata* Gord. Compact shrub with the tips of the brts. creamy white: lvs. mostly scale-like. G.M.6:292. (*J. c. albo-variegata* Veitch.)—*J. c. aurea* Young. Upright form with scale-like lvs., the young growth golden yellow. (*J. c. mascula aurea* Hort.)

Columnar or narrow-pyramidal forms: *J. c. mas* Gord. Dense columnar

form with mostly acicular lvs. and usually with staminate fls. Handelsbl. Deutsch. Gartenb. 26:315(h). (*J. c. mascula* Carr., *J. c. neaboriensis* Beiss. *J. c. neoboracensis* Spaeth, *J. struthiacea* Knight.)—*J. c. pyramidalis* (Carr.) Beiss. Very compact narrow-pyramidal form with upright brs. and crowded upright brts.: lvs. nearly always acicular and ternate, 4–10 mm. long, stiff and glaucous. (*J. japonica p.* Carr.)

Spreading and pendulous forms: *J. c. Pfitzeriana* Spaeth. Broad-pyramidal form or often without leader, with wide-spreading brs. and nodding brts. and grayish green or glaucous scale-like lvs. B.N.606(h). B.E.t.13(h).—*J. c. pendula* Franch., var. With spreading brs. and pendulous brts.

Low or dwarf forms: *J. c. globosa* Hornibr., var. Dwarf and dense subglobose form with short crowded thickish brts. clothed mostly with scale-like bright green lvs. (*J. virginialis g.* Hort.) A form, *J. c. aureo-globosa* Rehd., var., has the younger brts. variegated with golden yellow.—*J. c. plumosa* Hornibr., var. Low plant with spreading and arching brs. and short nodding brts. clothed with mostly scale-like lvs., forming plumose sprays. (*J. c. procumbens* Beiss., in part.) A form with the young foliage golden yellow is *J. c. "plumosa aurea"* Hornibr., var. (*J. c. japonica aurea* Mast., *J. japonica aurea* Carr.)—*J. c. japonica* (Carr.) Lav. Low shrub with decumbent brs. and mostly with acicular lvs. (*J. c. nana* Hochst., *J. c. procumbens* Beiss. in part, var. *decumbens* Hornibr., *J. j.* Carr.) A form with the foliage variegated with white is *J. c. alba* Rehd., f. (*J. japonica a.* Standish, *J. c. procumbens albo-variegata* Beiss.) A form variegated with yellow is *J. c. "japonica aureo-variegata"* (Beiss.) Mast., var. (*J. j. aurea-variegata* R. Smith.)—*J. c. Sargentii* Henry, var. Prostrate shrub with creeping stems and ascending brts. forming dense mats; adult plants with the lvs. scale-like and bluish green, on young plants acicular and grass-green: fr. bluish, slightly bloomy. W.A. 98,t(h). B.E.t.14(h). (*J. c. procumbens* Takeda, *J. procumbens* Sarg., not Sieb.) Japan, Saghal., Kurile Isls. Intr. 1892. Handsome form valuable as a ground-cover.

The plant now in cult. as *J. sphaerica* Lindl. does not differ from *J. chinensis*.

20. *J. virginiana* L. RED CEDAR. Tree to 30 m., with upright or spreading brs. forming a narrow- or broad-pyramidal head; bark reddish brown, shredding in long strips; brts. very slender, less than 1 mm. thick; scale-like lvs. rhombic-ovate, acute or acuminate and free at apex, 1.5 mm. long, often with a small gland on back, acicular lvs. often present, 5–6 mm. long, spiny-pointed, concave and glaucous above, opposite, but on vigorous shoots and on young plants in 3's: staminate fls. with about 6 pairs of stamens: fr. subglobose or ovoid, 6 mm. long, bluish, bloomy, ripening the first season; seeds 1–2. S.S.10:t.524. G.F.8:65(h);10:145(h). (*Sabina v.* Ant.) Canada to Fla., east of the Rocky Mts. Intr. before 1664. Zone II.—A variable species divided into two geographical vars. and with many garden forms. The type is found in Va. and southward; usually a broad-pyramidal or ovoid tree with spreading often pendent brs.; mature lvs. appressed, broad-deltoid, obtuse or subacute: seeds deeply pitted.—*J. v. crebra* Fern., var., the northern form to which most garden forms belong is usually a narrow-pyramidal or columnar tree with ascending brs.: lvs. loosely appressed, narrow-ovate, acute: seeds slightly pitted. Rh.37:t.333.

Color forms: *J. v. albo-spica* Beiss. Tips of brts. white; here belongs "Triomphe d'Angers" with the variegation more constant and more conspicuous.—*J. v. variegata* Laws., var. Brts. variegated with white. (*J. v. albo-variegata* Beiss.)—*J. v. glauca* Carr. Pyramidal form with very glau-

cous lvs. S.N.189(h). B.E.t.15(h).—*J. v. elegantissima* Hochst., var. Pyramidal tree with the tips of the brts. golden-yellow.—*J. v. "plumosa alba"* Beiss. Pyramidal form with mostly acicular lvs. and white tips. S.N.64(h). (*J. v. var. plumosa* Rehd., not Schneid.)

Columnar and narrow-pyramidal forms: *J. v. pyramidalis* Carr. Dense columnar form. S.N.104(h). B.E.t.3(h).—*J. v. venusta* (Ellw. & Barry) Rehd., var. Columnar form with light or bluish green lvs. (*J. v. Ellw. & Barry.*)—*J. v. pyramidiformis* D. Hill. Pyramidal form with the lvs. bright green in summer, soft-purple in autumn and winter.—*J. v. Schöttii* Gord. Narrow-pyramidal form with bright green scale-like lvs.—*J. v. Canariensis* SÉNÉCL. A compact pyramidal form with dark green lvs. and bluish bloomy frs. usually profusely produced. (*J. v. Canariensis* Beiss.)

Spreading or pendulous forms: *J. v. pèndula* Carr. With spreading brs. and slender pendulous brts.: lvs. scale-like. B.N.F.611(h).—*J. v. Chamberlainii* Carr. With spreading and reflexed brs. and pendulous brts.: lvs. mostly acicular, grayish green.—*J. v. filifera* D. Hill. Broad-pyramidal form with slender much divided brts. and blue-gray lvs.

Low or dwarf forms: *J. v. globosa* Beiss. Compact globose form with bright green scale-like lvs. S.N.64(h).—*J. v. tripartita* SÉNÉCL. Dwarf upright-spreading form of irregular dense habit with mostly acicular glaucous or bright green lvs.—*J. v. Kosteri* Beiss. Low form with wide-spreading brs. and glaucous lvs. (*J. v. Kosteriana* Beiss.)—*J. v. réptans* Beiss. Low shrub with slender spreading brs. and pendent brts.: lvs. bright green. M.G.11: 296(h). (*J. v. horizontalis* Arb. Kew.)

The closely related *J. silicicola* (Small) Bailey from the s. states with slender brts. and smaller ovoid fr., and *J. lucayana* Britt. from the W. Indies, with slenderer brts. and smaller reniform fr., are too tender.

21. *J. scopulorum* Sarg. WESTERN RED CEDAR. Tree to 12 m., with short trunk often dividing near base and with ascending brs. forming an irregular round-topped head; bark reddish brown, shreddy: brts. slender: lvs. rhombic-ovate, acute or acuminate, closely appressed, obscurely glandular, dark or yellowish green or glaucous: fr. subglobose, 6–8 mm. across, bright blue, bloomy, ripening the 2d season; seeds 1–2. S.S.14:t.739. C.B.3:28. G.F.10: 423(h). (*J. dealbata* Loud., not Dougl., *Sabina* s. Rydb.) Alb. to B. C., s. to w. Tex., n. Ariz. and Ore. Intr. 1836. Zone V.—*J. s. argentea* D. Hill. Narrow-pyramidal form with very glaucous, almost silvery-white lvs.—*J. s. viridifolia* D. Hill. Pyramidal form with bright green lvs.—*J. s. horizontalis* D. Hill. Upright form with spreading brs. and very glaucous lvs.

22. *J. Sabina* L. SAVIN. Shrub to 5 m., upright or more often low and spreading; brts. rather slender, of a strong disagreeable odor when bruised: scale-like lvs. rhombic-ovate, appressed, obtuse or acutish, 1 mm. long, glandular on back, dark green, acicular lvs. often present, slightly spreading, about 4 mm. long, concave and glaucous above with a prominent midrib: fls. monoecious or dioecious: frs. on scaly recurved brts., subglobose or ovoid, 5 mm. across, brownish blue, bloomy; seeds usually 2. C.B.3:26. B.N.586, 587(h). (*Sabina officinalis* Garcke.) Mts. of S. W. and C. Eu. to the Cauc. and Siberia. Cult. before 1580. Zone IV.—It does well on limestone soil.—*J. s. variegata* (West.) Audub. Tips of the brts. creamy-white and lvs. scale-like.—*J. s. fastigiata* Beiss. Columnar form with dark green, mostly scale-like lvs.—*J. s. cupressifolia* Ait., var. Low spreading or ascending shrub, rarely erect, usually with scale-like, often bluish green lvs. (*J. s. var. humilis* Endl.)—*J. s. tamariscifolia* Ait., var. Low spreading shrub with mostly

acicular, slightly spreading bright green lvs. on the primary brts. occasionally in 3's.—*J. S. lusitanica* (Mill.) Aschers. & Graebn. Upright shrub with scale-like acuminate lvs. S. Eu.

23. *J. horizontalis* Moench. CREEPING *J.* Procumbent shrub with long trailing brs. furnished with numerous short brts.: lvs. acute or cuspidate, glandular on back, bluish green or steel-blue, acicular lvs. usually present, 2-6 mm. long, mucronate, slightly spreading; fr. 6-8 mm. across, on recurved stalks, light blue, scarcely bloomy, 1-4-seeded. B.B.1:67. C.B.3:27. B.E.t. 16(h). (*J. prostrata* Pers., *J. virginiana* var. *prostrata* Torr., *J. Sabina* var. *prostrata* Loud., *J. Sabina* var. *procumbens* Pursh, *J. Sabina* Am. auth., not L.) N. S. to Alb., s. to N. J., Minn and Mont. Intr. 1836. Zone II.—Valued as ground-cover for sandy and rocky soil.—*J. h. variegata* Slavin, f. Form with creamy white tips.—*J. h. Douglasii* Rehd., f. WAUKEGAN *J.* Trailing form with bright steel-blue lvs. turning pale purple in autumn with glaucous bloom.—*J. h. alpina* (Loud.) Rehd., f. Form with at first nearly upright stems becoming gradually procumbent, but with ascending or nearly upright brs., to 75 cm. high; lvs. mostly acicular, 3-4 mm. long, more or less glaucous, purplish in autumn.—*J. h. glomerata* Rehd., f. Dwarf form, scarcely exceeding 20 cm., with very short brts. crowded into dense clusters, without long trailing brs.: lvs. all scale-like, minute, green.—*J. h. plumosa* Rehd., f. Depressed shrub with flattened top and nearly horizontally spreading brs.: lvs. linear, upright-spreading, 2-6 mm. long, tinged purplish in autumn. (*J. depressa plumosa* Hort.)

## 5. EPHEDRACEAE Wettst. EPHEDRA FAMILY

Contains only the following genus.

**EPHEDRA** L. Upright, climbing or decumbent much-branched shrubs; brts. green, with distant opposite or whorled lvs. more or less connate at base and usually reduced to membranous sheaths: fls. dioecious, rarely monoecious, in axillary, rarely terminal infl., the staminate with a 2-4-lobed perianth and 2-8 stamens connate into a column with sessile or stipitate anthers, borne in the axils of bracts and forming a subglobose or oblong spike; female fls. 1-3, with 2-many bracts at base, each fl. consisting of a naked ovule enclosed by an urceolate integument (also called perianth) contracted at the apex into a more or less elongated tube, the tubillus, which has the appearance of a style: seed with leathery integument, globose-ovoid to cylindric, enclosed by the bracts which are either membranous and wing-like or form a berry-like syncarp. (Ancient Greek name, possibly of the horse-tail.) About 30 species in arid regions of S. Eu., N. Afr., W. and C. Asia, N. and S. Am.—Shrubs of very peculiar and distinct appearance with brs. resembling those of the horse-tail (*Equisetum*). Rarely cult.; they may be used as a ground-cover in arid regions and on dry slopes; of evergreen appearance on account of their numerous usually green brs. The red berry-like fr. is ornamental, but rarely produced in cult.—Monograph by Stapf, *Arten Gatt. Ephedra* (in *Denkschr. Math.-Nat. Cl. Akad. Wiss. Wien*, LVI. 1899), cited below as Stapf.

A. Lvs. ternate or occasionally 2: fr. dry, with winged bracts.....1. *E. trifurca*  
AA. Lvs. opposite or occasionally 3-4: fr. fleshy, bracts not winged.

B. Habit climbing or prostrate.

C. Lvs., at least the upper ones, subulate, to 3 cm. long.....2. *E. foliata*

CC. Lvs. reduced to scales or a membranous sheath.....3. *E. fragilis*

BB. Habit upright or sometimes prostrate at base.

C. Brts. stout, 2-3 mm. thick.....4. *E. intermedia*

cc. Brts. slender, 1-2 mm. thick.

d. Bracts of fr. not margined.

e. Female spikes usually 2-fld., often terminal.

f. Staminate spikes with 4-8 pairs of fls. .... 5. *E. distachya*

ff. Staminate spikes with 3-4 pairs of fls. .... 6. *E. Gerardiana*

ee. Female spikes 1-fld.

f. Inner bracts of female spikes  $\frac{1}{2}$  connate. .... 7. *E. major*

ff. Inner bracts of female spikes  $\frac{2}{3}$  connate. .... 8. *E. equisetina*

dd. Bracts of fr. margined. .... 9. *E. viridis*

1. *E. trifurca* Torr. Upright much-branched shrub, 0.5-1.5 m. high, with rigid and spinescent, pale green or glaucescent, rather smooth brts.: lvs. scale-like, acuminate, 6-12 mm. long,  $\frac{1}{2}$ - $\frac{3}{4}$  connate, conspicuous; becoming shreddy: male spikes short-stalked, with about 5 whorls of ovate bracts: female spikes nearly sessile, 1-fld. with 8-10 whorls of thin winged bracts: fr. 1-1.5 cm. long, with solitary smooth, 4-sided seed and large scarious bracts. A.I.1:78. Colo. to Calif. and Tex. Cult. 1897. Zone VII?

Related species: *E. Torreyana* S. Wats. Shrub to 1 m.; brts. not spinescent, sometimes flexuose: lvs. 2-3 mm. long: staminate spikes with 6-7 whorls of fls.: female spikes short-stalked, 1-2-, rarely 3-fld., with 5-6 whorls of bracts: fr. about 1 cm. long. Stapf, t.1, f.7. Colo. to N. Mex. and Utah. Cult. 1912. Zone VII?—*E. Przewalskii* Stapf. Shrub to 1.5 m., with usually whorled yellowish green, rigid and scabrous brts.: lvs. ternate or opposite: male spikes sessile, with 4-6 whorls or pairs of fls.; female spikes 2-3-fld., with about 5 whorls of bracts, thickened on back and incurved at apex, with broad erose wing: fr. 5-6 mm. long. Stapf, t.1, f.4. C. Asia. Cult. 1912. Zone V?—*E. californica* S. Wats. Prostrate or ascendent shrub with rather thick yellowish green smooth brts.; male spikes with 4-5 whorls of fls.; female spikes short-stalked, 1-fld. with 4-6 whorls of narrow-margined entire bracts; fr. 8-9 mm. long, with subglobose or broad-ovoid black seeds. A.I.1:78. Stapf, t.1, f.8. Calif. Cult. 1899. Zone VII?

2. *E. foliata* C. A. Mey. Shrub, climbing to 5 m., or prostrate; brts. flexuose, bright green or glaucescent, striate; internodes to 8 cm. long; buds minute: lvs. 2 or 3-4, subulate, to 3 cm. long, green, connate at base: male spikes clustered, rarely solitary, ovoid, obtusely 4-angled, with 4-12 pairs of fls.; female spikes in lax or dense cymes, 2- or rarely 3-fld., with usually 3 pairs of bracts, the outer  $\frac{1}{4}$ , the inner  $\frac{3}{4}$  connate: fr. globose, 6 mm. long, red or whitish. Stapf, t.2, f.10. S.N.182(h). (*E. kokanica* Reg.) Persia, Turkestan, Arabia. Cult. 1895. Zone VII?

The closely related *E. altissima* Desf. from N. Afr., climbing to 8 m., with the male spikes paniculate and with 2-6 pairs of fls., is probably too tender for our area. B.M.7670(c). G.C.III.7:792. Intr. 1823.

3. *E. fragilis* Desf. Upright shrub, rarely tree-like, or climbing, sometimes prostrate; brts. dark green, striate, fragile, straight or flexuose, to 4 mm. thick; lvs. 1-2 mm. long,  $\frac{1}{2}$ - $\frac{3}{4}$  connate: male spikes glomerulate, sessile or short-stalked, with 4-8 pairs of fls., anthers usually 6; female spikes usually solitary, short-stalked, 1-2-fld., with 2-3 pairs of bracts, the lower  $\frac{1}{4}$ , the upper  $\frac{3}{4}$  connate: fr. 8-9 mm. long, red; seed ovoid. Stapf, t.2, f.12. Mediterr. Reg. Cult. ?—*E. f. campylópoda* (C. A. Mey.) Stapf, var. More or less climbing; brts. slenderer, 2-3 mm. thick, less fragile: female spikes 2-fld. C. A. Meyer, *Ephedra*, t.2. M.G.33:138(h). Cult. 1912. Zone VII.

4. *E. intermedia* Schrenk & Mey. Densely branched upright shrub, or prostrate and ascending; brts. yellowish green or glaucous, striate, smooth or scabrous, internodes to 6 cm. long: lvs. 2, rarely 3-4, scale-like, scarious,  $\frac{2}{3}$  connate, 2-4, rarely to 6 mm. long: fls. sometimes monoeious; male spikes glomerulate, ovoid or obovoid, with 3-4 pairs of fls.; female spikes solitary, stalked, 2-3-fld., with 2-3 pairs of bracts  $\frac{1}{2}$ - $\frac{3}{4}$  connate; tubillus twisted: fr. 6-7 mm. long, red; seeds slightly exserted. Stapf, t.2, f.15. C. Asia. Cult. 1902. Zone VI?

Related species: *E. pachyclada* Boiss. Upright shrub with rigid scabrous glaucous brts.: female spikes 1-2-fld., with about 3 pairs of bracts connate only at base or the inner  $\frac{1}{3}$ ; fr. 7-8 mm. long; seed much exserted. Stapf, t.2, f.14. C. Asia. Cult. 1899. Zone VII?

5. *E. distachya* L. Low, usually procumbent shrub with rather rigid, dark green, finely striate upright brts.; internodes to 5 cm. long: lvs. scale-like, scarcely longer than 2 mm.,  $\frac{2}{3}$  connate: female spikes 2, stalked, with 3-4 pairs of bracts, the outer to  $\frac{1}{3}$ , the inner to  $\frac{1}{2}$  connate; tubillus straight: fr. globose, red, 6-7 mm. long; seed slightly exserted. R.I.11:t.539(c). S.N.181. (*E. vulgaris* Rich.) S. Eu., N. Asia. Cult. 1570. Zone V.—*E. d. monostachya* (L.) Stapf, var. Very low; staminate spikes solitary. Intr. 1772.—*E. d. helvética* (C. A. Mey.) Hegi, var. Tubillus of the integument spirally twisted. Stapf, t.2, f.16. Cult. 1896.

Related species: *E. sinica* Stapf. Upright sparsely branched shrub, to 30 cm. high; upper internodes 2-edged: sheaths reddish brown at base; staminate spikes terminal, 4 mm. long, with 4-5 pairs of fls.; pistillate spikes 1-3 at end of brs., 2-fld.; upper bracts connate  $\frac{2}{3}$ . I.St.56. N. China. Cult. 1937. Zone V.

6. *E. Gerardiæna* Wall. Usually very low; brts. slender, dark green, finely striate: lvs. scale-like, scarcely 2 mm. long, connate about  $\frac{1}{2}$ : staminate spikes 1-2, sessile, globose-ovoid, with 3-4 pairs of fls.; female spikes solitary, sessile or stalked, with 3-4 pairs of bracts,  $\frac{1}{4}$ - $\frac{1}{2}$  connate; tubillus straight: fr. globose, 5-7 mm. long; seeds 1-2, exserted. Stapf, t.3, f.18. M.G.33:138(h). Himal., S. W. China. Cult. 1896. Zone V? The typical form scarcely exceeds 5 cm. in height.—*E. G. saxatilis* Stapf, var. Taller, ascending.—*E. G. sik-kiménsis* Stapf, var. Upright robust shrub; brts. to 15 cm. long. Intr. about 1915. Zone VII?

7. *E. mājor* Host. Upright, rarely ascending shrub, to 2 m., densely branched; brts. dark green, finely striate; internodes to 2 cm. long, partly disarticulating in winter: lvs. scale-like, not exceeding 3 mm., scarious,  $\frac{2}{3}$  or more connate: male spikes 1-3, subglobose, with 2-4 pairs of fls.; female spikes 1-3, short-stalked, 1-fld., with 2, rarely 3 pairs of bracts connate about  $\frac{1}{3}$ : fr. 5-7 mm. long, red. Stapf, t.3, f.20. S.N.131(h). (*E. nebrodensis* Tineo.) Mediterr. Reg. to Himal. Intr. 1750. Zone VI.—*E. m. procera* (Fisch. & Mey.) Aschers. & Graebn. Brts. quite smooth: fr. more elongated. C. A. Meyer, Ephedra, t.4.

8. *E. equisetina* Bge. Upright or ascending shrub to 2 m., with rigid brts. grayish green or glaucous, smooth or slightly scabrid: lvs. connate about  $\frac{1}{2}$ , the free part triangular, about 2 mm. long: male spikes 1-3, sessile, with 2-4 pairs of fls.; female spikes subsessile, with 2-3 pairs of bracts, the lower connate  $\frac{1}{3}$ , the upper  $\frac{2}{3}$ : fr. subglobose, 6-7 mm. long; seed ovoid, scarcely exserted. Stapf, t.3, f.21. I.St.55. Turkestan to Mong. and N. China. Intr. 1909. Zone V.

9. *E. viridis* Cov. Upright shrub with rather crowded erect rigid brs.; brts. bright green, finely striate, somewhat scabrous: lvs. subulate, 4-7 mm. long, green, connate at base, the lower ones sometimes reduced to scarious sheaths: male spikes sessile, usually several, with 3-4 pairs of fls.; stamens 6-8; female spikes short-stalked, usually 2-fld., with 3-5 pairs of ovate acute bracts: fr. 7-8 mm. long, with usually 2 sharply angled, much exserted seeds; bracts slightly fleshy, reddish, nearly free. A.I.1:77. Calif. to Colo. and Ariz. Cult. 1906. Zone VII?

The closely related *E. nevadensis* S. Wats. has spreading brs. and glaucous brts.: fr. with smaller and shorter seed and broader bracts. A.I.1:78. Nev. to Calif. Cult. 1894. Zone VII?—Another related species is *E. americana* Humb. & Bonpl. Brts. with 3-9 internodes: lvs. usually more connate, sometimes

subulate and to 1 cm. long; anthers sessile; female spikes 1-2 fld.; fr. 5-8 mm. long; seed brown, enclosed or slightly exserted. Stapf, t. 3, f. 25, 26. Andes: Ecuador to Patagonia. Cult. 1896. Zone VII?—*E. a. andina* Stapf, var. Low shrub from the high Andes of Chile. Cult. 1896. Zone VII?

## Subdivision II. ANGIOSPERMAE Brongn.

### ANGIOSPERMS

Ovules borne in a closed ovary which at maturity becomes the fruit.

#### Class I. DICOTYLEDONEAE Juss. DICOTYLEDONS

Stems formed of bark, wood and pith; the wood increasing by annual layers below the bark: lvs. net-veined: parts of fls. mostly in 4's or 5's, rarely wanting: embryo with two opposite cotyledons.

#### Subclass I. ARCHICHLAMYDEAE Engl.

Flowers without or with a simple perianth not differentiated into calyx and corolla, or with calyx and corolla but the latter consisting of distinct petals, or petals wanting. (*Apetalae* Juss., *Polypetalae* Lindl., *Dialypetalae* Endl., *Choripetalae* Eichl.)

#### 6. SALICACEAE Lindl. WILLOW FAMILY

Trees or shrubs with bitter bark and soft light wood: leaves alternate, undivided, stipulate: fls. dioecious, appearing before or sometimes with, rarely after the lvs., in catkins, each fl. in the axil of a bract, without perianth; stamens 2 to many; ovary 1-celled; stigma 2-4, often 2-lobed: fruit a dehiscent 2-4-valved capsule with 2-4 placentas bearing usually numerous seeds surrounded at base by long silky hairs; seed without albumen; cotyledons flattened.—Three genera with more than 200 species most abundant in the temperate regions of the northern hemisphere.

- A. Scales of the catkins lacinate, very rarely entire: fls. surrounded by a cup-shaped disk; catkins pendulous: buds with several scales, terminal bud present, rarely lacking. 1. *Populus*
- AA. Scales of catkins entire; fls. without disk: buds with a single scale, terminal bud lacking. 1. *Populus*
- B. Styles 2, distinct, bifid; staminate catkins pendulous: stamens adnate to bract: fls. without gland. 2. *Chosentia*
- BB. Style 1 with 2 usually bifid stigmas, or stigmas sessile; staminate catkins upright; stamens free from the bract; fls. with 1 or more glands at base. 3. *Salix*

1. **PÓPULUS L. POPLAR.** Trees with furrowed pale bark and terete or angled brs. with terminal bud, rarely without; buds resinous: lvs. alternate, mostly ovate to ovate-lanceolate and long-stalked, entire or dentate, involute in bud: fls. in pendulous catkins before the lvs.; each fl. with an oblique cup-shaped disk at the base, in the axil of a lacinate, rarely incised to entire, bract; stamens 4 to many; style short; stigmas 2-4: fruit 2-4-valved, ripening before the lvs. are fully grown; seeds numerous, small, ovoid or obovoid, brown; cotyledons elliptic. (The classical Latin name of the poplar.)—About 30 species in N. Am., Eu., N. Afr. and in Asia, s. to the Himal.—Ornamental shade and street trees much planted on account of their rapid growth and the easy propagation of most species by cuttings.

- A. Lvs. of long shoots white or grayish tomentose below; petioles terete: buds tomentose.  
 B. Lvs. of long shoots lobed.....1. *P. alba*  
 BB. Lvs. not lobed.  
 C. Lvs. to 15 cm. long.....2. *P. tomentosa*  
 CC. Lvs. to 10 cm. long.....3. *P. canescens*  
 AA. Lvs. glabrous or pubescent below, or thinly tomentose when unfolding; buds glabrous.  
 B. Lvs. without translucent border.  
 C. Petioles compressed; lvs. often suborbicular.  
 D. Lvs. obtuse, acute or short-acuminate.  
 E. Lvs. cuneate or rounded at the base, coarsely and irregularly dentate: brts. slightly tomentose.....4. *P. grandidentata*  
 EE. Lvs. rounded or subcordate at base, crenate-serrulate to sinuate-dentate.  
 F. Glands at base of blade on short brts. usually wanting.  
 G. Lvs. irregularly sinuate-dentate, often obtuse.....5. *P. tremula*  
 GG. Lvs. regularly crenate-serrulate, usually short-acuminate.....6. *P. tremuloides*  
 FF. Glands at base of blade usually well-developed: buds and young brts. slightly tomentose.....7. *P. Stebbinsii*  
 DD. Lvs. long-acuminate, glandular at base of blade.....8. *P. adenopoda*  
 CC. Petioles terete.  
 D. Lvs. light green beneath.  
 E. Lvs. cordate at base, with white tomentum when young.  
 F. Brts. pubescent when young.  
 G. Lvs. floccose-tomentose when young, dark green above, to 15 cm. long.  
 GG. Lvs. pubescent beneath, bright green above with red midrib, to 30 cm. long.....9. *P. heterophylla*  
 FF. Brts. glabrous: lvs. dull bluish green above.....10. *P. lasiocarpa*  
 EE. Lvs. rounded or broad-cuneate at base, lanceolate to ovate-lanceolate, glabrous.  
 F. Petiole 1-4 cm. long; lvs. lanceolate to ovate-lanceolate.....11. *P. Wilsonii*  
 FF. Petiole 3-7 cm. long; lvs. rhombic-lanceolate to rhombic-ovate.....12. *P. angustifolia*  
 DD. Lvs. whitish beneath.  
 E. Brts. brown.  
 F. Brts. glabrous (puberulous in var. of No. 17).

 GG. Lvs. broadest below the middle.  
 H. Brts. more or less angled: caps. 3-4-valved.  
 I. Lvs. broad-cuneate at base; petiole 0.5-2.5 cm. long.  
 II. Lvs. rounded or subcordate at base, 10-20 cm. long; petiole 2-4 cm. long.....14. *P. Simonii*  
 HH. Brts. terete: capsule 2-valved; petiole 3-5 cm. long.....15. *P. yunnanensis*  
 FF. Brts. pubescent, sometimes glabrous in No. 19.  
 G. Lvs. cordate at base: caps. 2-valved.....16. *P. szechuanica*  
 GG. Lvs. truncate to subcordate at base, rarely broad-cuneate.  
 H. Brts. angled, light brown: petioles 3-6 cm. long; caps. pubescent, 3-valved.....17. *P. Tacamahaca*  
 HH. Brts. terete, dark brown; petiole 1.5-4 cm. long.....18. *P. candicans*  
 EE. Brts. yellowish gray to orange-yellow.  
 F. Brts. terete.  
 G. Young brts. glabrous or puberulous, not viscid; petioles 1-4 cm. long.  
 H. Lvs. glabrous, ovate or narrow-ovate, acuminate.....19. *P. trichocarpa*  
 HH. Lvs. pubescent on the veins beneath, elliptic, abruptly narrowed into a twisted apex.....20. *P. tristis*  
 GG. Young brts. glandular-viscid: petioles 0.5-2.5 cm. long.....21. *P. koreana*  
 FF. Brts. sharply angled, pubescent when young: lvs. sparingly pubescent beneath, at least when young.....22. *P. Maximowiczii*  
 BB. Lvs. with a clearly defined translucent border.  
 C. Petioles terete or nearly so; translucent border very narrow: brts. slightly angled. (Hybrids).....23. *P. laurifolia*  
 CC. Petioles compressed.  
 D. Glands at base of blade absent (sometimes present in No. 27); blade not, or sparingly or minutely ciliate.  
 E. Lvs. rhombic-ovate, cuneate at base: caps. 2-valved.....24. *P. berolinensis*  
 EE. Lvs. truncate or broad-cuneate at base.  
 F. Lvs. deltoid, irregularly and sparingly ciliate, sometimes with 1 or 2 glands at base (hybrids).....25. *P. nigra*  
 FF. Lvs. broadly triangular-ovate, minutely ciliate: caps. 3-4-valved.....26. *P. canadensis*  
 DD. Glands present at base of blade; lvs. truncate or subcordate, densely ciliate.  
 E. Brts. terete, except very vigorous shoots: bracts of catkins lacinate.  
 F. Buds pubescent, rarely glabrous: lvs. very broad at base and very coarsely dentate.....27. *P. Wislizenii*  
 FF. Buds glabrous: lvs. triangular-ovate.....28. *P. Sargentii*  
 EE. Brts. sharply angled: lvs. ovate or nearly ovate-oblong, to 18 cm. long: bracts of catkins dentate.....29. *P. deltoides*  
 FF. Lvs. broadly triangular-ovate, minutely ciliate: caps. 3-4-valved.....30. *P. angulata*  
 EE. Brts. sharply angled: lvs. ovate or nearly ovate-oblong, to 18 cm. long: bracts of catkins dentate.....31. *P. angulata*

Sect. 1. **LEUCE** Duby. **WHITE POPLARS, ASPENS.** Bark smooth, rough only at the base of old trunks: buds tomentose or glabrous and glutinous: petioles compressed or nearly terete; lvs. tomentose at least on shoots, on short brts. less so or glabrous: bracts of catkins fringed; stigmas 2-4, narrow; stamens 5-20, anthers not apiculate: caps. oblong, usually 2-valved.

1. **P. alba** L. **WHITE P. (ABELE).** Tree to 30 m. or occasionally taller; bark whitish gray, smooth, rough at base of old trunks; young brts. and buds white-tomentose: lvs. on long shoots ovate, palmately 3-5-lobed, with triangular coarsely toothed lobes, acute, subcordate or rounded at base, 6-12 cm. long, dark green above, white-tomentose beneath, on short brts. smaller, ovate to elliptic-oblong, sinuate-dentate, usually gray-tomentose beneath; petioles tomentose: pistillate catkins about 5 cm. long, the staminate longer; scales dentate, fringed with long hairs; stigmas 4; stamens 6-10: R.I.11:t.614 (c). H.W.2:135(h),t.34(c). M.D.1914:277(h);1916:231(h). C. and S. Eu. to W. Siberia and C. Asia; naturalized in N. Am. Long cult. Zone III.—Large tree of irregular habit, chiefly planted for the contrasting white-felted under side of its lvs.—**P. a. nivea** Ait., var. Lvs. densely silvery-white-tomentose beneath, lobed. (*P. a. argentea*, *P. a. acerifolia* and *P. a. arembergica* Hort.) —**P. a. Richárdii** Henry, var. Lvs. yellow above.—**P. a. pyramidalis** Bge., var. Columnar tree: lvs. of the short brts. orbicular, coarsely toothed, glabrescent and green beneath. G.C.II.18:556. R.H.1891:188(h). M.D.1916:t.28(h);1917:t.38(h). (*P. a. Bolleana* Lauche, *P. Bolleana* Lauche.) Intr. from Turkest. in 1872.—**P. a. globosa** Spaeth. Shrub or small tree with dense oval head: lvs. slightly lobed, gray-tomentose beneath, pinkish when unfolding. Intr. 1886.—**P. a. péndula** Loud., var. With pendulous brs.

2. **P. tomentosa** Carr. **CHINESE WHITE P.** Tree similar to *P. alba*; brts. gray-tomentose; buds slightly tomentose; lvs. of long shoots triangular-ovate, acuminate, subcordate or truncate at base, doubly dentate, to 15 cm. long on young trees, dark green above, gray-tomentose beneath, on old trees smaller, sinuately toothed and glabrescent beneath, on short brts. much smaller, ovate or triangular-ovate, sinuately toothed, glabrous beneath. R.H. 1903:355. S.H.1:f.7t-u. B.D.1923:t.16(h). (*P. alba* var. *t.* Wesm., *P. alba* var. *denudata* Maxim., *P. pekinensis* L. Henry.) N. China. Intr. 1867. Zone V.

3. **P. canescens** (Ait.) Sm. **GRAY P.** Tall tree, similar to *P. alba*, but lvs. of long shoots deltoid-ovate, cordate, gray-tomentose beneath, with a few triangular teeth and irregularly glandular-serrate, ciliate, on short brts. sub-orbicular to ovate, obtuse, subcordate, not ciliate, with a narrow translucent border, light green beneath, glabrescent: staminate catkins 6-10 cm. long, pistillate 2-3 cm. long; stamens 8-15. R.I.11:t.615,616(c). H.W.2:137. E.H. 7:t.382(h). (*P. alba* var. *c.* Ait., *P. alba* Willd., not L., *P. hybrida* Reichenb., *P. Steiniana* Bornm.) Eu., W. Asia. Long cult. Zone IV.—Often considered a hybrid between *P. alba* and *P. tremula*.—**P. c. péndula** Dipp., f. With pendulous brs.

4. **P. grandidentata** Michx. **LARGE-TOOTHED ASPEN.** Tree to 20 m., with rather narrow, round-topped head; brts. rather stout, gray-tomentose at first, becoming reddish or orange-brown; buds ovoid, gray-pubescent: lvs. of long shoots ovate, acuminate, truncate to broad-cuneate at base, coarsely sinuate-dentate with callous-mucronate teeth, 7-10 cm. long, dark green above, gray-tomentose beneath at first, soon glabrescent and glaucescent, those of short brts. elliptic, with sharper teeth; petiole glabrescent: catkins 3.5-6 cm. long; scales lobed and fringed with long hairs; disk and ovary pubescent; stigmas

4; stamens 6-12. S.S.9:t.488. N. S. to Ont. and Minn., s. to N. C., Tenn, Ill. and Iowa. Intr. 1772. Zone III.

Related species: *P. pseudo-grandidentata* Dode. Brts. pendulous, tomentose at first: lvs. similar to those of *P. tremula*, but 7-10 cm. across, of thicker texture and with cartilaginous margin: stamens 5; disk glabrous. E.H.7:t.409, f.8. (*P. tremula* p. Aschers. & Graebn., *P. grandidentata pendula* Hort.) Origin unknown; probably a hybrid with *P. tremula*.

5. *P. trémula* L. EUROPEAN ASPEN. Tree to 30 m., usually much smaller, with round open head; suckering; brts. terete, glabrous; buds ovoid, acute, slightly viscid: lvs. thin, suborbicular or ovate, rounded or acute at apex, truncate or subcordate at base, sinuately crenate-dentate, 3-8 cm. long, tomentose when unfolding, quickly glabrous, glaucescent beneath: petioles compressed, glabrous, often as long as blade; lvs. of suckers ovate, to 15 cm. long, pubescent beneath: catkins 8-10 cm. long; scales deeply lobed and fringed; stamens 5-12; stigmas 2, 2-parted: fruiting catkins to 12 cm. long. R.I.11:t.618(c). H.W.2:131(h),t.33(c). Eu., N. Afr., W. Asia and Siberia. Long cult. Zone II.—*P. t. péndula* Loud., var. With pendulous brs. Gn.59:337(h). G.W.7:447(h).—*P. t. villôsa* (Láng) Wesm., var. Lvs. and brts, silky-pubescent while young. R.I.11:t.617(c). (*P. v. Lang*, *P. canescens* Reichenb., not Sm.)—*P. t. Davidiâna* (Dode) Schneid., var. Lvs. with smaller and shallower serrations, often rounded and mucronate at apex. N.K.18:t.47,48. (*P. D.* Dode.) China, N. E. Asia. Intr. 1907. Zone II?

Of the closely related *P. rotundifolia* Griff. from the Himal. only var. *Du-clouxiana* (Dode) Gombocz is in cult. It differs chiefly in the often cordate and short-acuminate lvs. and in the fruiting catkins being 15-16 cm. long. Dode, Monog. Pop. t.11,f.34a. (*P. D.* Dode.) W. China. Intr. 1908?

6. *P. tremuloides* Michx. QUAKING ASPEN. Tree to 30 m.; young brts. glabrous, reddish brown, slender; buds ovoid, pointed, slightly viscid: lvs. thin, ovate to orbicular, short-acuminate, truncate to broad-cuneate at base, finely glandular-serrate, 3-7 cm. long, glabrous and glaucescent beneath; lvs. of suckers ovate, large, glabrous: fr. like those of *P. tremula*, but smaller and catkins slenderer. S.S.9:t.487. For. & Irr. 10:424(b). (*P. graeca* Loud., not Ait., ? *P. atheniensis* Ludwig.—AMERICAN A.) Lab. to Alaska, s. to Pa., Mo., n. Mex. and L. Calif. Intr. about 1812. Zone I.—*P. t. péndula* Jaeg., var. With pendulous brs. (*P. t.* var. "Parasol de St. Julien").—*P. t. aurea* (Tidestr.) Daniels is the Rocky Mtn. form: lvs. broader, often broadest near the middle, with a short slender point and more remotely and irregularly serrate, changing to bright or orange-yellow in autumn. For. & Irr. 12:151(b). Contrib. U. S. Nat. Herb. 25:t.15(h). (*P. a.* Tidestr., *P. cercidiphylla* Brit.) Intr. 1916.—*P. t. vancouveriâna* (Trel.) Sarg., var. Brts. pubescent or puberulous: lvs. coarsely crenate-serrate, tomentose when unfolding, becoming glabrous. S.M.122. (*P. v.* Trel.) B. C. to Ore. Intr. 1922. Zone V?

7. *P. Sieböldii* Miq. JAPANESE ASPEN. Tree to 20 m.; brts. rather stout, with whitish tomentum partly persisting during summer; buds tomentose: lvs. thickish, ovate, short-acuminate, rounded to cuneate at the glandular base, minutely toothed or glandular-serrulate, 4-8 cm. long, pubescent while young, later glabrescent or finally glabrous; petioles 1-4 cm. long, pubescent: fis. like those of the preceding species, but scales more villous. S.I.1:t.18(c). K.M.t.12(c). E.H.7:t.408,f.6. (*P. tremula* var. *villosa* Franch. & Sav., not Wesm., *P. rotundifolia* Simon-Louis, not Griff.) Japan. Cult. 1881. Zone V.

8. *P. adenópoda* Maxim. CHINESE ASPEN. Tree to 25 m. or more; brts. slender, pubescent when young, becoming grayish brown or brown; buds conical, acute, glabrous: lvs. of long shoots ovate, acuminate, truncate or

cordate and with 2 prominent glands at base, crenate-serrate with incurved gland-tipped teeth, 7-10 or occasionally to 15 cm. long, glabrous above or pubescent on the veins, pale green and grayish pubescent beneath at least when young, those of short brts. smaller, ovate to orbicular-ovate, 5-8 cm. long; petioles 1.5-3 or sometimes to 6 cm. long; staminate catkins 6-10 cm. long; scales deeply lobed and long-ciliate; fruiting catkins 12-16 cm. long; caps. short-stalked. Nuov. Giorn. Bot. Ital. n.s.17:247(1). B.D.1922:23,t(h). (*P. tremula* var. *a.* Burk., *P. Silvestrii* Pampan.) C. and W. China. Intr. 1907. Zone V.

Sect. 2. *LEUCOIDES* Spach. Bark of trunk rough, scaly; lvs. of long and short shoots scarcely different, cordate at base; petiole only at apex slightly compressed; buds conical, scarcely viscid, glabrous; fls. with deeply lobed disk; ovary pubescent; stamens 12-40; anthers oblong, apiculate; style elongated; caps. 2-3 valved.

9. *P. heterophylla* L. SWAMP COTTONWOOD. Tree to 30 m., in cult. often shrubby; brts. stout, tomentose at first, dull brown or gray at maturity, rarely orange; lvs. broad-ovate, acute or obtuse, cordate or sometimes rounded at base, crenate-serrate, 10-18 cm. long, tomentose when unfolding, becoming glabrous or remaining floccose beneath, dark green above, paler and reticulate beneath, with yellow midrib; petioles 6-8 cm. long; staminate catkins 3-6 cm. long; stamens 12-20; scales filiform-lobed; pistillate few-fl'd., 3-5 cm. long; scales fimbriate; stigmas 2-3, thick; fr. slender-stalked. S.S.4:t.489. (Downy P., BLACK COTTONWOOD.) Conn. to Ga., w. to Ill., Mo. and La. Intr. 1656. Zone V. Rarely cult.

10. *P. lasiocarpa* Oliv. Round-headed tree, to 20 m.; brts. angled, tomentose when young; buds large, slightly viscid, the basal scales pubescent; lvs. ovate, acuminate, cordate, crenately glandular-serrate and revolute at margin, 15-30 cm. long, glabrous and bright green above, pubescent and light green beneath; petiole about half as long as blade, usually red like the midrib; catkins to 9 cm. long; scales glabrous, slightly laciniate; stamens 30-40; fruiting catkins 15-24 cm. long; caps. short-stalked, pubescent; disk glabrous, lobed. H.I.20:1943. B.M.8625(c). J.L.28:65;34:f.111(h). M.D. 1921:t.10(h). (*P. Fargesii* Franch.) C. and W. China. Intr. 1904. Zone V. Very striking and handsome on account of its large bright green lvs. with red midrib and petiole.

Related species: *P. violascens* Dode. Lvs. elliptic-ovate to oblong-ovate, 10-15 cm. long, acute, subcordate, of smaller brts. ovate to lanceolate, glandular-serrate, glabrescent above, white-villous beneath chiefly on the veins; petiole 2-3 cm. long, glabrate, violet. B.D.1921:24(1). China. Cult. 1921. Zone V?

11. *P. Wilsónii* Schneid. Tree to 25 m., with pyramidal head; brts. terete, glabrous, purple when young, older grayish brown; buds slightly viscid, glabrous; lvs. broad-ovate to broadly ovate-oblong, obtuse, cordate to rounded at base, crenate-dentate, 8-18 cm. long, 7-15 cm. broad, glabrous and dull bluish green above, reddish and floccose-tomentose beneath when unfolding, soon nearly glabrous; petiole 6-11 cm. long; pistillate catkins about 7 cm. long, pubescent, in fr. to 15 cm. long; caps. nearly glabrous. B.D.1921:25(h). G.W.31:684(h). C. and W. China. Intr. 1907. Zone V. Similar to the preceding but lvs. smaller and of duller color.

Sect. 3. *TACAMAHACA* Spach. BALSAM POPLARS. Bark of trunk furrowed; buds large, very viscid, exhaling a strong balsamic odor; lvs. usually whitish below, with translucent margin, cuneate to subcordate at base, often different on shoots and short brts.; petiole terete or quadrangular, usually grooved above; stamens 18-60; anthers oblong to subglobose; stigmas 2-4, with short style or subsessile, broad; caps. 2-4-valved.

12. *P. angustifolia* James. NARROW-LEAVED COTTONWOOD. Pyramidal tree to 20 m., with slender brs.; bark smooth, only on old trunks shallowly fissured; brts. glabrous, terete, orange at maturity; buds small, sharply pointed, glabrous; lvs. lanceolate or ovate-lanceolate, gradually acuminate, rounded or broad-cuneate at base, glandular-serrulate and revolute at margin, 5-10 cm. long or occasionally longer, light green beneath: catkins dense, glabrous; stamens 12-20; stigmas 2 on a short style; caps. 2-valved. S.S.9:t.492. M.D. 1912:119(h). (*P. fortissima* Nels. & Macbr., *P. balsamifera* var. *a.* S. Wats.) Assinib. to Nev., Ariz., and N. Mex. Intr. 1893. Zone II.

13. *P. acuminata* Rydb. Round-topped tree to 15 m., with more or less upright brs.; brts. terete, glabrous, pale yellow-brown; buds acuminate, chestnut-brown: lvs. rhombic-lanceolate to rhombic-ovate, acuminate, broad-cuneate at base, crenate-serrate, 5-10 cm. long, lustrous and dark green above, light green beneath and glabrous; petioles slender, terete, 2-7 cm. long; catkins slender, glabrous, 2-7 cm. long; ovary broad-ovoid, with nearly sessile stigmas; caps. 3- or 2-valved. S.S.14:t.731. (*P. coloradensis* Dode.) Assinib. to Neb. and Colo. Intr. 1898. Zone II.

*P. a.* × *Sargentii*; see under No. 29.

14. *P. Simónii* Carr. Tree to 12 m. or more, of rather narrow habit; shoots angled; brts. slender, terete, glabrous, reddish brown; buds pointed upright; lvs. rhombic-ovate or rhombic-elliptic, 4-12 cm. long, 3-8 cm. broad, abruptly acuminate, broad-cuneate to narrowly rounded at base, crenate-serrulate, glabrous, bright green above, pale green or whitish beneath; petiole on brts. 1-2.5, on shoots 0.5-1.5 cm. long, reddish: staminate catkins 2-3 cm. long; stamens 8; pistillate catkins slender, 2.5-6 cm. long, in fr. to 15 cm. long; caps. small, 2(-3)-valved. S.H.1:f.60-q. C.C.52. B.D.1923:t.16(h). (*P. przewalskii* Maxim.) N. China. Intr. 1862. Zone II. Handsome poplar with slender brs. and rather small bright green lvs.—*P. S. fastigiata* Schneid., f. Narrow-pyramidal tree with upright brs.; brts. slightly angled. U.S.Im.124:t. 202(h).—*P. S. pendula* Schneid., f. With pendulous brs.; brts. strongly angled.

15. *P. yunnanensis* Dode. Tree; brts. angled, glabrous, brown at maturity; buds glabrous, viscid: lvs. of long shoots elliptic-ovate, acuminate, broad-cuneate at base, crenate-serrulate, 6-15 cm. long, bright green above, whitish beneath, glabrous; petiole 5-25 mm. long, often red like the midrib; lvs. of fruiting brs. ovate, subcordate at base, about 15 cm. long; fruiting catkins 10-15 cm. long; caps. nearly sessile, 3-4-valved. Dode, Monog. Pop. t.11,f.103a. B.D.1922:81(h). M.D.1938:t.15(h). S. W. China. Intr. before 1905. Zone V.

16. *P. szechuanica* Schneid. Tree to 40 m.; young brts. angled, glabrous, often purplish, older yellowish brown, nearly terete; buds purplish, glabrous, viscid; lvs. reddish when young, glabrous, bright green above, whitish beneath, those of shoots ovate-oblong, acute or short-acuminate, rounded or subcordate at base, or ovate-lanceolate and broad-cuneate, crenately glandular-dentate, 11-20 cm. long and 5-11 cm. broad; petioles 2-4 cm. long; those of fruiting brts. broad-ovate on petioles 3-7 cm. long; fruiting catkins to 16 cm. long, glabrous; caps. subsessile, 3-4-valved. G.C.61:46. B.D.1921:25(l). W. China. Intr. 1908. Zone V. Handsome tree with large lvs.

17. *P. Tacamahaca* Mill. BALSAM P. Tree to 30 m., with ascending brs.; brts. terete, glabrous; buds elongated, pointed, viscid: lvs. rather thick and firm, ovate to ovate-lanceolate, acute or short-acuminate, rounded or rarely broad-cuneate at base, crenate-serrate, minutely ciliate, 7-12 cm. long, glabrous, whitish beneath; petiole terete, slender, 3-5 cm. long; catkins 5-7 cm.

long; stamens 12-20; fruiting catkins 12-14 cm. long; caps. ovoid, stalked, 2-valved. S.S.9:t.490. E.H.7:t.387(h). (*P. balsamifera* Muenchh. & auth., not L.) Lab. to Alaska, s. to N. Y., Mich., Neb., Nev. and Ore. Intr. before 1689. Zone II.—*P. T. Michauxii* (Dode) Farwell, var. Lvs. subcordate or rounded at base, sometimes slightly pubescent on the veins beneath. G.C.59:230. (*P. M.* Dode.) N. E. N. Am. Intr. 1917.

*P. t.* × *deltoides* = *P. Jäckii* Sarg. Lvs. broad-ovate, long-acuminate, cordate at base, more coarsely serrate and with a narrow translucent border. G.C.III.59:231. B.C.5:2763. (*P. Baileyana* Henry.) Ontario to Vt. and Mich. Intr. 1900.

18. *P. cándicans* Ait. BALM OF GILEAD. Tree to 30 m., with stout spreading brs.; brts. terete or slightly angled, pubescent; buds large, viscid: lvs. broadly ovate-deltoid, acuminate, cordate, rarely truncate at base, coarsely crenate-serrate, ciliate, usually 12-16 cm. long and about 10 cm. broad, dark green and slightly pubescent above, whitish and sparingly pubescent beneath, densely so on the veins; petioles terete, 3-6 cm. long, pubescent; fruiting catkins about 16 cm. long; caps. stalked, 2-valved. S.S.9:t.491 (excl. stam. fls.). M.A.t.19a(h). G.C.III.87:364(h). (*P. balsamifera* var. *c.* Gray, *P. ontariensis* Desf.—ONTARIO P.) Origin unknown. Cult. 1755. Zone IV. Often planted and escaped from cult. It has been confused with *P. tacamahaca* var. *Michauxii* and supposed to be native to N. Am.

*P. c.* × *berolinensis* Schreiner & Stout. Here belongs "Maine P."

19. *P. trichocarpa* Hook. WESTERN BALSAM P. (BLACK COTTONWOOD.) Tree to 60 m.; brts. slightly angled, pubescent or glabrous; buds elongated, glabrous: lvs. broad-ovate to rhombic-oblong, acute or short-acuminate, truncate, rounded or subcordate at base, finely crenate-serrate, 8-12 cm. long, or on vigorous shoots to 25 cm. long, thickish and firm, dark green and glabrous or puberulous above, whitish or rusty beneath and reticulate; petioles 3-6 cm. long: staminate catkins 3.5-6 cm. long; stamens 40-60; pistillate catkins slender, 6-8 cm. long; ovary tomentose: caps. 3-valved, pubescent. S.S.9:t.493. G.F.5:281(h). E.H.7:t.388(h). M.D.38:t.44(h). Alaska and B. C. to s. Calif. Intr. 1892. Zone IV.—*P. t. hastata* Henry, var. Lvs. mostly oblong-ovate, acuminate, rounded at base, glabrous or nearly so; ovary less pubescent; caps. often nearly glabrous. Dode, Monog. Pop. t.12,f.105. N. Calif. and northward. Intr. 1892.

*P. t.* × *angulata* = *P. generosa* Henry. Lvs. coarsely serrate, pale green beneath, with narrow translucent margin; petiole nearly terete. G.C.56:258(h), 259;71:321. Empire For. Jour. 4:182(h). Orig. 1912. Of very vigorous growth. —*P. t.* × *Maximowiczii* Schreiner & Stout. Here belongs "Androskoggin P." —*P. t.* × *nigra* Schreiner & Stout. Here belongs "Roxbury P." —*P. t.* × *nigra betulifolia* Schreiner & Stout. Here belongs "Andover P."

20. *P. tristis* Fisch. Small tree; brts. pubescent, terete, dark red-brown; buds pubescent, viscid, often subtended by persistent ovate stipules: lvs. narrow-ovate to oblong-ovate, about 10 cm. long and 5 cm. wide, acuminate, rounded or subcordate at base, crenate-serrate, ciliate, whitish and pubescent beneath; petiole 1.5-4 cm. long: fls. and frs. unknown. E.H.7:t.410,f.23. C. Asia. Intr. before 1831. Zone V.

21. *P. cathayana* Rehd. Tree to 30 m. with upright brs.; brts. terete, olive-green while young, later orange-yellow to grayish yellow; buds elongated, viscid: lvs. of short brts. ovate or narrow-ovate, 6-10 cm. long, 3.5-7 cm. broad, acuminate, rounded at base, rarely subcordate, or smaller ones broad-cuneate, glandular-crenate-serrulate, glabrous, bright green above, whitish beneath, with 5-7 curved veins, slightly raised above, more strongly so and reticulate beneath; lvs. of shoots 10-20 cm. long, often subcordate;

petiole glabrous, 2-6, on shoots 1-3 cm. long; staminate catkins 5-6 cm. long; fruiting catkins 10-20 cm. long; caps. glabrous, rather distant, nearly sessile, ovoid, acute, 7-9 mm. long, 3-4-, rarely 2-valved. G.C.53:198. U.S.Im.124: t.200(h). B.D.1923:t.16,17(h). (*P. suaveolens* auth., not Fisch.) N. W. China to Manch. and Korea. Intr. about 1908? Zone V. Handsome tree with large lvs. on young plants.

A closely related species is *P. Purdómii* Rehd. Lvs. ovate to narrow-ovate, 10-13 cm. long, or on shoots oblong-ovate and to 25 cm. long, rounded to subcordate at base, pilose on the distinctly raised veins and veinlets beneath or sometimes glabrous, more coarsely glandular-serrate. U.S.Inv.42:t.5(h). N. W. China. Intr. 1914. Zone V. Handsome large-leaved poplar.—Another related species is *P. suaveolens* Fisch. Brts. terete; lvs. oval or elliptic to elliptic-oblong, rarely obovate-oblong, mostly broadest about the middle, 5-12 cm. long, 2-5.5 cm. broad, abruptly acuminate with very short often twisted acumen, veins above often slightly impressed, beneath near the base usually slightly pilose; petioles 0.5-3, rarely 4 cm. long, often slightly pilose; fruiting catkins about 10 cm. long, rather dense. Pallas, Fl. Ross. 1:14, excl. f. B. D.L.2:206. E. Siberia. Intr. 1834. Zone II. Rare in cult.—*P. s. pyramidalis* Reg., var. Narrow-pyramidal tree with ascending brs.: lvs. oval or elliptic-ovate; petiole pilose, 1.5-2 cm. long. Cult. 1928.

22. *P. Maximowiczii* Henry. Tree to 30 m., with wide-spreading brs.; bark of old trunks gray and deeply fissured; brts. terete, densely pubescent, reddish at first, finally gray; lvs. nearly subcoriaceous, elliptic to elliptic-ovate, rarely suborbicular, abruptly short-acuminate or acute with twisted apex, subcordate, glandular-serrate and ciliate, 6-12 cm. long, dull dark green and wrinkled above, whitish beneath, pubescent on veins and veinlets on both sides; petioles 1-4 cm. long, puberulous; staminate catkins 5-10 cm. long; stamens 30-40; fruiting catkins 18-25 cm. long; caps. subsessile, 3-4-valved, glabrous. Fr.vii. K.M.t.11(c). N.K.18:198(h), t.50. G.C.53:198. N. E. Asia, Japan. Intr. before 1890. Handsome poplar of vigorous growth.

*P. M. × nigra plantiærensis* Schreiner & Stout. Here belongs "Rochester P."—*P. M. × berolinensis* Schreiner & Stout. Here belong "Geneva P." and "Oxford P."—*P. M. × trichocarpa*; see No. 19.

23. *P. koreana* Rehd. Tree to 25 m., brts. terete, viscid-glandular at first, later pale brown; lvs. of shoots elliptic or elliptic-ovate to ovate-oblong, short-acuminate, with rarely twisted apex, rounded or sometimes subcordate at base, 7-15 cm. long and to 8.5 cm. broad or occasionally larger, on short brts. elliptic-oblong or elliptic-lanceolate and 4-12 cm. long, cuneate or rounded at base, glandular-crenate-serrulate, dark green and wrinkled above, whitish beneath, glabrous, or those of short brts. sometimes minutely pilose on veins beneath and petioles; petioles 5-10 or on short brts. to 20 mm. long; staminate catkins 3-5 cm. long; stamens 10-30; fruiting catkins 10-14 cm. long; caps. sessile, 2-4-valved. N.K.18:198(h), t.49. F.R.N.1:17(h). Korea. Intr. 1918. Zone V. Handsome poplar, its large bright green lvs. with red midrib.

24. *P. laurifolia* Ledeb. Tree to 15 m.; brts. slender, sharply angled, pubescent at least near apex, at maturity grayish yellow; buds elongated, upright, but not appressed; lvs. of shoots ovate-lanceolate to lanceolate, acuminate, rounded at base, finely glandular-serrate, 7-12 cm. long, bright green above, whitish beneath and sparingly pubescent, at least on the midrib; petioles short, pubescent; lvs. of short brts. elliptic to elliptic-ovate, short-acuminate, rounded at base; petioles rather long; catkins about 5 cm. long; scales large, pubescent; stamens 20-30 (or to 60?): caps. 2-3-valved, slightly pubescent. E.H.7:t.410, f.30. B.C.5:2764(l). B.D.1922:23, t(h). (*P. balsamifera* var. *viminialis* Loud.) Siberia. Intr. about 1830. Zone IV.—P. I. Lind-

*leyana* (Carr.) Aschers. & Graebn. Lvs. narrower, rounded or broad-cuneate at base, with usually wavy margin, those of long shoots generally lanceolate, of short ones narrow-elliptic. B.C.5:2763. (*P. L.* Carr., *P. salicifolia* Hort., *P. crispa* Hort.) Orig. before 1867.

*P. l. × tristis?* = *P. Woobstii* (Reg.) Dode. Similar to *P. laurifolia*, but brts. glabrous, slightly ribbed: lvs. lanceolate, widest about the middle. P.H.1:10(1). (*P. suaveolens* var. *Woobstii* Reg.) Orig. unknown.—*P. l. × nigra*; see No. 25.—*P. l. × balsamifera*; see under No. 25.

Sect. 4. *ÆGEIROS* Duby. COTTONWOODS, BLACK POPLARS. Trees with furrowed bark; buds viscid: lvs. green and stomatiferous on both sides and with a well-defined translucent border, usually triangular-ovate and very broad at base or rhombic-ovate, long-acuminate and more or less coarsely crenate-serrate: stamens 15–30; anthers subglobose: caps. 2–4-valved.

25. *× P. berolinensis* Dipp. (*P. laurifolia × nigra* var. *italica*.) Columnar tree with ascending brs.; brts. slightly angular, pubescent, yellowish gray the 2d year; buds greenish, viscid: lvs. ovate or rhombic-ovate, long-acuminate, rounded or cuneate at base and with or without basal glands, crenate-serrate, with a very narrow translucent non-ciliate border, 7–10 cm. long, about 5 cm. wide, slightly whitish or greenish beneath; petiole terete, with scattered pubescence; catkins glabrous, 4–7 cm. long; stamens about 15. E.H.7:t.410, f.29. Gn.80:124. (*P. certinensis* Dieck.) Orig. before 1870. Zone II. A very hardy poplar, perhaps the best for planting on the prairies of the Northwest. Here belong also "Strathglass P.", "Frye P." and "Rumford P." (*P. laurifolia × nigra*.)

*P. b. × candicans*; see under No. 18.—*P. b. × Maximowiczii*; see under No. 22.—Similar hybrids are: *P. Rasumowskyana* Schneid. (?*P. laurifolia × nigra*). Brts. glabrous, angled: lvs. of long shoots orbicular-ovate, rounded or subcordate at base, to 14 cm. long, those of old trees smaller, elliptic. S.L.1:f.4q-s(1). Orig. before 1882.—*P. Petrowskyana* Schneid. (?*P. laurifolia × deltoides*.) Brts. angled, like the petioles minutely pubescent: lvs. ovate, acuminate, rounded or cordate at base and usually with 1 or 2 glands, strongly crenate-serrate, to 16 cm. long, pale beneath. S.L.1:f.4t-v. Orig. before 1882.—Also *P. Nolestii* Hort. seems to belong here.

26. *P. nigra* L. BLACK P. Tree to 30 m., with wide-spreading stout brs. and usually short trunk; bark deeply furrowed, often with large burs; brts. terete, glabrous, orange, changing to ashy gray the 2d year; buds viscid, reddish, elongated and curving outward at apex: lvs. rhombic-ovate, long-acuminate, broad-cuneate, finely crenate-serrate, non-ciliate, 5–10 cm. long, 4–8 cm. wide, glabrous, light green beneath, on short brts. smaller and broader and often truncate or rounded at base; petioles slender: staminate catkins 4–6 cm. long, scales lacinate; stamens 20–30; fruiting catkins 10–15 cm. long: caps. 2-valved; pedicels slender, 3–5 mm. long. H.W.2:139(h),t.35(c). R.I.11:t.619(c). M.A.t.85(h). Eu., W. Asia. Long cult. Zone II.—*P. n. italica* Muenchh. LOMBARDY P. Brs. closely ascending, forming a narrow columnar head; lvs. usually more narrowly cuneate: usually staminate. B.C.5:2758(1). H.W.2:140(h). Gn.M.31:293,317,319(h). (*P. n. pyramidalis* (Borkh.) Spach, *P. i.* Moench, *P. dilatata* Ait.) Orig. before 1750. Intr. to Am. 1784. The few pistillate trees known have less strictly upright brs. and a broader head. E.H.7:t.383(h). Striking tree on account of its formal columnar habit; often planted as street tree.—*P. n. thevestina* (Dode) Bean, var. Bark of older brs. grayish and of the trunk whitish, otherwise like var. *italica*. Dode, Monog. Pop.t.12,f.80. (*P. t.* Dode.) W. Asia, N. Afr. Cult. 1903.—*P. n. plantierensis* (Simon-Louis) Schneid., var. Of fastigate habit, with pubescent brts. and pubescent, usually reddish petioles. Probably cross between var. *italica* and var. *betulifolia*. (*P. n.* var. *elegans* Bailey.) Orig. before 1885.—*P. n. betuli-*

*folia* (Pursh) Torr., var. Young brts. and petioles pubescent: lvs. pubescent when young: rachis of catkins pubescent or sometimes glabrous. B.M.8298(c, except pist. catkins which belong to *P. Lloydii*). E.H.7:t.409,f.12. (*P. n.* var. *hudsonica* Schneid., var. *pubescens* Parl., *P. hudsonica* Michx., *P. b.* Pursh.) Eu. Intr. to Am. before 1800. Zone IV.

*P. n.* × *deltoides*; see No. 27.—*P. n.* × *angulata*; see under No. 31.—*P. n.* × *laurifolia*; see No. 25.—*P. n.* *plantierensis* × *Maximowiczii*; see under No. 22.—*P. n.* *betulifolia* × *trichocarpa*; see under No. 19.

27. × *P. canadensis* Moench (*P. deltoides* × *nigra*). Tall tree with spreading or more or less ascending brs.; buds viscid; brts. nearly terete or slightly angled, glabrous, rarely pubescent: lvs. deltoid, acuminate, truncate and without or with 1 or 2 glands at base, crenate-serrate, the serration at base of lf. distant, short-ciliate, 7-10 cm. long, glabrous, green beneath; petiole reddish; staminate catkins about 7 cm. long, glabrous; stamens 15-25; (? *P. helvetica* Poederle.) Orig. probably first in France about 1750. The following forms which apparently originated independently in different places have been distinguished: *P. c. serotina* (Hartig) Rehd., var. Tree to 40 m., with wide-spreading and ascending brs.; brts. brownish yellow, grayish the second year: lvs. truncate at base; stamens 20-25. E.H.7:t.386(h),409,f.16. (*P. s.* Hartig.) Only the staminate plant known. The following 2 forms belong here: *P. c. erecta* (Selys-Longchamps) Rehd., f. Of fastigiate habit. B.H.14:260(h). E.H.7:t.385(h). G.C.56:47(h). Cult. 1818.—*P. c. aurea* (Dipp.) Rehd., f. Lvs. yellow. I.H.23:t.232(c). (*P. serotina* var. *a.* Henry.) Orig. 1871.—*P. c. regenerata* (Schneid.) Rehd., var. Similar to *P. c. serotina*, but leafing 2 weeks earlier; catkins about 6 cm. long; stigmas usually 2. (*P. canadensis* Aschers., *P. r.* Henry.) Orig. about 1814. Also known as "Peuplier régéné" and "Peuplier suisse rouge."—*P. c. Eugènei* (Simon-Louis) Schelle. Tree of narrow-pyramidal habit; brts. glabrous, slightly angled; buds small, viscid; lvs. unfolding early, reddish while young, long-acuminate, usually broad-cuneate, about 6 cm. wide, coarsely crenate-serrate, sparsely ciliate; staminate catkins 3.5-5 cm. long; stamens 15-20, with thread-like filaments. E.H.7:t.409,f.17. G.C.56:68,f.17. B.C.5:2761(h). Am. For.21:995(h). Here belongs probably *P. charkoviensis* Schroed. M.G.17:393(h). Often planted as a street tree under the name "Carolina Poplar."—*P. c. marilandica* (Poir.) Rehd., var. Similar to var. *serotina*, but with the brs. more distant and not regularly ascending; brts. terete; leafing earlier: lvs. rhombic-ovate, long-acuminate, cuneate, crenate-serrate, sparsely minutely ciliate while young, about 10 cm. long and 7.5 cm. broad; petioles greenish; pistillate catkins about 6 cm. long; stigmas 2-4. E.H.7:t.409,f.19. (*P. m.* Poir.) Cult. 1800.—To this group of hybrids belong *P. Henryana* Dode, G.C.56:46(h),68,f.18, and *P. Lloydii* Henry, G.C.56:67(h),68,f.21; the first differing chiefly in its pubescent buds and the second in its minutely pubescent brts. and petioles; this seems to indicate *P. nigra* var. *betulifolia* as one of the parents.—Also *P. Krauseana* Dode, *P. ramulosa* Dode and *P. pseudo-canadensis* Schneid. belong here.

28. *P. Wislizeni* (S. Wats.) Sarg. Tree to 30 m., with stout spreading brs.; bark fissured only on old trunks; brts. terete, glabrous, yellowish; buds puberulous, viscid: lvs. broadly deltoid-ovate, abruptly short-acuminate, truncate and usually abruptly cuneate and without glands at base, coarsely and irregularly crenate-serrate, 5-10 cm. long and as broad or broader, yellowish green, glabrous on both sides; petioles slender, 3-5 cm. long; catkins 5-10 cm. long; disk of pistillate fl. cup-shaped: caps. ovoid, about 10 mm. long, 3-4-valved, on slender pedicels about 1.5 cm. long. S.S.14:t.732. (*P. Fremontii*

var. *W. S. Wats.*) *W. Tex.*, *N. Mex.* Intr. 1894. Zone VI? Often planted as street and shade tree in its native country like the following 4 related species.

Closely related species, all differing in the short-stalked caps., the pedicel not exceeding 6 mm., are the following: *P. Fremontii* S. Wats. Tree to 30 m.; brts. stout; winter-buds glabrous: lvs. truncate or subcordate at base, more finely toothed. S.S.9:t.496. M.D.1922:t.11(h). Calif. to Ariz. Intr. 1904. Zone VII? —*P. arizonica* Sarg. Tree to 25 m.; brts. slender: lvs. deltoid, long-acuminate, truncate or broad-cuneate at base, coarsely serrate, 3.5–5 cm. long; caps. about 6 mm. long. S.M.131. M.D.1922:t.12(h). Calif. to Ariz. and n. Mex. Cult. 1916. —*P. texana* Sarg. Tree to 20 m.; brts. stout: lvs. long-acuminate, truncate, coarsely serrate, 4–6 cm. long; disk of pistillate fl. minute; pedicel of fr. 2–3 mm. long. S.M.132. N. W. Tex. Cult. 1916. —*P. Macdougalii* Rose. Tree to 35 m.; brts. slender, puberulous at first: lvs. broad-ovate, short-acuminate, truncate to subcordate, usually rather finely crenate-serrate, 4–8 cm. long, pubescent beneath on the veins at first; petiole slightly compressed; disk minute; pedicel of fr. 3–5 mm. long. S.M.133. S. Calif. to Ariz. Cult. 1913. Zone VII?

29. *P. Sargentii* Dode. GREAT PLAINS COTTONWOOD. Tree similar to *P. deltoidea*, smaller; brts. lighter yellow; buds pubescent: lvs. often broader than long, 7–10 cm. wide, more coarsely serrate with fewer teeth, glabrous, yellow-green; pedicels shorter; fr. obtuse. S.T.2:t.183. S.M.135. Am. For. 26:414(h). (*P. deltoidea occidentalis* Rydb.) Sask. and Alb. to Neb., N. Mex. and w. Tex. Intr. 1908. Zone II.

*P. S. × acuminata* = *P. Andr  wsii* Sarg. Differs chiefly in its oblong-ovate, finely crenate-serrate lvs., rounded or cuneate at base, 9–10 cm. long; petiole nearly terete; brts. light orange-brown. B.D.1921:25(1). Colo. Intr. 1913. Zone II.

30. *P. deltoidea* Marsh. COTTONWOOD (NORTHERN C.) Tree to 30 m. with upright-spreading brs. forming a rather open broad head; brts. slightly angled or nearly terete, on vigorous shoots often strongly angled, glabrous; buds brownish, viscid: lvs. deltoid-ovate or broad-ovate, acuminate, subcordate to truncate and with 2 or 3 glands at base, coarsely crenate-dentate with curved teeth, entire at base and apex, densely ciliate, 7–12 cm. long and about as broad, bright green below, glabrous; catkins 7–10 cm. long; scales divided into filiform lobes; stamens 40–60; stigmas 3–4; fruiting catkins 15–20 cm. long; caps. short-stalked, 3–4 valved. S.S.9:t.495. S.M.137. B.C.5.2759,2760 (h). F.L.7:184,t.(h). (*P. balsamifera* var. *virginiana* Sarg., *P. monilifera* Ait., *P. deltoidea* var. *monilifera* Henry, *P. canadensis* Michx. f., not Moench.) Que. to N. D., Kans., Tex., and Fla. Intr. before 1750. Zone II. The cottonwood is much planted on account of its rapid growth and luxuriant foliage; in Eu. also planted as a timber tree. The tree here considered the typical form and described above is the Northern Cottonwood, *P. d. virginiana* (Castiglioni) Sudw., while the two following varieties are southern: *P. d. missouriensis* Henry, var. SOUTHERN COTTONWOOD. Brts. often more strongly angled: lvs. broad-ovate to ovate, 10–16 cm. long and usually longer than broad, more finely crenate-serrate; petioles usually with 3–4 glands at apex, glabrous, rarely pilose on the veins beneath when young. S.S.9:t.494,f.7. S.M.136. (*P. angulata* var. *m.* Henry, *P. angulata* Michx. f., not Ait., *P. deltoidea* var. *angulata* Sarg., *P. balsamifera* L., not Muenchh. and later auth.) Vt. to Ohio, Mo., Miss., and Fla. Intr. before 1800? Zone V. —*P. d. pilosa* (Sarg.) Sudw. A form of the preceding with the petioles and lvs. pubescent when young and often remaining so on the veins beneath until fall. Ga. to La., Okla. and Kans.

*P. d. × Tacamahaca*; see under No. 17.

Related species: *P. Palmeri* Sarg. Tree to 20 m.; brts. slender, glabrous: lvs. ovate, 6–12 cm. long, acuminate, broad-cuneate to rounded at base, rather finely crenate-serrate, ciliate at first; fruiting catkins 12–15 cm. long; pedicels 6–8 mm. long. S.M.138. Texas. Intr. 1918. Zone V.

31. *P. angulata* Ait. Tall tree with stout spreading brs. forming an open head; brts. angled, glabrous, the shoots with projecting ribs; buds greenish, slightly viscid: lvs. ovate or broadly oblong-ovate, rather abruptly short-acuminate, truncate to cordate and with 2 or more glands at base, crenate-serrate and ciliate, to 18 cm. long and to 12 cm. wide, glabrous light green beneath; catkins 5-7 cm. long, glabrous; scales concave, crenate-dentate, not lacerate; stamens 30-40; pistillate fls. sessile; stigmas 3-4. S.L.1:f.10-p.3q-r. E.H.7:t.384(h), 409,f.15. G.C.56:68,f.15. Orig. before 1789. Zone V or VI. Differs from the other poplars of this group in the crenate-dentate scales but otherwise resembles *P. deltoides missouriensis*.—*P. a. cordata* Simon-Louis is a staminate tree and said to be hardier than the type.

*P. a. × nigra plantierensis* = *P. robusta* Schneid. Vigorous tree with ascending brs.; brts. angled, minutely pubescent while young: lvs. cuneate to subcordate at base. E.H.7:t.409,f.20. G.C.56:66(h). M.D.1927:t.43,44,f.1(h). (*P. a. cordata robusta* Simon-Louis.) Orig. before 1900. Here belongs *P. Bachelieri* Solemacher.—*P. a. × trichocarpa*; see under No. 19.

To the sect. *TURANGA* Bge. characterized by polymorphous concolor lvs., brts. without terminal bud, pubescent not viscid winter-buds and laciniate deciduous disk, belongs *P. euphratica* Olivier. Tree with slender brs. or shrub: lvs. suborbicular or reniform to narrow-lanceolate or linear, coarsely dentate or entire, reticulate, grayish to bluish green, reticulate; petiole 0.5-4 cm. long: pistillate fls. slender-stalked; stigmas 3, on short styles; caps. oblong-ovate. Brandis, For. Fl. t. 63. Wesmael, Monog. Populus, t.10-13. Gn.89:597(h). (*P. diversifolia* Schrenk, *Turanga e.* Kimura.) N. Afr., W. to C. Asia. Cult. 1920. Zone VII?—Closely related species: *P. pruinosa* Schrenk with usually reniform larger lvs. entire or toothed only near apex and glaucous and the disk cut nearly to the base. Wesmael, Monog. Populus, t.14. U.S.Im.67:476,t.(h). (*Turanga p.* Kimura, *Balsamiflua p.* Kimura.) C. Asia. Intr. 1911.

2. *CHOSËNIA* Nakai. Deciduous tree; winter-buds with 1 scale: lvs. serrulate, short-petioled, estipulate: fls. in slender catkins, with the lvs.; staminate catkins pendulous, pistillate upright or ascending: fls. in the axils of entire bracts, without perianth or glands at the base; staminate fls. with 5 glabrous stamens shorter than bract, filaments glabrous, adnate to the base of the bract; pistillate fls. with a short-stipitate glabrous ovary; styles 2, distinct, each divided about  $\frac{1}{2}$  into 2 stigmas; ovary 1-celled, 4-ovuled: caps. 2-valved. (Chosen, the Japanese name of Korea.)—One species in N. E. Asia.

*C. bracteosa* (Trautv.) Nakai. Tree to 30 m., with upright brs.; bark brownish gray; brts. glabrous, bloomy: lvs. oblong-lanceolate to lanceolate, 5-8.5 cm. long, 1.5-2.3 cm. broad, acuminate, cuneate at base, obscurely serrulate or nearly entire, glabrous, bloomy, with many pairs of veins; petiole 1-5, on shoots 5-7 mm. long: catkins with glabrous axis and broad-elliptic bracts pilose on back, the staminate short-stalked, 1-2.5 cm. long, with 3-5 leaf-like bracts at base, the pistillate 1-2 cm. long, on short leafy brts.; styles 0.5 mm. long, shorter than stigmas: caps. 3.5-4 mm. long. N.K.18:t.3-5, p. 60 (h). (*C. eucalyptoides* Nakai, *C. splendida* (Nakai) Nakai, *Salix eucalyptoides* Schneid.) N. E. Asia. Introd. 1906. Zone IV?

3. *SÁLIX* L. WILLOW. Deciduous shrubs or trees, rarely evergreen, with usually terete brs.; winter-buds with a single scale: lvs. alternate, rarely sub-opposite, petioled or sessile, mostly lanceolate, dentate or entire; stipules often developed, chiefly on vigorous brs.: fls. in usually upright catkins, before or after the lvs., sessile or on bracted or leafy peduncles or brts.; each fl. in the axil of a bract (scale), with 1 or 2 glands or rarely a small lobed disk at base; staminate fls. with 1-12, usually 2 stamens; filaments slender, free or sometimes connate, exceeding the scale; pistillate fl. of a single ovary, com-

posed of 2 carpels, sessile or stipitate (pedicelled), with 2, often bifid stigmas sessile or on a usually short style; ovules many, rarely few; caps. 2-valved, 1-celled. (The ancient Latin name.) About 300 species chiefly in the colder and temperate regions of the n. hemisphere, few in the s. hemisphere, none in Australia. Some arboreal species are important timber-trees; the tough flexible brs. of some are used in making baskets; the bark contains tannic acid and salicin. Many species are ornamental.

The difficulty of the classification and determination of the numerous often polymorphic species is increased by frequent hybrids and by the fact that the sexes are separated and that the fls. mostly appear before the lvs. are developed. Within the scope of this book it is impossible to give a complete enumeration of all the species and forms known to have been introduced into the gardens and collections and only the more important and more widely cultivated species and hybrids are found in the following enumeration.

#### GENERAL KEY TO THE SERIES AND SPECIES

**Stamens 3-9; caps. glabrous; scales yellowish, deciduous; fls. with 2 glands.**

- A. Lvs. linear-lanceolate or linear, green on both sides; petiole glandless. (Ser. 1. *NIGRAE* Loud.).....1. *S. nigra*
- AA. Lvs. elliptic to lanceolate.
  - B. Pistillate fls. with 2 glands; petioles glandular.
    - c. Stigma thick; style short and thick; lvs. elliptic to lanceolate, not reticulate. (Ser. 2. *PENTANDRAE* Dum.)
      - d. Lvs. acute to acuminate; stipules oblong-ovate.....2. *S. pentandra*
      - dd. Lvs. caudate-acuminate; stipules semicordate.....3. *S. lucida*
    - cc. Stigma narrow, bifid, about as long as the slender style; lvs. broad-ovate to elliptic, reticulate beneath. (Ser. 3. *URBANIANAE* Seemen.).....4. *S. cardiophylla*
  - BB. Pistillate fls. with 1 gland; lvs. lanceolate. (Ser. 4. *TRIANDRAE* Dum.)
    - c. Petioles glandular; lvs. acuminate.....5. *S. amygdalina*
    - cc. Petioles glandless, slender; lvs. caudate-acuminate.....6. *S. amygdaloides*

**Stamens 2, rarely 1.**

- A. Staminate fls. with 2 glands; scales yellowish or reddish, not dark at apex; catkins on leafy brts., with or after the lvs.
- B. Upright trees or shrubs.
  - c. Filaments villous at base.
    - d. Catkins 2-7 cm. long; lvs. not reticulate beneath; scales deciduous.
      - E. Lvs. lanceolate to elliptic; catkins on short leafy brts. with the lvs. shorter than the catkins.
        - f. Pistillate fls. with 2 glands; lvs. glabrous or soon glabrous. (Ser. 5. *FRAGILES* W. D. Koch.)
          - g. Ovary glabrous.
            - h. Petiole 6-20 mm. long; pedicel as long or longer than gland.
              - 7. *S. fragilis*
              - HH. Petiole 2-8 mm. long; ovary sessile.....8. *S. Matsudana*
            - ga. Ovary thinly pubescent below the middle, short stalked; tree with pendulous brs. ....9. *S. elegantissima*
          - FF. Pistillate fls. with 1 gland; lvs. more or less silky. (Ser. 6. *ALBAE* Borrer.)
            - g. Ovary pubescent; petiole 2-5 mm. long; lvs. silky beneath.
              - 10. *S. jessoensis*
    - gg. Ovaries glabrous.
      - h. Lvs. more or less silky; ovary sessile.....11. *S. alba*
    - HH. Lvs. only slightly silky at first or glabrous; brs. pendulous.
      - i. Ovary sessile; lvs. linear-lanceolate, 8-15 mm. broad.....12. *S. babylonica*
      - II. Ovary short-stalked; pedicel longer than gland; lvs. lanceolate, 15-22 mm. broad.....13. *S. blanda*
    - EE. Lvs. linear to linear-lanceolate; catkins on elongated leafy brts.; lvs. about as long as catkins. (Ser. 7. *LONGIFOLIAE* Anderss.).....14. *S. longifolia*
    - DD. Catkins 8-12 cm. long; lvs. reticulate beneath, 6-20 cm. long. (Ser. 8. *PSILOSTIGMATAE* Schneid.) .....15. *S. phanera*
    - cc. Filaments glabrous; scales persistent.
      - d. Lvs. serrulate, pubescent on the veins beneath; catkins 5-13 cm. long. (Ser. 9. *ERIOSTACHYAE* Schneid.) .....16. *S. moupinensis*
      - DD. Lvs. entire, glaucous and glabrous beneath; catkins 10-30 cm. long. (Ser. 10. *MAGNIFICAE* Schneid.) .....17. *S. magnifica*
    - BB. Low, often prostrate shrubs, not exceeding 1 m; lvs. never linear, not exceeding 8 cm.; catkins on leafy brts.; scales persistent.
      - c. Ovary glabrous; scales yellowish; pistillate fls. with 1, rarely 2 glands; creeping shrubs; lvs. glabrous. (Ser. 11. *HERBACEAE* Borrer.)
        - d. Lvs. suborbicular, obtuse or emarginate; catkins 4-10 fld.; stigma sessile.
          - 18. *S. herbacea*
      - dd. Lvs. elliptic or obovate to oblong; catkins many-fld.; ovary with short style.

- E. Stamens 2; scales yellow: lvs. green beneath, not reticulate.....19. *S. retusa*  
 EE. Stamen 1; scales rose-red at tip: lvs. pale beneath, reticulate....20. *S. uva-ursi*  
 CC. Ovary pubescent; pistillate fls. with 2 glands.  
 D. Style wanting; scales yellowish; lvs. reticulate, silky at least when young. (Ser. 12. RETICULATAE E. Fries.)  
 E. Petiole 8-20 mm. long: prostrate shrub with glabrous brts.....21. *S. reticulata*  
 EE. Petiole 4-8 mm. long: upright shrub, rarely to 50 cm. tall; brts. pubescent.  
 22. *S. vestita*  
 DD. Style distinct; pistillate fls. with 1 gland; scales dark above the middle: lvs. entire.  
 E. Filaments glabrous: lvs. glabrous at maturity. (Ser. 13. OVALIFOLIAE Rydb.)  
 23. *S. petrophila*  
 EE. Filaments pilose: lvs. pubescent at least beneath. (Ser. 14. GLAUCAE E. Fries.)  
 F. Lvs. 1-3 cm. long: catkins 1-2 cm. long.....24. *S. brachycarpa*  
 FF. Lvs. 3-8 cm. long: catkins to 4.5 cm. long.....25. *S. glauca*  
 AA. Staminate fls. with only 1 gland: catkins usually sessile or subsessile, before or with the lvs.; scales persistent, usually dark-colored at apex (pale in Nos. 27, 36, 39, 40).  
 B. Stamens distinct, 2 (partly connate in No. 31).  
 C. Style wanting or very short, shorter than stigma (about as long in Nos. 26 and 27).  
 D. Ovary pubescent (glabrous in *S. silesiaca* under No. 28).  
 E. Pedicel shorter or little longer than scale.  
 F. Tall shrubs or small trees: lvs. usually rather large and broad; petiole usually 1-2.5 cm. long. (Ser. 15. CAPREAE Bluff & Fing.)  
 G. Brts. glabrous, or pubescent only the first year.  
 H. Lvs. smooth above, glaucous beneath, not reticulate, glabrous or pubescent: brts. soon glabrous.  
 I. Lvs. acute; stipules small.....26. *S. discolor*  
 II. Lvs. acuminate; stipules usually conspicuous.....27. *S. Wallichiana*  
 HH. Lvs. rugose above, reticulate and pubescent beneath: brts. pubescent until autumn.  
 I. Brts. stout; catkins large: lvs. 6-10 cm. long.....28. *S. caprea*  
 II. Brts. slender; catkins rather small: lvs. 3-8 cm. long.....29. *S. aurita*  
 GG. Brts. persistently tomentose until the 2d year.  
 H. Stamens distinct: lvs. 5-9 cm. long, puberulous above.....30. *S. cinerea*  
 HH. Stamens connate below: lvs. to 16 cm. long, glabrate above.  
 31. *S. Medemii*  
 FF. Low shrubs, rarely to 3 or 4 m. tall; petiole 2-10 mm. long; lvs. usually small. (Ser. 16. INCUBACAE Dum.)  
 G. Brts. glabrous or glabrate: lvs. glabrous to pubescent beneath.  
 H. Pedicels 2-3 times as long as gland: lvs. 3-6 cm. long.....32. *S. repens*  
 HH. Pedicel 4-6 times as long as gland: lvs. 5-8 cm. long.....33. *S. petiolaris*  
 GG. Brts. pubescent: lvs. pubescent beneath.  
 H. Lvs. silky-pubescent and lustrous beneath, serrulate.....34. *S. sericea*  
 HH. Lvs. grayish tomentose and dull beneath, crenate or subentire.  
 35. *S. humilis*  
 EE. Pedicel longer than scale: petiole 4-10 mm. long. Ser. 17. FULVAE Barlett.)  
 36. *S. Bebbiana*  
 DD. Ovary glabrous.  
 E. Ovary stalked.  
 F. Lvs. cuneate at base, entire: shrubs to 1 m. (Ser. 18. ROSEAE Anderss.)  
 37. *S. pedicellaris*  
 FF. Lvs. rounded or subcordate at base, glandular-serrulate: large shrub or small tree. (Ser. 19. BALSAMIFERAЕ Schneid.).....38. *S. pyrifolia*  
 EE. Ovary sessile or subsessile. (Ser. 20. LONGIFLORAE Schneid.).....39. *S. hypoleuca*  
 CC. Style distinct, longer than stigma.  
 D. Ovary distinctly stalked; style shorter than half the ovary.  
 E. Ovary pubescent (but usually glabrous in No. 42).  
 F. Scales light yellow-brown: pistillate catkins in fr. 6-10 cm. long, slender: lvs. entire, glaucous and glabrous or slightly silky beneath. (Ser. 21. HETEROCROMAE Schneid.).....40. *S. heterochroma*  
 FF. Scales dark brown at apex.  
 G. Lvs. lanceolate, tomentose beneath. (Ser. 22. CANDIDAЕ Schneid.)  
 41. *S. candida*  
 GG. Lvs. glabrous or pubescent, green or pale beneath. (Ser. 23. PHYLICIFOLIAE Dum.)  
 H. Lvs. glabrous or pubescent beneath  
 I. Ovary usually glabrous: lvs. blackening in drying.....42. *S. myrsinifolia*  
 II. Ovary pubescent: lvs. not blackening.....43. *S. phyllicifolia*  
 HH. Lvs. with white silky tomentum beneath.....44. *S. subcoerulea*  
 EE. Ovary glabrous. (Ser. 24. HASTATAE Borrer.)  
 F. Lvs. silky-pubescent and serrulate, green beneath.....45. *S. adenophylla*  
 FF. Lvs. glabrous or glabrescent, glaucous beneath.  
 G. Brts. not bloomy.  
 H. Lvs. lustrous above, glabrous from the first: caps. 9-11 mm. long.  
 46. *S. glaucophylloides*  
 HH. Lvs. dull above, pubescent at first: caps. shorter.  
 I. Petioles 3-8 mm. long; lvs. acute.....47. *S. hastata*

- ii. Petioles 5-15 mm. long: lvs. acuminate.....48. *S. cordata*  
 gg. Brts. bloomy, pedicels very short.....49. *S. irrorata*  
 dd. Ovary sessile or subsessile (stalked in No. 52); style usually about half as long as ovary.  
 e. Catkins on leafy peduncles: lvs. elliptic to lanceolate, 1-5 cm. long: ovary pubescent. (Ser. 25. MYRSINITES Borrer.).....50. *S. myrsinites*  
 ee. Catkin sessile or subsessile.  
 f. Ovary glabrous.  
 g. Lvs. pubescent or tomentose beneath, broad-elliptic to oblong-obovate. (Ser. 26. CHRYSANTHEAE W. Koch.)  
 h. Ovary subsessile: lvs. 2.5-7 cm. long.....51. *S. lanata*  
 hh. Ovary on a stalk 2-3 times as long as gland.....52. *S. Hookeriana*  
 gg. Lvs. lanceolate, glabrous: brts. usually bloomy. (Ser. 27. DAPHNOIDES Dum.) .....53. *S. daphnoides*  
 ff. Ovary pubescent (glabrous in No. 54): lvs. usually pubescent or tomentose beneath. (Ser. 28. VIMINALES Bluff & Fingerh.)  
 g. Ovary glabrous or sparingly pubescent: lvs. lanceolate, silky or glabrescent beneath .....54. *S. Rehderiana*  
 gg. Ovary densely pubescent.  
 h. Lvs. 2.5-6 cm. long, elliptic-oblong to lanceolate.....55. *S. lapponum*  
 hh. Lvs. 10-25 cm. long, lanceolate to linear lanceolate, tomentose beneath. 56. *S. viminalis*  
 aa. Stamens 2, more or less connate or only 1: catkins sessile or subsessile (stalked in No. 57).  
 c. Stamens 2, connate.  
 d. Style wanting or short, not more than half as long as ovary.  
 e. Lvs. white-tomentose beneath, linear: catkins stalked; stamens connate  $\frac{1}{2}$  or less: ovary glabrous. (Ser. 29. CANAE Kern.).....57. *S. Elaeagnos*  
 ee. Lvs. glabrous or silky beneath; stamens wholly connate: ovary pubescent. (Ser. 30. PURPUREAE E. Fries.)  
 f. Fls. in spring before the lvs.  
 g. Lvs. 5-15 cm. long: filaments wholly connate.  
 h. Lvs. lanceolate to narrow-lanceolate, alternate: staminate catkins to 5, pistillate to 8 cm. long in fr.....58. *S. Miyabeana*  
 hh. Lvs. often subopposite, usually oblong-obovate to oblanceolate: catkins about 2 cm. long.....59. *S. purpurea*  
 gg. Lvs. 1-4 cm. long: broad-oval to oblong: filaments only  $\frac{1}{2}$ - $\frac{4}{5}$  connate. 60. *S. caesia*  
 ff. Fls. in autumn, sessile in the axils of lvs.: lvs. oblong to obovate, 6-15 mm. long .....61. *S. Bockii*  
 dd. Style longer than the pubescent ovary: lvs. elliptic-oblong to oblong, 5-10 cm. long. (Ser. 31. GRACILISTYLAE Schneid.).....62. *S. gracilistyla*  
 cc. Stamens 1 or 2 in fls. of the same catkin: ovary stalked, pubescent; style distinct: lvs. oblong-obovate to oblanceolate, 5-12 cm. long. (Ser. 32. SITCHENSES Bebb.) 63. *S. sitchensis*

KEY BASED ON STAMINATE SPECIMENS <sup>1</sup>

<sup>1</sup> On account of the great variability of the species, the numerous hybrids and the often slight differences if not all the characters can be taken into consideration this and also the following keys allow in many cases only an approximate determination and cannot be considered final without further study of descriptions and specimens.

**Stamens 3 or more: catkins on leafy or at least bracted stalks.**

- A. Stamens more than 3.  
 B. Scales oval to oblong, villous on back, at least toward the base.  
 C. Catkins slender, about 5 mm. thick; young lvs. usually slightly silky.  
 D. Lvs. linear-lanceolate, green on both sides.....1. *S. nigra*  
 DD. Lvs. ovate-lanceolate to lanceolate, glaucous beneath.....6. *S. amygdaloides*  
 CC. Catkins about 1 cm. thick: young lvs. glabrous.  
 D. Stalk of catkins about 2 cm. long, its lvs. more than 1 cm. wide...2. *S. pentandra*  
 DD. Stalk of catkins about 1 cm. long, its lvs. less than 1 cm. wide.....3. *S. lucida*  
 BB. Scales glabrous, except ciliate: young lvs. glabrous.....4. *S. cardiophylla*  
 AA. Stamens usually 3.....5. *S. amygdalina*  
**Stamens 2 or rarely 1.**  
 A. Staminate fls. with 2 glands: filaments distinct.  
 B. Upright shrubs or trees.  
 C. Catkins 6-18 cm. long.  
 D. Bracts and rachis pubescent: catkins 6-12 cm. long: lvs. denticulate or serrulate.  
 E. Lvs. silky-tomentose beneath.....15. *S. phanera*  
 EE. Lvs. only sparingly pubescent on the veins beneath.....16. *S. moupinensis*  
 DD. Bracts and rachis glabrous; catkins 12-18 cm. long: lvs. entire glabrous, glaucous beneath .....17. *S. magnifica*  
 CC. Catkins 2-7 cm. long.  
 D. Tall shrubs or trees.  
 E. Lvs. lanceolate to elliptic-oblong: catkins with the lvs., longer than the sometimes bract-like lvs. of the peduncles.  
 F. Trees with upright brs. or spreading.

- g. Young lvs. and brts. more or less silky.  
 h. Scales broad-ovate ..... 10. *S. jessoensis*  
 hh. Scales oblong-ovate to lanceolate. .... 11. *S. alba*  
 gg. Young lvs. and brts. glabrous or slightly silky.  
 h. Catkins 2.5-6 cm. long; brts. brown or olive.  
 i. Catkins 2.5-4.5 cm. long; brts. brittle at base. .... 7. *S. fragilis*  
 ii. Catkins 4-6 cm. long; brts. not brittle. .... 11. *S. alba calva*  
 hh. Catkins 1-1.5 cm. long; scales oval; brts. yellowish. .... 8. *S. Matsudana*  
 ff. Trees with pendulous brts.  
 g. Catkins 2-4 cm. long.  
 h. Brts. brown or olive.  
 i. Peduncles and young lvs. slightly silky. .... 12. *S. babylonica*  
 ii. Peduncles at base and young lvs. glabrous. .... 13. *S. blanda*  
 hh. Brts. yellow ..... 11. *S. alba tristis*  
 gg. Catkins 1-1.5 cm. long; brts. yellowish. .... 8. *S. Matsudana pendula*  
 ee. Lvs. linear: catkins on elongated leafy brts. .... 14. *S. longifolia*  
 dd. Low shrubs not exceeding 1 m.; catkins after the lvs. on leafy brts.  
 e. Lvs. linear or linear-lanceolate; stamens villous to the middle. .... 14. *S. longifolia*  
 ee. Lvs. broader; stamens pilose only at base.  
 f. Brts. densely villous: catkins 1-2 cm. long. .... 24. *S. brachycarpa*  
 ff. Brts. glabrous or glabrescent.  
 g. Lvs. obtuse and rugose above; catkins slender; scales pale. .... 22. *S. vestita*  
 gg. Lvs. acute, not rugose; scales dark at apex. .... 25. *S. glauca*  
 bb. Prostrate or creeping shrubs.  
 c. Lvs. 1.5-8 cm. long, rugose above, strongly reticulate beneath; petiole 8-20 mm. long.  
 21. *S. reticulata*  
 cc. Lvs. smaller, not rugose above; petiole short.  
 d. Lvs. obovate to oblanceolate; catkins many-fld.  
 e. Fls. with 2 stamens.  
 f. Catkins about 1.5 cm. long; scales yellowish, slightly darker at apex.  
 19. *S. retusa*  
 ff. Catkins 2-3 cm. long; scales dark. .... 23. *S. petrophila*  
 ee. Fls. with 1 stamen. .... 20. *S. uva-ursi*  
 dd. Lvs. suborbicular: catkins 4-10-fld. .... 18. *S. herbacea*  
 aa. Staminate fls. with only one gland.  
 b. Filaments distinct; stamens 2.  
 c. Catkins with or after the lvs. on leafy or bracted brts.  
 d. Brts. pubescent or villous.  
 e. Catkins 1-2 cm. long; brts. finely pubescent. .... 42. *S. myrsinifolia*  
 ee. Catkins larger: brts. villous.  
 f. Catkins densely clothed with yellow villous hairs, 3-4 cm. long and 1.5 cm. thick ..... 51. *S. lanata*  
 ff. Catkins white-woolly.  
 g. Lvs. entire: catkins 4-5 cm. long, 1.5 cm. thick. .... 52. *S. Hookeriana*  
 gg. Lvs. glandular-serrate: catkins 3-4 cm. long and 1 cm. thick.  
 45. *S. adenophylla*  
 dd. Brts. glabrous or nearly so.  
 e. Scales yellowish or light yellow-brown.  
 f. Scales nearly glabrous.  
 g. Catkins 1-1.5 cm. long. .... 37. *S. pedicellaris*  
 gg. Catkins 3-6 cm. long. .... 39. *S. hypoleuca*  
 ff. Scales pubescent: catkins 4-5 cm. long, densely silky. .... 40. *S. heterochroma*  
 ee. Scales dark at apex or sometimes only pinkish.  
 f. Anthers red: catkins 1.5-2 cm. long, slender; scales dark brown.  
 50. *S. myrsinites*  
 ff. Anthers yellow or only slightly reddish at first.  
 g. Lvs. rather densely glandular-denticulate.  
 h. Catkins up to 5 cm. long; scales dark; basal lvs. short-petioled, cuneate ..... 46. *S. glaucophylloides*  
 hh. Catkins up to 3 cm. long; scales rather light; basal lvs. slender-petioled, rounded at base. .... 38. *S. pyrifolia*  
 gg. Lvs. remotely denticulate or nearly entire.  
 h. Lvs. glabrous or silky only on midrib beneath: catkins 2-3 cm. long.  
 i. Lvs. usually rounded at base. .... 47. *S. hastata*  
 ii. Lvs. cuneate at base. .... 43. *S. phyticifolia*  
 hh. Lvs. more or less pubescent when young, blackening in drying: catkins 1-2 cm. long. .... 42. *S. myrsinifolia*  
 cc. Catkins before or with the lvs., sessile or subsessile; without or with only 1-3 small bracts at base.  
 d. Brts. bloomy.  
 e. Catkins 3-4 cm. long, with long silky hairs little shorter than stamens.  
 53. *S. daphnoides*  
 ee. Catkins 2-2.5 cm. long; stamens distinctly longer than hairs.  
 f. Young lvs. glabrous. .... 49. *S. irrorata*  
 ff. Young lvs. silky beneath. .... 44. *S. subcoerulea*  
 dd. Brts. not bloomy.  
 e. Brts. pubescent at least toward the apex.

- f. Hairs of bracts yellow or yellowish, nearly as long as stamens.  
 g. Catkins 1.5 cm. thick, to 4.5 cm. long, hairs with golden sheen. 51. *S. lanata*  
 gg. Catkins about 1 cm. thick, to 3.5 cm. long, hairs yellowish. 55. *S. lapponum*  
 ff. Hairs shorter, whitish.  
 g. Anthers red.  
 ii. Brts. short-pubescent; catkins 1-1.5 cm. long. .... 35. *S. humilis*  
 HH. Brts. woolly-floccose; catkins about 2.5 cm. long. .... 41. *S. candida*  
 gg. Anthers yellow.  
 ii. Brts. persistently pubescent, rather stout: catkins 2 cm. or more long and more than 1 cm. thick. .... 30. *S. cinerea*  
 HH. Brts. finely pubescent, becoming glabrous: catkins 2 cm. or less long and scarcely 1 cm. across.  
 i. Brts. yellowish or gray-brown; catkins nearly 1 cm. across.  
 56. *S. viminalis*  
 II. Brts. red-brown: catkins about 7 mm. thick: brts. slender.  
 j. Catkins 1.5-2 cm. long: upright shrub. .... 34. *S. sericea*  
 jj. Catkins 1-1.5 cm. long: prostrate or ascending shrub.  
 32. *S. repens*  
 EE. Brts. glabrous.  
 f. Anthers red.  
 g. Scales with yellowish hairs as long as stamens; anthers sometimes yellow; catkins at least 10 mm. thick. .... 55. *S. lapponum*  
 gg. Scales with whitish shorter hairs: catkins about 8 mm. thick.  
 54. *S. Rehderiana*  
 FF. Anthers yellow.  
 g. Catkins 2-5 cm. long: brts. rather stout.  
 ii. Scales dark brown or nearly black above the middle.  
 i. Catkins ovoid-oblong, 1.5 cm. thick. .... 28. *S. caprea*  
 ii. Catkins cylindric-oblong, usually less than 1.5 cm. thick.  
 j. Catkins sessile, about 3 cm. long.  
 k. Winter-buds finely pubescent. .... 53. *S. daphnoides*  
 kk. Winter-buds glabrous ..... 26. *S. discolor*  
 jj. Catkins short-stalked, with a few bracts at base.  
 k. Catkins 3.5-5 cm. long. .... 46. *S. glaucophylloides*  
 kk. Catkins 2.5-3 cm. long. .... 48. *S. cordata*  
 HH. Scales paler, light red-brown to pinkish toward the apex.  
 i. Filaments about 6 mm. long, glabrous. .... 27. *S. Wallichiana*  
 ii. Filaments about 1 cm. long, villous at base. .... 38. *S. Bebbiana*  
 gg. Catkins 8-15 mm. long: brts. slender; scales red-brown. .... 29. *S. aurita*  
 BB. Filaments connate or fls. with only 1 stamen.  
 c. Stamens 2; filaments partly or wholly connate.  
 d. Fls. before or with the lvs.  
 E. Brts. tomentose: filaments connate  $\frac{1}{2}$ . .... 31. *S. Medemii*  
 EE. Brts. glabrous (pubescent the first year in Nos. 57 and 62.)  
 f. Anthers reddish when young.  
 g. Catkins 1.5-2.5 cm. long; shrub with long slender brs. .... 59. *S. purpurea*  
 gg. Catkins 1 cm. or less long: low shrub, less than 1 m. tall. .... 60. *S. caesia*  
 FF. Anthers yellow.  
 g. Scales obtuse.  
 h. Filaments connate  $\frac{1}{2}$  or less; catkins usually short-stalked, with the lvs. .... 57. *S. Elaeagnos*  
 HH. Filaments wholly connate; catkins sessile. .... 58. *S. Miyabeana*  
 gg. Scales ovate-lanceolate, acuminate. .... 62. *S. gracilistyla*  
 DD. Fls. in late summer or autumn in the axils of lvs. .... 61. *S. Bockii*  
 CC. Stamen 1 and 2 in fls. of the same catkin: brts. tomentose or glabrescent: catkins on short bracted stalks. .... 63. *S. sitchensis*

## KEY BASED ON PISTILLATE SPECIMENS

## Ovary glabrous.

- A. Scales yellowish to yellow-brown, not dark at apex (reddish in No. 20); catkins usually on leafy stalks: brts. glabrous.  
 B. Upright shrubs or trees.  
 C. Ovary stalked.  
 D. Fls. with 2 glands.  
 E. Style distinct: petioles glandular: lvs. glandular-serrulate, glabrous.  
 F. Stigmas short, thick.  
 G. Pedicels about twice as long as gland. .... 2. *S. pentandra*  
 GG. Pedicel 3-4 times as long as gland. .... 3. *S. lucida*  
 FF. Stigmas narrow, bifid. .... 4. *S. cardiophylla*  
 EE. Style wanting.  
 F. Catkins slender, 2-5 cm. long.  
 G. Tree with upright brs. .... 7. *S. fragilis*  
 GG. Tree with pendulous brs.: ovary slightly pubescent at base.  
 9. *S. elegantissima*  
 FF. Catkins short and dense, 1-2 cm. long; pedicels short. .... 8. *S. Matsudana*

- dd. Fls. with 1 gland.  
 e. Scales villous: lvs. serrulate or denticulate: caps. green.  
 f. Catkins on rather short brts., longer than the basal lvs.: lvs. serrulate.  
 g. Lvs. linear or linear-lanceolate.  
 h. Lvs. green on both sides, glabrous.....1. *S. nigra*  
 hh. Lvs. whitish-tomentose beneath.....57. *S. Elaeagnos*  
 gg. Lvs. elliptic-oblong to lanceolate, more or less glaucous beneath and glabrous.  
 h. Trees with upright or spreading brs.  
 i. Pedicels 4 or 5 times as long as gland; petiole slender.  
 6. *S. amygdaloides*  
 ii. Pedicel 2 or 3 times as long as gland: petiole short.....5. *S. amygdalina*  
 hh. Tree with pendulous brts.: pedicel short.....13. *S. blanda*  
 ff. Catkins on elongated brts.: lvs. about as long as catkins, narrow, remotely denticulate.....14. *S. longifolia*  
 ee. Scales nearly glabrous: lvs. entire, oblong to obovate, obtuse: caps. reddish green.....37. *S. pedicularis*  
 cc. Ovary sessile or subsessile (see also No. 8); fls. with 1 gland.  
 d. Catkin 2-7 cm. long.  
 e. Scales villous at least on margin.  
 f. Lvs. pubescent: brts. upright or pendulous and yellow.  
 g. Lvs. white-tomentose beneath, linear or nearly so.....57. *S. Elaeagnos*  
 gg. Lvs. silky beneath, lanceolate.....11. *S. alba*  
 ff. Lvs. glabrous or slightly silky when young.  
 g. Brts. upright.....11. *S. alba calva*  
 gg. Brts. pendulous.....12. *S. babylonica*  
 ee. Scales glabrous: stigma sessile: lvs. elliptic to oblong.....39. *S. hypoleuca*  
 dd. Catkins 8-30 cm. long, glabrous or sparingly pubescent.  
 e. Lvs. serrulate; catkins sparingly pubescent.....16. *S. moupinensis*  
 ee. Lvs. entire; catkins quite glabrous.....17. *S. magnifica*  
 bb. Low prostrate shrubs: lvs. small.  
 c. Lvs. suborbicular, serrulate: catkins few-fl.; style distinct.....18. *S. herbacea*  
 cc. Lvs. elliptic to oblanceolate, remotely and slightly toothed.  
 d. Scales yellowish: lvs. green beneath.....19. *S. retusa*  
 dd. Scales rose-red at tip: lvs. glaucescent beneath.....20. *S. uva-ursi*  
 aa. Scales dark at apex; upright shrubs or trees.  
 b. Catkins on leafy or bracted stalks, with or after the lvs.  
 c. Brts. pubescent or villous.  
 d. Catkins densely clothed with yellow villous hairs; ovary sessile; style rather long.  
 51. *S. lanata*  
 dd. Catkins white-villous: ovary stalked.  
 e. Lvs. entire: catkins about 1.5 cm. thick.....52. *S. Hookeriana*  
 ee. Lvs. glandular-serrulate; catkins about 1 cm. thick.....45. *S. adenophylla*  
 cc. Brts. glabrous or glabrate.  
 d. Pedicels as long or longer than scale: catkin in fr. 4-7 cm. long.  
 e. Veins of lvs. prominent beneath.....38. *S. pyrifolia*  
 ee. Veins of lvs. not raised beneath.....46. *S. glaucophyllodes*  
 dd. Pedicel shorter than scale.  
 e. Style much longer than stigma: catkins very villous.....47. *S. hastata*  
 ee. Style slightly longer than stigma: catkins moderately pubescent.  
 42. *S. myrsinifolia*  
 bb. Catkins sessile or subsessile, before or with the lvs.  
 c. Brts. bloomy.  
 d. Ovary short-pedicelled.....53. *S. daphnoides*  
 dd. Ovary sessile.....49. *S. irrorata*  
 cc. Brts. not bloomy.  
 d. Ovary pedicelled.....48. *S. cordata*  
 dd. Ovaries subsessile.....54. *S. Rehderiana*  
 Ovary pubescent.  
 a. Scales yellowish to yellow-brown, not dark at apex: catkins on leafy or bracted stalks.  
 b. Catkins 1-5 cm. long; stigma sessile or subsessile.  
 c. Brts. glabrous; catkins 3-5 cm. long.  
 d. Catkins on rather short leafy stalks, its lvs. shorter than the catkins.  
 10. *S. jessoensis*  
 dd. Catkins on elongated leafy brts., its lvs. about as long as catkins.  
 14. *S. longifolia*  
 cc. Brts. pubescent: catkins 1-2 cm. long: low shrub.....24. *S. brachycarpa*  
 bb. Catkins 6-30 cm. long; style distinct.  
 c. Pedicel not exceeding the gland or wanting.  
 d. Lvs. glabrescent.....16. *S. moupinensis*  
 dd. Lvs. silky-villous beneath.....15. *S. phanera*  
 cc. Pedicel several times longer than gland.....40. *S. heterochroma*  
 aa. Scales dark at apex.  
 b. Catkins on leafy stalks or brts.  
 c. Prostrate or creeping shrubs.  
 d. Lvs. broad-elliptic to obovate; petiole 8-20 mm. long; fls. with 2 glands.  
 21. *S. reticulata*

- DD. Lvs. elliptic to oblanceolate; petiole 3-6 mm. long; fls. with 1 gland.  
23. *S. petrophila*
- CC. Upright shrubs.  
D. Style distinct; ovary stalked.  
E. Lvs. glabrous or nearly so.  
F. Lvs. entire; pedicels 3-4 times as long as gland.....43. *S. phylicifolia*  
FF. Lvs. usually serrate; ovary short-stalked.....50. *S. myrsinites*
- EE. Lvs. pubescent beneath.  
F. Ovary short-stalked; lvs. entire, 3-8 cm. long.....25. *S. glauca*  
FF. Ovary long-stalked; lvs. entire or serrate, 5-16 cm. long.  
52. *S. Hookeriana tomentosa*
- DD. Style wanting; ovary sessile; lvs. pubescent.....22. *S. vestita*
- BB. Catkins sessile or subsessile, without or with 1-3 small bracts at base.  
C. Style wanting or shorter than stigma.  
D. Brts. pubescent; pedicels distinct; stigma sessile or subsessile.  
E. Caps. attenuate at apex; winter-buds pubescent.  
F. Catkins up to 9 cm. long; tall shrubs.  
G. Pubescence of brts. dark gray.....30. *S. cinerea*  
GG. Pubescence of brts. light gray or whitish.....31. *S. Medemii*  
FF. Catkins 1.5-3, rarely to 4 cm. long; stigma sessile or on a short style; low shrub.....35. *S. humilis*
- EE. Caps. obtuse, about 4 mm. long; stigma sessile; winter-buds glabrate or minutely pubescent.....34. *S. sericea*
- DD. Brts. glabrous.  
E. Ovary stalked.  
F. Style distinct, but short.  
G. Pedicels, at least the lower ones, longer than scale; catkins not bracted at base.....26. *S. discolor*  
GG. Pedicels shorter than scale; catkins usually with small bracts at base.  
27. *S. Wallichiana*
- FF. Style wanting.  
G. Pedicel about as long as scale.  
H. Catkins 5-6 cm. long.....28. *S. caprea*  
HH. Catkins up to 3 cm. long.....29. *S. aurita*  
GG. Pedicel longer than scale.....36. *S. Bebbiana*
- EE. Ovary sessile or subsessile.  
F. Fls. in early spring before the lvs.  
G. Style distinct.....54. *S. Rehderiana*  
GG. Style wanting.  
H. Catkins about 1 cm. long; low shrub, not exceeding 1 m....60. *S. caesia*  
HH. Catkins 2-4 cm. long; taller shrubs or trees.  
I. Catkins often subopposite; scales shorter than half the ovary, nearly black; shrub.....59. *S. purpurea*  
II. Catkins alternate; scales longer than half the ovary, brown; tree.  
58. *S. Miyabeana*  
FF. Fls. in late summer; catkins in the axils of lvs.....61. *S. Bockii*
- CC. Styles as long as stigma or longer.  
D. Ovary sessile or subsessile.  
E. Style shorter than ovary; scales oblong, obtusish.....56. *S. viminalis*  
EE. Style longer than ovary.....62. *S. gracilistyla*
- DD. Ovary stalked, on a stalk as long or longer than gland.  
E. Brts. pubescent.  
F. Tomentum of brts. floccose; scales long-villous; style red, longer than stigma.....41. *S. candida*  
FF. Tomentum of brts. villous; scales short-pubescent; style about as long as stigma.....63. *S. sitchensis*
- EE. Brts. glabrous.  
F. Brts. bloomy; catkins subsessile.....44. *S. subcoerulea*  
FF. Brts. not bloomy; catkins on short bracted stalks.  
G. Pedicel about twice as long as gland.....42. *S. myrsinifolia*  
GG. Pedicel 3-4 times as long as gland.....43. *S. phylicifolia*

## KEY BASED ON VEGETATIVE CHARACTERS

## Upright shrubs or trees.

- A. Lvs. glabrous or only slightly pubescent beneath at maturity.  
B. Lvs. green on both sides.  
C. Lvs. oblong-lanceolate to lanceolate.  
D. Petiole glandular; lvs. 4-12 cm. long, glandular-serrulate.  
E. Lvs. acuminate.....2. *S. pentandra*  
EE. Lvs. caudate.....3. *S. lucida*
- DD. Petiole glandless.  
E. Lvs. 6-12 cm. long, glandular-serrulate.....16. *S. moupinensis*  
EE. Lvs. 1-5 cm. long, serrulate or sometimes entire (see also *S. myrtilifolia* under No. 33).....50. *S. myrsinites*
- CC. Lvs. linear-lanceolate to linear; petiole glandless.  
D. Lvs. closely serrulate.....1. *S. nigra*

- DD. Lvs. remotely denticulate.....14. *S. longifolia*
- BB. Lvs. glaucous or glaucescent beneath (sometimes green in Nos. 5 and 7).
- C. Lvs. lanceolate to linear-lanceolate, at least 4 times longer than broad.
- D. Lvs. distinctly serrate or denticulate.
- E. Lvs. quite glabrous at maturity.
- F. Brts. bloomy.
- G. Lvs. obscurely serrulate or subentire; petiole about as long as bud or shorter, scarcely exceeding 1 cm.....49. *S. irrorata*
- GG. Lvs. usually serrulate; petiole always longer than bud, up to 2 cm. long.  
53. *S. daphnoides*
- FF. Brts. not bloomy.
- G. Brs. upright.
- H. Petiole glandular.
- I. Brts. brittle at base; petiole 6-25 mm. long.....7. *S. fragilis*
- II. Brts. not brittle at base; petiole 3-12 mm. long.....5. *S. amygdalina*
- HH. Petiole glandless or sometimes obscurely glandular in No. 11.
- I. Lvs. caudate-acuminate; petiole slender, 1-1.5 cm. long.  
6. *S. amygdaloides*
- II. Lvs. acuminate or acute; petiole not longer than 1 cm.
- J. Lvs. long-acuminate, closely serrulate, broadest below the middle.
- K. Lvs. slightly silky at first, soon glabrous.....8. *S. Matsudana*
- KK. Lvs. more or less silky beneath.....11. *S. alba*
- JJ. Lvs. acute or acuminate, often broadest above the middle.
- K. Stipules lanceolate, as long or longer than petiole; lvs. alternate, sinuate-serrulate .....58. *S. Miyabeana*
- KK. Stipules usually wanting or minute; lvs. often opposite and often subentire .....59. *S. purpurea*
- GG. Brs. pendulous.
- H. Brts. yellow: lvs. usually slightly silky beneath.....11. *S. alba tristis*
- HH. Brts. olive- to red-brown, sometimes yellowish: lvs. glabrous.
- I. Lvs. narrow-lanceolate, 8-15 mm. wide, finely serrulate.
- J. Petiole to 8 mm. long; brts. brown.....12. *S. babylonica*
- JJ. Petiole not exceeding 5 mm.: brts. olive or yellowish.  
8. *S. Matsudana pendula*
- II. Lvs. broader, usually 15-22 mm. wide.
- J. Lateral veins diverging at an angle of more than 45°.  
9. *S. elegantissima*
- JJ. Lateral veins diverging at an angle of 45° or less.....13. *S. blanda*
- EE. Lvs. pubescent beneath, at least along the midrib.
- F. Pubescence of white silky hairs.
- G. Petiole glandular: tree.....11. *S. alba*
- GG. Petiole glandless: shrub.....33. *S. petiolaris*
- FF. Pubescence of brown hairs: brts. usually purple.....34. *S. sericea*
- DD. Lvs. entire, 1.5-4 cm., silky beneath.....32. *S. repens*
- CC. Lvs. ovate or elliptic to ovate- or elliptic-lanceolate, less than 4 times as long as broad.
- D. Lvs. entire or indistinctly toothed (see also No. 36).
- E. Lvs. 1-10 cm. long.
- F. Lvs. glabrous.
- G. Lvs. oblong, glaucous and finely reticulate beneath.....37. *S. pedicellaris*
- GG. Lvs. elliptic to elliptic-oblong, not reticulate.
- H. Petiole 2-6 mm. long; lvs. glaucous beneath, 2-5 cm. long.  
39. *S. hypoleuca*
- HH. Petiole 1-3 mm. long; lvs. pale green beneath, 1.5-3 cm. long.  
60. *S. caesia*
- FF. Lvs. more or less pubescent.
- G. Brts. and petioles pubescent.
- H. Lvs. 3-8 cm. long, acute or acuminate, villous; petiole 2-8 mm. long.  
25. *S. glauca*
- HH. Lvs. 1-3 cm. long, obtusish to acute, silky beneath; petiole 1-3 mm. long .....32. *S. repens*
- GG. Brts. and petioles glabrous, at least at maturity; lvs. acuminate, 4-8 cm. long; petiole 5-15 mm. long.....40. *S. heterochroma*
- EE. Lvs. 10-20 cm. long, elliptic or elliptic-obovate, rounded or subcordate at base.  
17. *S. magnifica*
- DD. Lvs. toothed.
- E. Lvs. quite glabrous at maturity.
- F. Lvs. reticulate beneath.
- G. Lvs. acute or acutish, 4-9 cm. long.....33. *S. pyrifolia*
- GG. Lvs. acuminate to acute, 6-18 cm. long.....4. *S. cardiophylla*
- FF. Lvs. not reticulate beneath.
- G. Lvs. distinctly acuminate, usually rounded at base.
- H. Lvs. caudate-acuminate .....5. *S. amygdaloides*
- HH. Lvs. acuminate.
- I. Midrib of lvs. puberulous above.....48. *S. cordata*
- II. Midrib of lvs. glabrous above; lvs. very glaucous beneath.  
46. *S. glaucophylloides*

- gg. Lvs. acute or abruptly short-acuminate, usually cuneate at base and often broadest above the middle.
- h. Lvs. always alternate.
- i. Lvs. usually 5-10 cm. long, generally oblong.....26. *S. discolor*
- ii. Lvs. usually 3-6 cm. long, generally elliptic.
- j. Petiole 1-4 mm. long; lvs. sometimes subcordate, usually stipulate.
47. *S. hastata*
- jj. Petiole 3-10 mm. long; lvs. never subcordate, without or with minute stipules.....43. *S. phylicifolia*
- hh. Lvs. often subopposite.....59. *S. purpurea*
- ee. Lvs. slightly pubescent.
- f. Lvs. more or less acuminate, generally oblong.
- g. Petiole 2-6 mm. long; brts. glabrous; lvs. oblong-lanceolate to lanceolate.
54. *S. Rehderiana*
- gg. Petiole 5-15 mm. long; young brts. pubescent; lvs. usually oblong.
- h. Lvs. cuneate at base, 4-8 cm. long.
- i. Pubescence of white and brown hairs; lvs. rarely subentire.
26. *S. discolor*
- ii. Pubescence of white hairs; lvs. often subentire or entire.
36. *S. Bebbiana*
- hh. Lvs. often rounded or nearly so at base, larger.
- i. Lvs. to 20 cm. long, reticulate beneath.....15. *S. phanera*
- ii. Lvs. to 12 cm. long, not reticulate.....27. *S. Wallichiana*
- ff. Lvs. acute or abruptly acuminate, elliptic to broad-oblong.
- g. Lvs. 6-12 cm. long.
- h. Winter-buds pubescent; petiole 3-8 mm. long; lvs. obovate-oblong to oblong.....62. *S. gracilistyla*
- hh. Winter-buds glabrous or nearly so; petiole 5-15 mm. long.
- i. Lvs. generally oblong.....27. *S. Wallichiana*
- ii. Lvs. generally elliptic.....28. *S. caprea*
- gg. Lvs. 3-6 cm. long.
- h. Lvs. reticulate beneath, not turning black in drying.....29. *S. aurita*
- hh. Lvs. not or slightly reticulate, turning black in drying.
42. *S. myrsinifolia*
- aa. Lvs. densely pubescent or tomentose beneath.
- b. Lvs. villous, with rather loosely appressed long hairs or floccose-tomentose.
- c. Lvs. broad-elliptic to oblong-lanceolate or oblanceolate.
- d. Lvs. crenate or serrate.
- e. Lvs. glandular-serrulate, green beneath, cordate; brts. densely pubescent.
45. *S. adenophylla*
- ee. Lvs. crenulate or crenate-serrate.
- f. Lvs. obtuse or acutish, crenulate, 2-6 cm. long.....22. *S. vestita*
- ff. Lvs. acute to acuminate, crenate-serrate, larger.
- g. Lvs. crenate-serrate, sometimes obscurely so, 5-8 cm. long.....30. *S. cinerea*
- gg. Lvs. of shoots with rather prominent acuminate teeth, up to 16 cm. long.
31. *S. Medemii*
- dd. Lvs. entire or indistinctly toothed.
- e. Lvs. sessile, elliptic-oblong to oblanceolate.....24. *S. brachycarpa*
- ee. Lvs. petioled.
- f. Stipules ovate, acute, about as long as petiole; lvs. broad-elliptic to elliptic.
51. *S. lanata*
- ff. Stipules small or wanting.
- g. Lvs. 5-16 cm. long; brts. densely tomentose.....52. *S. Hookeriana*
- gg. Lvs. 3-8 cm. long; brts. thinly villous, becoming glabrous.
- h. Pubescence of lvs. loose, of long straight hairs.....25. *S. glauca*
- hh. Pubescence of lvs. dense, of matted hairs.....55. *S. lapponum*
- cc. Lvs. lanceolate or oblong-lanceolate to linear-lanceolate.
- d. Brts. floccose-tomentose.....41. *S. candida*
- dd. Brts. villous.
- e. Lvs. oblong-lanceolate to lanceolate, entire or subentire.....35. *S. humilis*
- ee. Lvs. narrow-lanceolate to linear, serrulate toward the apex.....57. *S. Elaeagnos*
- bb. Lvs. closely and densely silky-pubescent beneath.
- c. Brts. pubescent.
- d. Lvs. more than 5 cm. long.
- e. Lvs. oblong-obovate to oblanceolate.....63. *S. sitchensis*
- ee. Lvs. lanceolate to narrow-lanceolate.....56. *S. viminalis*
- dd. Lvs. 6-30 mm. long.
- e. Lvs. with 5-8 pairs of lateral veins, usually entire.....32. *S. repens*
- ee. Lvs. with 10 or more closely set pairs of lateral veins, usually remotely denticulate.....61. *S. Bockii*
- cc. Brts. glabrous.
- d. Lvs. serrulate.....10. *S. jessoensis*
- dd. Lvs. entire or indistinctly serrulate.....44. *S. subcoerulea*
- Prostrate shrubs with often rooting stems.
- a. Petiole 8-25 mm. long; lvs. broad-elliptic to broad-obovate, entire.....21. *S. reticulata*
- aa. Petiole 2-10 mm. long.
- b. Lvs. pubescent beneath, rugulose above, crenulate.....22. *S. vestita*

- bb. Lvs. glabrous or glabrescent.  
 c. Lvs. crenate-serrulate, suborbicular, green on both sides.....18. *S. herbacea*  
 cc. Lvs. entire or only slightly toothed near apex.  
 d. Lvs. reticulate beneath and pale or glaucous.  
 e. Lvs. 1-2 cm. long; petiole 2-6 mm. long.....20. *S. uva-ursi*  
 ee. Lvs. 2-3.5 cm. long; petiole 4-10 mm. long.....23. *S. petrophila*  
 dd. Lvs. not reticulate, green on both sides.....19. *S. retusa*

1. *S. nigra* Marsh. BLACK W. Tree to 12 m., with dark brown, rough and scaly bark and slender spreading brs.; brts. yellowish, slightly pubescent when young; lvs. linear-lanceolate to lanceolate, 6-12 cm. long, cuneate, acuminate, serrulate, pale green and sometimes pubescent on the veins beneath; petiole 3-6 mm. long; stipules semicordate, persistent; catkins on leafy brts.; staminate 3-5 cm. long, slender, pistillate 4-8 cm. long; stamens 3-7; ovary glabrous; pedicel much longer than gland; stigma subsessile. S.S.9:t.462. H.H.78, 79(b). N. B. to w. Ont., Fla. and Cal. Cult. 1809. Zone III. Graceful species. —*S. n. falcata* Torr., var. Lvs. only 4-6 mm. wide, falcate, green on both sides. S.S.9:t.463. Mass to Ohio and Fla.

*S. n. × alba* = *S. Hankensönii* Dode. Lvs. lanceolate, glaucous beneath; stamens 2-4; ovary sessile; style short. G.F.8:425. Orig. before 1890.

2. *S. pentandra* L. BAY W. Tree to 20 m.; bark gray, fissured; brts. lustrous, brownish green; young growth viscid; buds yellow: lvs. elliptic or ovate to elliptic-lanceolate, 4-12 cm. long, short-acuminate, rounded or subcordate at base, glandular-denticulate, lustrous dark green above, lighter beneath, midrib yellow, petiole 6-10 mm. long, glandular; stipules oblong-ovate, often small: catkins on leafy stalks, its lvs. serrulate; the staminate 3-5, the pistillate 3-6 cm. long; stamens 5-12, villous to the middle; ovary glabrous; pedicel slightly longer than glands; style short; stigma 2-lobed. R.I.11:t.612,f.1268(c). S.E.8:t.1303(c). H.W.2,1:103. (*S. laurifolia* Wesm.) Eu. to Cauc.; escaped in the E. States. Long cult. Zone IV. One of the handsomest willows with lustrous dark green foliage and golden yellow catkins in spring.

*S. p. × fragilis* = *S. Meyeriana* Rostk. Lvs. generally oblong-elliptic, acuminate, broad-cuneate, often glaucescent beneath; stamens usually 4; pedicel 2-3 times as long as ventral gland. R.I.11:t.611(c). S.E.8:t.1304-5(c). Cambridge Brit. Fl.2:t.19. (*S. cuspidata* Schultz). Eu. Cult. 1829. —*S. p. × alba* = *S. Ehrhartiana* Sm. Lvs. oblong, slender-pointed, usually silky at first, green beneath: stamens usually 4. Andersson, Monog. t.3,f.27. C.S.t.39a-e. (*S. hexandra* auth., not Ehrh.) Eu. Cult. 1894. —? *S. p. × purpurea* = *S. heterandra* Dode. Lvs. lanceolate, remotely serrate, glaucous beneath: stamens 3-5, partly connate. B.F.55:653c. Cauc. Cult. 1910.

Related species: *S. paraplésia* Schneid. Tree to 7 m.: lvs. ovate to elliptic-ovate or elliptic-lanceolate, 4-10 cm. long, glaucous or pale green beneath. H.S.f.10. W. China. Intr. 1908. Zone V. —*S. serissima* Fern. Lvs. elliptic-lanceolate to oblong-lanceolate, 4-8 cm. long, glaucous beneath; staminate catkins 1-1.5, pistillate 2-3.5 cm. long; fr. ripening in autumn. Gray Man. ed. 7:322. Que. to Alb., s. to N. J., w. N. Y. Cult. 1880. Zone III.

3. *S. lucida* Muhlenb. SHINING W. Shrub or tree to 6 m., brts. yellowish brown, lustrous: lvs. ovate-lanceolate to lanceolate, 7-12 cm. long, long-acuminate, broad-cuneate to rounded at base, glandular-serrulate, green and lustrous on both sides, glabrous or pubescent on midrib; petiole 6-12 mm. long, glandular; stipules semicordate, very glandular, usually persistent: catkins on leafy brts.; the staminate 3-6, the pistillate 5-7 cm. long, dense; stamens usually 5, villous to the middle; stigmas subsessile. S.S.9:t.453. H.H. 80,81(b). Nfd. to N. W. Terr., s. to N. J., Ky. and Neb. Cult. 1830. Zone II? Handsome willow with lustrous lvs.

Related species: *S. lasiandra* Benth. Tree to 20 m.; brts. pilose or tomentose at first: lvs. lanceolate to narrow-lanceolate, glaucous or glaucescent beneath and pubescent at first: stamens 5-9; scales glandular-dentate, those of pistillate catkins often entire. S.S.9:t.469,470. A.I.1:489. (*S. Lyallii* Heller,

*S. lancifolia* Anders.) B. C. and Alb. to Calif., Mont., Colo. and N. Mex. Cult. 1883. Zone VI?—*S. longipes* Shuttlew. Tree to 10 m., with spreading or slightly drooping brs.: lvs. lanceolate to oblong-lanceolate, 6–18 cm. long, subcordate to broad-cuneate at base, whitish and slightly pubescent beneath; petiole glandless; stipules foliaceous, acute; catkins 5–10 cm. long; stamens 3–7; caps. slender-stalked. S.S.9:t.465,466. (*S. occidentalis* Bosc ex Koch, not Walt.) Va. to Fla., Cuba.—*S. l. Wardii* (Bebb) Schneid., var. Lvs. very glaucous beneath; stipules broad, obtuse; catkins slender, pedicel less than half as long as caps. S.S.9:t.464. H.H.76,77(b). (*S. Wardii* Bebb.) Md. to Mo., Miss. and Ala. Intr. 1895. Zone VI?

4. *S. cardiophylla* Trautv. & Mey. Tree to 25 m.: lvs. elliptic to oblong-ovate, 6–15 cm. long, acuminate, usually rounded at base, glandular-serrate, glaucous and reticulate beneath, glabrous; petiole 1–3 cm. long, usually glandless; catkins slender, the staminate 4–8, the pistillate to 10 cm. long; stamens 5–9; ovary short-stalked, glabrous; style distinct, cleft at apex; stigmas slender, 2-parted. Tokyo Bot. Mag. 19(18):t.2. Middendorf, Reise Sib. 1.2,2:t.19, 20a-i. Saghal., Korea, Japan. Intr. 1919. Zone V.

5. *S. amygdalina* L. ALMOND-LEAVED W. Shrub or tree, sometimes to 10 m.; bark separating in flakes; brts. slightly pubescent at first, reddish brown or olive-brown: lvs. lanceolate or ovate-lanceolate, 5–10 cm. long, acuminate, cuneate or nearly rounded at base, serrulate, lustrous and dark green above, light or bluish green beneath, glabrous; petiole 3–12 mm. long, glandular; stipules usually semicordate, serrate; catkins on short leafy brts.; the staminate 3–8, the pistillate 3–7 cm. long; stamens 3, rarely 2, pilose at base: pistillate fls. with 1 gland; ovary long-conical, glabrous; pedicel 3–5 times as long as gland; stigmas subsessile, often emarginate. R.I.11:t.604(c). S.E.8:t.1313,1315(c). H.W.2:t.29,f.1–5(c). (*S. triandra* L., *S. Hoppeana* Willd.) Eu., W. to E. Asia. Long cult. Zone IV. Much cult. in Eu. for basketmaking.—*S. a. glaucophylla* (Ser.) Seemen, var. Lvs. grayish or whitish beneath. (*S. a. var. discolor* Wimm. & Grab., *S. triandra* var. *amygdalina* Babingt., var. *nipponica* Franch. & Sav.)—*S. a. cóncolor* Wimm. & Grab., var. Lvs. light green beneath (*S. triandra* L.)—*S. a. angustifolia* (Ser.) Seemen, prol. Lvs. narrow-lanceolate, green or grayish beneath.

*S. a. × fragilis* = *S. speciosa* Host. Brts. brown: lvs. oblong to lanceolate, dark green above, pale or bluish green beneath: stamens 2–3; pistillate fls. with usually 1 gland. Host.Salt.t.17(c). C.S.t.23a-c. (*S. alopecuroides* Tausch.) Eu. Cult. 1821.—*S. a. × viminalis* = *S. mollissima* Ehrh. Lvs. lanceolate, serrate or undulate-denticulate, thinly gray-tomentose beneath; ovary pubescent. I.T.4:t.140. (*S. multifloris* Doell.) Eu. Cult. 1809.—Here belong also *S. undulata* Ehrh. (*S. lanceolata* Sm.) with less pubescent lvs. and usually glabrous ovary (S.L.8:t.1312), *S. hippophaifolia* Thuill. with linear-lanceolate glabrate lvs. and villous ovary (R.I.11:t.599), and *S. Trevirani* Spreng. with linear-lanceolate glabrate, long-acuminate lvs. and usually glabrate ovary (C.S.t.24s).

Related species: *S. Medwedewii* Dode. Small glabrous shrub: lvs. linear-lanceolate, 6–10 cm. long and 5–6 mm. wide, remotely glandular-serrate, bluish white beneath; pistillate catkins dense. B.F.55:653g. Asia Minor. Cult. 1910.

6. *S. amygdaloides* Anders. PEACH-LEAVED W. Small tree, sometimes to 20 m., with ascending brs.; brts. red-brown or orange, lustrous, glabrous: lvs. lanceolate or ovate-lanceolate, 8–12 cm. long, cuspidate-acuminate, broad-cuneate to rounded at base, sharply serrulate, pale or glaucous beneath, pubescent when young, soon glabrous; petiole 6–15 mm. long, glandless; catkins on leafy brts., the staminate 3–5, the pistillate 4–10 cm. long, in fr. very loose; stamens 5–9, slightly pilose at base; pedicel nearly as long as caps. S.S.9:t.467. H.H.74,75(b). Que. to B. C., s. to N. Y., Tex. and Ore. Cult. 1895. Zone IV.

7. *S. fragilis* L. CRACK W. Tree to 30 m., with rough thick bark; brts.

glabrous, olive or brown, lustrous, growing at an angle of 60–90° to the br., brittle at base: lvs. oblong-lanceolate to narrow-lanceolate, 6–16 cm. long, long-acuminate, cuneate, glandular-serrate, lustrous, light green or bluish green beneath, usually slightly silky at first, soon glabrous; petiole 6–25 mm. long, glandular; stipules semicordate, serrate: catkins on leafy stalks, its lvs. entire; the staminate 2–4.5, the pistillate 3–6 cm. long; fls. of both sexes with 2 glands; filaments villous at base; ovary conic-ovoid; pedicel as long or longer than glands. R.I.11:t.609(c). H.W.2:t.28(c). H.H.82,83(b). Kew Bull. 1907:312, t.(h). Eu., W. Asia, sometimes escaped in the E. States. Long cult. Zone IV. *S. f. bullata* Spæth. A compact subglobose bush. M.D.1935:t.20(h). (*S. f. var. sphaerica* Hryniewiecki & Kobenza.)—*S. f. decipiens* (Hoffm.) Koch, var. Brts. yellowish or reddish at first; winter-buds dark brown, often nearly black: lvs. lanceolate, pale green beneath. F.Sa.t.29(c). S.E.8:t.1307(c). Possibly a hybrid with *S. amygdalina*.

*S. f. × alba* = *S. rubens* Schrank. Intermediate between the parents and very variable: lvs. usually silky when young, becoming glabrous, usually glaucous beneath; pistillate fls. usually with 1 gland; pedicel short; style short. (*S. Russelliana* Willd.)—*S. r. viridis* (Fries) Schneid., var. lvs. pale green beneath, glabrescent. S.E.8:t.1306(c, as *S. fragilis*). (*S. v. Fries*).—*S. r. palustris* (Host) Schneid., var. Lvs. silky-pubescent. Host, Sal.t.24–5(c). (*S. p.* Host, *S. Russelliana* Sm.)—*S. f. × pentandra*; see under No. 2.—*S. f. × babylonica*; see No. 13.—*S. f. × amygdalina*; see under No. 5.

8. *S. Matsudana* Koidz. Tree to 13 m., with upright or spreading brs., yellowish or olive-green and glabrous when young: lvs. narrow-lanceolate, 5–8 cm. long, long-acuminate, rounded or rarely cuneate at base, sharply glandular-serrate, glaucescent or whitish beneath, slightly silky at first, soon glabrous; petiole 2–8 mm. long; stipules lanceolate, often wanting: catkins 1–1.5 cm. long; peduncle with entire lvs.; glands obtuse; ovary subsessile; style wanting or very short. C.C.51. B.D.1923:t.14(h). Transbaikalia, N. China, Manch., Korea. Intr. 1905. Zone IV.—*S. M. umbraculifera* Rehd., f. A form with a broad umbrella-shaped or semiglobose head. U.S.Intr.80:t.(h). G.C.86:307(h). B.D.1923:t.15(h). Intr. 1906.—*S. M. tortuosa* Rehd., f. Brs. twisted and contorted. G.W.37:71. Gt.84:68. Cult. 1925.—*S. M. pendula* Schneid. f. Brs. pendulous. Intr. 1908.

9. *S. elegantissima* K. Koch. THURLOW WEEPING W. Tree with long pendulous brs.; brts. brown, glabrous, lustrous: lvs. lanceolate, 8–15 cm. long, about 2 cm. broad, long-acuminate, sharply serrulate, bright green above, bluish green beneath, glabrous except midrib above; petiole 1–1.5 cm. long: stipules semicordate: pistillate catkins to 5 cm. long; the peduncle with entire lvs.; ovary short-stalked, thinly pubescent near base; style short; ventral gland emarginate or 2-parted, slightly longer than pedicel. M.G.13:88(h). Origin unknown, possibly *S. babylonica* × *fragilis*. Intr. about 1860. Zone IV. Ornamental tree with long pendulous brs.

10. *S. jessoensis* Seemen. Tree to 25 m., with spreading brs.; bark light brownish gray, somewhat flaky; brts. light brown, grayish pubescent when young; winter-buds pubescent: lvs. lanceolate to narrow-lanceolate, 5–9 cm. long, acuminate, mucronate-serrulate, densely silky when young, later slightly silky above, densely so and glaucescent beneath; petiole 2–5 mm. long; stipules ovate-lanceolate, small, silky: catkins on short leafy stalks, the staminate 2–3 cm. long, rather loose; scales oblong-elliptic, slightly villous at base; filaments villous at base; pistillate catkins dense, to 4.5 cm. long; scales obtuse or emarginate; ovary pubescent; stigmas oblong, undivided. Seemen, Sal. Jap. t.3,ff.1. M.K.t.14(c). Japan. Intr. 1897. Zone V.

Related species: *S. koreénsis* Anders. Tree to 20 m.; glabrous: lvs. lanceolate to narrow-lanceolate, 6–12 cm. long, sharply serrulate; petiole 5–10 mm. long, yellowish like the midrib; style distinct, rather long; ovary pubescent or glabrate; style emarginate. N.K.18:t.38. Korea. Intr. 1919. Zone V.—Other species which may belong here are: *S. lispóclados* Dode. Brts. reddish, glabrous: lvs. subsessile, ovate-lanceolate, about 6 cm. long, glandular-serrate, bluish white beneath, glabrous: staminate catkins 1–1.5 cm. long; stamens 2–3. B.F.55:653H. Asia Minor. Cult. 1910.—*H. Tominii* Dode. Brts. dark brown, glabrous, young growth villous: lvs. lanceolate, 8–10 cm. long, nearly rounded at base, remotely serrulate, glabrate above, appressed-silky beneath and bluish white; petiole 5–8 mm. long; staminate catkins to 2 cm. long; stamens 2, connate at base. B.F.55:653A. Cauc. Cult. 1910.—*S. óxica* Dode. Brts. reddish brown, glabrous, young growth silky: lvs. lanceolate to 12 cm. or more long, cuneate, serrate, bluish gray and appressed-silky beneath; staminate catkins 4–6 cm. long; scales lanceolate; ovary glabrous, short-stalked. B.F.55:653B. Turkest. Cult. 1910.

11. *S. alba* L. WHITE W. Tree to 25 m., with spreading brs. pendent at ends; brts. silky when young, olive-brown, spreading at an acute angle (30–45°) from the br.: lvs. lanceolate, 4–10 cm. long, acuminate, cuneate, serrulate, glaucous and silky beneath; petiole 6–12 mm. long, with small glands; stipules lanceolate: catkins on leafy stalks, 4–6 cm. long; stamens villous at base; ovary subsessile, conic-ovoid, glabrous; style short. R.I.11:t.608(c). S.E.8:t.1309(c). H.W.2:1:100(h),t.27(c). S.H.1:35(h). Eu. and N. Afr. to C. Asia. Long cult. Zone II.—Planted as timber-tree, also var. *vitellina* as basket-willow and var. *tristis* for ornament.—*S. a. ovális* Wimm., f. Lvs. elliptic-oblong.—*S. a. calva* G. F. W. Mey. Brs. more upright; brts. dark brown: lvs. slightly silky at first, finally glabrous or nearly so; ovary slightly stalked. (Var. *coerulea* Koch, *S. coerulea* Sm.—CRICKET-BAT W.) S.E.8:t.1310(c). B.S.2:480,t(h). E.H.7:t.331(h).—*S. a. sericea* Gaud., var. Lvs. densely silky beneath and more or less so above. (*S. a. var. leucophylla* Hartig, var. *splendens* Anders., var. *argentea* Wimm., var. *regalis* Hort.)—*S. a. vitellina* (L.) Stokes, var. Brts. yellow: lvs. narrow-lanceolate, long-acuminate, glaucous beneath and slightly silky; catkins longer; scales longer. F.Sa.t.137(c). S.E.8:t.811(c). (*S. v. L.*)—*S. a. chermesina* Hartig, var. Brts. bright red. (*S. vitellina britzensis* Spaeth.)—*S. a. tristis* Gaud., var. With bright yellow pendulous brs. M.G.13:88(h);32:322(h). Gn.86:603(h);89:143(h). (*S. a. var. vitellina pendula* Rehd., *S. chrysocoma* Dode.)

*S. a. × nigra*; see under No. 1.—*S. a. × pentandra*; see under No. 2.—*S. a. × fragilis*; see under No. 7.—*S. a. × babylonica*; see under No. 12.

12. *S. babylónica* L. WEEPING W. Tree to 10 m., with long pendulous brs.; brts. brown, glabrous, only young growth slightly silky: lvs. lanceolate to linear-lanceolate, 8–16 cm. long, long-acuminate, cuneate, serrulate, dark green above, grayish green beneath, with distinct venation, glabrous; petiole 3–5 mm. long; stipules rarely developed, ovate-lanceolate: catkins short-stalked, curved, the staminate to 4, the pistillate to 2 cm. long; scales villous only at base, nearly as long as ovary; ovary sessile or subsessile, glabrous; style very short; stigmas oblong, 2-lobed; gland about  $\frac{1}{2}$  as long as ovary. Brandis, For. Fl. t.59. Seemen, Jal. Sap. t.3a-e. Gn.M.31:318–20(h). B.S.1:64(h). (*S. pendula* Moench.) China. Intr. about 1730. Zone V or VI.—Handsome weeping tree, often planted; frequently confused with *S. elegantissima* and *S. blanda*.—*S. b. crispa* Loud., var. Lvs. folded and spirally curved. F.Sa.t.41(c). (*S. b. annularis* (Forbes) Aschers., f., *S. a. Forbes*, *S. Napoleonis* F. Schultz.)

*S. b. × alba* = *S. sepulcrális* Simonk. Tree with spreading brs. and pendulous brts., similar to *S. babylonica*, but of more vigorous growth and less weeping; young growth silky: lvs. bluish or whitish beneath and silky-pubescent or sometimes glabrous; catkins pistillate or androgynous, thicker, their axis more pubescent; scales shorter, acute, long-ciliate. B.F.45:t.6. C.S.t.22e-i. Gn.55:

19(h). B.S.1:98,t(h). (*S. Salamonii* Carr., *S. babylonica Salamonii* Simon-Louis.) Orig. before 1864. Zone IV.—*S. b.*  $\times$  *fragilis*; see No. 13.

13. *S. blanda* Anders. (*S. babylonica*  $\times$  *fragilis*.) WISCONSIN WEEPING W. (NIOBE W.) Tree with widespreading head and long pendulous brs.; brts. dull green or brown, brittle at base: lvs. lanceolate to narrow-lanceolate, 8–15 cm. long, long-acuminate, cuneate, serrulate, dark green above, bluish green beneath, glabrous; petiole 5–12 mm. long; stipules ovate or oblong-ovate; catkins slender, 2–3 cm. long; stamens pubescent at base; ovary short-stalked; pedicel about twice as long as gland; style short; stigmas emarginate. Andersson, Monog. t.3,f.31. C.St.22d. M.G.13:89(h). (*S. babylonica* var. *dolorosa* Rowlee, *S. Petzoldii pendula* Hort., ? *S. pendulina* Wender.) Orig. before 1830? Zone IV.

14. *S. longifolia* Muhlenb. SANDBAR W. Shrub 1–4 m. tall, forming thickets, sometimes a slender tree to 8 m., with rather smooth bark; brts. orange to purplish red, glabrous: lvs. linear-lanceolate, 6–10 cm. long, acuminate, cuneate, remotely denticulate, bright green, distinctly veined, silky beneath when young, later glabrous; petiole 3–5 mm. long; stipules minute or wanting; catkins on rather long leafy brts., the staminate dense, 2–4 cm. long, sometimes paniced, the pistillate to 5 cm. long in fr. and rather loose; ovary silky when young, short-stalked; scales ovate or obovate; stigmas subsessile, with short elliptic lobes; stamens pilose at base. S.S.9:t.474. H.H.84,85(b). (*S. fluviatilis* Sarg., in part, not Nutt.) Que. to Va. and La., w. to Man., Wyo., N. Mex. and n. Mex. Cult. 1873. Zone IV.

Related species: *S. exigua* Nutt. Shrub or small tree to 5 m.: lvs. subsessile, linear to linear-lanceolate, nearly entire, yellowish green, silky. B.T.195. A.I.1:493. B. C. to Calif., w. to Mont., Idaho, Colo. and N. Mex. Intr. 1921. Zone V?—*S. melanopsis* Nutt. Shrub or small tree; lvs. elliptic-lanceolate to oblanceolate, 4–6 cm. long, serrulate, rarely nearly entire, glaucous beneath, silky when young, soon glabrous: petiole 1–5 mm. long; catkins 5–7 cm. long; scales linear-oblong; ovary glabrous. A.I.1:493. B. C. to Ore. and Mont. Intr. 1921. Zone V.—*S. argophylla* Nutt. Shrub or small tree; lvs. subsessile, narrow-lanceolate, 4–8 cm. long, usually entire, silky-pubescent on both sides, silvery-white beneath: ovary densely pubescent. N.S.1:t.20(c). B.T.196. Wash. and Mont. to Calif. and Tex. Cult.?

15. *S. phanera* Schneid. Large shrub or tree to 12 m.; brts. tomentulose at first, soon glabrous: lvs. ovate-lanceolate or broadly elliptic-lanceolate, 6–20 cm. long, short-acuminate or acute, rounded at base, crenate-denticulate, sparingly puberulous or glabrate and impressed-reticulate above, tomentose beneath, finally glabrescent and reticulate beneath, midrib and the numerous parallel veins glabrate and yellowish; petiole 1–2 cm. long; stipules semi-cordate, glandular-serrate; staminate catkins 10–12 cm. long, slender; rachis villous; filaments villous at base; scales broad-ovate, rounded, yellow-brown, villous on both sides. H.S.f.33. W. China. Intr. 1911. Zone (V). Handsome willow with large lvs.

16. *S. moupinensis* Franch. Shrub or tree to 6 m.; brts. glabrous, becoming orange to red-brown: lvs. narrow-elliptic to oblong, 6–12 cm. long, acute or short-acuminate, broad-cuneate or rounded at base, sharply glandular-serrulate, glabrous above, light green and reticulate beneath, silky on the veins or quite glabrous; petiole 1–1.5 cm. long, glabrous, glandless; stipules wanting; catkins on short leafy brts., the staminate 6–9, the pistillate to 14 cm. long, loose, with the fls. subverticillate; scales yellow-brown, glabrous or nearly so, persistent; rachis sparingly pubescent; ovary glabrous, short-stalked; style about  $\frac{1}{2}$  as long as ovary, with oblong bifid stigmas. W. China. Intr. 1911. Zone (V). Handsome willow with large bright green lvs.

Closely related species: *S. Fargésii* Burk. Lvs. elliptic to elliptic-oblong, up to 18 cm. long, usually more densely pubescent beneath; petiole to 2.5 cm. long; staminate catkins to 12, pistillate to 16 cm. long; scales long-villous; style slender; caps. sessile. B.J.29:t.3a-f. W. China. Intr. 1911. Zone (V).

17. *S. magnifica* Hemsl. Shrub or small tree to 6 m.; glabrous; young shoots and buds purple: lvs. elliptic or elliptic-obovate, 10–20 cm. long, abruptly acuminate, rounded or subcordate at base, entire or denticulate near apex, dull bluish green above, glaucous beneath; petiole 1–3.5 cm. long, purplish: catkins on leafy brts., glabrous, the staminate 10–18, the pistillate 18–30 cm. long in fr.: ovary sessile; style distinct. J.L.39:f.148. Gt.75:29. W. China. Intr. 1903. Zone VI? Very distinct willow, remarkable for its large and broad lvs. and the very long catkins.

Related species: *S. pella* Schneid. Shrub: lvs. elliptic-oblong to elliptic, 4–13 cm. long, acute or obtusish, serrulate, silky-pubescent on the veins beneath; petiole 6–15 cm. long; fruiting catkins 4–9 cm. long; scales glabrous; rachis pubescent. W. China. Intr. 1911. Zone VII.

18. *S. herbacea* L. DWARF W. Depressed shrub with partly underground creeping stems and slender angled brts. to 15 cm. long; young growth slightly pubescent, soon glabrous: lvs. suborbicular, 8–20 mm. long, rounded or emarginate at apex, rounded or cordate at base, crenulate-serrate, bright green and lustrous on both sides, reticulate-veined, glabrous; petiole 4–8 mm. long; catkins on 2-lvd. brts., 4–10-fld.; scales obovate, obtuse, yellowish, glabrous or nearly so; glands mostly incised or lobed; ovary short-stalked, glabrous; style short, with 2-parted stigmas. R.I.11:t.557,f.1182(c). S.E.8:t.1378(c). High Mts. of Eu. and N. Asia; arctic N. Am. s. to N. H. Cult. 1789. Zone II.

*S. h. × formosa* = *S. simulatrix* B. White. Creeping shrub: lvs. suborbicular to ovate, to 1.5 cm. long; catkins many-fld., on leafy brts.; ovary pubescent. Gs.5:91(h). Switzerland. Cult. 1922.

A similar species is *S. polaris* Wahlenb. Lvs. smaller, entire: scales dark at apex; stamens sometimes slightly connate at base; pistillate fls. with 1 gland; ovary pubescent. S.H.1:f.19g,27d. S.L.67(h). M.G.25:141(h). Arctic Eu. and Asia. Cult. 1910. Zone I.

19. *S. retusa* L. Prostrate shrub with rooting glabrous brs.: lvs. obovate to oblong, 8–35 mm. long, obtuse, rarely emarginate or acutish, cuneate, entire or with few small teeth, green on both sides, glabrous or slightly pubescent beneath; petiole 2–5 mm. long; catkins on leafy brts., the staminate to 18 mm. long, loose, the pistillate to 2 cm. long; scales oval to oblong, yellowish, glabrous or sparingly hairy; pedicel  $\frac{1}{4}$  as long as the glabrous ovary; style about  $\frac{1}{2}$  as long as ovary, bifid; stigmas short, bifid. R.I.11:t.558,f.1186–7(c). H.W. 2,1:107a. Mts. of Eu. Intr. 1763. Zone I.

*S. r. × myrsinifolia* = *S. Cottéti* Kerner. Low, usually prostrate: lvs. elliptic to oblong, 2–4 cm. long, obtuse or acute, serrulate, pubescent when young; catkins short-cylindric; scales darker toward apex, pubescent. C.S.2:t.12e-g. G.W.9:542(h). Eu. Alps. Cult. 1905. Zone V.

Related species: *S. serpyllifolia* Scop. Lvs. 4–8 mm. long; catkins about 5 mm. long; pedicel shorter than ventral gland. R.I.11:t.558,f.1185(c). (*S. retusa* var. *s. Ser.*) Alps and mts. of s. e. Eu. Cult. 1898.

20. *S. ūva-ŭrsi* Pursh. BEARBERRY W. Prostrate shrub with glabrous brs. to 30 cm. long; lvs. elliptic to obovate, 5–25 mm. long, acute or obtuse, cuneate, slightly toothed or entire, lustrous above, pale or glaucous beneath, strongly veined; petiole 2–4 mm. long; catkins on slender leafy brts., about 1 cm. long, the pistillate 2–4 cm. long in fr.; scales obovate, rose-red at apex, silky; usually 1 stamen, rarely 2; caps. conic-ovoid, glabrous, short-stalked; style short, but distinct. Fl. Dan. 17:t.3053(c). B.B.1:601. (*S. Cutleri* Tuckerm.) Lab. to Alaska, s. to alpine summits of N. Y. and N. H. Intr. 1880. Zone I.

21. *S. reticulata* L. Low procumbent shrub; brts. angled, glabrous; lvs. broad-elliptic to broad-obovate, 1.5–5 cm. long, obtuse, sometimes emarginate, broad-cuneate to subcordate at base, entire, rugulose above, gray-green and usually silky beneath at first, soon glabrous, reticulate; petiole 8–20 mm. long; catkins slender, long-peduncled, on leafy brts., the staminate to 2, the pistillate to 3 cm. long; scales light brown, oval, villous; stamens villous below the middle; ovary sessile, tomentose; style very short. R.I.11:t.557,f.1184(c). S.E.8:t.1369(c). M.G.25:124(h). Gs.5:91(h). (*S. orbicularis* Anders., in part.) Eu., N. Asia, in N. Am. from Lab. to Alaska. Cult. 1789. Zone I. An attractive species for the rock-garden.

22. *S. vestita* Pursh. Low shrub to 20 cm., usually prostrate; young brts. pubescent: lvs. obovate or elliptic, 2–5 cm. long, obtuse or emarginate, broad-cuneate to rounded at base, slightly crenate, silky above at first, soon dark green and glabrous, silky-tomentose beneath; petiole 4–8 mm. long; catkins on leafy brts., the staminate to 3.5 cm. long, the pistillate in fr. to 5 cm. long; fls. similar to those of No. 21. A.I.1:507. B.B.1:603. Lab. and Que. to Man.—*S. v. erecta* Anders., var. Upright to 50 cm. tall: lvs. thinner, narrower, often acutish: caps. more obtuse. A.I.1:507. (*S. Fernaldii* Blankinsh.) B. C. to Calif. and Mont. Intr. 1892? Zone V.

Related species: *S. nivalis* Hook. Cespitose creeping shrub: lvs. oval to oblong, about 1 cm. long, acute at ends, entire, glabrous, dark green above, glaucous beneath: catkins 1 cm. or less long, on leafy brts.; scales yellow, nearly glabrous; caps. pubescent, sessile. B. C. and Wash. to Mont. and Alberta.—*S. n. saximontana* (Rydb.) Schneid., var. Brts. thick: lvs. 1.5–3.5 cm. long, 0.8–2 cm. broad; petiole to 1.8 cm. long; staminate catkins to 1.2, pistillate to 1.8 cm. long. Rocky Mts. Intr. 1921. Zone II?

23. *S. petróphila* Rydb. Creeping shrub to 10 cm. tall: lvs. obovate or elliptic to oblanceolate, 1–3 cm. long, obtuse or acutish, cuneate, entire, bright green above, slightly paler and strongly veined beneath, glabrous or sparingly silky at first; petioles 3–6 mm. long: catkins on leafy brts., 2–3 cm. long; scales obovate, blackish, sparingly silky-villous; caps. sessile, white-villous; style distinct, 0.5 mm. long, with elongated bifid stigmas. A.I.1:500. B. C. and Alb. to Calif., Wyo., Colo. and N. Mex. Intr. 1922. Zone V.

A closely related species is *S. ártica* Pall. Creeping shrub with thick brts.: lvs. obovate, 2.5–4, rarely to 7 cm. long, obtuse, broad-cuneate at base, sometimes sparingly denticulate, glaucous beneath; petiole 0.5–2 cm. long; catkins 2–4 cm. long. Proc. Wash. Acad. Sci. 3:t.40. Arctic N. Am., N. Eur., N. Asia. Cult. 1902. Zone I.

24. *S. brachycarpa* Nutt. Upright shrub to 1 m.; brts. densely villous: lvs. subsessile, elliptic-oblong to oblanceolate, 1–3 cm. long, entire, villous on both sides, more densely so beneath: catkins on leafy brts., 1–2 cm. long, dense; scales obovate, yellowish, villous; ovary subsessile, densely villous; style very short; caps. 4–5 mm. long. S.H.1:f.26e,27b-b. (*S. desertorum* Anders., not Richards.) B. C. and Wash. to Man., Colo. and Utah. Intr. about 1890. Zone V.

25. *S. glauca* L. Shrub to 1 m.; young brts. silky or whitish tomentose, later brown or yellowish, lustrous: lvs. lanceolate to obovate, 3–8 cm. long, acute at ends or sometimes obtuse at apex, entire, silky above, later glabrate or glabrous, silky- or white-tomentose and grayish green or glaucous, rarely green beneath; petiole to 1.5 cm. long; stipules usually small or obsolete: catkins on leafy stalks, to 4.5 cm. long; scales oval to oblong, dark above the middle; filaments glabrous or villous at base; ovary short-stalked, silky or tomentose; ventral gland truncate or 2-parted, as long or longer than pedicel; style not more than  $\frac{1}{4}$  as long as ovary, with oblong, deeply emarginate stig-

mas. R.I.11:t.571,f.1214(c). H.W.2,1:122,f.206. Eu. Alps; N. As.; n. w. N. Am., from Alaska to B. C., Alb. and Mont. Cult. 1813. Zone II?—The Am. plant has been separated from the Eu. type as *S. g. acutifolia* (Hook.) Schneid., var. (*S. Seemannii* Rydb.), differing chiefly in the usually well-developed stipules, the longer pedicels, sometimes twice as long as the gland and in the glabrescent filaments, and as *S. g. glabrascens* (Anders.) Schneid., var., similar, but less pubescent.

Related species: *S. pyrenaica* L. Lower: lvs. not more than 3 cm. long, scales usually pale; pistillate fls. with 1 gland. C.S.1:t.10b. Trautvetter, Sal. Frig. t.4. Gs.5:90(h). Pyrenees. Cult. 1875.—*S. argyrocarpa* Anders. Erect or ascending, to 0.5 m.: lvs. short-petioled, oblong to oblanceolate, 3–5 cm. long, silky-pubescent beneath, entire or crenulate and slightly revolute; catkins 1.5–2.5 cm. long; style elongated; pedicels about  $\frac{1}{2}$  as long as the silky caps. B.B.1:603. Anderson, Mon. Sal. t.6,f.60. Lab. and Que. to N. H. Intr. 1883. Zone II.

26. *S. discolor* Muhlenb. Pussey W. Shrub or small tree to 7 m.; young brts. pubescent at first, soon glabrous: lvs. elliptic-oblong to oblong-oblanceolate, 4–10 cm. long, acute at ends, irregularly crenate-serrate or nearly entire, pubescent when young, glabrous or nearly so at maturity, glaucous beneath, rather thin; petiole 8–25 mm. long; stipules usually conspicuous, semi-cordate, deciduous; catkins before the lvs., subsessile, the staminate dense, to 3.5 cm. long, the pistillate to 7 cm. long in fr.; filaments glabrous; pedicel glabrous,  $\frac{1}{4}$ – $\frac{1}{2}$  as long as the pubescent rostrate ovary; style distinct, short, with narrow bifid stigmas. S.S.9:t.478. F.Sa.t.147(c). H.H.92,93(b). (*S. conifera* Wagh.) N. S. to Man., s. to Va. and Mo. Cult. 1809. Zone II.—*S. d. latifolia* Anders., var. Brts. pubescent: lvs. pubescent beneath, often ferrugineous: catkins smaller. (*S. d. var. eriocephala* Anders.)

Closely related species: *S. Scouleri* Barratt. Large shrub or tree to 10 m.; lvs. elliptic to oblong-obovate, acute to short-acuminate, entire to slightly crenate-serrulate, white- or rusty-pubescent to glabrous and reticulate beneath; pedicels shorter, villous; stigma sessile. S.M.161. A.I.1:505. (*S. flavescens* Nutt.) Alaska to Mont., n. Calif., Ariz. and N. Mex. Intr. 1918 Zone V.

27. *S. Wallichiana* Anders. Shrub or small tree; young brts. silky, soon glabrous; winter-buds glabrous: lvs. ovate-lanceolate to oblong-lanceolate, 5–10 cm. long, acuminate, cuneate to broad-cuneate, entire or sometimes serrulate, silky at first, later glabrous and smooth above, glaucous and nearly glabrous or sometimes pubescent beneath, with many lateral veins and indistinct veinlets; petiole 8–15 mm. long, glabrous; stipules small: catkins on short bracted stalks or subsessile, very villous, the staminate 2–3, the pistillate 2–5, in fr. to 10 cm. long; scales black-brown, obtuse; filaments glabrous; pedicels short, rarely  $\frac{1}{2}$  as long as the pubescent rostrate ovary; style short, with upright, oval to oblong and emarginate to bifid stigmas. Andersson, Mon. t.5,f.46. Brandis, For.Fl.t.61. Himal. China. Intr. 1911. Zone V.

Related species: *S. livida* Wahlenb. Low shrub or sometimes small tree to 8 m.; brts. glabrous or nearly so, lustrous: lvs. obovate to oblong-lanceolate, up to 6 cm. long, acute, entire or crenate, glabrous or nearly so; petiole 2–5 mm. long; scales obtuse, yellow, usually dark at apex; pedicel about as long as ovary; style short. R.I.11:567(c). H.W.2,1:118. (*S. ? Starkeana* Willd., *S. depressa* E. Fries, not L.) Eu., N. Asia. Cult. 1872. Zone III?—*S. l. cinerascens* Wahlenb., var. Young brts. and lvs. pubescent. R.I.11:t.567,f.2008(c).

28. *S. cáprea* L. Goat W. Shrub or sometimes tree to 9 m.; young brts. gray-pubescent, later glabrous, brown and lustrous; winter-buds becoming glabrous: lvs. broad-elliptic to oblong, 6–10 cm. long, acute, rarely rounded at base, irregularly and slightly toothed or nearly entire, pubescent at first, finally glabrate, rugulose and dark green above, gray-pubescent beneath and reticulate; petiole 8–20 mm. long; stipules oblique-reniform, serrate: catkins sub-

sessile, with 3-6 bracts at base, densely villous, the staminate oval, 2.5-3.5 cm. long, dense, the pistillate to 6, in fr. to 10 cm. long; scales lanceolate; filaments glabrous or slightly villous at base; pedicel  $\frac{2}{3}$  or as long as the gray-pubescent ovary; style wanting or very short; stigma oval, emarginate or bifid; gland short,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as pedicel. R.I.11:t.577(c). H.W.2:t.32(c). S.E.8:t.1331-2(c). Eu. to N. E. Asia and n. Persia. Long cult. Zone IV. The rather large bright yellow catkins are conspicuous in early spring.—*S. c. variegata* West., var. Lvs. variegated with white. Cult. 1770.—*S. c. pëndula* Th. Lang. KILMARNOCK W. With stiffly pendulous brs. Cult. 1853.

*S. c. × myrsinifolia* = *S. latifolia* Forb. Lvs. broad-elliptic or obovate to oblong, silky-pubescent beneath, later glabrate, turning blackish in drying; catkins on short bracted stalks; ovary silky or nearly glabrous, on pedicel of about equal length. C.S.t.44.f.1-o. F.S.t.118(c). Eu. Cult. 1829.—*S. c. × phyllicifolia* = *S. laurina* Sm. Brts. pubescent at first: lvs. obovate to obovate-oblong, 4-8 cm. long, short-acuminate, lustrous above, glaucescent and glabrous beneath at maturity, pubescent at first; stigma thick, usually not bifid, about as long as style. R.I.11:t.564.f.2004(c). S.E.8:t.1333(c). (*S. bicolor* Sm., not Willd.) Cult. 1809.—*S. c. × daphnoides*; see under No. 53.—*S. c. × lapponum*; see under No. 55.—*S. c. × viminalis*; see under No. 56.—*S. c. × Elaeagnos*; see under No. 57.—*S. c. × purpurea*; see under No. 59.

Closely related species: *S. grandifolia* Ser. Lvs. to 15 cm. long, at maturity glabrous or pubescent only at midrib and closely reticulate beneath; petiole to 1 cm. long; catkins with 1-3 bracts at base, smaller, less densely villous; pedicel as long or longer than ovary; style short. R.I.11:t.578(c). H.W.2:117A-E. (*S. appendiculata* Vill.?) Mts. of Eu. Cult. 1871.—*S. g. × purpurea*; see under No. 59.—*S. silesiaca* Willd. Lvs. lanceolate or ovate to obovate, to 14 cm. long, crenate-serrate, silky when young, later glabrate and pale green and closely reticulate beneath: pedicels as long as the usually glabrous ovary; style short. R.I.11:t.574(c). H.W.2,1:117F-H. Mts. of Eu. and Transcauc. Cult. 1876. Zone V.

29. *S. aurita* L. Shrub to 2, rarely to 3 m.; brts. slender, tomentulose when young, later glabrous, usually dark brown; wood of 2-5-year-old brs. under the bark with short raised striations: lvs. obovate to oblanceolate, 3-8 cm. long, acute or obtusish, cuneate, obscurely serrate, dull green and rugose above and usually slightly pubescent, closely reticulate beneath and gray-tomentose at first, usually later glabrate; petiole 4-10 mm. long; stipules conspicuous, reniform, serrate: catkins sessile, staminate to 2.5, pistillate to 3 cm. long; scales brownish yellow, dark at apex; filaments villous at base; pedicels about as long as the pubescent ovary; stigmas oval, emarginate or bifid, subsessile. R.I.11:t.575(c). S.E.8:t.1330(c). H.W.2,1:116A-E. Eu., W. Asia. Long cult. Zone V.

*S. a. × cinerea* = *S. multinervis* Doell. Brts. densely pubescent: lvs. obovate to oblong-obovate, acute, cuneate, gray-pubescent, later usually glabrate above; catkins small. C.S.1:t.30s-y. (*S. lutescens* Kern.) Eu. Cult. 1873.—*S. a. × repens* = *S. ambigua* Ehrh. Low shrub with often prostrate brs.; young brts. silky or silky-tomentose: lvs. elliptic or oblong to lanceolate, rather small, serrulate, silky-tomentose, later glabrescent above; stipules usually inconspicuous: catkins small; scales ovate, acute; pedicel about  $\frac{1}{2}$  as long as ovary. R.I.11:t.592.f.1243b(c). S.E.8:t.1354(c). Eu. Cult. 1872.—*S. a. × phyllicifolia* = *S. ludificans* F. B. White. Brts. glabrous at maturity: lvs. elliptic to narrow-obovate, crenulate, glabrous at maturity and glaucous beneath; stipules usually persistent: catkins on bracted stalks. N. Eu. Cult. 1900.—*S. a. × viminalis*; see under No. 56.—*S. a. × Elaeagnos*; see under No. 57.—*S. a. × purpurea*; see under No. 59.—*S. a. × phyllicifolia × purpurea*; see under No. 59.

30. *S. cinérea* L. GRAY W. Shrub to 5 m., sometimes tree-like, 1- and 2-year-old brts. and winter-buds tomentose; wood with striation as in No. 29: lvs. elliptic or obovate to obovate-lanceolate, 5-9 cm. long, acute, cuneate to rounded at base, crenate or remotely serrate, often obscurely so, tomentose at first, later glabrescent and dull green above, gray or bluish gray and densely

pubescent beneath; petiole to 1 cm. long; catkins subsessile, with 4-7 bracts at base, staminate to 5, pistillate to 8 cm. long in fr.; filaments villous at base; pedicel about  $\frac{1}{2}$  as long as the pubescent or tomentose, rarely glabrate ovary; style as long as the oval emarginate stigmas. R.I.11:t.576(c). S.E.8:t.1327-9 (c). H.W.2.1:116F-G. Gn.87:131. Eu. to Kamchatka and n. Persia. Long cult. Zone II.—*S. c. tricolor* Dipp., f. Lvs. variegated with yellow and white or white and red.

*S. c.*  $\times$  ? = *S. renécia* Dode. Lvs. oblong to oblong-lanceolate, 8-10 cm. long, pubescent and glaucous beneath; pedicels slender; style longer than stigmas. B.F.55:653f. Eu. Cult. 1910.—*S. c.*  $\times$  *phylicifolia* = *S. Wardiana* F. B. White. Young brts. pubescent; lvs. oblong-obovate or narrow-elliptic to oblong, 4-8 cm. long, glaucescent and slightly pubescent and slightly reticulate at maturity beneath; style as long as the often bifid stigmas. C.S.1:t.31s-u. Eu. Cult. 1896.—*S. c.*  $\times$  *aurita*; see under No. 29.—*S. c.*  $\times$  *lappinum*; see under No. 54.—*S. c.*  $\times$  *viminialis*; see under No. 56.—*S. c.*  $\times$  *purpurea*; see under No. 59.

31. *S. Medémii* Boiss. Shrub to 4 m. with stout brs.; brts. tomentose; lvs. oblong, rarely oblong-obovate, 6-15 cm. long, acute, rounded to broad-cuneate at base, crenate-serrate or irregularly and rather coarsely dentate, pubescent at first, later glabrate above, sparingly pubescent and glaucous beneath; petiole to 2 cm. long; stipules semicordate; catkins sessile, thick, staminate to 3.5 cm. long; pistillate to 9 cm. long in fr.; filaments connate about  $\frac{1}{2}$ , hairy at base; pedicel about  $\frac{1}{2}$  as long as the pubescent ovary; stigmas subsessile, bifid. S.H.1:f.15h,20e-f. G.C.77:129. Armenia, Persia. Cult. 1880. Zone V. Handsome willow, one of the earliest to bloom.

32. *S. repens* L. CREEPING W. Low shrub to 1 m., with prostrate stem and ascending brs.; young brts. pubescent, later glabrous, brown; lvs. elliptic to lanceolate, 1.5-3.5, rarely to 5 cm. long, acute and recurved at apex or obtuse, entire or nearly so and revolute, silky when young, usually glabrous above at maturity, with 6-8 pairs of veins; petiole 2-3 mm. long; stipules small, only present on vigorous shoots; catkins with or shortly before the lvs. on short bracted stalks, staminate 1-1.5, pistillate to 3.5 cm. long; scales obtuse, brown at apex; pedicel about  $\frac{1}{2}$  or sometimes as long as the narrow-conical caps; style very short. R.I.11:t.589(c). S.E.8:t.1356-61(c). H.W.2.1:123. Eu. to W. and N. E. Asia. Long cult. Zone IV.—*S. r. nitida* (Ser.) Wender., var. Lvs. broad-elliptic to oblong, densely silky when young, later glabrescent above. (*S. r.* var. *arenaria* Anders., var. *argentea* (Smith) Wimm. & Grab., var. *sericea* Gaud.) R.I.11:t.589,f.1243(c). S.E.8:t.1362(c).—*S. r. rosmarinifolia* (L.) Wimm. & Grab., var. Lvs. linear to oblong-lanceolate, acute and not recurved at apex, with 8-12 pairs of veins. R.I.11:t.591,f.1242(c). S.E.8:t.1363-4(c). (*S. rosmarinifolia* L., *S. r.* var. *angustifolia* Gren. & Godr.) *S. r.*  $\times$  *aurita*; see under No. 29.—*S. r.*  $\times$  *S. daphnoides*; see under No. 53.—*S. r.*  $\times$  *viminialis*; see under No. 56.—*S. r.*  $\times$  *Elaeagnos*; see under No. 57.—*S. r.*  $\times$  *purpurea*; see under No. 59.

33. *S. petiolaris* Sm. Low shrub; brts. slender, soon glabrous, purple; lvs. lanceolate or narrow-lanceolate, 4-8 cm. long, acuminate, cuneate, serrulate, slightly silky when young, soon glabrous, remaining green in drying; petiole 4-10 mm. long; catkins on short bracted stalks, with the lvs., staminate 1-2, pistillate to 4 cm. long in fr.; scales yellowish or pale brown; caps. pubescent, narrowed from an ovoid base; pedicel  $\frac{1}{2}$ - $\frac{1}{2}$  as long as caps.; stigmas subsessile. E.B.16:t.1147(c). B.B.1:599. Gr.M.f.659. N. B. and Man., s. to Wis. and Tenn. Cult. 1802. Zone II. Valuable basket-willow.

34. *S. sericea* Marsh. SILKY W. Shrub to 4 m., with slender purplish brs. puberulous when young; lvs. lanceolate or narrow-lanceolate, 4-10 cm. long.

acuminate, cuneate to rounded at base, serrulate, silky when young, later dark green and glabrous above, minutely silky beneath; petiole 4-14 mm. long; stipules narrow, deciduous: catkins sessile, before the lvs., staminate about 2, pistillate to 4 cm. long in fr.; filaments pilose at base; pedicel about  $\frac{1}{3}$  as long as the ovoid-oblong, obtuse ovary; stigmas short, sessile. Gr.M.f.662. S.H.1: f.15g, 21m-m'. (*S. grisea* Willd.) Me. to Mich. and Va. Cult. 1809. Zone III. Handsome willow.

*S. s. × cordata*; see under No. 48.

35. *S. humilis* Marsh. PRAIRIE W. Shrub to 2.5 m.; brts. pubescent or tomentose: lvs. oblanceolate or oblong-lanceolate, 5-10 cm. long, acute at ends, or the lower ones obovate and obtusish, sparingly denticulate and slightly revolute, dull dark green and puberulous or glabrate above, glaucous and tomentose beneath; petiole 4-6 mm. long; stipules semi-ovate, usually persistent: catkins sessile, before the lvs., ellipsoid, 1.5-4 cm. long; anthers red; pedicels about  $\frac{1}{4}$  or  $\frac{1}{2}$  as long as the beaked caps.; stigma sessile or on a short style. B.B.1:600. Gr.M.f.660. Nfd. to Minn. and N. C. Intr. 1876. Zone III?

Closely related species: *S. tristis* Ait. Shrub to 0.5 m.: lvs. oblanceolate or linear-oblong, 2-5 cm. long; petiole 2-3 mm. long; stipules minute, deciduous; catkins small, subglobose to ovoid; pedicel longer than scale. B.B.1:600. Gr.M.f.661. (*S. humilis* var. *t.* Griggs.) Me. to Minn., s. to Fla. and Tenn. Intr. 1765. Zone II.

36. *S. Bebbiana* Sarg. BEAK W. Shrub or sometimes tree to 8 m.; brts. pubescent or puberulous: lvs. elliptic to oblong-lanceolate, 3-10 cm. long, acute or acuminate, rounded or narrowed at base, sparingly serrate or entire, dull green and puberulous above, reticulate and tomentose beneath, or glabrate on both sides when old, firm; petiole 4-12 mm. long; stipules semi-cordate, deciduous: catkins subsessile, bracted at base with the lvs., staminate to 3, pistillate to 6 cm. long; scales pale, rose-tipped, thinly villous; filaments villous at base, 1 cm. long; pedicels slender, about half as long as ovary, longer than scale; caps. long-beaked, stigma subsessile. S.S.9:t.477. B.B.1:599. (*S. rostrata* Richards., not Thuill.) Nfd. to Alaska, s. to Pa., Ill., Utah and Calif. Intr. 1889. Zone II.—*S. B. perrostrata* (Rydb.) Schneid., var. Brts. glabrescent: lvs. glabrescent, smaller and often thinner. Neb. to Colo., N. Mex. and Utah. Intr. 1922.

Closely related species: *S. Geyeriana* Anders. Shrub to 3 m.; mature brts. often bloomy: lvs. linear-oblanceolate, 2-6 cm. long, densely silky when young, sometimes becoming glabrate: catkins on very short bracted stalks; pedicel  $\frac{1}{2}$  or  $\frac{1}{4}$  as long as ovary; style short, but distinct. A.I.1:506. B. C. to Ore., Mont. and Colo. Intr. 1918. Zone V.

37. *S. pedicellaris* Pursh. BOG W. Upright shrub to 1 m.; brts. glabrous, light brown: lvs. linear-oblong to elliptic-obovate, 1.5-7 cm. long, obtuse or acute, cuneate, entire and revolute, reticulate, glabrous, pale or glaucous beneath; petiole 2-4 mm. long: catkins on leafy stalks, staminate 1-2, pistillate to 3 cm. long; scales yellowish or brownish, obtuse, slightly villous; ovary conic-oblong, often reddish; pedicel slender, exceeding the scale; style short. T.N.t.120(c). B.B.1:602. (*S. myrtilloides* var. *p.* Anders., *S. myrtilloides* Tuckerm., not L.) Que. to B. C., s. to Pa., Iowa, Idaho and Wash. Intr. 1911. Zone III.

Closely related species: *S. myrtilloides* L. Shrub to 0.5 m., with creeping subterranean stem: lvs. orbicular-elliptic to narrow-elliptic, acute, cuneate to subcordate: staminate catkins subsessile, 1-1.5 cm. long. R.I.1:t.593, f.1244(c). H.W.2,1:124, f.209. N. Eu. to N. E. Asia. Intr. 1772. Zone II?

38. *S. pyrifolia* Anders. BALSAM W. Much-branched shrub, rarely tree, to 7 m.; brts. glabrous, lustrous, red-brown or olive: lvs. elliptic-ovate to

ovate-lanceolate, 4-9 cm. long, acute or occasionally obtuse, subcordate or rounded at base, slightly crenulate-serrulate, dark green above, glaucous and reticulate beneath, thin, glabrous; petiole, slender, 6-15 mm. long; catkins with the lvs., bracted at base, staminate cylindric, about 2, pistillate 5-7 cm. long in fr., rather loose; ovary glabrous, rostrate; pedicel 6-8 times as long as gland; style very short; stigmas short, thick, 2-lobed. S.S.14:t.728. B.B. 1:596. (*S. balsamifera* Barratt.) Lab. to Man., s. to Me. and Minn. Intr. 1880. Zone II. Handsome willow, conspicuous in winter with its lustrous brs. and bright red buds.

39. *S. hypoleuca* Seemen. Shrub to 4 m.; brts. glabrous, yellow-brown: lvs. elliptic or elliptic-obovate to oblong, 2.5-5 cm. long, acute or acuminate, cuneate to nearly rounded at base, entire or indistinctly denticulate, dark green above, glaucous beneath, glabrous; petiole 3-5 mm. long; catkins on short leafy stalks, slender, cylindric, 3-6 cm. long; axis slightly villous; scales pale, oval, obtuse, glabrous; stamens villous at base; ovary sessile, ovoid, glabrous; stigmas subsessile, elliptic, bifid. H.S.f.52. W. China. Intr. 1911. Zone V. Graceful willow with neat foliage.

Related species: *S. cathayana* Diels. Shrub to 4 m.; young brts. pubescent: lvs. oblong or narrow-elliptic, obtuse or acutish, entire or minutely glandular-denticulate, glaucescent and slightly pubescent on midrib beneath or silky all over: scales ciliate; style short, but distinct. W. China. Intr. 1909. Zone V?—*S. macroblasta* Schneid. Shrub to 6 m.; brts. yellowish or yellowish brown, pubescent; winter-buds oblong, twice as long as petioles: lvs. narrow-lanceolate, 1.5-3 cm. long, acute, rounded or subcordate at base, glaucous beneath, glabrous; fruiting catkins 2.5-3 cm. long; ovary glabrous, with very short style and short emarginate stigmas. H.S.f.49. W. China. Intr. 1911. Zone V?

40. *S. heterochroma* Schneid. Shrub or tree to 15 m.; brts. glabrous or slightly pubescent at first, later yellow- to purple-brown: lvs. elliptic-ovate or elliptic to oblong-lanceolate, 5-10 cm. long, acuminate, cuneate, entire, dark green above, glaucous beneath and silky at first, soon glabrous or sometimes remaining silky; petiole 5-15 mm. long; stipules minute or wanting: catkins on short bracted stalks, with or shortly before the lvs., staminate 3-5.5, pistillate in fr. 6-10 cm. long; scales oblong, very villous, light yellow-brown; caps. gray-pubescent, 5 mm. long; pedicel about 4 times as long as gland; style about  $\frac{1}{2}$  as long as caps., with narrow-oblong bifid stigmas. H.S. f.59. (*S. Henryi* Burk.) C. China. Intr. 1908. Zone V?

41. *S. candida* Fluegge. HOARY W. Shrub to 2 m.; brts. white-woolly, older red: lvs. oblong-lanceolate to linear-lanceolate, 4-12 cm. long, acute at ends, slightly revolute and denticulate or entire, dull and pubescent or finally glabrate above, white-tomentose beneath; petiole 3-5 mm. long; stipules lanceolate, deciduous: catkins sessile, with the lvs., cylindric, densely villous, staminate about 2.5, pistillate 3-5 cm. long in fr.; anthers red; ovary conic-ovoid, pubescent; pedicels as long or longer than gland; stigmas short, spreading. Torrey, Fl. N. Y. t.117(c, as *S. incana*). F.Sat.t.91(c). Gr.M.f.665. Nfd. and Lab. to Athabasca, s. to N. J., Iowa and Mont. Cult. 1809. Zone I. Very distinct willow on account of its white-woolly tomentum.

42. *S. myrsinifolia* Salisb. Shrub to 4 m., rarely tree-like, with spreading brs.; young brts. densely pubescent, tardily glabrescent, rarely glabrous: lvs. orbicular-ovate or elliptic to oblong-lanceolate, 2-10 cm. long, acute or acuminate, rounded or sometimes subcordate to cuneate at base, irregularly- or undulate-serrate, dark green and glabrous or nearly so above, glabrous or pubescent, rarely tomentose beneath and gray-green or bluish gray, turning black in drying; petiole 1-2 cm. long; stipules reniform or oblique-ovate: catkins shortly before or with the lvs., on short leafy stalks, staminate to 2.5

cm. long, oval to oblong, pistillate to 6 cm. long; scales dark-colored at apex, villous; filaments villous at base; pedicel  $\frac{1}{2}$ – $\frac{2}{3}$  as long as the glabrous, rarely pubescent ovary, nearly twice as long as gland; style  $\frac{1}{4}$ – $\frac{3}{4}$  as long as ovary; stigmas oblong. R.I.11:t.573(c). S.E.8:t.1347,1351–4(c). H.W.2.1:119. (*S. nigricans* Sm., *S. Andersoniana* Sm., *S. phyllicifolia* Willd., not L., ? *S. spadicea* Vill.) Eu. to W. Asia and W. Siberia. Long cult. Zone IV. An extremely variable species of which numerous varieties have been described, but neither of horticultural nor economic importance.

*S. m. × hastata* = *S. Mielichhoferi* Saut. Small shrub; young brts. silky-pubescent, rarely glabrous; lvs. elliptic to lanceolate, inequally and closely serrate, near base and petiole pubescent, later glabrous, dark lustrous green above, lighter beneath; petiole 5–10 mm. long; pedicel  $\frac{1}{2}$  as long as the glabrous ovary. C.S.2:t.42g-k. S.H.1:f.19q,20c-d. Eu. Cult. 1888.—*S. m. × retusa*; see under No. 19.—*S. m. × caprea*; see under No. 28.—*S. m. × phyllicifolia*; see under No. 43.

43. *S. phyllicifolia* L. Upright shrub to 1, rarely 3 m.; brts. glabrous or pubescent when very young, later dark brown and lustrous; lvs. elliptic or obovate to lanceolate, 2–8 cm. long, acute or short-acuminate, rounded or cuneate at base, serrate or crenate-serrate, lustrous above, glaucous or gray-green beneath, glabrous or slightly pubescent at first, subcoriaceous, not blackening in drying; petiole 8–10 mm. long; stipules semi-cordate, rarely present; catkins on short bracted stalks, before or with the lvs., staminate to 2.5, pistillate to 6 cm. long in fr.; scales oblong to obovate, acutish, dark except at base; filaments glabrous; pedicel 3–4 times as long as gland; caps. pubescent, rarely glabrous, 7–10 mm. long. R.I.11:t.563,f.2002(c). S.E.8:t.1335–6, 1340,1345(c). F.Sa.t.38,44,46,47(c). (*S. bicolor* Ehrh., *S. Weigeliana* Willd.) Eu. to N. E. Asia. Cult. 1809. Zone III?

*S. p. × myrsinifolia* = *S. tetrápia* Walker. Lvs. more or less pubescent when young; blackening in drying; foliaceous stipules usually present; filaments villous at base; ovaries often only partially pubescent. S.E.8:t.1337,1341–4,1348–50(c). Eu. Cult. 1829.—*S. p. × aurita*; see under No. 29.—*S. p. × caprea*; see under No. 28.—*S. p. × aurita × purpurea*; see under No. 59.

Closely related species: *S. formosa* Willd. Dense procumbent or upright shrub, to 0.5, rarely to 1 m.; brts. and lvs. glabrous or slightly pubescent at first, the latter 1–5 cm. long, serrate or entire; scales pale, darker at apex; pedicel much shorter than the narrow gland; anthers red or reddish at first. R.I.11:t.561(c). S.E.8:t.1371–4(c). H.W.2.1:120. (*S. arbuscula* L., in part, *S. prunifolia* Sm.) Eu. to Cauc. and Siberia. Cult. ? Zone V.—*S. f. × herbacea* = *S. simulatrix*; see under No. 18.—*S. planifolia* Pursh. Shrub to 3 m.; brts. purplish, sometimes bloomy; lvs. elliptic to lanceolate or oblong-obovate, 2–5 cm. long, entire or indistinctly denticulate, glaucous beneath, glabrous; catkins smaller; pedicels as long or slightly exceeding the gland; caps. 5–6 mm. long. B.B.1:600. Gr.M.668. (*S. chlorophylla* Anders., *S. phyllicifolia* Tuckerm., not L.) Lab. to Alb., s. to N. H., Vt., Colo. and Calif. Cult. 1816. Zone I.

44. *S. subcoerúlea* Piper. Shrub to 2 m.; brts. glabrous or slightly pubescent at first, later purple and sometimes bloomy; lvs. lanceolate to oblanceolate, 3–6 cm. long, acute or short-acuminate, cuneate or rounded at base, entire or indistinctly crenulate, glabrous above, with lustrous, white silky tomentum beneath, with conspicuous yellow glabrescent midrib, of firm texture; petiole 2–7 mm. long; catkins sessile, staminate 2–3.5, pistillate 2.5–5 cm. long in fr.; pedicels about half as long as gland; caps. 5 mm. long. A.I.1:502. (*S. pellita* Anders., in part.) Wash. to Wyo., Colo., N. Mex., Utah and Calif. Cult. 1890. Zone V. Handsome willow, conspicuous in winter on account of its often bloomy brs.

Closely related species: *S. pellita* Anders. Brts. bloomy; lvs. lanceolate or oblanceolate to linear-lanceolate, 4–12 cm. long, white silky-villous beneath, later glabrescent; catkins longer; pedicel longer than gland. B.B.1:598. Gr.M.f.667.

Nfd. to Lake Winnipeg, s. to Me., Vt. and Mich. Intr. 1918. Handsome willow. —*S. Drummondiana* Barratt. Brts. tomentulose, not bloomy; lvs. obovate or obovate-oblong to elliptic-oblancoate, 3–8 cm. long, obtuse or acute, velutinous-tomentose beneath; pedicel longer than gland. A.I.1:503. B. C., Alb. Intr. 1921.

45. *S. adenophylla* Hook. FURRY W. Straggling shrub to 2.5 m.; brts. silky-villous: lvs. ovate to ovate-lanceolate, 3–6 cm. long, short-acuminate, cordate or rounded at base, glandular-serrulate, densely silky-villous on both sides, green beneath; petiole 3–6 mm. long, dilated at base, shorter than the cordate-ovate, persistent stipules: catkins on short leafy stalks, cylindric, staminate about 2, pistillate 4–10 cm. long in fr.; scales light brown, obtuse, scarcely darkened at apex; ovary glabrous, conic-ovoid; pedicel about as long as gland, shorter than scale; style longer than stigma. B.B.1:597. (*S. syrticola* Fern.) Lab. to Wisc., s. to Pa. and Ill. Cult. 1900. Zone II. Handsome and distinct willow.

46. *S. glaucophylloides* Fern. Shrub or shrubby tree to 5 m.; brts. glabrous: lvs. ovate or obovate to oblong-lanceolate, 5–12 cm. long, short-acuminate, rounded or cuneate at base, glandular-serrulate, dark green above, glaucous beneath, glabrous, subcoriaceous at maturity; petiole 3–10 mm. long; stipules large, persistent; catkins cylindric, on leafy stalks, very silky, staminate 3–5, pistillate, 4–7 cm. long in fr.; scales obtuse; pedicel about as long as scale; caps. rostrate, 9–11 mm. long, glabrous. B.B.1:596. Gr.M.f.652. (*S. glaucophylla* Robins. & Fern., not Schleich. et al.) N. B. to Que. and Me.—*S. g. glaucophylla* (Bebb) Schneid., var. Lvs. firmer, thicker; pedicels longer, exceeding the scale; style longer. (*S. glaucophylla* Bebb, not Schleich. et al.) Ont. to Ohio, Ill. and Wisc. Intr. 1894. Zone III.

Closely related species: *S. monticola* Bebb. Shrub to 7 m.: lvs. elliptic to ovate or obovate, 3–5 cm. long; catkins subsessile, in fr. to 4.5 cm. long; caps. 5–7 mm. long. (*S. padophylla* Rydb.) Mont. to Colo., N. Mex. and Utah. Intr. 1898. Zone V.—*S. Barclayi* Anders. Shrub; brts. villous: lvs. elliptic-oblong to oblong, usually cuneate, glandular-denticulate, villous above at first, glaucous and glabrous beneath: catkins on leafy stalks; scales mostly acute; caps. 5–8 mm. long, sometimes slightly silky. A.I.1:498. B. C. to Ore. and Mont. Intr. 1919. Zone V.

47. *S. hastata* L. HALBERD-LEAVED W. Much-branched shrub to 1.5 m.; young brts. pubescent, soon glabrous, red-brown the 2d year: lvs. very variable, elliptic to ovate or obovate, 2–8 cm. long, rounded to cuneate, or on vigorous shoots cordate at base, irregularly serrulate, dull green above, glaucous and glabrous beneath or slightly pubescent when young, of firm texture; petiole 3–8 mm. long: stipules usually large, semicordate: catkins on leafy stalks, with the lvs., staminate to 3.5, pistillate to 5 cm. long; scales with long villous hairs; filaments glabrous; pedicel 2–4 times as long as gland; style as long or slightly longer than stigma. R.I.11:t.570(c). H.W.2.1:121. Mitt. Thuring. Bot. Ver. 29:10(h). Mts. of C. and S. Eu. to N. E. Asia and Kashmir. Intr. 1780. Zone V.

*S. h. × myrsinifolia*; see under No. 42.

Related species: *S. glabra* Scop. Brts. and lvs. quite glabrous, the latter broad-elliptic or ovate to oblong, crenulate; scales long-cliate, otherwise glabrous; filaments villous near base. R.I.11:t.568(c). H.W.2.1:121. Alps and mts. of S. E. Eu. Cult. 1870. Zone V.—*S. japonica* Thunb. Lvs. elliptic-oblong, 5–12 cm. long, acuminate, cuneate, sharply serrate with glandular teeth, those of peduncle entire, silky-pubescent when young, soon glabrous: catkins with the lvs., thin and slender, to 10 cm. long; filaments villous at base; pedicel longer than gland. Seemen, Sal. Japt.7. S.H.1:f.20z,23b. Jap. Cult. 1874. Zone V?—*S. pyrolaefolia* Ledeb. Shrub or small tree to 5 cm.; brts. pubescent when young: lvs. oblong-elliptic, 3–7 cm. long, or on vigorous shoots orbicular-elliptic, acute, serrate, bluish gray beneath, soon glabrous; petiole 1.5–2 cm. long;

stipules large, suborbicular: catkins before the lvs., short-stalked, to 5 cm. long; pedicel 2-3 times as long as gland. S.H.1:f.20z, 23n. Ledebour, Ic. Pl. Ross. t.476. N. E. Asia. Intr. about 1900. Zone III?

48. *S. cordata* Muhlenb. Shrub to 4 m.; brts. glabrous or puberulous at first: lvs. oblong-lanceolate to lanceolate, 5-14 cm. long, acuminate, rounded to subcordate or often cuneate on flowering brts., sharply serrulate, dull green above, green or paler beneath, glabrous or slightly pubescent beneath; petiole 5-15 mm. long; stipules reniform or ovate, usually large: catkins on short bracted stalks before the lvs., rather slender, staminate 2-5, pistillate 2.5-6 cm. long in fr.; caps. 4-7 mm. long, its pedicel  $\frac{1}{4}$ - $\frac{1}{2}$  as long; style 0.5-0.8 mm. long. B.B.1:596. Gr.M.f.650. (*S. rigida* Muhlenb.) N. B. to B. C., s. to Va., Mo., Colo. and Calif. Intr. 1812. Zone III. Staminate catkins conspicuous.—*S. c. purpurascens* (Dieck) Schneid., f. Lvs. purple when young. (*S. Nicholsonii* f. p. Dieck.) Orig. before 1889.

*S. c. × sericea* = *S. myricoides* Muhlenb. Brts. pubescent: lvs. lanceolate, cuneate, glaucous or glaucescent beneath and glabrate or more or less silky beneath; stipules small: caps. often silky when young. (*S. cordata* var. *m.* Carey.) Mass. to Wisc. and Kans. Cult. 1880.

A closely related species is *S. missouriensis* Bebb. Large shrub or tree to 15 m.; brts. pubescent: lvs. lanceolate to ovate-oblong, rarely obovate, 8-15 cm. long, glaucous beneath: fruiting catkins 6-10 cm. long; caps. 8-10 mm. long. S.S.9:t.480. B.T.193. H.H.90,91(b). Ky. to Mo., Iowa and Neb. Intr. 1898. Zone V.—Another related species is *S. myrtillofolia* Anders. Shrub to 0.5 m.: lvs. elliptic to oblanceolate, 1-5 cm. long, acutish to obtuse, crenate-serrate, green on both sides, glabrous; petiole 2-4 mm. long: catkins on short leafy stalks, 1-3 cm. long; style very short. (*S. pseudomyrsinites* Anders., in part.) Proc. Wash. Acad. Sci. 3:325. Alaska to Alb. Intr. 1922. Zone V.

49. *S. irrorata* Anders. Upright shrub to 3 m.; brts. glabrous, purple, rarely yellowish, bloomy: lvs. oblong to linear-lanceolate, 6-10 cm. long, acuminate, cuneate, bright green and lustrous above, glaucous beneath, remotely serrate or entire, glabrous, firm; petiole 3-10 mm. long, usually yellow: catkins sessile, usually naked at base, short and dense, 1.5-2.5 cm. long; scales dark, densely white-villous; pedicel about 0.5 mm. long; style rather short; stigmas short and thick. Colo. to N. Mex., Ariz. Intr. 1898. Zone IV. Conspicuous in winter with its bloomy brs.

50. *S. myrsinites* L. Shrub to 0.4 m., with short densely leafy brs., pubescent when young, later glabrous, dark brown and lustrous: lvs. short-petioled, elliptic or obovate to lanceolate, 1-5 cm. long, acute at ends, rarely obtuse, serrate with usually glandular teeth, pubescent at first, later glabrous and lustrous green or both sides; stipules little developed: catkins on leafy stalks, dense, staminate to 4, pistillate to 5 cm. long; scales purple, darker at apex; anthers purple; ovary short-stalked, pubescent, later glabrescent; style  $\frac{1}{6}$ - $\frac{1}{2}$  as long as ovary, purple, with narrow stigmas. R.I.11:t.559(c). S.E.8:t.1375-6(c). H.W.2,1:124. (*S. m.* var. *serrata* Neilr.) Mts. of Eu., N. Asia to Kamch. Cult. 1789. Zone IV.—*S. m. Jacquiniæana* (Willd.) Koch, var. Lvs. entire or sparingly serrulate. R.I.11:t.559(c). (*S. J.* Willd.)

51. *S. lanata* L. Shrub to 1.5 m.; young brts. and winter-buds woolly: lvs. elliptic-obovate to oblong-obovate, 2.5-7 cm. long, acute, broad-cuneate to subcordate at base, entire, sometimes undulate, silky-villous above when young, later glabrescent and dull green, glaucous and reticulate beneath and clothed with long silky hairs; petiole 5-15 mm. long; stipules often large, entire: catkins with the lvs., densely yellowish silky, staminate ovoid-oblong, sessile, about 5 cm., pistillate 4-6, in fr. to 8 cm. long, short-stalked; scales dark brown; filaments glabrous; ovary glabrous, sessile or the lower short-stalked; gland linear; style about  $\frac{1}{2}$  as long as the glabrous ovary, with nar-

row bifid stigmas. S.E.8:t.1367 (c, excl. stamens). S.H.1:f.21a-b,25l. C.S.2:t.36a-e. N. Eu. and N. Asia. Cult. 1789. Zone III? Handsome willow on account of its long silky pubescence.

52. *S. Hookeri* Barratt. Shrub, sometimes with prostrate brs., or tree to 10 m.; young brts. densely tomentose: lvs. oblong to oblong-obovate, 5-16 cm. long, usually acute, entire or crenate-serrate, tomentose above when young, glaucous and pubescent or tomentose beneath; petiole 5-15 mm. long, pubescent; stipules wanting or small: catkins subsessile, with few bracts at base, 3-5, the pistillate in fr. to 8 or 12 cm. long; ovary glabrous, sometimes tomentose (var. *tomentosa* Schneid.); pedicel 2-3 times as long as gland; stigmas short, spreading, emarginate. S.S.9:t.485. S.H.1:26g,27n-o. A.I.1:500. B.C. to Ore. Cult. 1891. Zone V.

Related species: *S. Piperi* Bebb. Shrub to 6 m.; brts. slightly villous, soon glabrous: lvs. similar to those of the preceding species: filaments hairy at base; caps. slightly hairy at apex. A.I.1:499. Wash. to Ore. Intr. 1898. Zone V.

53. *S. daphnoides* Vill. Large shrub or tree to 10 m.; brts. slender, yellowish or brown, bloomy, sometimes slightly pubescent when young: lvs. oblong-lanceolate to narrow-lanceolate, 5-10 cm. long, acuminate, finely glandular-serrulate or nearly entire, pubescent when young, soon glabrous, dark lustrous green above, glaucous beneath, of firm texture; petiole 2-4 mm. long; stipules semicordate, large: catkins cylindric, about 3 cm. long, densely silky; scales oblong-obovate, dark brown; filaments glabrous; ovary conic-ovoid, glabrous, short-stalked; gland linear; style nearly half as long as ovary; stigmas linear-oblong, entire. R.I.11:t.602(c). F.Sa.t.26(c). H.W.2,1:110. Eu. to C. Asia and Himal. Cult. 1829. Zone IV. Conspicuous in winter with its bloomy brs.—*S. d. pomerànica* (Willd.) Koch, var. Usually shrubby: lvs. narrower: catkins slenderer. Eu.

*S. d. × caprea* = *S. Erdingeri* Kern. Young brts. pubescent: lvs. obovate to oblong, acuminate, silky when young, later glabrous and lustrous above, gray-green and glabrate beneath; pedicel about  $\frac{1}{2}$  as long as the silky ovary; style about  $\frac{1}{4}$  as long as ovary; stigma upright. C.S.2:t.46a-c. (*S. cremensis* A. & J. Kern., *S. Figerti* A. & G. Camus.) Eu. Cult. 1872.—*S. d. × repens* = *S. maritima* Hartig. Brts. and lvs. beneath silky at first; brts. purple: lvs. oblong or oblong-lanceolate, 2.5-5 cm. long, acute, rounded at base; petiole 2-5 mm. long; catkins 1.5-2 cm. long; ovary sparingly silky. Cult. 1873.—*S. d. × purpurea* = *S. calliantha* Kern. Brts. not bloomy: lvs. smaller than in No. 53, lanceolate, glaucous beneath and pubescent when young: catkins 2-3.5 cm. long; stamens connate at base, sparingly pubescent; ovaries nearly sessile; stigmas oval. Cult. 1872.—*S. d. = Elaeagnos*; see under No. 57.

Closely related species: *S. acutifolia* Willd. Less tall; brs. slenderer, violet- or red-brown, bloomy: lvs. lanceolate to linear-lanceolate, 6-12 cm. long, long-acuminate, cuneate; stipules lanceolate: catkins slenderer, remote; style shorter; stigmas emarginate. R.I.11:t.603(c). S.E.8:t.1366(c). H.W.2:t.29, f.6-9(c). (*S. daphnoides* var. *a.* Doell.) Russia to E. Asia. Cult. 1809. Zone IV. Brs. used for coarse basket-work.

54. *S. Rehderiana* Schneid. Shrub or tree to 9 m.; young brts. sparingly villous or glabrous, later red-brown: lvs. lanceolate, 5-12 cm. long, short-acuminate, rounded to broad-cuneate at base, irregularly glandular-crenulate, rarely nearly entire, grayish white and silky beneath or sometimes glabrescent and glaucous; petiole 2-8 mm. long, usually puberulous: catkins sessile or subsessile, with 2-3 bracts at base, 2-3 cm. long; scales oblong, obtuse, sparingly silky-villous; filaments glabrous or pilose at base; anthers purple at first; ovary glabrous or sparingly silky-villous, subsessile; style about  $\frac{1}{2}$  as long as ovary, with short emarginate stigmas. W. China. Intr. 1908. Zone V.

55. *S. lappònum* L. Dense much-branched shrub to 1.5 m.; brts. pubescent, later glabrous, dark brown and lustrous; winter-buds pubescent: lvs.

elliptic-oblong to obovate-oblong or lanceolate, 2.5–6 cm. long, acute or acuminate, rounded to cuneate at base, entire, soft-pubescent and dull green above, gray- or white-tomentose beneath; petiole to 1 cm. long; stipules wanting or minute: catkins subsessile with few small bracts, staminate about 2.5 cm. long, pistillate 2.5–5 cm. long; scales oblong, obtuse or acutish, silky-villous; filaments glabrous; anthers yellow or reddish; ovary densely pubescent, subsessile or the lower ones short-stalked; gland linear; style slender, longer than the narrow, usually divided stigmas. S.E.8:t.1368–9(c). F.Sa.t. 70,72,73(c). M.G.25:140(h). Mts. of Eu. to the Altai. Cult. 1789. Zone III?

*S. l. × caprea* = *S. Laestadiana* Hartm. Young brts. hoary-pubescent: lvs. obovate-oblong to elliptic-lanceolate, acute at ends, silky-pubescent beneath: pedicel slightly longer than gland; style short, about as long as stigmas. C.S.2:t. 39m-p. Eu. Cult. 1873.

Closely related species: *S. helvética* Vill. Low shrub, to 0.6 m.: lvs. oblong to elliptic-lanceolate, entire, slightly pubescent or glabrous above, white-tomentose beneath: catkins on leafy stalks with the lvs. R.I.11:t.572,f.1216(c). H.W. 2,1:122. (*S. lapponum* var. *h.* Anders.) Alps. Cult. 1872. Zone V.

56. *S. viminalis* L. COMMON OSIER. Upright shrub or tree to 5 or occasionally 10 m.; young brts. densely pubescent, later glabrescent; winter-buds pubescent: lvs. linear-lanceolate to lanceolate, 10–25 cm. long, broadest below the middle, acuminate, cuneate, nearly entire or obscurely crenate, undulate, dull green and glabrate above, grayish white and silky-tomentose beneath; petiole 4–12 mm. long; stipules small, lanceolate, deciduous: catkins subsessile, dense, staminate 2–4, pistillate about 2.5 and in fr. 3–6 cm. long; stamens long, glabrous; ovary conic-ovoid, pubescent; pedicel much shorter than the linear gland; style nearly as long as ovary, with narrow stigmas. R.I.11:t. 597(c). S.E.8:t.1322(c). H.W.2,1:112,t.31(c). Eu. to N. E. Asia and Himal.; naturalized in the E. States. Long cult. Zone III? One of the best basket willows.—*S. v. Gmelini* (Pall.) Anders., var. Young brts. pubescent or glabrescent: lvs. equally narrowed at both ends, slightly pubescent above: catkins short-stalked; ovary always sessile; style shorter than the slender stigmas. (*S. splendens* Ledeb.) Russia, W. Siberia. Cult. 1905.

*S. v. × caprea* = *S. Smithiana* Willd. Tall shrub to 6 m.; brts. later glabrescent: lvs. oblong-lanceolate or ovate-lanceolate, 6–12 cm. long, soon glabrate above, grayish and soft-pubescent beneath; stipules large: catkins about 2.5 cm. long; pedicel finally as long or longer than gland; style as long as stigmas. F.Sa.t.134(c). C.S.1:t.29a-f. (*S. mollissima* Sm., not Ehrh.) Cult. 1829.—*S. v. × aurita* = *S. fruticosa* Doell. Shrub to 3 m.; brts. soon glabrous: lvs. lanceolate or oblong-lanceolate, 3–10 cm. long, crenate-serrate, slightly wrinkled above, reticulate and pubescent or glabrescent beneath; pedicels about as long as gland; style as long as stigmas. F.Sa.t.128(c). Eu. Cult. 1829.—*S. v. × cinerea* = *S. holosericea* Willd. Shrub to 4 m.; brts. persistently pubescent; wood under bark with short raised striations: lvs. oblong-ovate to lanceolate or oblanceolate, 5–12 cm. long, crenulate, dull green and pubescent above, light gray and silky-pubescent beneath; stipules ovate-lanceolate, subtentire: catkins about 3 cm. long; pedicel finally as long as gland; style about as long as stigmas. S.E.8:t.1324(c). F.Sa.t.128(c). C.S.1:t.29m-r. Eu. Cult. 1829.—*S. v. × repens* = *S. Friesiana* Anders. Lvs. lanceolate to narrow lanceolate, 2–7 cm. long, entire, sometimes revolute, densely silky when young, later glabrate above; catkins sessile or subsessile: style about  $\frac{1}{4}$  as long as ovary; stigmas linear, bifid. F.Sa.t.87(c). Andersson, Mon. Salt.6.f.66. (*S. rosmarinifolia* L., in part?) Eu. Cult. 1829.—*S. v. × alba*; see under No. 5.—*S. v. × purpurea*; see under No. 58.

Closely related species or hybrids with species of the *Caprea* group, but differing from the 3 hybrids described above in the subsessile or sessile ovaries, are the following two: *S. stipularis* Sm. Large shrub, similar to No. 56, but lvs. broader with foliaceous stipules longer than petioles; brts. densely woolly; lvs. narrow-lanceolate, 12–20 cm. long; catkins about 3 cm. long; stigmas linear, undivided, as long or longer than style. F.Sa.t.132(c). R.I.11:t.598(c). S.E.8:

1323(c). Eu. Cult. 1829.—*S. dasyclados* Wimm. Tall shrub or tree to 6 m.; brts. densely woolly: lvs. oblong-lanceolate or lanceolate to obovate-lanceolate, to 20 cm. long, acuminate, dull green above and slightly pubescent, soft-pubescent and glaucescent beneath; stipules large, ovate-lanceolate: catkins large, staminate to 4.5, pistillate to 5.5 cm. long; stigmas thick, undivided, about as long as style. F.Sa.t.131(c). S.E.8:t.1326(c). (*S. acuminata* Sm., not Mill., nor Pall.) Eu. Cult. 1829.—Another related species is *S. sachalinensis* Fr. Schmidt. Tree to 10 m.; young brts. thinly pubescent, becoming glabrous: lvs. lanceolate, to 14 cm. long and 2.2 cm. broad, dark green above, glaucous and slightly pubescent or glabrescent beneath; stipules ovate-cordate, serrate: pedicel of ovary about as long as gland or slightly shorter. S.I.2:t.9(c). M.K.t.18(c). (*S. opaca* Seemen.) Saghal., Japan. Intr. 1905. Zone IV.

57. *S. Elaeagnos* Scop. Shrub or sometimes tree to 15 m., with slender brs. gray-pubescent when young: lvs. linear to narrow-lanceolate, 5–15 cm. long, acute at ends, revolute and finely serrate toward the apex, densely tomentose when young, later glabrous and dark green above, white-tomentose beneath; petiole 4–8 mm. long; stipules usually wanting: catkins on short bracted stalks, about 3 cm. long; scales oval, truncate or slightly emarginate, pale; filaments connate at base or  $\frac{1}{2}$ ; ovary glabrous, short-stalked; style about  $\frac{1}{2}$  as long as ovary; stigmas linear-oblong, cleft. R.I.11:t.596(c). H.W. 2,1:109. Gs.4:48. (*S. incana* Schrank.) Mts. of C. and S. Eu. and Asia Minor. Cult. Zone IV. Handsome with its grayish feathery foliage turning yellow in fall.

*S. E. × caprea* = *S. Seringeana* Gaud. Brts. tomentose: lvs. lanceolate or oblong-ob lanceolate, revolute and irregularly serrulate, finally glabrous above, gray-tomentose beneath; catkins before the lvs.; stamens connate and villous at base; pedicel about  $\frac{1}{2}$  as long as ovary; style short. R.I.11:t.580(c). C.S. 1:t.28h-l. (*S. salviaefolia* Link, *S. Flueggeana* Willd., in part, *S. oleaefolia* Vill., in part.) Eu. Cult. 1872.—*S. E. × aurita* = *S. pátula* Ser. Brts. gray-pubescent: lvs. oblong to lanceolate, acute at ends, at maturity slightly pubescent above, gray-tomentulose beneath; catkins cylindric, on bracted stalks; filaments connate and villous at base; pedicel about  $\frac{1}{2}$  as long as ovary; stigmas oblong, somewhat shorter than style. F.Sa.t.96(c). C.S.1:t.28n-p. (*S. pallida* Forb., *S. oleaefolia* Vill., in part.) Eu. Cult. 1829.—*S. E. × repens* = *S. subalpina* Forb. Lvs. lanceolate, entire or remotely serrulate, silky-tomentose beneath; catkins oblong to cylindric; stamens connate at base; style about  $\frac{1}{4}$  as long as ovary. C.S.1:t.28q-t. Andersson, Monog. Sal. t.6.f.68. Alps. Cult. 1829.—*S. E. × daphnoides* = *S. Reuteri* Moritz. Often tree-like; young brts. gray-pubescent, often bloomy when older: lvs. lanceolate or narrow-lanceolate, silky-tomentose beneath; stipules small, lanceolate; catkins subsessile; scales dark brown above the middle: filaments slightly connate at base. C.S.1:t.27r-x. Eu. Cult. 1870.

58. *S. Miyabeana* Seemen. Shrub or small tree to 5 m.; brts. light brown, glabrous: lvs. lanceolate to narrow-lanceolate, 5–15 cm. long, acute at ends, crenate-serrate, glaucous beneath, glabrous; petiole 3–10 mm. long; stipules lanceolate, about as long as petiole; catkins before or with the lvs., cylindric, staminate 3–5.5 cm. long, sessile, pistillate 4–8 cm. long in fr. and rather lax, on short leafy-bracted stalks; scales oval, dark brown, villous; filaments wholly united; anthers yellow; ovary ovoid, sessile, tomentose; stigmas short, undivided, sessile. M.K.t.19(c). Seemen, Sal. Jap. t.12-e. Japan. Intr. 1897. Zone V. Handsome small tree.

Related species: *S. Pieróti* Miq. Shrub: brts. glabrous, brown; lvs. lanceolate, 7–15 cm. long, broadest below the middle, serrulate, glaucous beneath, pubescent at first, soon glabrous; catkins smaller; style about  $\frac{1}{2}$  as long as ovary. Seemen, Sal. Jap. t.13e-f. S.H.1:f.23a,271-m. (*S. japonica* Dipp., not Thunb.) Amurl., Japan. Cult. 1893. Zone V?

59. *S. purpúrea* L. PURPLE OSIER. Shrub to 3 m., with slender tough brs., purplish at first, later gray or olive-gray, glabrous: lvs. oblanceolate, rarely oblong-obovate, often opposite, 5–10 cm. long, acute or acuminate, cuneate, serrulate toward the apex, dull green above, pale or glaucous beneath, glabrous

or slightly pubescent at first, turning black in drying; petiole 4-8 mm. long; stipules small or wanting; catkins subsessile, usually curved, before the lvs., slender, staminate 1.5-2.5, pistillate to 2 cm. long; scales obovate, obtuse, villous, dark above the middle; filaments wholly connate; anthers reddish; ovary ovoid, sessile or subsessile, tomentose; stigmas thick, usually entire, sessile or subsessile. R.I.11:t.582(c). S.E.8:t.1316,1319(c). H.W.2:t.30(c). Eu. and N. Afr. to C. Asia and Jap. Long cult. Zone IV. Graceful willow, often planted for ornament, also for finer basket-work.—*S. p. pendula* Dipp., f. Brts. very slender, pendulous. (*S. p. scharfenbergensis* Bolle, *S. nigra pendula* and *S. americana pendula* Hort.)—*S. p. gracilis* Gren. & Godr., var. A slender-branched, narrow-lvd. form. (*S. p. wulensis* Hort.)—*S. p. Lamberiana* (Sm.) Koch, var. Brs. purplish, stouter: lvs. obovate, oblong. R.I.11:t.585(c). S.E.8:t.1318(c). (*S. L. Sm.*)—*S. p. sericea* (Ser.) Koch, var. Young brts. and lvs. beneath silky-tomentose at first, becoming glabrous.—*S. p. amplexicaulis* (Bory & Chaub.) Boiss., var. Lvs. always opposite, subsessile, oblong to oblong-lanceolate, acutish, rounded to subcordate at base. S. E. Eu. and W. Asia.—*S. p. multinervis* Matsum., var. Similar to the preceding var., but lvs. broader, narrow-elliptic to oblong, up to 2.5 cm. broad, usually obtuse. S.I.2:t.8,f.7(c). Seemen, Sal. Jap.t.11f-k. (*S. Savatieri* Camus.) Japan. Intr. ?

*S. p. × caprea* = *S. Wimmeriana* Gren. & Godr. Young brts. sparingly gray-pubescent, later glabrous, lustrous: lvs. oblong to oblong-lanceolate or lanceolate, irregularly serrulate, thinly silky at first, becoming glabrous, dark green above, grayish or glaucescent beneath: catkins subsessile; filaments connate at base and slightly villous; pedicel about  $\frac{1}{2}$  as long as ovary; stigmas oblong, emarginate, subsessile. Host, Sal. t.60,61(c, as *S. discolor*). Eu. Cult. 1872.—*S. p. × grandifolia* = *S. austriaca* Host. Lvs. lanceolate or oblong-ob lanceolate, serrulate, glabrous except when young; filaments partly connate, villous at base; anthers reddish at first; pedicel  $\frac{1}{2}$  as long as ovary; style very short. Host, Sal. t.64,65(c). (*S. neriifolia* Schleich., *S. Pontederana* Parl., not Willd.) Eu. Cult. 1870.—*S. p. × aurita* = *S. dichroa* Kern. Brts. glabrous or nearly so: lvs. oblong-obovate or oblanceolate, glaucescent and slightly pubescent beneath, acute or abruptly contracted into a short acumen; filaments connate below and pilose at base; stalk nearly  $\frac{1}{2}$  as long as ovary; stigmas nearly sessile. Cult. 1870.—*S. p. × aurita × phyllifolia* = *S. sesquiteria* F. B. White. Shrub to 2 m., with slender brs. pubescent when young: lvs. oblong-obovate, crenate-serrate, rugulose above, glaucous beneath, soon glabrous; catkins usually androgynous; filaments connate; ovaries short-stalked; style distinct. Eu. Cult. 1900.—*S. p. × cinerea* = *S. Pontederana* Willd. Brts. becoming glabrous: lvs. obovate-lanceolate to lanceolate, at maturity glabrous or nearly so above, silky and glaucous beneath; filaments usually connate  $\frac{1}{2}$ ; anthers reddish at first; style short. R.I.11:t.587(c). F.Sat.t.43(c). (*S. sordida* Kern.) Eu. Cult. 1829.—*S. p. × repens* = *S. Doniana* Sm. Young brts. thinly pubescent, soon glabrous: lvs. oblong to lanceolate, serrulate toward the apex, minutely silky when young, later glabrous above, glaucous and glabrescent beneath; catkins oblong; filaments more or less connate; anthers red; pedicel  $\frac{1}{4}$  as long as ovary; stigmas subsessile, oval, emarginate. S.E.8:t.1365(c). F.Sat.85(c). (*S. parviflora* Host.) Eu. Cult. 1829.—*S. p. × viminalis* = *S. rubra* Huds. Shrub to 3 m., with long brs. pubescent at first, later glabrous and yellow: lvs. lanceolate to oblanceolate, 6-14 cm. long, acuminate, glaucescent and glabrescent beneath or sometimes pubescent: catkins 2-3 cm. long; filaments more or less connate; anthers reddish at first; style distinct. R.I.11:t.586(c). S.E.8:t.1320(c). F.Sat.t.6(c). (*S. Helia* L.?) Eu. Long cult.; brs. used for basket-work.—*S. p. × pentandra*; see under No. 2.—*S. p. × daphnoides*; see under No. 53.

Related species: *S. Wilhelmsiana* Bieb. Shrub; young brts. tomentose: lvs. linear, 1.5-4 cm. long, not more than 4 mm. broad, remotely denticulate or entire, tomentose on both sides when young: catkins on leafy stalks, thin; scales pale, villous only near base; anthers yellow; ovary pilose. Mem. Div. Sav. St. Petersb. 3:t.3. S.H.1:f.20x-y. (*S. angustifolia* Willd., not Wulf.) Cauc. to E. Asia. Cult. 1887. Zone V.—*S. microstachya* Turcz. ex Trautv. Similar to the preceding: brts. glabrous: lvs. silky-pilose at first, becoming glabrous: ventral gland of

male fl.  $\frac{1}{2}$  as long as scale; ovary glabrous. (*S. Wilhelmsiana* var. *m.* Herd.) W. Siber. to Mongol. Cult. 1933. Zone III.—*S. Gilgiana* Seemen. Shrub to 3 m.; brts. slender, light yellow-brown, pubescent or glabrous: lvs. sometimes opposite, linear or linear-lanceolate, 3–6 cm. long, acute at ends, glaucescent beneath, gray-pubescent when young, later glabrous: catkins sessile, 1.5–3 cm. long; scales broad-oval, black-brown, thinly villous; anthers yellow; ovary short-stalked; stigmas oblong, bifid, about as long as style. Seemen, Sal. Jap. t.13a-d. Japan. Intr. 1897. Zone V.

60. *S. caesia* Vill. Low shrub to 1 m.; brts. glabrous, brown, lustrous: lvs. crowded, broad-oval or obovate to oblong, 1–3.5 cm. long, acute or acuminate, rarely obtuse, broad-cuneate to subcordate at base, grayish green above, pale or whitish beneath, glabrous; petiole 2–3 mm. long; catkins on short bracted stalks, with the lvs., about 1 cm. long; scales oval, yellowish, darker at apex, sparingly silky; filaments connate at base, rarely more, villous at base; anthers violet; ovary sessile, villous; stigmas subsessile, red. R.I.11:t.565(c). Alps. to C. Asia and Dahur. Cult. 1871. Zone V.

61. *S. Bockii* Seemen. Shrub to 3 m.; young brts. densely gray-pubescent: lvs. oblong to obovate, 6–15 mm. long, obtuse or acute, entire or sparingly denticulate, revolute at margin, deep green and glabrous above, bluish white and silky beneath: catkins in autumn in the axils of lvs., sessile, staminate 1–2.5 cm. long, pistillate 3–3.5 cm. long; scales lanceolate, acute, pale; filaments wholly connate; ovary sessile, pubescent; stigmas subsessile, bifid. B.M.9079(c). Gn.87:609. W. China. Intr. 1908. Zone V. Distinct species with small deep green lvs., remarkable for its catkins appearing in late summer and autumn.

62. *S. gracilistyla* Miq. Upright shrub, to 3 m.; young brts. gray-tomentose, glabrescent the 2d year: lvs. elliptic-oblong to oblong-obovate or oblong, 5–10 cm. long, acute at ends, serrulate, silky-pubescent when young, later glabrate above, grayish or bluish gray and pubescent beneath; petiole 4–8 mm. long, pubescent; stipules semicordate: catkins before the lvs., sessile, densely silky, staminate to 3.5, pistillate to 8 cm. long in fr.; scales lanceolate, acute, dark at apex; filaments connate, glabrous; anthers yellow; ovary subsessile, silky-pubescent; gland linear; style slender, longer than ovary. S.I. 2:t.7,f.1–9(c). B.M.9122(c). N.K.18:t.17. T.M.42:570(h). (*S. Thunbergiana* Bl.). Japan, Korea. Cult. 1900. Zone V. One of the earliest willows to bloom and conspicuous with its large catkins.

63. *S. sitchensis* Bong. Tree to 10 m.; brts. tomentose, glabrescent the 2d year and brown or orange, sometimes bloomy: lvs. oblong-obovate to oblanceolate, 5–12 cm. long, acute or acuminate, sometimes obtuse, entire or glandular-denticulate, pubescent above at first, later dark lustrous green and glabrous, shining silky-tomentose beneath; petiole to 1 cm. long; stipules wanting or small: catkins on short bracted stalks before the lvs., cylindric, staminate 3–5, pistillate 5–7.5 cm. long; fls. partly with 1, partly with 2 stamens; filaments more or less connate; ovary short-stalked, pubescent; style short. S.S.9:t.436. Alaska to Ore. and Mont.. Intr. 1918. Zone V?

## 7. GARRYACEAE Lindl. GARRYA FAMILY

Evergreen shrubs or rarely trees; usually more or less pubescent; brts. quadrangular at first: lvs. opposite, petioled, oval to lanceolate, entire, estipulate: fls. dioecious, in axillary or terminal catkin-like racemes, apetalous, 4-merous; staminate fls. with 4 valvate sepals; stamens 4, with introrse, elliptic to linear anthers on short filaments; pistillate fls. without sepals, but sometimes with 2 small adnate bracts which have been taken for sepals; ovary 1-celled, 2-ovuled,

with 2 subulate styles; fr. a rather dry globose or ovoid berry, 1-2-seeded; seed ovoid to subglobose with copious albumen and a minute embryo.—Contains only the following genus with about 15 species in W. N. Am. from Ore. to C. Mex and 1 species in the W. Indies.

**GARRYA** Lindl. Characters of the family. (After Nicholas Garry, secretary of the Hudson Bay Company; about 1820.)

- A. Lvs. pubescent below, at least while young: staminate infl. usually simple; pistillate infl. dense, with usually 3 fls. in the axils; bracts broadly connate at the base.  
 B. Lvs. beneath with curly or woolly hairs.....1. *G. elliptica*  
 BB. Lvs. beneath with appressed silky hairs.  
 c. Mature lvs. densely appressed-silky beneath.....2. *G. flavescens*  
 cc. Mature lvs. nearly glabrous beneath.....3. *G. Fremontii*  
 AA. Lvs. glabrous: staminate infl. branched; pistillate infl. with remote solitary fls.; at least the lower bracts leaf-like, narrowed at base.....4. *P. Wrightii*

1. *G. elliptica* Lindl. Shrub to 2.5 m.; brts. densely pubescent while young; lvs. thick, leathery, elliptic to elliptic-oblong, acute or obtusish and mucronulate, usually rounded at base, revolute and usually undulate at the margin, 4-8 cm. long, densely woolly-tomentose beneath, glabrous above at maturity; staminate spikes to 20 cm. long; pistillate spikes dense, 5-9 cm. long; fr. globose, densely silky-tomentose. FL.I-III; fr.VI-VIII. B.R.1686(c). G.C.35:42,43;60:254. B.S.1:578. Gn.78:114(h). Ore. to Calif. Intr. 1826. Zone VII?

A hybrid of this species with *G. Fadyenii* Hook. from the W. Indies is *G. Thurétii* Carr. raised 1862 in France: lvs. narrower and longer, to 10 cm. long; pistillate spikes slender with usually one fl. in each axil. Zone VII?

2. *G. flavescens* S. Wats. Shrub to 2.5 m.; brts. silky-pubescent at first: lvs. elliptic, acute and mucronulate, cuneate at base, quite entire, 3-7 cm. long, densely silky-pubescent below, sparingly so above while young; spikes short, the staminate not or little branched; the pistillate dense, 2.5-5 cm. long; fr. globose-ovoid, appressed silky-pubescent. FL.III; fr.VII-VIII. (*G. Veitchii* var. *f.* Coult. & Evans.) Nev. and Utah to N. Mex. Intr. before 1904. Zone VII?

3. *G. Fremontii* Torr. Shrub to 2 m.; brts. soon glabrous: lvs. elliptic to elliptic-obovate, acute or obtusish, mucronulate, cuneate at base, entire or slightly undulate, 4-6 cm. long, at first slightly appressed pubescent on both sides, finally quite glabrous above and slightly pubescent or glabrous beneath: staminate spikes 5-15 cm. long, simple; pistillate spikes 3-7 cm. long, dense; bracts short, triangular, acuminate; fls. usually solitary; ovaries pilose: fr. ovoid, stalked, slightly pubescent or nearly glabrous, dark purple. FL.IV-V; fr.VIII-IX. Wash. to Calif. Intr. 1842. Zone VII?

4. *G. Wrightii* Torr. Shrub to 2 m.; brts. at first sparingly appressed-pubescent, soon glabrous: lvs. elliptic or ovate to oblong, acute at the ends, entire or sometimes rough at the margin, 2.5-5 cm. long, slightly appressed-pubescent at first, soon quite glabrous: spikes slender, staminate more or less branched, 3-4 cm. long, pistillate 3-7 cm. long, with remote pairs of globose ovaries, the lower bracts leaf-like, but smaller and narrower, the upper lanceolate. FL.VII-VIII; fr.VIII-XI. E.P.IV.56a:13. Ariz. and N. Mex. to W. Tex. Intr. 1901. Zone VI? Apparently the hardest species.

## 8. MYRICACEAE Lindl. SWEET GALE FAMILY

Deciduous or evergreen shrubs or trees; buds small, scaly: lvs. alternate, entire to dentate or pinnatifid, resinous-dotted: fls. monoecious or dioecious, solitary in the axils of bracts, forming catkins; perianth wanting; stamens

2-16, with the filaments somewhat united below; anthers 2-celled; ovary 1-celled, with one erect ovule; style short, with 2 filiform stigmas: fr. a small, globose or ovoid drupe or nut usually coated with resinous grains or wax. Two genera with about 35 species widely distributed through both hemispheres chiefly in temp. and subtrop. regions.

- A. Lvs. entire or toothed, deciduous or evergreen, estipulate.....1. *Myrica*  
 AA. Lvs. pinnatifid, deciduous, stipulate.....2. *Comptonia*

1. **MYRICA** L. Deciduous or evergreen shrubs: leaves alternate, short-petioled, entire or toothed, estipulate: fls. monoecious or dioecious; stamens 2-8, rarely to 16: fr. with or without a waxy covering or resinous-dotted, without or with 2-4 small adnate bracts not exceeding the fr. (*Myrike*, ancient Greek name of a shrub, probably the Tamarisk.) Syn. *Morella* Lour., *Cerothamnus* Tidestr.—About 50 species of the same distribution as the family.

- A. Fr. more or less coated with wax, globular, bractless, on the growing wood: fls. with or after the lvs.  
 B. Fr. grayish white, thickly covered with wax: fls. dioecious.  
     Subgen. **MORELLA** (Lour.) Endl.  
     C. Lvs. obovate to oblong-obovate, obtuse or acutish, 1.5-4 cm. broad.  
     D. Lvs. deciduous, pubescent; fr. pubescent when young.....1. *M. pensylvanica*  
     DD. Lvs. evergreen, glabrous or pubescent: fr. glabrous when young. 2. *M. heterophylla*  
     CC. Lvs. oblanceolate or oblong-lanceolate, acute, evergreen, 1-1.5 cm. broad.  
     3. *M. cerifera*  
 BB. Fr. dark purple, thinly coated with wax: fls. monoecious: lvs. serrate, persistent.  
     4. *M. californica*  
 AA. Fr. resinous-dotted, ovoid with 2 adnate, wing-like bracts, in cone-like axillary catkins at the end of last year's brts.....Subgen. **GALE** (Adams.) Endl.  
     5. *M. Gale*

1. ***M. pensylvanica*** Lois. **BAYBERRY.** Deciduous shrub to 3 m.; brts. gray pubescent and glandular: lvs. obovate to oblong-obovate or oblong, 4-10 cm. long, 1.5-4 cm. broad, obtuse or acutish, shallowly toothed toward the apex or entire, dull green and pubescent above, pubescent beneath, resinous-dotted: fr. 3.5-4.5 mm. thick. Fl. III-IV; fr. IX-IV. Em. 255, t(c). G.F. 7:477. F.E. 23:825 (h). S.L. 238(h). (*M. carolinensis* auth., not Mill., *M. cerifera* var. *latifolia* Ait.) Nfld. to w. N. Y. and Md., chiefly along the sea-shore. Intr. 1727. Zone II. The aromatic lvs. fall late in autumn; conspicuous in winter with its grayish white fr. Valuable for planting on sterile dry soil.

2. ***M. heterophylla*** Raf. **EVERGREEN BAYBERRY.** Evergreen shrub or small tree to 5 m.; brts. pubescent, blackish brown: lvs. coriaceous, obovate to oblong, occasionally lanceolate, 4-7 cm. long, 1.5-2.5 cm. broad, rounded or apiculate at apex, cuneate, entire or sharply toothed toward the apex, pubescent on both sides, finally glabrous and lustrous above: fr. about 3 mm. across. Fl. III; fr. X-IV. (*M. Curtissi* var. *media* Chev.). N. J. to Fla. and Ark., inner Coastal Plain. Cult. 1903. Zone VI.—*M. h. Curtissi* (Chev.) Fern. Brts. glabrous, reddish brown: lvs. glabrous above, sparingly glandular beneath. (*M. C. Chev.*) Md. to Fla. and La. Intr. ?

3. ***M. cerifera*** L. **WAX-MYRTLE.** Shrub or small tree, occasionally to 12 m.; brts. reddish, glabrous or puberulous: lvs. evergreen, lanceolate to oblong-lanceolate, acute, entire or serrate toward the apex, 3-8 cm. long, 1-1.5 cm. broad, resin-dotted, dark green and glabrous above, glabrous or sometimes puberulous beneath: fr. 2.5-3 mm. thick. Fl. III-IV; fr. X-IV. S.S. 9:t.459. G.F. 7:476. (*M. carolinensis* Mill.) N. J. to Fla. and Tex. Intr. 1699. Zone VI.

4. ***M. californica*** Cham. **CALIFORNIAN BAYBERRY.** Shrub or slender tree, occasionally to 12 m.; brts. pubescent: lvs. coriaceous, lanceolate to oblong-lanceolate, acute, remotely serrate, 5-10 cm. long, resinous-dotted, lustrous above, glabrous or puberulous beneath and black-dotted: fr. globose or glo-

bose-ovoid, 4-6 mm. long, purple. Fl.v-vi; fr.ix-i. S.S.9:t.461. A.I.1:509. J.H.1852:283. Wash. to Calif. Intr. 1848. Zone VII. Handsome shrub with ornamental fr.

5. *M. Gâle* L. SWEET GALE. Shrub to 1.5 m., with upright virgate dark brown brs.: lvs. deciduous, oblanceolate, obtuse or acute, toothed toward the apex, 3-6 cm. long, dark green and glabrous above, usually pubescent beneath: staminate catkins with glabrous brown scales, 7-10 mm. long: fr. compressed, 3-pointed, in dense catkins 8-10 mm. long. Fl.iii-iv; fr.ix. Em.255,t(c). B.B.1:584. H.W.2:97. (*Gale palustris* Cheval.) N. Am., s. to Va., Mich. and Wash.; Eu. to N. E. Asia. Cult. 1750. Zone I.—*M. G. subglâbra* (Cheval.) Fern., var. Lvs. glabrous or nearly so throughout. (*Gale palustris* var. s. Cheval.) N. Am., Eu. Cult. 1864.—*M. G. tomentosa* C. DC., var. Brts. pubescent: lvs. pubescent on both sides, more densely below. (*M.t.* Aschers. & Graebn., *Gale japonica* Cheval.) E. Siberia, Japan. Intr. 1892.

2. *COMPTONIA* L'Hérit. Deciduous shrub, pubescent: lvs. alternate, petioled, pinnatifid; stipules semicordate: fls. usually monoecious; staminate fls. with 3-4, usually 4 stamens, in cylindric catkins; pistillate fls. with 8 linear-subulate, persistent bracts, at the base, in globose-ovoid aments: fr. a glabrous, ovoid, obtuse nutlet subtended by the elongated subulate bracts, in bur-like heads. (After Henry Compton, bishop of Oxford; 1632-1713.) One species.

*C. peregrina* (L.) Coult. SWEET FERN. Shrub to 1.5 m.; brts. brown, covered with spreading hairs: lvs. linear-oblong, deeply pinnatifid with roundish-ovate, oblique, often mucronulate lobes, 5-12 cm. long and 1-1.5 cm. broad, pubescent, fragrant: staminate catkins about 1.5 cm. long, with acuminate brown ciliate bracts: fruiting aments 1.5-2.5 cm. in diam.; fr. about 5 mm. long, olive-brown, lustrous. Fl.iv-v; fr.viii. Em.255(c). N.D.2,t.11(c). S.L.2:273(h). Rh.40:t.415,f.7-10. (*C. asplenifolia* Ait., *Myrica a. L.*, in part.) N.S. to N. C., Ind. and Mich. Intr. 1714. Zone II. Graceful aromatic shrub, doing well in peaty or sandy soil.—*C. p. asplenifolia* (L.) Fern., var. Brts. minutely puberulous: lvs. smaller, sparingly puberulous or glabrous except the midrib: fruiting aments 8-15 mm. in diam. Rh.40:t.415,f.1-6. (*Myrica a. L.*, in part.) Long Island to Va.

## 9. LEITNERIACEAE Drude. CORKWOOD FAMILY

Deciduous tree or shrub, with light soft wood and pale slightly fissured bark; buds scaly: lvs. alternate, petioled, entire, penninerved, estipulate: fls. dioecious, without perianth, in the axils of bracts, forming axillary catkins, appearing before the lvs.; staminate fls. with 8-12 stamens; anthers oblong, yellow; pistillate fls. consisting of a 1-celled, 1-ovuled ovary subtended by 3-4 gland-fringed scales; style slender, curved, caducous: fr. a drupe.—One monotypic N. American genus.

*LEITNERIA* Chapm. Character of the family. (After Dr. E. T. Leitner, a German naturalist, killed about 1840 during the Seminole war in Fla.)

*L. floridana* Chapm. CORKWOOD. Shrub or tree, occasionally to 6 m. tall with open loose head, the trunk swollen at base; brts. tomentose at first, later glabrous and brown; buds tomentose: lvs. elliptic-lanceolate to lanceolate, acuminate, cuneate at base, 8-15 cm. long, firm, bright green and pubescent above at least on the veins, paler and reticulate and silky-pubescent

below; petioles slender, 3–5 cm. long, tomentose: staminate catkins 2–4 cm. long, with acuminate silky-pubescent bracts, pistillate smaller and slenderer: fr. 1–4 on one ament, oblong, 1.5–2 cm. long, light olive brown. Fl. III (v); fr. V (ix). S.S. 7:t.330. H.I. 11:t.1044. R.Mo. 6:t.30–44. S. Mo. to Tex. and Fla. Intr. 1894. Zone V. Without particular ornamental qualities, but botanically interesting; it demands peaty humid soil and spreads by suckers.

## 10. JUGLANDACEAE Lindl. WALNUT FAMILY

Trees, rarely shrubs, aromatic; brts. terete; buds scaly or naked, usually several superposed: lvs. alternate, odd-pinnate, with short-stalked or sessile lfts., estipulate: fls. monoecious, with or after the lvs.; the staminate fls. in lateral, usually drooping catkins; stamens 3-many, with or without an irregularly lobed perianth: filaments short; anthers oblong; pistillate fls. terminal, solitary or in racemes, in the axils of bracts and subtended by 2 bractlets; calyx 3–5-lobed; ovary inferior, 1- or incompletely 2–4-celled, with one erect ovule; styles 2, stigmatic only on the inner face; fr. a drupe or nut; seed 2–4-lobed, without endosperm; cotyledons usually corrugate and very oily.—Six genera with about 40 species distributed through the temp. regions of the n. hemisphere.

- A. Fr. a winged nutlet.
- B. Frs. in the axils of persistent lanceolate bracts forming an upright cone-like catkin: pith of brs. solid.....1. *Platycarya*
- BB. Frs. in pendulous racemes: pith lamellate.....2. *Pterocarya*
- AA. Fr. an indehiscent or dehiscent large drupe, solitary or in pendulous racemes.
- B. Pith lamellate: husk indehiscent; nut sculptured or rugose.....3. *Juglans*
- BB. Pith solid: husk splitting; nut smooth, often angled.....4. *Carya*

1. **PLATYCÁRYA** Sieb. & Zucc. Deciduous tree; pith solid: buds small, scaly, brown, nearly glabrous: staminate and pistillate aments upright; fls. without perianth; staminate catkins slender, short-peduncled, usually several below the terminal pistillate catkin; stamens 8–10 in the axils of lanceolate bracts; pistillate catkin solitary, ovoid-oblong; bracts adnate to the ovary forming the wings of the fr.; style 5, short and thick; fr. a small compressed winged nutlet in the axils of stiff lanceolate bracts, forming a small strobile. (Greek *platys*, broad, and *karya*, nut; alluding to the compressed nutlet.)—One species in China.

**P. strobilácea** Sieb. & Zucc. Shrub or tree to 12 m.; brts. hairy at first, soon glabrous, yellowish brown or chestnut-brown: lvs. 15–30 cm. long; lfts. 7–15, sessile, ovate- to oblong-lanceolate, slightly falcate, acuminate, doubly serrate, 4–10 cm. long, sparingly pubescent at first, finally nearly glabrous; staminate catkins 5–8 cm. long; fruiting catkins ovoid to oblong, 3–4 cm. long, brown; nutlets about 5 mm. long. Fl. VI; fr. IX. S.Z. 2:t.149(c). S.I. 1:t. 17(c). M.O. t.37. N.K. 20:t.16. (*Fortunaea chinensis* Lindl., *Petrophiloides* s. Reind. & Chandler.) China. Intr. 1845. Zone (V). Handsome shrubby tree with graceful foliage.—*P. sinensis* Mottet is probably only a form of this species.

2. **PTEROCÁRYA** Kunth. WING-NUT. Deciduous trees; pith lamellate; buds stalked, usually several, naked or with a few deciduous scales: lvs. alternate, pinnate, estipulate: fls. monoecious, in pendulous catkins, staminate axillary, on last year's brts., or at base of the new shoots; fls. with 1–4 sepals and two bractlets adnate to an elongated bract; stamens 6–18; pistillate fls. consisting of a 1-celled ovary enclosed in a connate perianth 4-pointed at apex, with 2 bractlets at base; style short, divided into 2 stigmas: fr. a rather

small winged nutlet 1-seeded, 4-celled at the base; cotyledons 4-lobed, raised above ground and becoming green. Fls. appearing in June; fruit ripening in September and October. (Greek *pteron*, wing, and *karya*, nut; referring to the winged nut.)—Eight species; 6 in China, 1 in Japan and 1 in W. Asia.

- A. Buds naked, several, superposed. (Sect. I. EUPTEROCARYA Rehd. & Wils.)  
 B. Fr. with 2 distinct wings.  
 C. Wings of fr. suborbicular: rachis of lf. terete.  
 D. Lfts. 11-25 ..... 1. *P. fraxinifolia*  
 DD. Lfts. 5-9 ..... 2. *P. hupehensis*  
 CC. Wings of fruit oblong: rachis more or less winged; lfts. 11-21. .... 3. *P. stenoptera*  
 BB. Fr. winged all around: lfts. 7-9. (Sect. II. CYCLOPTERA Franch.) ..... 4. *P. paliurus*  
 AA. Bud with 2-3 dark brown scales, falling during winter, accessory buds wanting: leaflets 11-21. (Sect. III. CHLAENOPTEROCARYA Rehd. & Wils.) ..... 5. *P. rhoifolia*

1. *P. fraxinifolia* (Lam.) Spach. CAUCASIAN W. Tree to 30 m., often divided into several stems near base, with wide-spreading head; bark deeply furrowed; brts. minutely scurfy while young, soon glabrous: lvs. 20-45 cm. long; rachis terete, glabrous; lfts. 11-20, ovate-oblong to oblong-lanceolate, acuminate, sharply serrate, 8-12 cm. long, thin, glabrous except stellate hairs in the axils and along the midrib beneath: fr. with semiorbicular wings, 1.5-2 cm. broad, in racemes 20-45 cm. long. L.I.t.20,21. G.C.III.4:381. B.S.2:262, t(h). E.H.2:t.121-3(h). (*P. caucasica* C. A. Mey., *P. Spachiana* Lav., *P. laevigata* Hort., *P. sorbifolia* Dipp.) Cauc. to N. Persia. Intr. 1782. Zone (V). Tree with handsome dark green lvs. and long drooping racemes of light green frs. during summer. It prefers humid soil.—*P. f. dumosa* (Lav.) Schneid., var. Shrubby; brts. yellowish brown: lfts. smaller, 5-7 cm. long. (*P. d.* Lav., *P. fraxinifolia* K. Koch, not Spach.)

*P. f. × stenoptera* = *P. Rehderiana* Schneid. Lf.-rachis more or less winged, at least on vigorous brs.; lfts. somewhat smaller and narrower: wings of fr. oval or oval-oblong, longer than broad. S.T.2:t.137. B.C.5:2854. R.H.1925:372, 373(h). Orig. 1880.—Apparently more vigorous and hardier than either of the parents; spreading by suckers.

2. *P. hupehensis* Skan. Tree to 20 m., with pale gray smooth bark deeply fissured on old trunks; brts. minutely scurfy: lvs. 15-30 cm. long; rachis terete, glabrous: lfts. 5-9, oblong to oblong-lanceolate or oblong-obovate, acuminate, serrate or serrulate, 6-14 cm. long, stellate-pubescent in the axils beneath: fr. including the semi-orbicular wings 2.5-3 cm. across, in racemes to 45 cm. long. C. China. Intr. 1903. Zone VI.

3. *P. stenoptera* DC. Tree to 30 m.; young brts. and petioles pilose or nearly smooth: lvs. 20-40 cm. long; rachis winged, the wings sometimes serrate; lfts. 11-23, the terminal one often wanting, oval-oblong to narrow-oblong, acute or sometimes obtusish, serrulate, 4-10 cm. long, slightly pubescent on the midrib and veins beneath: fr. with oblong to oblong-lanceolate upright wings, with the nutlet 1.5-2 cm. long, in racemes 20-30 cm. long. C.C.65. L.I.t.19. R.H.1920:91(l). M.O.415(h). (*P. sinensis* Hort., *P. japonica* Hort.) China. Intr. about 1860. Zone VI.

4. *P. paliurus* Batal. Tree to 20 m.; young brts. and the terete leaf-rachis tomentulose or scurfy while young; lvs. 15-25 cm. long; lfts. 7-9, oblong-ovate to oblong-lanceolate, acuminate, very oblique at base, serrulate, 6-15 cm. long, firm, pubescent on the midrib and often on the veins beneath or nearly glabrous: fr. forming with the large wing a circular disk 3-7 cm. across, in racemes 15-25 cm. long. J.H.28:65. C.C.66. C. China. Intr. 1901. Zone VI?

5. *P. rhoifolia* Sieb. & Zucc. Tree to 30 m.; brts. and the terete leaf-rachis finely pubescent while young or nearly glabrous; buds with 2-3 large brown glabrous scales, about 1.5 cm. long, deciduous during the winter or

early in spring; lvs. 20-40 cm. long; lfts. 11-21, ovate-oblong to ovate-lanceolate, acuminate, sharply and finely serrate, 6-12 cm. long, pubescent on the veins beneath or nearly glabrous: fr. with the broad rhombic wings which are broader than long, 2-2.5 cm. across, in racemes 20-30 cm. long. S.I.1:t.16(c). K.M.t.21(c). J.L.50:f.75(h). Japan. Intr. 1888. Zone V.

3. **JUGLANS L. WALNUT.** Deciduous trees, rarely shrubby; brs. with lamellate pith; trunk with scaly furrowed bark; buds with few scales, sessile, rarely short-stalked: lvs. alternate, odd-pinnate, large, aromatic, estipulate; lfts. opposite, serrate or entire: fls. monoecious; the staminate fls. on last year's brts. in lateral pendulous catkins, each consisting of a bract bearing 8-10 stamens, 2 bractlets and 1-4 calyx-lobes; pistillate fls. in few- to many-flid. terminal racemes, with 4 calyx-lobes and a 3-lobed involucre consisting of a bract and 2 bractlets; style divided into 2 plumose stigmas; fr. a large indehiscent drupe; nut thick-walled, incompletely 2-4-celled, indehiscent or finally separating into 2 valves; seed 2-4-lobed, remaining within the shell in germination. Fls. appearing with or shortly after the lvs.; fruit in autumn. (Ancient Latin name for *J. regia*, derived from *Jovis glans*, Jupiter's acorn.)—About 15 species in N. and S. America, in the Old World from S. E. Eu. to E. Asia.

- A. Lfts. entire or nearly so, glabrous, usually 7-9: nut with thin partition, splitting. 1. *J. regia*
- AA. Lfts. serrate, 9-25: nut with thick bony partition, not splitting.
- B. Frs. glabrous or finely pubescent, solitary or few: leaf-scars without a prominent pubescent band on their upper edge: nut 4-celled at base.
- C. Width of lfts. 1-2.5 cm., rarely more: nut grooved or smooth.
- D. Lfts. 17-23, about 1 cm. broad: fr. 1.5-2 cm. thick.....2. *J. rupestris*
- DD. Lfts. 9-19, 2 cm. broad or more: fr. 2.5-5 cm. thick.
- E. Lfts. on the midrib beneath and rachis more or less pubescent, 9-13, rarely to 19: nut deeply grooved.....3. *J. major*
- EE. Lfts. nearly glabrous at maturity, 15-19: nut obscurely or not grooved.
- 4. *J. Hindsii*
- CC. Width of lfts. 2.5-5 cm.: nut prominently and irregularly ridged.....5. *J. nigra*
- BB. Frs. viscid-pubescent, racemose: leaf-scars with a prominent band of hairs on their upper edge: nut 2-celled at base.
- C. Nut strongly 6-8-ridged.
- D. Mature brts. red- or purplish-brown; lfts. with spreading teeth.....6. *J. cinerea*
- DD. Mature brts. grayish or yellowish brown; lfts. with shallow teeth directed forward.
- E. Lfts. densely pubescent on the veins beneath: fr. 6-10 in pendulous racemes.
- 7. *J. cathayensis*
- EE. Lfts. often glabrescent: fr. in short racemes.....8. *J. mandshurica*
- CC. Nut rugose or nearly smooth; frs. in long pendulous racemes.....9. *J. Sieboldiana*

1. **J. regia L. ENGLISH W. (PERSIAN W.)** Broad-headed tree to 30 m., with silvery gray bark remaining smooth a long time; brts. glabrous: lfts. 5-9, rarely to 13, elliptic to obovate or oblong-ovate, acute or acuminate, entire, rarely and chiefly on young plants obscurely serrate, 6-12 cm. long, glabrous except small axillary tufts of hairs beneath: staminate catkins 5-10 cm. long; fr. subglobose, glabrous, green, 4-5 cm. across; nut usually ovoid, or ellipsoid, pointed, more or less wrinkled, usually thick-shelled. H.W.2:87-89,t.36(c). M.D.1911:197(h). E.H.2:t.74,75(h). S. E. Eu. to Himal. and China. Long cult. Zone (V).—Much planted as a fruit tree in the warmer parts of the country, particularly in Calif. Variable in size and shape of the nut and the thickness and sculpturing of the shell. Several geographical varieties have been distinguished: *J. r. turcomanica* Popof, ssp. Lfts. oblong-ovate to ovate-lanceolate: nut with a hard thick or thin shell. Bull. Appl. Bot. 22:295,296,298. Turkestan.—*J. r. kamaonia* DC., var. Lfts. ovate-lanceolate, pubescent on the veins beneath: nut with thin shell. B.D.1906:82,96. (*J. k.* Dode.) Himal.—*J. r. fallax* (Dode) Popof, ssp. Lfts. usually elliptic, up to 16 cm. long and 10 cm. broad: shell very thick, with protruding ridges inside. B.D.1906:83,96. Bull. Appl. Bot. 22:296,299. J.A.11:t.19(h). (*J. f.*

Dode.) C. Asia.—Here belongs *J. Duclouxiana* Dode. Lfts. elliptic-ovate, short-acuminate: nut thin-shelled. B.D.1906:82. Cult. in S. China, Himal. Cult. 1917.—The following are horticultural forms: *J. r. laciniata* Jacques. Lfts. pinnately dissected. M.G.23:717(h). (*J. r. filicifolia* and *asplenifolia* Hort., *J. heterophylla* Loud.)—*J. r. monophylla* DC., var. Lvs. simple or 3-foliolate. S.H.1:f44g.—*J. r. pendula* Pépin. Brs. pendulous.—*J. r. prae-parturiens* Lem., var. A shrubby form producing rather small thin-shelled nuts at an early period, sometimes on plants 2 or 3 years old. (*J. r. fertilis* Kirchn., *J. r. f. fruticosa* Dipp.)

*J. r. × mandshurica* = *J. sinensis* (DC.) Dode. Lfts. oblong-ovate: sparingly denticulate: shell of nut with large lacunes. (*J. r. var. sinensis* DC.) B.D.1906:83,96. N. and E. China.—*J. r. × Hindsii*; see under No. 4.—*J. r. × nigra*; see under No. 5.—*J. r. × cinerea*; see under No. 6.—*J. r. × Sieboldiana*; see under No. 9.

2. *J. rupestris* Engelm. Shrub or small tree, rarely 10 m. tall; brts. pubescent when young: lfts. 15–23, lanceolate to narrow-lanceolate, acuminate, finely serrate or nearly entire, 4–8 cm. long, soon glabrous or nearly so, or pubescent on the midrib beneath: stamens 20; ovary pubescent or tomentose: fr. globose, rarely ovoid, 1.5–2 cm. across, sometimes nearly glabrous at maturity; nut thick-shelled, with deep longitudinal grooves, about 1.5 cm. across. S.S.7:t.335. S.L.206(h). Texas, N. Mex. Cult. 1868. Zone V. Shrubby graceful species, the lvs. with numerous small and narrow lfts. Somewhat similar is *J. californica* under No. 4.

3. *J. major* (Torr.) Heller. Tree to 20 m. with a rather narrow head; brts. pubescent while young: lfts. 9–13, rarely to 19, oblong-lanceolate to ovate, acuminate, cuneate or rounded at base, coarsely serrate, 7–10, the lowest pair 3–5 cm. long, soon glabrous or pubescent on the midrib beneath; stamens 30–40: fr. subglobose or ovoid and sometimes pointed, 2.5–3.5 cm. across, rufous-tomentulose; nut subglobose, slightly compressed, deeply grooved, thick-shelled, 2–3 cm. across. S.M.172. (*J. rupestris* var. *m.* Torr., *J. Torreyi* Dode.) N. Mex., Ariz. and Colo. Intr. 1894? Zone VII.

4. *J. Hindsii* (Jeps.) Jeps. Round-headed tree to 15 or occasionally to 25 m.; brts. densely pubescent while young: petioles villous; lfts. 15–19, ovate-lanceolate to lanceolate, long-acuminate, usually rounded at base, coarsely serrate, 6–10 cm. long, pubescent on the midrib and veins beneath: stamens 30–40: fr. subglobose, 3–5 cm. across, soft-pubescent; nut nearly globose, 2.5–3.5 cm. across, thick-shelled, faintly grooved. (*J. californica* var. *H.* Jeps.) S.S.7:t.337,f.5–8. S.M.175. Gn.49:278(h). C. Calif. Cult. 1878. Zone VII?—Much planted in Calif. as a street tree and used as stock for the English Walnut.—*J. H. quercinifolia* Babcock, mut. Lfts. usually 3, rarely 1, ovate to elliptic, obtuse or truncate, 1.5–5.5 cm. long. Univ. Calif. Pub. Agr. Sci. 2:t.20,f.1–2.

*J. H. × regia* = "Paradox" of Burbank.—*J. H. × nigra* = "Royal" of Burbank. Am. Nut Jour. 11:61(h).

Closely related species: *J. californica* S. Wats. Shrub or small tree: lfts. usually 11–15, oblong-lanceolate, acute, 2.5–6.5 cm. long, glabrous: fr. globose, 1–2 cm. across; nut deeply grooved. S.S.7:t.337,f.1–4. S.M.174. A.I.1:509. S. Calif. Cult. 1889. Zone VII?—*J. c. quercina* Babcock, mut. Lfts. 1–5, usually 3, broad-ovate to oblong. J.S.51–53. (*J. quercifolia* Pierce.) Orig. 1900.

5. *J. nigra* L. BLACK W. Tall tree to 50 m. with round head; bark deeply furrowed, brown; brts. pubescent; upper margin of lf.-scar notched: lfts. 15–23, ovate-oblong to ovate-lanceolate, acuminate, rounded at base, irregularly serrate, 6–12 cm. long, at first minutely pubescent above, finally nearly glabrous and somewhat lustrous, pubescent and glandular beneath: staminate

catkins 5-12 cm. long; stamens 20-30; pistillate fls. 2-5: fr. globose or slightly pear-shaped, 3.5-5 cm. across, pubescent; nut ovoid and pointed or subglobose and sometimes broader than high, slightly compressed, strongly and irregularly ridged, 3-4 cm. across. S.S.7:t.333,334. Em.211(c). E.H.2,t.76-77 (h). G.C.30:303(h). Mass. to Fla. w. to Minn. and Tex. Cult. 1686. Zone IV. Tree with round head and dark green foliage; its timber highly valued.

*J. n. × regia* = *J. intermedia* Carr. Similar to *J. regia*: lfts. usually 11, ovate to elliptic-ovate, remotely denticulate, dark green and glabrous except axillary tufts of hairs below: fr. smooth; nut deeply sculptured. The type of the hybrid is *J. i. pyriformis* Carr. Young shoots glandular-pubescent: fr. obovoid. R.H.1863:30. Gn.50:478.—*J. i. Vilmoreana* Carr. Brts. glabrous: fr. subglobose, apiculate. G.F.4:52 (h), 53. M.D.1911:197 (h). B.C.3:1724(fr). (*J. Vilmoreana* Vilm.)—Here belongs probably the so-called "James River Hybrid." F.L.2:133,134 (h), which has large oblong-ovoid nuts about 5 cm. long very much like *J. regia gibbosa* Carr. (R.H.1861:428) in shape, but with numerous longitudinal irregular ridges separated by deep grooves.—*J. n. × Hindsii*; see under No. 4.

6. *J. cinerea* L. BUTTERNUT. Tree occasionally to 30 m., with gray deeply fissured bark; brts. pubescent, glandular while young; upper margin of leaf-scar straight or rounded: petiole and rachis glandular-pubescent; lfts. 11-19, oblong-lanceolate, acuminate, appressed-serrate, 6-12 cm. long, finely pubescent above, pubescent and glandular beneath: staminate catkins 5-8 cm. long; pistillate spikes 5-8-fld.: frs. 2-5, ovoid-oblong, 4-6.5 cm. long, viscid-pubescent; nut ovoid-oblong, with 4 prominent and 4 less prominent, sharp irregular ridges and many broken ridges between, thick-shelled. S.S.7:331,332. Em.207,t.(c). H.H.50,51 (b). F.L.7:56,t.(h). N. B. to Ga., w. to Dak. and Ark. Cult. 1633. Zone III. Less handsome and less valuable than No. 5.

*J. c. × regia* = *J. quadrangulata* (Carr.) Rehd. Similar to *J. regia*: lfts. usually 9, oval to oblong, obscurely and remotely serrate, slightly pubescent beneath: fr. sparingly produced, subglobose; nut ovoid-oblong, deeply sculptured; walls thinner than those of *J. cinerea*. G.F.7:435. R.H.1870:494. Gn.50:578. (*J. intermedia quadrangulata* Carr., *J. intermedia alata* Carr., *J. alata* Schelle.) Orig. before 1870.—*J. c. × Sieboldiana*; see under No. 9.

7. *J. cathayensis* Dode. CHINESE W. Tree to 25 m.; brts. glandular-pubescent: lvs. up to 1 m. long; lfts. 9-17, ovate- or obovate-oblong, acuminate, obliquely rounded or subcordate at base, serrulate, 8-15, or occasionally to 22 cm. long, dark green and sparingly pubescent above, more densely pubescent beneath, midrib and petiole glandular: staminate catkins 20-35 cm. long: frs. in racemes of 6-10, ovoid, pointed, 3-4.5 cm. long; nut ovoid, pointed, 6-8-angled with broken and spiny ridges. G.C.50:189;77:203. C. China. Intr. 1899. Zone V. Vigorous tree with large foliage; the nut is edible, but the walls thick and the kernel small.

8. *J. mandshurica* Maxim. MANCHURIAN W. Tree to 20 m., with broad round head; brts. glandular-pubescent: lfts. 9-17, ovate-oblong to oblong, acute, serrulate, 7-18 cm. long, sparingly pubescent above at first, finally glabrous or nearly so, pubescent below and usually densely glandular-pubescent on the midrib and rachis: staminate catkins about 10 cm. long; pistillate catkins 5-10-fld.: fr. subglobose or ovoid, pointed, 4.5-5.5 cm. long; nut ovoid, pointed, with 8 prominent, sharply edged ridges and irregular broken ridges between, 4-4.5 cm. long. N.K.20:t.17,18. G.C.30:302. Manch., Amurland. Intr. 1859. Zone V.

Related species: *J. stenocarpa* Maxim. referred often to *J. mandshurica*, but the plant in cultivation differs in its nearly glabrous brts., in the absence of the prominent hairy band above the leaf-scars, in the glabrescent lvs. and in the very large terminal lfts. which is up to 18 cm. long and to 10 cm. broad: nut cylindric-oblong. Mél. Biol. 8:632(fr). Manch. Cult. 1903. Zone V.

9. *J. Sieboldiana* Maxim. Tree to 20 m., with broad round head, very similar in its brts. and lvs. to the preceding species, but quite different in its fls. and fr.: the staminate catkins 15-30 cm. long, the pistillate 12-20-fld.; fr. globose to ovoid, viscid-pubescent, nut subglobose or ovoid, pointed, with thick projecting sutures, rugose, thick-shelled, 2.5-3.5 cm. long. S.I.2:t.5(c). M.K.t.20(c). R.H.1878:414,415. (*J. ailanthifolia* Carr.) Japan. Intr. 1860. Zone IV.—*J. S. cordiformis* (Maxim.) Mak., var. Nut heart-shaped or ovoid, much flattened, sharply 2-edged, with a shallow longitudinal groove in the middle of the flat sides, smooth, rather thin-shelled. S.I.1:t.17(c). G.C.30:292,t. B.C.3:1724. (*J. c.* Maxim.) Japan. Intr. 1862 or 1863.—To this species belong the following names of Dode: *J. Allardiana*, *J. coarctata*, *J. Lavallei* (L.I.t.1,2), *J. subcordiformis*; the last named is scarcely different from the var. *cordiformis*, while the second and third are intermediate between this variety and the type (B.D.1909:33,38,39).

*J. S. × regia* = *J. notha* Rehd. Lfts. 7-9, elliptic to elliptic-oblong, glabrous above, glabrescent beneath, sparingly and minutely denticulate; nut much like that of *J. Sieboldiana*. Orig. 1878.—*J. n. Batesii* Rehd., var. (*J. S. cordiformis* × *regia*.) Nut slightly compressed, more acuminate and smoother.—*J. S. × cinerea* = *J. Bixbyi* Rehd. Nut rough-shelled, but less deeply and less sharply ridged than in *J. cinerea*. Orig. about 1903.—*J. B. lancastrensis* Rehd., var. (*J. S. cordiformis* × *cinerea*.) Nut slightly compressed and more acuminate.

4. **CÁRYA** Nutt. HICKORY. Deciduous trees; brs. with solid pith; buds scaly: lvs. alternate, odd-pinnate, estipulate; lfts. 3-17, opposite, serrate: fls. monoecious, with the lvs.; staminate fls. in axillary, usually ternate pendulous catkins, each fl. in the axil of a 3-lobed bract; stamens 3-10; pistillate fls. sessile, in terminal 2-10-fld. spikes, consisting of a 1-celled ovary enclosed by a 4-lobed involucre; stigmas 2, short: fr. globose to oblong, with a husk separating more or less completely into 4 valves; nut smooth or slightly rugose, often angled, 4-celled at base, 2-celled at apex; cotyledons remaining enclosed in the shell. (Greek *karya*, Walnut tree.) Syn. *Hicoria* Raf. About 20 species in E. N. Am., s. to Mex.; 1 in China and 1 in Tonkin.—Trees with handsome foliage, the head usually oblong or ovoid in outline; often planted as ornamental trees. Most species have edible nuts, some of commercial importance; see Rep. U. S. Dept. Agric. Div. Pomol. Nut-culture (1896) for illustrations of nuts. Several species are valued for their strong and tough wood.

A. Bud-scales 4-6, valvate: lfts. 5-17, usually lanceolate and often falcate: fr. with winged sutures; nut usually thin-shelled. (Sect. APOCARYA DC.)

B. Nuts mostly elongated, nearly terete; husk thin, splitting to the base; kernel sweet; cotyledons entire or emarginate.

C. Lfts. 11-17, tomentose and glandular when young: fr. 3.5-8 cm. long. .... 1. *C. Pecan*

CC. Lfts. 5-11, scurfy-pubescent when young: fr. about 3.5 cm. long.

BB. Nuts usually as broad as long, compressed, irregularly angled and reticulate; kernel bitter; cotyledons deeply 2-lobed.

C. Winter-buds dark reddish brown: lfts. 7-13: husk splitting to the base.

C. Winter-buds bright yellow, glandular: leaflets 5-9: husk splitting somewhat below the middle ..... 3. *C. aquatica*

AA. Bud-scales imbricate, more than 6: fr. not or slightly winged; nut usually thick-shelled: lfts. 3-9, not falcate; the uppermost larger and often obovate. (Sect. EUCARYA DC.)

B. Buds small, 6-15 mm. long: nut slightly or not angled; husk usually thin.

C. Petioles and lvs. beneath glabrous: lfts. 5-7: nut thin-shelled.

D. Fr. obovoid, splitting only to the middle: kernel usually bitter. .... 5. *C. glabra*

DD. Fr. ovoid, splitting tardily to the base: kernel sweet. .... 6. *C. ovalis*

CC. Petioles and lvs. beneath at least on the veins pubescent; lfts. usually 7.

7. *C. pallida*

BB. Buds large, terminal ones 1.5-5 cm. long: nut angled; kernel sweet.

C. Brts. and petioles tomentose: bark close: husk not separating quite to the base.

8. *C. tomentosa*

- cc. Brts. and petioles glabrous or pubescent: bark shaggy: husk separating to the base.  
 n. Lfts. 7-9: brts. pale orange.....9. *C. laciniosa*  
 dd. Lfts. usually 5: brts. light red-brown.....10. *C. ovata*

1. **C. Pècan** (Marsh.) Engl. & Graebn. PECAN. Tree to 50 m.; bark deeply furrowed; buds pubescent, yellow; brts. pubescent while young: lfts. 11-17, short-stalked, oblong-lanceolate, serrate or doubly serrate, 10-18 cm. long, glandular and tomentose when young, becoming glabrous; petiole glabrous or pubescent: frs. in spikes of 3-10, oblong, 3.5-8 cm. long; nut ovoid or oblong, 2.5-5 cm. long, smooth, light brown marked with dark brown, 2-celled at base; kernel sweet. S.S.7:t.333,339. R.Mo.7:t.1(h),2(b). Am. For. 28:459 (h). (*Hicoria* P. Brit., *C. olivaeformis* Nutt., *C. illinoensis* K. Koch.) Iowa and Ind. to Ala., Tex. and Mex. Intr. about 1766. Zone (V).—Planted in the S. States as a fruit tree; many named vars. are in cult. (see B.C.5:2522-3).

*C. P. × cordiformis* = C. Brönnii Sarg. Similar to *C. Pècan*, but differing chiefly in its 11 or rarely 9 lfts., in the ovoid fr. rounded at base and 3.5-4 cm. long and in the compressed nut. S.T.2:t.178. Intr. 1909.—There are also hybrids with *C. tomentosa* = C. Schneekii Sarg. and with *C. laciniosa* = C. Nussbaumeri Sarg. (see R.Mo.7:t.20-23).

Closely related species: *C. texana* (Le Conte) DC. Lfts. 7-11, broader and nearly sessile; nut smaller, red-brown, rough and obscurely 4-angled. S.S.14:t. 719. (*Hicoria* t. Le Conte.) E. Tex. Intr. 1900. Zone V.

2. **C. myristicaeformis** (Michx.f.) Nutt. NUTMEG H. Tree to 30 m.; bark dark brown, broken into small appressed scales; buds with brown scurfy pubescence; brts. coated with yellow or brown scales, dark reddish brown the second year: lfts. 5-11, short-stalked or subsessile, ovate-lanceolate, the upper ones oblong-obovate, acuminate, pubescent or glabrous and silvery white beneath, 8-12 cm. long: fr. usually solitary, obovoid or ellipsoid, 4-winged to the base, 3-4 cm. long, husk splitting nearly to base; nut ovoid, reddish brown, marked with irregular bands and spots, thick-shelled, 4-celled below; kernel sweet. S.S.7:t.342,343. (*Hicoria* m. Brit., *H. Fernowiana* Sudw.) S. C. to Ark. and Mex. Intr. 1890. Zone VI. Tree with handsome foliage.

Related species: *C. cathayensis* Sarg. Tree to 20 m.; young brts. covered with orange-yellow scales: lfts. 5-7, short-stalked, ovate to ovate-lanceolate, 10-14 cm. long, yellow-scurfy beneath and pilose on the midrib: fr. obovoid, 4-winged, nut ovoid, obscurely 4-angled, 2-2.5 cm. long; kernel sweet. C.C.63. Jour. Hered. 9:280(h). E. China. Intr. 1917.

3. **C. aquatica** (Michx.f.) Nutt. BITTER PECAN. Small tree rarely to 30 m.; bark light brown, separating into long and thin, plate-like scales; buds dark reddish brown; brts. slightly glandular or loosely tomentose at first, finally dark red-brown: lfts. 7-13, lanceolate, long-acuminate, serrate, 8-12 cm. long, yellow-tomentose while young, glabrous at length: frs. often 3-4, ovoid or obovoid, compressed, 4-winged, 2.5-3.5 cm. long; nut broadly obovoid, much compressed, 4-angled, irregularly and longitudinally wrinkled, dull reddish brown; kernel bitter. S.S.7:t.344,345. R. Mo. 7:t.3(h),4(b). (*Hicoria* a. Brit.) Va. to Ill., s. to Fla. and Tex. Intr. about 1800. Zone VII?

4. **C. cordiformis** (Wangh.) K. Koch. BITTERNUT. Tree to 30 m.; bark broken into thin scales, light brown; brts. rusty pubescent at first, finally glabrous, lustrous and reddish brown: lfts. 5-9, ovate-lanceolate to lanceolate, acuminate, serrate, 8-15 cm. long, light green and pubescent below, particularly along the midrib, nearly glabrous at length: fr. obovoid to subglobose, 4-winged above the middle, 2-3.5 cm. long; husk thin, splitting somewhat below the middle; nut subglobose to broadly ovoid, slightly compressed, abruptly contracted into a short point, nearly smooth, gray, thin-shelled; kernel bitter. S.S.7:340,341. E.H.3:t.170,171(h). F.L.5:81,t(h). (*Hicoria* c.

Brit., *H. minima* Brit., *C. amara* Nutt.) Que. to Minn., s. to Fla. and La. Intr. about 1689. Zone IV. Tree with rather broad head and handsome foliage.

*C. c.* × *Pecan*; see under No. 1.

5. *C. glabra* (Mill.) Sweet. PIGNUT. Tree sometimes to 40 m.; bark dark gray, fissured, close; buds with the outer glabrous scales deciduous, the inner pubescent; brts. glabrous or nearly so, slender: lfts. 3-7, usually 5, oblong to oblong-lanceolate, acuminate, sharply serrate, 8-15 cm. long, nearly glabrous; petioles and rachis glabrous, green: fr. usually obovoid, slightly winged toward the apex, about 2.5 cm. long and 2 cm. across, smooth; husk splitting usually only to the middle; nut usually brownish, not angled; kernel usually astringent. S.T.2:t.179. S.M.192. E.H.3:t.172(h). B.C.2:677(h). R.Mo.7:t.7(b). (*Hicoria g.* (Mill.) Brit., *C. porcina* (Michx. f.) Nutt.) Me. to Ont., s. to Fla., Ala., and Miss. Intr. about 1750. Zone IV. Tall handsome tree.—*C. g. megacarpa* (Sarg.) Sarg., var. Fr. 2.5-5 cm. long and about 3 cm. across, obovoid, slightly flattened, with thick husk splitting earlier and a thick-shelled nut. S.T.2:t.180. S.M.193. N. Y. to Mo. and Fla. Intr. 1912. Zone V.

6. *C. ovàlis* (Wangh.) Sarg. SWEET PIGNUT. Tree similar to the preceding; bark close and furrowed on young trees, often shaggy on old trunks; brts. scurfy-pubescent at first, soon glabrous, stout: lfts. 5-7, oblong-ovate to oblong-lanceolate or oblong-obovate, 8-15 cm. long, finely serrate, often scurfy-pubescent while young, becoming glabrous; petioles often red: fr. subglobose to ellipsoid, 2-3 cm. long, densely scaly, slightly winged, splitting tardily to near the base; nut slightly flattened, usually rounded at apex, sometimes slightly angular, brownish, rather thin-shelled; kernel sweet. S.M.194. A.G.11:381,f.1,2,5,8,10. B.C.2:678(h). R.Mo.7:t.10(b). (*C. microcarpa* Nutt., partly, *Hicoria m.* Brit.—FALSE SHAGBARK.) Mass. to Wis., s. to Ga., Ala. and Miss. Intr. probably before 1800. Zone IV.—Very variable in the shape of its fr.: *C. o. obcordata* Sarg., var. Fr. subglobose or broad-ellipsoid, to 3 cm. diam.; nut angled, broader than high, often obcordate. S.S.7:t.354,f.5,6,7,9. S.M.194.—*C. o. odorata* (Sarg.) Sarg., var. Lfts. usually broader, glandular beneath: fr. subglobose to ellipsoid, with distinctly winged sutures, splitting freely to the base, to 2 cm. high; nut slightly higher than broad, very slightly ridged, gray. S.S.7:t.354,f.8. S.M.195. R.Mo.7:t.8(b). Conn. to Pa. and Mo.—*C. o. obovâlis* Sarg., var. Fr. obovoid, about 2.5 cm. high; nut much compressed, pointed or rounded at apex, rounded at base. S.M.196. Mass. to Va. and Mo.—*C. o. boreâlis* (Ashe) Sarg., var. Bark scaly; brts. and lvs. pubescent at first: fr. ellipsoid, flattened, about 2 cm. high, very narrowly winged, often incompletely splitting; husk rather thick; nut ellipsoid, ridged, whitish. B.T.236. Mich. and Ont.—*C. o. hirsuta* (Ashe) Sarg., var. Bark scaly; petioles and lfts. beneath pubescent: fr. obovoid, narrowed at base, compressed. (*Hicoria glabra h.* Ashe.) N. C. Intr. 1919.

7. *C. pallida* (Mill.) Engl. & Graebn. Tree with very rough pale bark; brts. purple-brown; buds acute, with 5-9 scales: lfts. usually 7, sometimes 9, oblong-lanceolate to lanceolate, 8-12 cm. long, finely serrate, bright green above, beneath with silvery scales and scurfy-pubescent while young; petiole and rachis pubescent with stellate hairs at least while young: middle lobe of the staminate bract longer than lateral lobes: fr. subglobose to obovoid, 2-3 cm. long; husk rather thin, tardily splitting to the base; nut flattened, whitish, rather thin-shelled. G.F.10:305. S.M.190. Ala. and Tenn. Intr. 1898. Zone V.

Related species: *C. Buckleyi* Durand. Tree 10-15, rarely to 20 m.; bark dark, furrowed; young brts. rusty-pubescent: lfts. usually 7, lanceolate or ob-

lanceolate, 8–15 cm. long, pubescent on the veins beneath; petioles rusty-pubescent and villous when young; fr. subglobose, about 3.5 cm. long; husk splitting to the base; nut acute at apex, 4-angled above the middle, red-brown; kernel sweet. S.T.2:t.182. S.M.197. (*C. texana* Buckl., not Le Conte.) Tex. to Okl. and Ark. Intr. 1909. Zone V.—*C. B. arkansana* (Sarg.) Sarg., var. Tree to 25 m.: fr. obovoid, rounded at apex, 3.5–4 cm. long, splitting to the middle or nearly to the base; nut rounded at ends, often slightly obovoid, slightly angled, pale brown. S.T.2:t.181. S.M.198. Ark. and Okl. Intr. 1910. Zone V.—*C. B. villosa* (Ashe) Sarg., var. Tree to 15 m.: lfts. 5–7, oblong-elliptic to oblanceolate, more pubescent beneath; fr. broad-ellipsoid or obovoid, rounded at apex, 2–3 cm. long, tardily splitting to base by 1–2 sutures or indehiscent; nut broad-ovoid, pointed at apex, slightly angled, faintly tinged red. S.S.7:t.355. S.M.199. R.Mo.7:t.9(b). (*C. v. Schneid.*, *C. glabra* var. *v. Robins.*) Mo. Intr. 1915.

8. *C. tomentosa* (Lam.) Nutt. MOCKERNUT. Tree sometimes to 30 m.; bark rather close, ridged; brts. tomentose, sometimes nearly glabrous in autumn; terminal bud 1.5–2 cm. long; lfts. 7–9, oblong to oblong-lanceolate, acuminate, serrate, 8–18 cm. long, densely pubescent and glandular below, very fragrant when crushed; petiole and rachis hirsute or tomentose; fr. subglobose or pear-shaped, 3.5–5 cm. long; husk thick, splitting to the middle or nearly to the base; nut subglobose to ellipsoid, slightly flattened, angled, light brown, thick-shelled; kernel sweet. S.S.7:t.350. B.S.1:301,t.(h). R.Mo.7:t.11(b). (*C. alba* K. Koch, not Nutt.—BIG-BUD H.) Mass. to Ont. and Neb., s. to Fla. and Tex. Intr. 1766. Zone IV. Handsome tree.

*C. a.* × *Pecan* = *C. Schneckii*; see under No. 1.

9. *C. laciniosa* (Michx. f.) Loud. BIG SHELLBARK-H. Tree to 40 m.; bark shaggy; brts. pubescent while young, later nearly glabrous and orange; terminal bud to 2.5 cm. long; lfts. 7, rarely 5 or 9, oblong-lanceolate, 10–20 cm. long, acuminate, serrate, pubescent beneath; petiole and rachis pubescent or glabrous, often persistent during winter; fr. ellipsoid to subglobose, 4–7 cm. long, 4-ribbed above the middle; nut ellipsoid or subglobose, compressed and obscurely 4-angled, pointed at ends, yellow or reddish, thick-shelled; kernel sweet. S.S.7:t.348,349. (*C. sulcata* Nutt.—BOTTOM SHELLBARK H., KING-NUT.) N. Y. to Iowa, s. to Tenn. and Okl. Intr. about 1800. Zone V.

*C. l.* × *Pecan*; see under No. 1.

10. *C. ovata* (Mill.) K. Koch. SHAGBARK H. Tree, occasionally to 40 m.; bark light gray, shaggy; brts. scurfy-pubescent at first, usually soon glabrous and bright reddish brown; inner-bud-scales becoming large and conspicuous when unfolding; lfts. 5, rarely 7, elliptic to oblong-lanceolate, 10–15 cm. long, acuminate, serrate and densely ciliate, pubescent and glandular below when young, finally glabrous; fr. subglobose, 3.5–6 cm. long, husk thick, splitting to base; nut ellipsoid to broad-obovoid, slightly flattened and angled, white, rather thin-shelled; kernel sweet. S.S.7:t.346,347. G.F.2:460(b). F.L.4:56,t.(h). E.H.3:t.173(h). (*Hicoria o.* Brit., *C. alba* Nutt.—LITTLE SHELLBARK H.) Que. to Minn., s. to Fla. and Tex. Cult. 1629. Zone IV.—Next to the Pecan this species is the best as a fruit tree and several named varieties are in cult.; one of the best known is *C. o. Halësii* Hort. with large, thin-shelled nuts.—*C. o. Nuttallii* Sarg., var. Fr. smaller; nut subglobose, usually obcordate, much compressed and angled, about 1.5 cm. across. N.S.1:t.13(c). (*C. microcarpa* Nutt.) Mass. to Pa. and Mo.—*C. o. fraxinifolia* Sarg., var. Lfts. lanceolate or oblanceolate, the terminal one 12–15 cm. long and 4–5 cm. broad; fr. smaller, pointed. S.M.185. W. N. Y. Intr. 1911.

*C. o.* × *cordiformis* = *C. Llavei* Sarg. Bark close, dark gray; terminal bud about 1 cm. long, the outer scales glabrous, deciduous, the inner lepidote, yellow; lfts. 5, lanceolate to oblanceolate; fr. ovoid, 3–5 cm. long; nut compressed, slightly obovoid, thin-shelled; kernel large, sweet. W. N. Y. Intr. 1913.—*C. L.*

*chataugayensis* Sarg., var. resembles more the Bitternut and has usually 7 lfts., a smaller fr. with a bitter kernel or sometimes sweet. Que. Intr. 1895.

Closely related species: *C. carolinae-septentrionalis* (Ashe) Engl. & Graebn. Lfts. 3-5, lanceolate, glabrous; fr. smaller; nut thin-shelled. S.S. 14: t. 720. N. C. to Ga. Intr. 1904. Zone V.

## 11. BETULACEAE Agardh. BIRCH FAMILY

Deciduous trees or shrubs: lvs. alternate, petioled, usually straight-veined, stipulate; fls. monoecious, rarely dioecious; staminate fls. in catkins, pistillate in clusters, spikes or catkins; stamens 2-10 to each bract, with or without calyx; ovary 2-celled, with 2 pendulous ovules in each cell; styles 2: fr. a 1-seeded nut; seed without albumen.—Six genera with more than 100 species in the temp. and colder regions of the n. hemisphere.—Monograph by Winkler in E.P.IV.101.

- A. Nut small, compressed and often winged, without involucre, 2-3 in the axils of scales forming catkins; stamens 2-4, with 2-4-parted calyx.....Subfam. 1. BETULEAE (Döll) Aschers.
- B. Scales of fruiting catkins thin, 3-lobed, deciduous; stamens 2, bifid: buds sessile with 3 or more scales.....1. *Betula*
- BB. Scales of fruiting catkins, 5-lobed, woody, persistent; stamens 4: buds usually stalked and with 2 valvate scales.....2. *Alnus*
- AA. Nut with a foliaceous involucre, forming clusters or spikes; stamens 3-10, without calyx; buds with several scales.....Subfam. 2. CORYLEAE (Meissn.) Aschers.
- B. Frs. in pendulous slender spikes: buds elongated, acute; lvs. with 9 or more pairs of veins.
- C. Involucre of the fr. flat, 3-cleft or dentate, leafy; staminate catkins appearing in spring.....3. *Carpinus*
- CC. Involucre a bladder-like closed bag; staminate catkins formed in autumn.....4. *Ostrya*
- BB. Frs. in clusters: buds ovoid, obtuse or acute: staminate catkins naked during winter: lvs. ovate or orbicular-ovate, with usually 5-8 pairs of veins.
- C. Anthers undivided, not hairy at apex: fls. with the lvs.: nut small, enclosed by the tubular involucre 3-fid at apex.....5. *Ostryopsis*
- CC. Anthers divided, with tufts of hairs at apex: fls. before the leaves: nut large, wholly or partly enclosed by a leafy involucre irregularly lacinate at apex.....6. *Corylus*

1. **BETULA** L. BIRCH. Deciduous shrubs or trees: buds with several imbricate scales: lvs. petioled, generally ovate, serrate or dentate to lobulate, with few or many veins: fls. monoecious; staminate catkins elongated, formed in autumn and remaining naked during winter, every bract with 3 fls., each fl. with a minute 4-parted calyx and 2 stamens divided at the apex; pistillate catkins oblong or cylindrical, each bract with 3 fls. without calyx: fr. a minute nut usually with membranous wings, at maturity dropping together with the 3-pointed bract from the slender rachis. (The ancient Latin name of the Birch.) About 40 species in the n. hemisphere, in N. Am. s. to Colo., Ala. and Calif., in Asia s. to the Himal.—Ornamental trees or shrubs, some valued as timber trees; they are essentially northern trees and mostly short-lived; most of them are well suited for planting on poor sandy or boggy soil.

- A. Lvs. with 7 or more pairs of veins, usually more or less impressed above.
- B. Strobiles cylindric, pendulous, racemose or solitary and 3.5-11 cm. long; wing of the fruit much broader than the nutlet: lvs. 1-14 cm. long.....Ser. 1. ACUMINATAE Reg.
- C. Lvs. cordate at base: strobiles 2-4, racemose, 1.5-7 cm. long.....1. *B. Maximowicziana*
- CC. Lvs. rounded or subcordate at the base: strobiles solitary; bracts without distinct lateral lobes.....2. *B. luminifera*
- BB. Strobiles solitary, 2-5 cm. long, bracts with distinct lateral lobes: wings of fr. not or not much broader than nutlet.....Ser. 2. COSTATAE Reg.
- C. Lvs. light green beneath: strobiles subglobose to cylindric.
- D. Strobiles cylindric or subcylindric, sometimes ellipsoid in No. 3.
- E. Wings of fr.  $\frac{1}{4}$ - $\frac{1}{2}$  as broad as nutlet: lvs. triangular-ovate to ovate-oblong.
- F. Petioles 1-2 cm. long.
- G. Lvs. triangular-ovate, truncate or subcordate at base.....3. *B. Ermani*
- GG. Lvs. ovate to ovate-oblong rounded, rarely broadly cuneate at base.
- H. Brts. glandular and villous: lvs. ovate, pubescent beneath.....4. *B. utilis*
- HH. Brts. glabrous, sometimes slightly glandular: lvs. often ovate-oblong, glabrous beneath.....5. *B. albo-sinensis*

- FF. Petioles 0.5-1 cm. long; leaves rounded or broad-cuneate at base, 4-8 cm. long ..... 6. *B. Schmidtii*
- EE. Wings much narrower than nutlet: lvs. ovate to elliptic or obovate, 6-12 cm. long ..... 7. *B. Medwediewi*
- DD. Strobiles subglobose to ellipsoid.
- E. Lvs. oblong-ovate, acuminate, 5-12 cm. long; petioles 0.5-2.5 cm. long; wings of fr. about  $\frac{1}{2}$  as broad or as broad as nutlet: bark of young brs. aromatic.
- F. Veins very prominent, 3-4 mm. distant; lvs. firm, long-acuminate, 5-8 cm. long ..... 8. *B. costata*
- FF. Veins less prominent, about 5 mm. distant; lvs. rather thin, 6-12 cm. long.
- G. Serration of lvs. coarse, usually 2 teeth between two veins: lvs. usually subcordate; petiole 1-2.5 cm. long ..... 9. *B. grossa*
- GG. Serration fine, usually 3-4 teeth between two veins: petioles 0.5-1.5, rarely 2 cm. long.
- H. Bracts of strobiles glabrous: young brts. nearly glabrous: bark close, brown ..... 10. *B. lenta*
- HH. Bracts of strobiles pubescent: young brts. pubescent: bark yellowish, flaky ..... 11. *B. lutea*
- EE. Lvs. broad-ovate to elliptic, acute, rarely acuminate, 2-7 cm. long; petioles 3-12 mm. long; wings of frs. very narrow.
- F. Pairs of veins 7-10; petioles 6-12 mm. long.
- G. Lvs. broad-ovate, usually short-acuminate, 4-7 cm. long; strobiles 2.5-3 cm. long ..... 12. *B. globispica*
- GG. Lvs. ovate, acute, 2-5 cm., rarely to 6 cm. long; strobiles 1.5 cm. long. 14. *B. chinensis*
- FF. Pairs of veins 10-20; lvs. acute, usually rufous-villous beneath on the veins; petioles 3-8 mm. long; shrub ..... 13. *B. Potanini*
- CC. Lvs. whitish beneath, rhombic-ovate, with 7-9 pairs of slightly impressed veins: strobiles cylindric-oblong ..... 15. *B. nigra*
- AA. Lvs. with 3-7 pairs of veins (sometimes 8 in No. 24).
- B. Wings of fr. broader than the nutlet ( $\frac{1}{2}$  as broad in No. 24): trees, rarely shrubs. Ser. 3. *ALBAE* Reg.
- C. Bracts of strobiles with the lateral lobes spreading or recurved, usually longer than the middle lobe: brts. resinous-glandular and glabrous: bark white.
- D. Lvs. quite glabrous, rhombic-ovate, cuneate at base.
- E. Lvs. long-acuminate: bark chalky- or ashy-white, rather close. 16. *B. populifolia*
- EE. Lvs. acuminate: bark creamy-white, flaky ..... 17. *B. pendula*
- DD. Lvs. slightly pubescent beneath and with axillary tufts of hairs at least while young, triangular-ovate or ovate, usually truncate at base.
- E. Lvs. bright green, usually truncate or subcordate ..... 18. *B. mandshurica*
- EE. Lvs. dull green above, usually rounded or truncate at base. 19. *B. coerulea-grandis*
- CC. Bracts with the lateral lobes ascending, rarely spreading, shorter than the middle lobe: brts. pubescent, sometimes glabrous, not or slightly, rarely densely glandular.
- D. Bark flaky.
- E. Wings of fr. as broad as nutlet: bark white or sometimes brown.
- F. Lvs. usually truncate or subcordate at base, 5-10 cm. long; strobiles 3-5 cm. long ..... 20. *B. papyrifera*
- FF. Lvs. usually cuneate at base, 3-6 cm. long; strobiles 2.5-3 cm. long. 21. *B. pubescens*
- EE. Wings  $\frac{1}{2}$  as broad as nutlet, rarely as broad: bark brown; brts. glandular and pubescent: strobiles 2-2.5 cm. long ..... 22. *B. davurica*
- DD. Bark close, brown: wings as broad as nutlet: lvs. 3-5 cm. long ..... 23. *B. fontinalis*
- BB. Wings of fr. much narrower than nutlet, rarely as broad: shrubs: lvs. small, 0.5-3, rarely to 5 cm. long, with 2-5 pairs of veins ..... Ser. 4. *HUMILES* Koch.

1. *B. Maximowicziana* Reg. Tree to 30 m.; bark gray or orange-gray, peeling off in papery flakes; brts. dark reddish brown, glabrous: lvs. broad-ovate, acuminate, deeply cordate at base, 8-14 cm. long, doubly serrate, pubescent on young trees, nearly glabrous on old trees, with 10-12 pairs of veins; petiole 2.5-3.5 cm. long, glabrous or pubescent: strobiles 2-4 in a raceme, 1.5-7 cm. long, cylindric, nodding; bracts with ascending lateral lobes shorter than the middle lobe. B.M.8337(c). K.M.t.25(c). S.I.1.t.23(c). E.P.IV.61:90.

(*B. Maximowiczii* Reg., not Rupr., *B. candelae* Koidz.) Japan. Intr. 1888. Zone V. Very handsome vigorously growing tree with large lvs.

2. *B. luminifera* Winkl. Tree to 20 m.; bark of old trunks dull yellowish gray, not exfoliating; brts. brown: lvs. ovate, acuminate, subcordate or rounded at base, 6–12 cm. long, sharply and unequally serrate with acuminate teeth, tomentulose or nearly glabrous beneath, with 10–13 pairs of veins; petiole 1–2.5 cm. long; strobiles solitary, 3.5–11 cm. long; bracts with the middle lobe much longer than the reduced lateral lobes. E.P.IV.61:92. Gn. 89:698(h). (*B. Wilsoniana* Schneid., *B. hupehensis* Schneid., *B. alnoides* var. *pyrifolia* Burk., partly.) C. and W. China. Intr. 1901. Zone VI? Ornamental tree with handsome large lvs.

Related species: *B. alnoides* Hamilt. Tree to 20 m.; bark brown; young brts. short-pubescent or nearly glabrous: lvs. ovate-oblong, 6–14 cm. long, rounded or cuneate at base, with appressed teeth, nearly glabrous: strobiles several, 3–9 cm. long. E.P.IV.61:90.f.22a-c. I.S.3:t.101. (*B. acuminata* Wall.) Himal., S. W. China. Intr. 1901. Zone VII?

3. *B. Ermáni* Cham. Tree to 20 m.; bark grayish or reddish to nearly white, exfoliating in thin sheets; brts. usually glandular; older brs. orange-colored: lvs. triangular-ovate, 5–10 cm. long, acuminate, truncate or subcordate at base, unequally coarsely serrate, glabrous and usually glandular beneath or pubescent on the veins, with 7–11 pairs of veins: petiole 5–35 mm. long; strobiles erect, oblong, 2–3 cm. long; bracts with linear-oblong lobes, the middle one longer than the ascending lateral ones; wing nearly half as broad as nutlet. S.I.1:t.21(c). E.P.IV.61:63.f.180-r. K.M.t.26(c). N.K.2:t.16. (*B. ulmifolia* Reg., not Sieb. & Zucc.) N. E. Asia, Japan. Cult. 1880. Zone V. Ornamental tree with handsome foliage, early leafing.—*B. E. subcordata* (Reg.) Koidz., var. Brts. less glandular: lvs. more often subcordate, often with 10–14 pairs of veins. Later in leafing than the type. (*B. E.* var. *nipponica* Maxim.) N. E. Asia, Japan. Cult. 1903.

4. *B. utilis* D. Don. Tree to 20 m.; dark brown, peeling off in thin flakes; brts. villous and glandular: lvs. ovate to ovate-oblong, 5–8 cm. long, acuminate, rounded to broad-cuneate at base, unequally serrate, subcoriaceous, with 10–14 pairs of veins impressed above, pubescent beneath, otherwise glabrous or slightly hairy; strobiles peduncled, cylindric, about 3 cm. long; bracts pubescent, with oblong lobes, the middle lobe dilated above and usually longer than the ascending lateral ones; wings of fr. about half as broad as nutlet. E.H.4:t.269.f.7. Brandis, Ind. Trees, 622.f.191. G.C.100:316–7 (h). (*B. Bhojpathra* Wall.) Himal. Cult. 1880. Zone VII?—*B. u. Pratii* Burk., var. Bark orange-brown to pale gray: lvs. pubescent below, chiefly on the midrib: bracts of strobiles ciliate; lateral lobes spreading, spatulate. W. China. Intr. 1908. Zone V.

Closely related species: *B. Jacquemontiana* Spach. Bark white; brts. short-pubescent, slightly glandular: lvs. ovate, 5–7 cm. long, rounded or slightly cuneate at base, doubly serrate, glandular beneath and hairy on the veins, with 7–9 pairs of veins: strobiles on long pubescent stalks; bracts with linear middle lobe. E.H.4:t.270.f.15. (*B. utilis* var. *J.* Henry.) W. Himal. Cult. 1880. Zone VII?

5. *B. albo-sinensis* Burk. Tree to 30 m.; bark bright orange or orange-red, exfoliating; brts. glabrous, sometimes glandular: lvs. ovate to ovate-oblong, acuminate, rounded or sometimes truncate, rarely subcordate at base, doubly serrate and often slightly lobulate, 4–7 cm. long, dark yellow-green above, light green and glandular beneath, with 10–14 pairs of veins, like the midrib sparsely silky or nearly glabrous; petioles 5–15 mm. long, glabrous or sparingly silky; strobiles cylindric, pendulous, 3–4 cm. long; bracts ciliate, the

middle lobe linear-oblong, much longer than the broad ascending lateral lobes. I.S.3:t.103. (*B. utilis* var. *sinensis* Winkl.) C. and W. China. Intr. 1910. Zone V. Handsome tree; particularly the bark is beautiful.—**B. a. septentrionalis** Schneid., var. Bark dull orange to orange-brown; brts. more glandular: lvs. oblong-ovate, 5–9 cm. long, more densely silky on the veins beneath and with axillary tufts of hairs. W. China. Intr. 1908.

6. **B. Schmidtii** Reg. Tree to 30 m., with dark gray or nearly black bark broken into thick small plates; brts. pubescent and glandular, finally glabrous, brown; lvs. ovate, acuminate, rounded or broad-cuneate at base, unequally serrate, 4–8 cm. long, light green and resin-dotted beneath, with 9–10 pairs of veins pilose like the midrib; petioles 5–10 mm. long, pilose: strobiles cylindric, upright, 2–3 cm. long; bracts with narrow ciliate lobes, the middle one much longer. S.I.1:t.23(c). N.K.2:t.19. N. E. Asia, Japan. Intr. 1896. Zone V. Handsome tree.

7. **B. Medwediewi** Reg. Tall tree; brts. rather stout, smooth, pilose while young; buds large, glutinous; lvs. ovate to elliptic or obovate, short-acuminate, usually rounded or sometimes subcordate at base, unequally or nearly doubly serrate, 6–12 cm. long, dark green above and glabrous or sparingly appressed-pubescent, light green below, with 8–11 pairs of veins impressed above glabrous or pilose below: strobiles cylindric-oblong, 2.5–4 cm. long; bracts with linear-oblong lobes, the middle one nearly twice as long as the ascending lateral ones; wing of fr. about  $\frac{1}{4}$  as broad as nutlet. Gt.36:383, f.95,1–4. S.L.105(h). Transcauc. Intr. 1897. Zone III. Distinct on account of its large and broad lvs.

8. **B. costata** Trautv. Tree to 30 m.; bark grayish brown, exfoliating in papery flakes; brts. glabrous or finely villous when young, brown: lvs. ovate to oblong-ovate, 5–8 cm. long, long-acuminate, rounded or rarely subcordate at base, finely and doubly serrate with acuminate teeth, firm, sometimes sparingly pubescent above, glandular beneath, with 10–16 pairs of veins pilose beneath at least when young; petiole 8–15 mm. long: strobiles ellipsoid, about 2 cm. long, short-stalked: middle lobe of bracts about twice as long as the ovate or obovate somewhat spreading lateral ones. S.H.1:f.53o-o\*, 54k-k\*. (*B. ulmifolia* var. *c.* Reg., *B. ulmifolia* Dipp. partly, not Sieb. & Zucc.) N. E. Asia. Cult. 1880. Zone V. Graceful tree with rather small and narrow lvs.

9. **B. gróssa** Sieb. & Zucc. JAPANESE CHERRY B. Tree to 25 m.; bark dark gray or nearly black, smooth, fissured on old trees; brts. glabrous, with small scattered lenticels, usually yellow-brown at first, chestnut-brown later: lvs. ovate to oblong-ovate, 5–10 cm. long, acuminate, usually subcordate at base, rather coarsely doubly serrate, rather thin, glandular beneath, with 10–15 pairs of veins silky beneath; petiole 1–2.5 cm. long, silky: strobiles nearly sessile, ellipsoid, 1.8–2.5 cm. long; bracts ciliate; middle lobe narrow-oblong, longer than the ovate lateral ones; wings of the fr. often narrowed toward the base. S.I.1:t.22(c). T.M.8:t.6,f.16–19. (*B. carpinifolia* Sieb. & Zucc., *B. ulmifolia* Sieb. & Zucc.) Japan. Intr. 1896. Zone IV. Similar to *B. lenta*.

10. **B. lenta** L. CHERRY B. Tree to 25 m.; bark dark reddish brown, close, fissured into thick plates on old trunks; young bark aromatic and of agreeable flavor; brts. slightly pilose when young, soon glabrous and red-brown: lvs. oblong-ovate, 6–12 cm. long, acuminate, usually cordate at base, sharply and doubly serrate, silky-pubescent below when young, with 9–12 pairs of veins; petiole 1.5–2.5 cm. long: strobiles nearly sessile, ovoid-oblong, 2–3.5 cm. long and less than 1.5 cm. thick; bracts about 4 mm. long, glabrous, with short lobes of nearly equal length; wings about as broad as nutlet. S.S.9:t.448. H.T.124,

125(b). Em. 232,t(c). (*B. carpinifolia* Ehrh.—SWEET or BLUE B.) Me. to Ala., w. to Ohio. Intr. 1759. Zone III.—Handsome tree pyramidal while young, round-headed in age, attractive in spring with its long and slender pendulous catkins.—*B. l. laciniata* Rehd., f. Lvs. deeply lobed. Me. spont. Not yet intr.

*B. l.* × *pumila* = *B. Jackii*; see under No. 25.

11. *B. lutea* Michx. YELLOW B. Tree to 30 m.; bark yellowish or silvery gray, separating into thin flakes, reddish brown on old trunks; young bark aromatic and somewhat bitter; brts. pilose: lvs. ovate to oblong-ovate, 8–12 cm. long, with long pale hairs on the veins above and below, nearly glabrous at maturity, at the end of vigorous shoots often pubescent below, with 9–11 pairs of veins; petiole slender, 1.5–2.5 cm. long; strobiles short-stalked or subsessile, 2–3 cm. long and 1.5–2 cm. thick; bracts 5–8 mm. long, pubescent with narrow ascending lobes, the middle lobe longer; wing slightly narrower than the nutlet. S.S.9:t.449. Em.235,t(c). H.T.126,127(b). (*B. excelsa* Pursh; not Ait.—GRAY B.) Nfd. to Man., s. to the high peaks of Ga. and Tenn. Cult. 1800. Zone III. Similar to the preceding, but not succeeding as well in warmer regions; a valuable timber tree.—*B. l. macrolepis* Fern., var. Bracts of strobiles 8–12 mm. long; fr. usually suborbicular. B.B.1:610,f.1500 and B.T.f.217, as *B. lutea*.—*B. l. alleghaniensis* (Brit.) Ashe. Bracts similar to those of No. 10, but ciliate. (*B. a.* Brit.) Alleghany Mts. with the type.

*B. l.* × *glandulifera*; see under No. 26.

12. *B. globispica* Shirai. Tree to 20 m.; bark nearly white, exfoliating; brts. yellowish gray or grayish brown with prominent lenticels: lvs. orbicular-ovate or broad-ovate, 4–7 cm. long, short-acuminate, usually broad-cuneate or nearly rounded at base, sharply and coarsely unequally serrate, with about 10 pairs of veins pilose beneath like the midrib; petiole 5–15 mm. long, pilose: strobiles globose-ovoid, 2.5–3.5 cm. long; bracts with linear ciliate lobes. S.I.1:t.21(c). E.P.IV.61:68,f.19b–f. C. Japan. Intr. 1896. Zone V.

13. *B. Potanini* Batal. Shrub to 3 m., with often prostrate brs.; brts. densely villous: lvs. ovate or oblong-ovate, acute or acutish, rounded or broad-cuneate at base, unequally and sharply serrate, with acuminate teeth, 2–4 cm. long, glabrous above, rufous-pubescent chiefly on the nerves beneath, with 10–22 deeply impressed pairs of veins; petioles 2–4 mm. long, hairy: strobiles ellipsoid, 1.5–2 cm. long; bracts ciliate, with obtusish suberect lateral lobes about half as long as the middle lobe; nutlets with narrow wings. (*B. Wilsonii* Bean.) W. China. Intr. 1908. Zone VI? A very distinct shrubby birch easily recognized by its small acutish lvs. with numerous deeply impressed veins.

Related species: *B. Delavayi* Franch. Small tree or shrub: lvs. ovate or elliptic-ovate, 2–4 cm. long, acute or obtuse, sparingly silky above, silky on midrib and veins beneath, with 10–14 pairs of impressed veins: strobiles 1.5–2 cm. long; bracts long-ciliate, the lateral lobes acute, more spreading. E.P.IV. 61:f.19m. W. China. Intr. 1910. Zone V.—*B. Forrestii* (W. W. Sm.) Hand-Mazz. Shrub to 5 m.: lvs. ovate or oblong-ovate, 3–6 cm. long; petiole 2–8 mm. long; strobiles 2–3 cm. long; bracts with the lateral lobes suberect, about  $\frac{1}{2}$  as long as middle lobe. (*B. Delavayi* var. *F.* W. W. Sm.) W. China. Intr. 1919. Zone V.

14. *B. chinensis* Maxim. Shrub or small tree with grayish bark; brts. villous while young, later brown: lvs. ovate, acute, rounded at the base, unequally serrate with mucronulate teeth, 2–5, rarely 6 cm. long; pilose beneath along the midrib and base of veins, with 8–10 pairs of veins; petiole 4–8 mm. long; strobiles ellipsoid, 1.5–2 cm. long; bracts with lanceolate, acute ciliate lobes, the lateral ones 2–3 times shorter, sometimes reduced; nutlets

with very narrow wing. E.P.IV.61:f.68g-L. N.K.2:t.20. I.S.3:t.106. (*B. exalata* S. Moore.) N. E. Asia, N. China. Intr. 1906. Zone V.

Into this affinity seems to belong *B. Raddeana* Trautv. Tree with densely villous and sparingly glandular brts.: lvs. ovate, rounded at base, 3-4.5 cm. long, pubescent along the veins beneath, with 6-7 pairs of not impressed veins; petioles 1-1.5 cm. long; strobiles ellipsoid; wings about as broad as nutlet. Gt.36:385,f.95,5-11. Trav. Acad. Sci. St. Petersb. 12:76,79. Cauc. Intr. ?

15. *B. nigra* L. RIVER B. Tree to 30 m.; bark reddish brown or silvery gray on younger brs., exfoliating in papery flakes; brts. pubescent: lvs. rhombic-ovate, acute, doubly serrate, 3-8 cm. long, dark green above, whitish below and pubescent when young, finally only on the nerves, with 7-9 slightly impressed pairs of veins; strobiles oblong-cylindric, 2.5-3.5 cm. long; bracts pubescent, with upright, linear-oblong, nearly equal lobes; wing  $\frac{1}{2}$  or nearly as broad as nutlet. S.S.9:t.452. G.F.2:593(h). Gn.55:161(h). H.T.122,123(b). (*B. rubra* Michx.—RED B.) Mass. to Fla., w. to Minn. and Kan. Cult. 1736. Zone IV. Graceful tree with an ovoid head and slender brts., remarkable for its torn and ragged bark; it likes moist sandy soil.

Related species: *B. corylifolia* Reg. Tree to 20 m.; bark pale gray or nearly white; brts. glabrous or nearly so: lvs. elliptic to obovate, 4-6 cm. long, glaucous below and silky on the nerves, with 10-14 impressed pairs of veins; strobiles subcylindric; bracts pubescent, with narrow upright lobes; nutlet with narrow wings. S.I.2:t.14(c). E.P.IV.61:60. C. Japan. Intr. ?

16. *B. populifolia* Marsh. GRAY B. Small tree to 10 m. with usually ascending stem; bark chalky or ashy white, rather close; brts. densely glandular: lvs. triangular-ovate or deltoid, 6-8 cm. long, long-acuminate, truncate at base, coarsely and doubly serrate, glutinous when young, lustrous above; petiole 1.5-3 cm. long, slender; strobiles slender-stalked, cylindric, 1.5-3 cm. long; bracts spreading, puberulent. S.S.9:t.450. H.T.118,119(b). B.T.248(h). G.C.60:302(h). (*B. alba* var. *p.* Spach.—WHITE B.) N. S. and Ont. to Del. Intr. 1750. Zone IV. A small and graceful but short-lived tree; suited for dry and poor and also for boggy soil; useful as nurse for more valuable trees.—*B. p. laciniata* Loud., var. Lvs. pinnately lobed.—*B. p. purpurea* Ellw. & Barry. Lvs. purple when young, green at length.—*B. p. pendula* Loud., var. Brs. pendulous.

*B. p. × papyrifera* has been observed in Mass. G.F.8:356.

17. *B. pendula* Roth. EUROPEAN B. Tree to 20 m.; bark white, exfoliating; brs. usually pendulous, at least in older trees; brts. resinous-glandular: lvs. rhombic-ovate, 3-7 cm. long, acuminate, usually cuneate at base, sometimes truncate, doubly serrate, glutinous when young, glabrous; petiole slender, 2-3 cm. long; strobiles cylindric, 2-3 cm. long, slender-stalked; bracts puberulous or glabrous. H.W.2:20(h),t.15(c). E.P.IV.61:76. B.C.1:498(h). (*B. verrucosa* Ehrh., *B. alba* L. partly.) Eu., Asia Minor. Long cult. Zone II. A handsome but comparatively short-lived tree. Of its vars. var. *dalecarlica* is most often planted; it forms a very graceful tree.—*B. p. purpurea* (André) Schneid., f. Lvs. purple. R.B.4:t.185(c). 18. *B. mandshurica* (Reg.) Nakai. Tree to 20 m.; bark white; brts. resinous-glandular: lvs. ovate or deltoid-ovate, 4-6 cm. long, acuminate, truncate to broad-cuneate at base, unequally serrate, paler and glabrous beneath or sometimes with axillary tufts of hairs, glandular-dotted: petioles 1-2.5 cm. long; strobiles cylindric, pendulous, puberulous; middle lobe of bracts triangular, shorter or about as long as the spreading broad lateral lobes; wings as broad or broader than nutlet. N.K.2:t.13. I.S.3:t.108. (*B. alba* ssp. *mandshurica* Reg. *B. japonica* var. *m.* Winkl.) Mandsh., Korea. Intr. ?—*B. m. kamtschatica* (Reg.) Rehd., var. Lvs. thinner, broad-ovate to triangular-ovate, 5-7.5 cm. long, unequally serrate-dentate and slightly lobulate, with axillary tufts of hairs beneath, rarely slightly pilose on the veins. S.I.2:t.11 (c). Bull. Soc. Nat. Moscou, 38, 2:t.7, f.16-20. (*B. alba* var. *k.* Reg., *B. japonica* var. *k.* Winkl.) N. E. Asia, Jap. Cult. 1917. Zone II?—*B. m. szechuanica* (Schneid.) Rehd., var. Tree with wide-spreading brs.: lvs. ovate or rhombic-ovate, rounded to broad-cuneate at base, short-acuminate, unequally dentate-serrate, dull green above, densely glandular-dotted beneath and glabrous or slightly pilose. W. China. Intr. 1872 and 1908. Zone V. Remaining green until late in fall.—*B. m. japonica* (Miq.) Rehd., var. Lvs. broad-ovate to triangular-ovate, 4-7.5 cm. long, to 6 cm. broad, truncate or subcordate at base, puberulous or glabrous below, usually with axillary tufts of hairs. K.M.t.27 (c). S.H.1:f.62q. Gn.89:719(h). (*B. japonica* Winkl., not Thunb., *B. pendula* var. *Tauschii* Rehd., *B. Tauschii* Koidz., *B. latifolia* Komar., not Tausch.) Japan, N. China. Intr. 1902. Zone IV.

19. *B. coerulea-grandis* Blanchard. Tree to 10 m.; brts. glabrous; slightly resinous-glandular: lvs. ovate or triangular-ovate, acuminate, usually rounded or truncate at base, 6-8 cm. long, sharply and usually doubly serrate, bluish green above, yellowish green beneath and slightly hairy on the veins at first, soon glabrous or nearly so; petioles 1.5-2.5 cm. long; strobiles cylindric, pubescent, 2.5-3 cm. long and 8-10 mm. thick; lateral lobes of bracts spreading, as long or slightly longer than middle lobe. S.M.211a. (*B. coerulea* var. *Blanchardi* Sarg.) N. S. to Que., Vt. and N. H. Intr. 1905. Zone II?

*B. c. × populifolia* = *B. coerulea* Blanchard. Lvs. usually broad-cuneate at base, slightly smaller: strobiles to 3.5 cm. long, slenderer. S.M.211. N. S. to Vt. Intr. 1905.

20. *B. fontinalis* Sarg. Small shrubby tree, usually forming clumps, occasionally to 12 m.; bark close, reddish brown; brts. slender, densely resinous-glandular: lvs. broad-ovate, 2-4 cm. long, acute, usually rounded at base, sharply and often doubly serrate, bright green, glandular-dotted beneath, with 3-4 pairs of veins; petiole 5-15 mm. long; strobiles 2-3 cm. long, 5-10 mm. thick; bracts pubescent, the lateral lobes ascending, shorter than the narrow middle lobe, all acute. S.S.9:t.453. N.S.1:t.8(c). (*B. occidentalis*

Hook., in part, *B. rhombifolia* Nutt., not Tausch.) Alaska to Ore. and through the Rocky Mts. to Colo. Intr. 1874. Zone IV. Graceful tree with slender spreading and pendulous brs.—*B. f. Piperi* (Brit.) Sarg., var. Small tree: lvs. ovate or elliptic, 5–6 cm. long, usually broad-cuneate at base, pubescent on the veins beneath when young; strobiles cylindric, 3–5 cm. long; lateral lobes of bracts broad and spreading, auricled at base. S.M.219. B.T.255. (*B. P.* Brit.) Wash., Mont. Intr. 1903. Zone V.

21. *B. papyrifera* Marsh. CANOE B. Tree to 30 or occasionally 40 m.; bark white, exfoliating; brts. pubescent when young and often slightly glandular: lvs. ovate to narrow-ovate, 4–10 cm. long, acuminate, cuneate or rounded at base, coarsely and usually doubly serrate, glabrous above, pubescent on the nerves beneath or nearly glabrous; petiole stout, 1.5–3 cm. long, pubescent: strobiles cylindric, 3–5 cm. long, slender-stalked, usually pendulous; bracts pubescent, with suberect or spreading lateral lobes slightly shorter than the middle lobe. S.S.9:t.451. Em.238,t. H.T.121(b). W.A.26,t(h). M.G.29:145 (h). (*B. papyracea* Ait., *B. latifolia* Tausch.—PAPER B., WHITE B.) Lab. to B. C. and Wash., s. to Pa. and Mich., Neb. and Mont. Intr. 1750. Zone II. Handsome tree, often planted in the N. E. States; the vars. occasionally seen in collections.—*B. p. cordifolia* (Reg.) Fern., var. Small tree with usually white bark, sometimes shrubby; brts. pubescent while young: lvs. broad-ovate, subcordate at base, doubly serrate, pilose on the veins beneath. S.S.14:t.724. (*B. c.* Reg.) Lab. to Minn. Intr. 1876.—*B. p. minor* (Tuckerm.) Wats. & Coult., var. Shrub or low bushy tree: lvs. elliptic-ovate or ovate, truncate or broad-cuneate at base, 1.5–4 cm. long, glabrous beneath, glutinous: strobiles 1.5–3 cm. long, 5–10 mm. thick. Am. Jour. Sci. 14:t.5,f.9–12. Lab. to N. H. and Minn. Intr. 1904.—*B. p. occidentalis* (Hook.) Sarg., var. Large tree to 40 m.; bark orange to dark brown, sometimes nearly white: lvs. ovate or broad-ovate, acute or acuminate, rounded or truncate at base, doubly serrate, bright or dark green, rather thin: strobiles 3–4 cm. long; lateral lobes of bracts spreading, much shorter than the middle lobe. S.S.14:t.725. A.I.1:512. (Var. *Lyalliana* Henry, *B. Lyalliana* Koehne, *B. o.* Hook., in part.) B. C. and Wash. to Mont. Intr. about 1835.—*B. p. kenáica* (Evans) Henry, var. Bark usually white, tinged with orange and brown; brts. minutely pubescent and slightly or not glandular: lvs. usually cuneate at base, about 5 cm. long: strobiles shorter; bracts glabrous, ciliate. S.S.14:t.723. (*B. k.* Evans.) Coast of Alaska. Intr. 1897.—*B. p. subcordata* (Rydb.) Sarg., var. Small tree with silvery gray purple-tinged bark; brts. glabrous or puberulent, rarely slightly glandular: lvs. ovate or broad-ovate, acute, rounded to cordate at base, glabrous, rarely slightly pubescent near base beneath, unequally dentate-serrate; bracts of strobiles pubescent and ciliate. Bull. Torr. Bot. Club, 36:436. (*B. s.* Rydb.) B. C. and Alb. to Idaho and Mont. Intr. 1918.—*B. p. neoalaskana* (Sarg.) Raup, var. Bark reddish brown to dull white; brts. densely resinous-glandular: lvs. triangular-ovate, usually truncate at base: strobiles 3–3.5 cm. long; bracts glabrous or puberulent; the rhombic lateral lobes shorter than the middle lobe. S.S.14:t.726. (*B. n.* Sarg., *B. alascaná* Sarg., not Lesquereux.) Sask. to Alaska. Intr. 1905.

*B. p.* × *populifolia*; see under No. 16.—*B. p.* × *pendula*; see under No. 17.—*B. p.* × *pumila*; see under No. 25.—*B. p.* × *glandulifera*; see under No. 26.

22. *B. pubescens* Ehrh. Tree to 20 m.; with usually ascending or spreading brs.; bark white, exfoliating, dark and rough at base of old trunks; young brts. densely pubescent, glandless: lvs. rhombic-ovate or ovate, 3–5 cm. long, acute, truncate or cuneate at base, usually unequally doubly serrate, pubes-

cent beneath, at least while young, often with axillary tufts of hairs; petiole pubescent, often finally glabrous, 1-2.5 cm. long; strobiles cylindric, 2.5-3 cm. long; bracts puberulous, lateral lobes suberect to recurved, slightly shorter than the middle lobe; wing as broad or twice as broad as nutlet. R.I.12:t.625 (c). H.W.2:24,25(h). (*B. alba* L. in part, *B. odorata* Bechst.) N. and C. Eu. to Siberia. Cult. 1789. Zone II. A very variable species with many geographical vars. and forms which are scarcely cult. in this country, except perhaps *B. p. urticifolia* (Loud.) Schelle. Lvs. coarsely doubly serrate or lobulate, dark green and slightly pubescent above, more densely beneath: wing much narrower than nutlet. S.H.1:f.64m-m<sup>4</sup>. (*B. u.* Reg., *B. alba* var. *u.* Loud.) Orig. unknown; said to have been found wild in Sweden. Cult. 1836.

*B. p.* × *pendula*; see under No. 17.—*B. p.* × *nana*; see under No. 28.

Related species: *B. turkestanica* Litvin. Tree with yellowish or whitish bark; brts. pubescent and resinous-glandular: lvs. ovate, cuneate to rounded at base, pubescent when young, later only beneath along the veins, without axillary tufts: strobiles about 2.5 cm. long; lateral lobes of bracts suberect, about ½ as long as central lobe. Trav. Acad. Sci. St. Petersburg. 12:t.12,f.5. Turkest. Intr. ?—*B. microphylla* Bge. Tree; bark yellowish; brts. pubescent and densely glandular: lvs. rhombic-ovate to rhombic-obovate, 2-5 cm. long, cuneate at base, acute, coarsely dentate, almost glabrous and glandular beneath: lateral lobes of bracts ascending, slightly shorter than middle lobe. Trav. Acad. Sci. St. Petersburg. 12:t.12,f.12. C. Asia. Intr. ? Plants seen under this name in cult. belonged to *B. Middendorffii*.—Here may be also mentioned: *B. coriacea* Gunnarsson. Tree or shrub; bark gray or grayish brown; brts. glabrous, often minutely verrucose: lvs. broad-elliptic or ovate, rounded at base, subglabrous, thickish, reticulate beneath: middle lobe of bracts scarcely longer than lateral lobes. Gunnarsson, Monog. Scand. Betul. t.1,f.3;t.4,f.3. Scand.—*B. concinna* Gunnarsson. Tree or shrub; bark blackish brown: lvs. elliptic-ovate, acute, equally serrate, slightly reticulate beneath and pilose on the veins: middle lobe of bract distinctly longer than lateral lobes. Gunnarsson, t.1,f.2;t.4,f.2. Scand.

23. *B. davurica* Pall. Tree to 20 m.; bark purplish brown, exfoliating in thin and small flakes; brts. glandular and pubescent: lvs. rhombic-ovate or narrow-ovate, 4-8 cm. long, acute or acuminate, cuneate, unequally dentate-serrate, gland-dotted beneath, with 6-8 pairs of veins pubescent on both sides, finally glabrescent above; petiole 5-15 mm. long, slightly pilose: strobiles 2-2.5 cm. long; bracts glabrous, lustrous, firm, middle lobe triangular, about as long as the lateral rounded and spreading lobes; wing of fr. about half as broad as nutlet. S.H.1:f.60p. N.K.2:t.14. I.S.3:T.107. Gn.89:719(h). (*B. Maximowiczii* Rupr., *B. Maackii* Rupr., *B. wutaica* Mayr.) N. E. Asia, Japan. Intr. 1883. Zone V or IV? Tree with wide-spreading brs. and peculiar bark similar to that of the Red Birch.

24. *B. humilis* Schrank. Shrub to 3 m.; brts. resinous-glandular and hairy: lvs. ovate or elliptic, rarely obovate, 1.5-3 cm. long, acute or acutish, cuneate, rarely rounded at base and apex, irregularly dentate-serrate, glabrous and green on both sides, with 4-5 pairs of veins; petiole 1-4 mm. long: strobiles upright, oblong, 5-15 mm. long; bracts ciliate, middle lobe usually thinner and larger than the lateral lobes; wing about half as broad as nutlet. R.I.12:f.1279 (c). H.W.2:f.122a-d. S.H.1:f.55a-e. Eu., N. Asia to Altai Mts. Intr. 1818. Zone II. Small-leaved shrub, rarely cult.

Closely related species: *B. fruticosa* Pall. Brts. often less glandular: lvs. 2-5 cm. long, more distinctly serrate with finer serrations, with 5-6 pairs of veins, slightly pubescent on the midrib beneath: wing ½-¾ as broad as nutlet. S.H.1:f.56d-e,57b-b<sup>1</sup>. N.K.2:t.15. (*B. Gmelini* Bge.) N. E. Asia to Altai, N. China. Cult. 1876. Zone IV.—*B. Middendorffii* Trautv. & Mey. Brts. resinous-glandular and finely pubescent when young or quite glabrous and smooth: lvs. orbicular-ovate or broad-ovate, 2-4 cm. long, rounded or acutish at apex, usually rounded at base, coarsely serrate, pale yellow green beneath; strobiles 1.5-2 cm.

long; wing about as broad as nutlet. Middendorff, Reise, I.1:t.21. N. E. Asia. Cult. 1904. Zone III?

25. *B. pumila* L. Low B. Shrub to 5 m.; brts. densely tomentose when young, not glandular: lvs. suborbicular to broad-elliptic or obovate, 1-3 cm. long, obtuse or acutish, rounded or broad-cuneate at base, coarsely crenate-dentate, usually densely pubescent beneath while young and grayish white and reticulate-veined, often becoming quite glabrous, with 4-6 pairs of veins: strobiles cylindric-oblong, upright, stalked, 1.5-2.5 cm. long; bracts pubescent, lateral lobes spreading, shorter than the middle lobe; wing about half as broad as nutlet. B.B.1:511. E.P.IV.61:f.20g-m. (*B. excelsa* Ait.) Nfd. to Assina., s. to N. J., Ohio and Minn. Intr. 1762. Zone II.

*B. p.* × *lenta* = *B. Jäckii* Schneid. Bark aromatic: lvs. ovate or elliptic-ovate, 3-5 cm. long, glabrate, with about 7 pairs of veins: strobiles about 1.2 cm. thick. G.F.8:243. Orig. 1888.—*B. p.* × *papyrifera* = *B. Borggreveana* Zabel ex Winkl. Bark gray; brts. pubescent: lvs. ovate or rhombic-ovate, broad-cuneate or rounded at base, coarsely serrate, slightly pubescent and glandular-punctate beneath; petiole 1-1.5 cm. long; bracts similar to No. 25. S.H.1:f.59r<sup>2</sup>-r<sup>3</sup>. (*B. excelsa* auth., not Ait.) Cult. 1872.

26. *B. glandulifera* (Reg.) Butler. Shrub to 2 m.; brts. slender, reddish brown, slightly resinous-glandular and pilose: lvs. obovate or elliptic to suborbicular, 2-5 cm. long, usually acute, cuneate, serrate or crenate-serrate, pubescent on the veins beneath when young, reticulate and resin-dotted: strobiles 1.5-2 cm. long, cylindric; lateral lobes of bracts ascending, shorter than the obtuse middle lobe. Bull. Torr. Bot. Club, 36:424,f.2. A.I.1:511. (*B. pumila* var. *g.* Reg.) Ont. and Mich. to B. C. Intr.?

*B. g.* × *lutea* = *B. Purpusii* Schneid. Lvs. usually oblong-ovate, 2.5-5 cm. long, pubescent beneath, with 7-9 pairs of veins: strobiles 1.5-2 cm. long; lateral lobes ascending, about ½ as long as middle lobe. S.H.1:f.58a-a<sup>1</sup>. Cult. 1900.—*B. g.* × *papyrifera* = *B. Sandbergi* Brit. Tree or shrub; bark gray or yellowish gray; brts. pubescent: lvs. rhombic-ovate, cuneate or broad-cuneate at base, slightly hairy beneath: strobiles 2-2.5 cm. long. B.T.256. Minn. Intr. 1914. Zone II?

Closely related species: *B. Hallii* Howell. Brts. finely or velvety-pubescent and sparingly glandular: lvs. obovate, rounded at apex, cuneate, crenate-serrulate, bright green, glabrous and resin-dotted beneath: lobes of bracts obtuse, of about equal length, the lateral suberect. Bull. Torr. Bot. Club, 36:428,f.6. (*B. pumila* var. *fastigiata* Rehd.) Ore. to Alaska and Yukon. Intr. about 1898. Zone II.

27. *B. glandulosa* Michx. Shrub to 2 m.; brts. resinous-glandular, glabrous: lvs. suborbicular to broad-elliptic or obovate, 8-25 mm. long, rounded at ends or broad-cuneate at base, crenate-dentate, pale and gland-dotted beneath, glabrous; petiole 3-8 mm. long; strobiles 1.5-2 cm. long; bracts with nearly equal lobes, the lateral suberect; nutlets with very narrow wings. B.B. 1:510. Nfd. to Alaska, s. to N. Y., Mich., Colo. and Calif. Intr. 1880. Zone II.

28. *B. nana* L. Low spreading much-branched shrub, to 0.5 m.; brts. velutinous, later often nearly glabrous, not glandular: lvs. orbicular to broad-obovate, rounded or truncate at apex, 5-15 mm. long, crenate, glutinous when young and slightly pubescent beneath; petiole very short: strobiles nearly sessile, 7-10 mm. long; bracts with rather narrow nearly equal lobes, the lateral ascending; nutlets with very narrow wings. R.I.12:f.1278(c). E.P.IV. 61:f.20d-f. N. Asia, N. and C. Eu., Greenl., Alaska. Cult. 1789. Zone II.—*B. n. Michauxii* (Spach) Reg., var. Lvs. cuneate-flabellate, deeply crenate: strobiles with oblong-lanceolate, entire bracts or the lower ones 3-lobed. B.B. 1:612. E.P.IV.61:f.20a-c. (*B. M.* Spach.) Lab., Nfd. Intr. ?

*B. n.* × *pubescens* = *B. intermedia* Thomas. Shrub to 3 m.: lvs. suborbicular to ovate, 8-25 mm. long. S.H.1:f.58e-e<sup>2</sup>,59o-p<sup>1</sup>. (*B. alpestris* Fries.) Spont. in Eu. Cult. 1895.—*B. n.* × *pendula* = *B. fennica* Doerfl. Similar to *B. intermedia*, but brts. glandular. S.H.1:f.58g-g<sup>4</sup>,59l-n. Spont. in Eu. Cult. ?

2. **ALNUS** B. Ehrh. ALDER. Deciduous trees or shrubs; buds stalked and with 2 or 3 subsequent scales or sessile and with imbricate scales: lvs. usually serrate or dentate: staminate catkins elongated, each bract with 3 fls., each fl. with a 4-parted calyx and 4, rarely 1-3, undivided stamens; pistillate catkins short, each bract with 2 fls. without calyx; the bractlets adnate to the bract; fr. a minute compressed, usually narrowly winged nutlet, in pairs in the axils of woody, 5-lobed or truncate persistent scales forming an ellipsoid or ovoid strobile. The fls. appear before or with the lvs.; the fr. ripens in autumn. (The ancient Latin name of the alder.) About 30 species in the northern hemisphere, in America s. to Peru.—Ornamental trees or shrubs; some species valued as timber trees. Mostly moisture-loving and essentially plants of cool climates.

- A. Buds sessile, with 3-6 imbricate, rarely with 2 unequal scales: pistillate catkins terminal enclosed during the winter in the bud: fr. with broad membranous wing: fls. with the lvs. (Subgen. *ALNASTER* Endl.)
  - B. Lvs. with 12-26 pairs of veins.
    - C. Strobiles 1-2: lvs. with 12-18 pairs of veins: brts. grayish or yellowish brown.
      - 1. *A. firma*
    - CC. Strobiles 2-5, pendulous: lvs. with 18-26 pairs of veins: brts. dark red-brown.
      - 2. *A. pendula*
  - BB. Lvs. with 5-10 pairs of veins, glutinous when young.
    - C. Lvs. not lobed, finely serrulate.
      - D. Lvs. broad-cuneate or rounded at base, usually pilose on the midrib.
        - 3. *A. viridis*
      - DD. Lvs. rounded or subcordate at base.
        - 4. *A. crispa*
      - CC. Lvs. distinctly lobulate, thin, glabrous.
        - 5. *A. sinuata*
    - AA. Buds stipitate, with 2 or 3 subequal scales. (Subgen. *ALNUS* Endl.)
      - B. Aments appearing in autumn at the end of the brts.
        - C. Lvs. plicate in bud, usually lobulate, with straight veins: pistillate catkins several from each bud.
          - D. Lvs. green beneath, glutinous while young.
            - E. Lvs. serrulate, not or scarcely lobulate: strobiles partly sessile.
              - 6. *A. rugosa*
            - EE. Lvs. lobulate, dentate or denticulate.
              - F. Strobiles all stalked: lvs. obtuse or acutish, coarsely and doubly dentate.
                - 7. *A. glutinosa*
                - 8. *A. tenuifolia*
            - FF. Upper strobile sessile: lvs. acute or acuminate, lobulate and doubly serrate.
              - 9. *A. rubra*
          - D. Lvs. strongly lobed, 8-14 cm. long, hirsute on the midrib beneath or glabrous.
            - 10. *A. hirsuta*
          - FF. Lvs. not strongly lobed except on shoots, usually smaller, tomentose or nearly glabrous beneath.
            - 11. *A. incana*
        - CC. Leaves not plicate in bud, irregularly and rather remotely serrate, not lobulate; veins arching: pistillate catkins solitary or 2-3 from each bud.
          - D. Fls. opening in spring.
            - E. Lvs. rounded to cordate at base.
              - F. Lvs. suborbicular to ovate, cordate at base, appressed-crenate-serrate: brts. and lvs. glabrous.
                - 12. *A. cordata*
              - FF. Lvs. ovate to oblong-ovate, coarsely and unequally serrate: brts. and lvs. pubescent.
                - 13. *A. subcordata*
            - EE. Lvs. cuneate, rarely nearly rounded at base, oblong-ovate to oblong-lanceolate.
              - 14. *A. japonica*
            - DD. Fls. opening in autumn: lvs. elliptic or obovate to oblong, cuneate at base.
              - 15. *A. maritima*
          - BB. Aments of both sexes solitary in the axils of lvs.; pistillate catkins long-stalked; staminate fls. naked. (Subgen. *CREMASTOGYNE* Winkl.)
            - 16. *A. cremastogyne*

1. *A. firma* Sieb. & Zucc. Shrub or small tree to 3 m.; brts. glabrous; lvs. ovate-oblong, 5-12 cm. long, acuminate, usually rounded at base, sharply and irregularly serrate, pubescent on the veins beneath; strobiles about 2 cm. long, on stalks to 2.5 cm. long. S.I.2:t.12(c). (*A. Sieboldiana* Matsum.) Japan. Not yet intr. and probably tenderer than the var. Ornamental shrub or small tree with handsome foliage remaining green until late in autumn. —*A. f. hirtella* Franch. & Sav., var. Shrub or tree to 10 m.; brts. pubescent:

lvs. ovate-oblong to ovate-lanceolate. E.H.4:t.268,f.2. S.H.1:f.66n-n<sup>2</sup>,67b-c<sup>1</sup>. G.C.75:255. (*A. yasha* Matsum., *A. firma* var. *yasha* Winkl.) Japan. Intr. 1892. Zone V.

2. *A. péndula* Matsum. Shrub or small tree to 8 m.; young brts. pubescent, soon glabrous: lvs. oblong-lanceolate, 5-12 cm. long, acuminate, irregularly and sharply serrate, pubescent on the veins beneath, finally nearly glabrous: strobiles 8-15 mm. long, slender-stalked, in nodding racemes 3-6 cm. long. S.I.2:t.12(c). M.K.T.31(c). S.H.1:f.66o,67d-d<sup>2</sup>. (*A. firma* var. *multinervis* Reg., *A. m.* (Reg.) Callier.) Japan. Intr. 1862. Zone V. Similar to the preceding species, but smaller and more graceful.

3. *A. viridis* DC. EUROPEAN GREEN A. Shrub to 2 m.; brts. pubescent when young, finally gray or red-brown: lvs. ovate or elliptic, sometimes roundish ovate, 2.5-6 cm. long, acute, usually broad-cuneate, pale green and glabrous beneath or pubescent on the veins, rarely on the whole under side: pistillate catkins on glabrous or puberulous stalks: strobiles about 1 cm. long, slender-stalked, racemose. H.W.2:t.14(c). L.B.12:1141(c). R.I.12:t.678(c). (*A. Alnobetula* Hartig, *A. ovata* Lodd.) Mts. of Eu. Intr. 1820. Zone III. Smaller in every part than the following species and not as handsome.

4. *A. crispa* (Ait.) Pursh. AMERICAN GREEN A. Shrub to 3 m., sometimes decumbent; young brts. glabrous or sparingly pubescent: lvs. ovate or broad-elliptic, 3-8 cm. long, acute, usually rounded or slightly subcordate at base, finely and closely serrulate or biserrulate, glabrous beneath or slightly pubescent on the veins, glutinous while young: stalks of pistillate catkins pubescent; filaments longer than perianth; anther-cells connate their whole length: strobiles 3-6, racemose, 1-1.5 cm. long, on stalks 5-15 mm. long. B.B.1:612. (*A. Mitchelliana* M. A. Curt., *A. Alnobetula* var. *crispa* (Ait.) Winkl., *A. viridis* of Am. auth.) Lab. to N. C. in the mts. Intr. 1782. Zone II. Shrub with bright green lvs. exhaling an aromatic fragrance when young; prefers cool and moist situations.—*A. c. mollis* (Fern.) Fern., var. Young brts. and lvs. beneath pubescent; lvs. usually larger; strobiles to 2 cm. long. G.C.77:41. (*A. m.* Fern.) Nfd. to Lake Winnipeg, s. to Mass. Intr. 1897.

5. *A. sinuata* (Reg.) Rydb. Shrub or small tree to 12 m.; brts. glandular and puberulous when young: lvs. ovate, 6-12 cm. long, acute, rounded to broad-cuneate at base, usually lobulate, sharply serrate, light green and glabrous beneath or villous along the midrib; anther-cells free at ends and spreading; filaments shorter than perianth: strobiles about 1.5 cm. long, 3-6 in sometimes leafy racemes, on slender peduncles to 2 cm. long. S.S.14:t.727. (*A. sitchensis* Sarg., *A. Alnobetula* var. *stenophylla* Winkl.) Alaska to n. Calif. Intr. 1903. Zone II. Shrub with rather large bright green lvs.; like the preceding species it prefers cool and moist situations.

Closely related species: *A. fruticosa* Rupr. Lvs. ovate, sometimes broad-cuneate at base, glabrous beneath; filaments shorter than perianth. S.H.1:f. 66h. (*A. viridis* var. *sibirica* Reg.) N. E. Asia. Cult. 1888. Zone IV.—*A. Maximowiczii* Callier. Lvs. abruptly short-acuminate, truncate or cordate at base; anther-cells free at base and apex. M.K.t.30(c). S.H.1:f.66k. M.D.1918: t.9. (*A. viridis* var. *sibirica* Reg. in part.) Japan. Intr. 1914. Zone V.

6. *A. rugosa* (Du Roi) Spreng. SMOOTH A. Shrub or small tree to 8 m.; brts. nearly glabrous or pubescent, rarely densely villous; stipules oval: lvs. elliptic to obovate, 5-10 cm. long, acute or obtuse, cuneate, rarely elliptic-ovate and rounded at base, finely and nearly regularly serrulate, green beneath and glabrous or pubescent on the veins, rarely pubescent all over: strobiles 4-10, the upper sessile, the lower short-stalked, ovoid, 1-1.5 cm. long; nutlet ovate. Add 7:t.237(c). Em.248,t(c). B.B.1:613. (*A. serrulata* Willd.) Me.

to Minn., s. to Fla. and Tex. Cult. 1769. Zone IV.—A tall rather coarse shrub adapted for planting along water-courses and banks of ponds.

*A. r. × incana* = *A. Aschersoniæ* Callier. Differs chiefly in the more pointed, rather coarsely serrate lvs. usually yellowish pubescent beneath and often slightly glaucous. S.H.1:f.72b-c. Occasionally among the parents, first observed in Eu.—*A. r. × glutinosa* = *A. silesiaca* Fiek. S.H.1:f.69r-r<sup>1</sup>. Observed in Eu.

7. *A. glutinosa* (L.) Gaertn. BLACK A. Tree to 25 m.; young growth very glutinous; brts. usually glabrous; stipules ovate to lanceolate; lvs. oval or obovate to suborbicular, 4–10 cm. long, rounded or emarginate at apex, usually broad-cuneate, coarsely and doubly dentate, usually nearly glabrous except axillary tufts of hairs beneath, with 5–6 pairs of veins: strobiles 3–5, distinctly stalked. H.W.2:12(h),t.12(c). H.T.130. G.C.II.2:294,295(h). E.H.4:t.252–3(h). (*A. vulgaris* Hill, *A. rotundifolia* Mill., *A. communis* Desf.) Eu. to Cauc. and Siberia, N. Afr.; occasionally escaped in N. E. Am. Long cult. Zone III. Tree with an ovoid or oblong head and very dark foliage remaining green until late in autumn; growing well in swampy soil. Besides No. 10 silviculturally the most important Alder.—*A. g. aurea* Versch., var. Lvs. yellow. I.H.13:t.490(c). Cult. 1866.—*A. g. laciniata* (Leske) Willd., var. Lvs. deeply and regularly lobed about halfway to the middle, with ovate to lanceolate, dentate or nearly entire lobes. Gt.37:585. E.H.4:t.268,f.7. S.H.1:f.69o-o<sup>1</sup>. Cult. 1750.—*A. g. imperialis* (Lem.) Kirchn., f. Similar to the preceding, but lvs. smaller, more deeply lobed, with linear nearly entire lobes. I.H.6:97,t. Gt.37:585. Orig. 1853.—*A. g. quercifolia* Loud., var. Lvs. deeply lobed, with irregular ovate lobes. S.H.1:f.69m.—*A. g. sorbifolia* Dipp., f. Similar to the preceding, but lvs. smaller with broader partly overlapping lobes. S.H.1:f.69n.—*A. g. incisa* Willd. Lvs. small, deeply lobed or pinnate, with broad rounded dentate lobes. E.H.4:t.268,f.10. S.H.1:f.69p-p'. (*A. g. var. oxyacanthifolia* Loud.) Cult. 1800.—*A. g. rubrinervia* Dipp., f. Lvs. lustrous, dark green, with red veins and petioles; a very handsome form of vigorous growth and broad pyramidal habit. Intr. about 1870.—*A. g. pyramidalis* Dipp., f. Habit narrow-pyramidal: lvs. dark green, rather short and broad. K.B.1929:t.12(h). (*A. g. pyramidalis* Birkiana Hort.) Cult. 1880.—Besides these forms the following geographical vars. are sometimes cult.: *A. g. denticulata* (C. A. Mey.) Ledeb., var. Lvs. broad-elliptic, obtuse or short-acute, denticulate, not or slightly lobed except on vigorous shoots. M.D.1918:t.20. S.H.1:f.691. Cauc., W. Asia, Italy, N. Afr. Intr. 1759?—*A. g. barbata* (C. A. Mey.) Ledeb., var. Lvs. ovate-oblong, denticulate, beneath like the petioles pubescent. (*A. b. C. A. Mey.*) Cauc. Cult. 1870.

*A. g. × incana* = *A. hybrida* A. Br. Not uncommon in Eu. with the parents. R.I.12:f.1292(c). S.H.1:f.69s-s'. (*A. pubescens* Tausch, not Sartorelli, *A. ambigua* Beck, *A. spuria* Callier.)—*A. g. × rugosa*; see under No. 6.—*A. g. × cordata*; see under No. 12.

8. *A. tenuifolia* Nutt. Tree, occasionally to 10 m.; brts. slightly pubescent at first, finally light brown or often red; buds red; stipules ovate to lanceolate: lvs. ovate to ovate-oblong, 4–10 cm. long, rounded or less often subcordate or broad-cuneate at base, lobulate with obtuse lobes and usually obtusely toothed, usually yellowish green, glabrous or slightly pubescent and light green or sometimes glaucescent beneath; petiole 1.5–2.5 cm. long: stamens 4: strobiles 3–9, ovoid-oblong, 1–1.5 cm. long, on peduncles 3–8 mm. long. S.S. 9:t.455. (*A. incana* var. *virescens* S. Wats., *A. occidentalis* Dipp.) B. C. to L. Calif., e. to Sask., Colo. and N. Mex. Cult. 1880. Zone V. Small shrubby tree with slender brs. forming an ovoid round-topped head. Its more n. form with

larger more sharply toothed lvs. slightly glaucescent beneath has been distinguished as var. **occidentális** (Dipp.) Callier (*A. o.* Dipp.) Intr. 1891.

Related species: *A. rhombifolia* Nutt. Tree to 25 m.: lvs. ovate to elliptic, acute or obtuse, usually finely serrate, not lobulate, pubescent when young, later only below: stamens 2-3. S.S.9:t.456. Wash. to Idaho and S. Calif. Intr. about 1885. Zone V.—*A. oblongifolia* Torr. Tree to 10 m.: lvs. oblong-ovate to ovate-lanceolate, 4-8 cm. long, usually acute, cuneate, sharply and usually doubly serrate, not lobulate or slightly so, glabrous or puberulous below: stamens 2-3; strobiles 1.5-2.5 cm. long. S.S.9:t.457 (as *A. acuminata*). N. Mex. and Ariz. to n. Mex. Intr. ? Zone VII?

9. *A. rúbra* Bong. Tree to 20 m.; bark light gray, nearly smooth; brts. tomentulose at first, soon glabrous, finally dark red; buds red, scurfy: lvs. ovate to oblong-ovate, 7-12 cm. long, acute, broad-cuneate or truncate at base, lobulate and crenate-serrate with slightly revolute margin, at maturity glabrous above, grayish green or glaucous beneath and glabrous or with short rusty pubescence, with 12-15 pairs of veins; petiole and nerves red or yellow: strobiles 6-8, ovoid to ovoid-oblong, 1.5-2.5 cm. long, on stout orange-colored stalks or sessile. N.S.1:t.9(c). S.S.9:t.454. (*A. oregana* Nutt.) Alaska to Calif., e. to Idaho. Cult. 1884. Zone IV.—*A. r. pinnatisécta* Starker, var. Lvs. deeply pinnately lobed, with 5-7 pairs of oblong-ovate to oblong lobes. Jour. For. 37:416. Intr. 1939.

10. *A. hirsùta* (Spach) Rupr. Tree to 20 m.; brts. villous at first, later glabrous; buds pubescent: lvs. broad-ovate to elliptic-ovate, 8-14 cm. long, acute, rounded at base, coarsely doubly serrate and shallowly lobed, dark green above, glaucous and rufous-pubescent beneath; petiole 2-4 cm. long, pubescent: strobiles usually 3-4, ellipsoid to oblong-ovoid, 1.5-2 cm. long, short-stalked or sessile. S.I.2:t.3(c). M.K.t.29(c). G.F.10:473. S.L.82(h). (*A. tinctoria* Sarg., *A. incana* var. *h.* Spach.) N. E. Asia, N. Japan. Intr. about 1888. Zone IV. Handsome tree of broad-pyramidal habit and of vigorous growth while young.—*A. h. sibírica* (Spach) Schneid., var. Brts. glabrous or nearly so: lvs. hirsute only on the midrib and sparingly on the veins beneath. S.H.1:f.68h-h<sup>2</sup>,72l;2:f.557i. (*A. incana* var. *s.* Spach, *A. s.* Fisch. ex Komar.)

Related species: *A. Matsúmuræ* Callier. Lvs. smaller, broad-elliptic or obovate, emarginate, scarcely lobulate and nearly glabrous beneath. S.H.2:f. 557k. M.D.1918:t.15. (*A. incana* var. *emarginata* Matsum.) Japan. Intr. 1914. Zone V.

11. *A. incàna* (L.) Moench. SPECKLED *A.* Shrub or tree to 20 m.; brts. pubescent while young; bark smooth, light gray; stipules lanceolate: lvs. broad-elliptic to ovate, 4-10 cm. long, acute, usually rounded at base, doubly serrate and usually slightly lobulate, dull dark green above with impressed veins, glaucous or grayish green and pubescent or nearly glabrous beneath: strobiles 4-8, sessile or short-stalked, about 1.5 cm. long. H.W.2:16(h),t.13 (c). Eu., Cauc., N. Am. Long cult. Zone II. A very variable plant; the typical European form, distinguished as var. **vulgàris** Spach, is a shrub or tree to 20 m.: lvs. usually pubescent beneath, 4-8 cm. long; petiole more than ½ as long as blade. Eu., Cauc. Many forms of this var. are in cult.—*A. i. àurea* Dipp., f. Lvs. yellowish, pubescent beneath; brts. reddish yellow.—*A. i. coccínea* Schelle, f. Lvs. yellowish, nearly glabrous beneath: brts. reddish yellow.—*A. i. acuminàta* Reg., var. Lvs. lobed about halfway to the middle, with lanceolate serrulate lobes. S.H.1:f.72p. (*A. i. var. pinnatifida* Spach, f. *incisa* Dipp., var. *laciniata* Loud.)—*A. i. pinnatifida* Wahlenb. Lvs. small, deeply lobed, with broad serrate lobes. Mem. Soc. Nat. Mosc. 13:t.17,f.5,6. M.D.1918:t.21,f.13.—*A. i. pëndula* Callier, f. Brs. pendulous. Lustgard,4:143

(h).—**A. i. glauca** (Marsh.) Loud., var. Shrub, rarely small tree to 6 m.: lvs. usually glabrous and glaucous, 5–12 cm. long, sometimes pubescent beneath; petiole usually less than  $\frac{1}{2}$  of blade. Em.251,t. B.B.1:613. (*A. g. Michx.*, *A. i.* subvar. *americana* Reg.) Nfd. to Sask., s. to Pa., Iowa and Neb.—**A. i. tomo-phýlla** Fern., f. Form with deeply and irregularly dissected lvs.; not yet intr. *A. i. × rugosa*; see under No. 6.—*A. i. × glutinosa*; see under No. 7.—*A. i. × subcordata*; see under No. 13.—*A. i. × japonica*; see under No. 14.

12. **A. cordata** Desf. Tree to 15 m.; young brts. viscid, glabrous, finally reddish brown: lvs. suborbicular or broad-ovate, 5–10 cm. long, abruptly acuminate, cordate at base, serrulate, light green beneath, pubescent on the veins only when young and with axillary tufts of hairs; petiole about  $\frac{1}{2}$  as long as lf.: strobiles 1–3, ovoid, 1.5–2.5 cm. long, stalked. B.M.8658(c). B.S.1:179. G.C.III.19:285. (*A. cordifolia* Ten., *A. tiliacea* and *pyrifolia* Hort.) Italy, Corsica. Intr. 1820. Zone V. Round-headed tree with handsome glossy lvs. resembling those of a pear-tree.

*A. c. × glutinosa* = *A. elliptica* Requier. Lvs. obtuse or emarginate, rounded or subcordate at base; strobiles 2–5, smaller. M.D.1918:t.19,f.6,7. S.H.1:f.66q<sup>1</sup>. (*A. cordata* var. *nervosa* Hort.)

13. **A. subcordata** C. A. Mey. Tree to 15 m.; brts. usually pubescent, reddish brown; buds puberulous: lvs. ovate to oblong-ovate, 5–16 cm. long, short-acuminate, rounded or subcordate at base, serrate, usually pubescent on both sides while young, later glabrous above, light green and pubescent on the veins beneath; petiole  $\frac{1}{2}$ – $\frac{3}{4}$  as long as lf.: strobiles 1–4, oblong-ovoid, 1.5–2.5 cm. long, stalked. S.H.1:f.69a. (*A. cordifolia* var. *s.* Reg., *A. macrophylla* Hort.) Cauc., Persia. Cult. 1860. Zone VI. Tree with large broad lvs.

*A. s. × incana* = *A. Koehnei* Callier. Brts. more densely pubescent: lvs. usually elliptic, acute; strobiles short-stalked or nearly sessile. S.H.1:f.69b-c. (*A. orientalis* var. *pubescens* Dipp.) Orig. unknown.—*A. s. × japonica* = *A. Spaethii* Callier. Lvs. ovate-lanceolate, sharply serrate, violet-purple when unfolding. S.H.2:f.555n-o. Orig. before 1908.

Related species: *A. orientalis* Dene. Tree to 15 m.; brts. glabrous: lvs. rounded or broad-cuneate at base, glabrous. S.H.1:f.66r<sup>1</sup>. Syria. Cult. ?

14. **A. japónica** (Thunb.) Steud. JAPANESE *A.* Tree to 25 m.; brts. glabrous or slightly pubescent while young: lvs. narrow-elliptic to oblong-lanceolate, rarely ovate-oblong, 6–12 cm. long, acuminate, broad-cuneate, serrulate, glabrous or slightly pubescent when young, light green beneath; petiole 1.5–2.5 cm. long: strobiles 1–3, peduncled, about 1.5 cm. long. S.I.1:t.19(c). G.F. 6:345. (*A. maritima* var. *j.* Reg.) Japan, N. E. Asia. Intr. 1886. Zone V. Pyramidal tree with dense dark green foliage.—**A. j. arguta** (Reg.) Callier, var. Lvs. elliptic to elliptic-obovate, cuneate, irregularly or doubly serrate. M.K.t. 28(c). N. Jap. Intr. ?

*A. j. × incana* = *A. spectabilis* Callier. Lvs. dull green above and sometimes slightly lobed. S.H.1:f.69h-h<sup>1</sup>. Orig. before 1908.—*A. j. × subcordata*; see under No. 13.

Related species: *A. trabeculosa* Hand.-Mazz. Tree: lvs. elliptic to elliptic-oblong, acuminate, broad-cuneate to rounded at base, serrate, glabrous and green beneath, veins connected by conspicuous parallel veinlets: strobiles axillary, solitary, about 2 cm. long, short-stalked. I.S.1:t.16. (*A. Jackii* Hu.) S.E. China. Intr. 1926. Zone VI ?

15. **A. marítima** (Marsh.) Nutt. SEA-SIDE *A.* Shrub or sometimes tree to 10 m.; brts. pubescent at first, finally dull orange or reddish brown; buds acute, scurfy-pubescent: lvs. oblong or obovate, acute or short-acuminate, rarely obtuse, cuneate at base, remotely serrulate, 6–10 cm. long, lustrous dark green above, light green and glabrous or nearly so beneath: strobiles 1–3, about 2 cm. long, short-stalked. Fl.ix. S.S.9:t.458. (*A. oblongata* Reg., not Ait. nor

Willd.) Del., Md. and Okl. Intr. 1878. Zone V. Attractive in autumn with its dark green foliage and the yellow pendulous catkins.

Related species flowering in autumn is *A. nitida* Endl. Tree to 30 m.: lvs. ovate to ovate-oblong, entire or remotely serrulate, 6-10 cm. long, glabrous; staminate catkins up to 15 cm. long; strobiles about 2.5 cm. long, stalked. B.M. 7654(c). Himal. Intr. 1882. Zone VI.

16. *A. cremastogyne* Burk. Tree to 40 m.; brts. pubescent while young, soon glabrous, finally reddish brown or dark purple: lvs. obovate to obovate-oblong or elliptic, abruptly acuminate, broad-cuneate at base, regularly and rather remotely serrate, 6-14 cm. long, dark green above, light green and usually floccose-pubescent beneath while young, soon glabrous, rarely pubescent on the veins: catkins of both sexes solitary in the axils of the young lvs.: strobiles 1.5-2 cm. long on slender stalks 2-6 cm. long, pendulous; nutlets with broad membranous wings. E.P.IV.61:128. C.C.75. K.B.1913:164,t(h). W. China. Intr. 1908. Zone VII?

Closely related species: *A. lanata* Duthie. Lvs. rufous-pubescent beneath: stalks of the strobiles not exceeding 4.5 cm. W. China. Intr. 1908. Zone VII?

3. **CARPINUS L. HORNBEAM.** Deciduous trees or sometimes shrubs; brts. slender; bark gray, smooth or scaly; buds acute with many imbricate scales: lvs. more or less 2-ranked, with 7-24 pairs of straight veins, serrate: staminate catkins pendulous, inclosed in the bud during winter; fls. without perianth, each bract with 3-13 stamens 2-forked at apex; pistillate catkins terminal, slender; each bract with 2 fls. subtended each by 2 bractlets; perianth adnate to the ovary, with 6-10 teeth at apex; style short, with 2 linear stigmas; fr. a ribbed nutlet subtended by a large bract. Flowers in spring with the lvs.; fr. ripening in autumn. (The ancient name of the Hornbeam.) About 26 species from Eu. to E. Asia, s. to the Himal., and in N. and C. Am.—Small or medium-sized trees with usually short trunk and deliquescent stem and with handsome foliage; the pendulous light green fruiting catkins are attractive in some species. The wood is very hard and tough.

A. Lvs. with 7-15 pairs of veins: bracts of staminate fls. broad-ovate, subsessile; bracts of fruiting catkins ovate to lanceolate, not imbricate, chartaceous: bark smooth. (Sect. *EUCARPINUS* Sarg.)

B. Lvs. 4-12 cm. long, usually acuminate: fruiting bracts lobed at base.

C. Brts. glabrous or only slightly pubescent when young: fruiting bracts with a lobe on each side.

D. Lvs. acuminate or acute: fruiting bracts 2-5 cm. long.

E. Buds small, about 3 mm. long, hairy at first; fruiting bracts 5-7-nerved at base.

EE. Buds about 5 mm. long, glabrous; fruiting bracts 3-5-nerved.....1. *C. caroliniana*

DD. Lvs. cuspidate: fruiting bracts about 1.5 cm. long.....2. *C. Betulus*

CC. Brts. densely pubescent: fruiting bracts lobed only on one side.....3. *C. lasiflora*

BB. Lvs. 2.5-5, rarely 6 cm. long, usually acute: fruiting bracts without distinct lobes or with a very small lobe at base.....4. *C. Tschonoskii*

C. Bracts serrate on both sides.....5. *C. orientalis*

CC. Bracts not or slightly serrate on the inner side.....6. *C. Turczaninowii*

AA. Lvs. with 15-24 pairs of veins deeply impressed above: bracts of staminate fls. ovate-lanceolate, stipitate: fruiting bracts ovate, serrate, imbricate, membranous: bark scaly. (Sect. *DISTEGOCARPUS* Sarg.)

B. Lvs. ovate-lanceolate, 2.5-3.5 cm. broad, with 20-24 pairs of veins, usually rounded at base.....7. *C. japonica*

BB. Lvs. ovate, 4-7 cm. broad, with 15-20 pairs of veins, cordate at base.....8. *C. cordata*

1. *C. caroliniana* Walt. AMERICAN H. Small tree, rarely to 12 m.; trunk fluted: lvs. ovate-oblong, 6-12 cm. long, 2.5-6 cm. broad, acuminate, rounded or subcordate at base, sharply and doubly serrate, glabrous except pilose on the nerves beneath and with axillary tufts of hairs: fruiting catkins slender-stalked, 5-10 cm. long; bracts ovate to ovate-lanceolate, 2-3 cm. long, with short and broad lateral lobes, usually with 1-5 pointed teeth. S.S.9:t.447.

Em.t.199(c). (*C. americana* Michx.; BLUE BEECH.)—N. S. to Minn., s. to Fla. and Tex. Intr. 1812. Zone II. Handsome bushy tree with fluted trunk and slender often slightly pendulous brts.; lvs. turning scarlet and orange in autumn.—The tree described above is the northern form extending s. to N. C. and Ark. distinguished as var. *virginiana* (Marsh.) Fern. The southern form extending n. to s. Ill. and Va. has ashy-gray bark, smaller and narrower lvs. with shorter teeth; bracts with few blunt teeth or entire. Rh.37:t.394.

2. *C. Bétulus* L. EUROPEAN H. Tree to 20 m.: lvs. similar to those of the preceding species, ovate to ovate-oblong, cordate or rounded at base, to 12 cm. long, of somewhat thicker texture, with the veins more impressed above: fruiting catkins 7–14 cm. long; bracts 3–5 cm. long with ovate-lanceolate middle lobe and ovate lateral lobes, entire or remotely toothed on the margin. H.W. 2:31,32(h),t.17(c). E.P.61:29. E.H.3:t.148–152(h). G.C.53:397(h). Eu. to Persia. Long cult. Zone V. Used sometimes for tall hedges.—*C. B. purpurea* K. Koch, f. Lvs. purple when young, later green.—*C. B. incisa* Ait., var. Lvs. rather narrow, deeply lobed, with often nearly entire lobes. S.H.1:f.76d-d. (*C. B. asplenifolia* Hort., *C. B. f. heterophylla* Kirch.)—*C. B. quercifolia* Desf. Lvs. smaller than of *C. B. incisa*, deeply lobed with broader serrate lobes. S.H.1:f.76e-e<sup>2</sup>—*C. B. fastigiata* Jaeg., var. Of upright habit forming a narrow-pyramidal tree. (*C. B. pyramidalis* Moehl.)—*C. B. columnaris* Späth is similar but slenderer.—*C. B. pendula* Kirch., f. With pendulous brs.—*C. B. Carpinizza* (Host) Neill., var. Differs chiefly in the usually entire fruiting bracts and the smaller lvs. often cordate at base and with only 7–9 pairs of veins.

3. *C. laxiflora* Bl. Tree to 15 m.: lvs. ovate or elliptic, abruptly long-acuminate, obliquely rounded or subcordate at base, doubly serrate, 4–7 cm. long, glabrous beneath except in the axils of the veins: fruiting catkins loose, 5–7 cm. long; bracts slightly 3-lobed at base, with the middle lobe lanceolate, acute, serrate on one side; nutlets slightly resin-dotted. S.I.1:t.25(c). Japan. Intr. 1914. Zone V.—*C. l. macrostachya* Oliv., var. Lvs. ovate-oblong, not lobulate; fruiting catkins 6–9 cm. long; bracts obtusish, less distinctly lobed at base. H.I.20:1989. (*C. Fargesii* Franch.) W. and C. China. Intr. 1900. Zone VI?

4. *C. Tschonoskii* Maxim. Tree to 15 m.; young brts. and petioles soft-pubescent: lvs. elliptic-ovate to ovate-oblong, acuminate, rounded at base, irregularly or doubly, rather finely serrate, with mucronulate teeth, 4–9 cm. long, pubescent on both sides when young, later only pilose on the nerves beneath, with 12–15 pairs of veins; fruiting catkins 5–7 cm. long, with pubescent stalk and rachis; bracts ovate to lanceolate, acute, serrate on one side, with a small lobe at base of the entire side; nutlet glabrous. S.I.2:t.11(c). I.S.3:t.117. N.K.2:t.9. (*C. yedoensis* Maxim., *C. Fauriei* Nakai.) Japan, N. E. Asia, N. China. Intr. 1894. Zone V. Graceful shrubby tree.

Closely related species: *C. Henryana* Winkl. Lvs. ovate-lanceolate, simply and rather coarsely serrate, 4–7 cm. long; bracts ovate; nutlet puberulous. I.S. 3:t.124. B.J.50 (Suppl.):507.f.7. (*C. Tschonoskii* var. *H. Winkl.*) C. and W. China. Intr. 1907. Zone VI?—*C. Fargesiana* Winkl. Tree to 20 m.: lvs. ovate to elliptic-oblong, short-acuminate, doubly serrate, 4–6.5 cm. long; bracts semi-ovate; nutlets pilose at apex and sparingly glandular, otherwise glabrous. E.P. IV.61:f.10g. I.S.3:t.118. (*C. yedoensis* Winkl., not Maxim.) China. Intr. 1920. Zone V.—*C. eximia* Nakai. Tree to 10 m.: lvs. ovate to ovate-oblong, doubly serrate, 8–10 cm. long, pubescent above and on the veins beneath, pairs of veins 14–16; bracts semi-ovate, about 2.5 cm. long; nutlet pilose at apex and sparingly glandular. N.K.2:t.8. Korea. Intr. 1921. Zone V?

5. *C. orientalis* Mill. Shrub or small tree to 5 m.; young brts. and petioles

silky-pubescent: lvs. ovate or elliptic-ovate, acute, usually rounded at base, sharply and doubly serrate, 2.5–5 cm. long, lustrous and dark green above, glabrous beneath except pilose on the midrib, with 11–15 pairs of veins: fruiting catkins 3–6 cm. long, with ovate bracts serrate on both sides, pilose below; nutlet pilose at apex. R.I.12:t.634(c). H.W.2:34. S.H.1:140. (*C. duinensis* Scop.) S. E. Eu., Asia Minor. Intr. 1739. Zone V.

6. *C. Turczaninowii* Hance. Small tree to 5 m.; brts. and petioles tomentulose; stipules linear, persistent during the winter: lvs. ovate to broad-ovate, acute, usually rounded at base, doubly serrate, 3–5 cm. long, pilose on the nerves beneath and bearded in the axils, with 10–12 pairs of veins: fruiting catkins 3–4 cm. long, slender-stalked; bracts semi-ovate, acute, or obtuse, incisely serrate on one side, on the other with 1–3 small teeth at apex and with a very small lobe at base; nutlet resin-dotted. E.P.IV.61:34.f.10a–c, 11. N.K. 2:t.12. I.S.3:t.116. (*C. Parü* Winkl., *C. stipulata* Winkl.) N. China, Korea. Intr. 1905. Zone V. Graceful shrubby tree with small foliage.—*C. T. ovalifolia* Winkl., var. Lvs. ovate or nearly ovate-oblong, scarcely doubly serrate, 3–6 cm. long: bracts not lobulate at base. E.H.3:t.201.f.5. (*C. Turczaninowii* Franch., not Hance, *C. polynura* Burk. in part, not Franch.) W. China. Intr. 1889. Zone V.

7. *C. japonica* Bl. Tree to 15 m.; young brts. pubescent: lvs. oblong-ovate to oblong-lanceolate, acuminate, rounded or subcordate at base, irregularly and sharply serrate, 5–10 cm. long, glabrous or nearly so except brownish pubescent beneath on the nerves while young, with 20–24 pairs of veins: fruiting catkins slender-stalked, ovoid-oblong, 5–6 cm. long; bracts ovate, dentate, appressed and overlapping, about 2 cm. long; nutlet covered by a small bractlet opposite to the bract. S.I.1:t.24(c). G.F.6:365. R.H.1895:427. G.C. 66:107. (*C. carpinoides* Mak., *Distegocarpus Carpinus* Sieb. & Zucc.) Japan Intr. 1879, 1892. Zone IV. Small tree with handsome lvs.

8. *C. cordata* Bl. Tree to 15 m.; young brts. and petioles slightly hairy at first, soon glabrous; terminal winter-bud about 2 cm. long: lvs. ovate to oblong-ovate, acuminate, cordate at base, irregularly and doubly serrate, 7–12 cm. long, slightly pubescent on the veins beneath or glabrous, with 15–20 pairs of veins: fruiting catkins slender-stalked, 6–8 cm. long; bracts appressed, overlapping, dentate, inflexed at the base and covering the nutlet. S.I.1:t.24(c). K.M.t.22(c). G.F.8:295. N.K.2:t.6. Japan, N. E. Asia, N. and W. China. Intr. 1879. Zone V. Small tree with large handsome foliage.—*C. c. chinensis* Franch., var. Brts. and petioles densely pubescent: lvs. smaller. S.H.2:f.558f. C. and W. China. Intr. 1901. Zone V.

4. *OSTRYA* Scop. HOP-HORNBEAM. Deciduous trees; bark scaly, rough; buds pointed, with many imbricate scales: lvs. doubly serrate, generally ovate to oblong-ovate: staminate catkins slender, pendulous, naked during the winter: fls. without perianth, each bract with 3–14 stamens, the filaments bifid at apex; pistillate catkins upright, slender, with 2 fls. in the axil of each deciduous bract; calyx adnate to the ovary which is enclosed in a tubular involucre formed by the union of a bract and 2 bractlets and open at the apex; stigmas 2, linear: fr. a ribbed nutlet, enclosed by the bladder-like involucre with rigid hairs at base, these imbricated into a short, slender-stalked pendulous strobile. Flowers appearing in spring with the lvs.; frs. ripening in autumn. (The ancient Greek name of a tree with hard wood.) Seven species in N. and C. Am., and in Eu. and in W. and E. Asia.—Ornamental

small or medium sized round-headed trees with handsome foliage and attractive in autumn with their light green fruits.

a. Lvs. acuminate, 4-12 cm. long.

b. Lvs. slightly pubescent or nearly glabrous, with 11-15 pairs of veins.

c. Nutlet ovoid: petioles 5-10 mm. long, glandless; lvs. usually rounded at base.

cc. Nutlets spindle-shaped: petioles 3-6 mm. long, like the brts. often with stalked glands: lvs. usually subcordate..... 1. *O. carpinifolia*

bb. Lvs. soft-pubescent beneath, with 9-12 pairs of veins: nutlet narrow-ovoid..... 2. *O. virginiana*

aa. Lvs. acute or obtusish, 3-5 cm. long, with 5-8 pairs of veins..... 3. *O. japonica*  
4. *O. Knowltonii*

1. *O. carpinifolia* Scop. EUROPEAN H. Tree to 20 m.; bark gray; young brts. pubescent: lvs. ovate to ovate-oblong; acuminate, usually rounded at base, sharply and doubly serrate, 4-10 cm. long, dark green and sparingly hairy above, sparingly hairy chiefly on the nerves beneath, with 12-15 pairs of veins: fruiting clusters 3.5-5 cm. long; nutlet ovoid, 4-5 mm. long, with a tuft of hairs at apex. H.W.2:35,t.18(c). R.H.1895:188(h),189. G.C.III.8:274. E.H.3:t.153(h). (*O. italica* Winkl., *O. vulgaris* Willd.) S. Eu., Asia Minor. Intr. 1724. Zone V.

2. *O. virginiana* (Mill.) K. Koch. AMERICAN H. Tree to 20 m., similar to the preceding species; bark brown: lvs. 6-12 cm. long, usually subcordate at base: nutlets spindle-shaped, 6-8 mm. long, glabrous at apex. S.S.9:t.545. Gn.24:230,231. (*O. virginica* Willd., *O. italica* subsp. v. Winkl.—IRONWOOD.) Cape Breton, Ont. and Minn. to Fla. and Tex. Intr. 1690. Zone IV.—*O. v. glandulosa* (Spach) Sarg., var. Young brts., petioles and peduncles with stalked glands. (*O. virginica* var. *g.* Spach.) The northern form.

3. *O. japonica* Sarg. JAPANESE H. Tree to 25 m.; similar to *O. carpinifolia*; brts. densely pubescent: lvs. irregularly, but scarcely doubly serrate, soft-pubescent on both sides: nutlet oblong-ovoid, 5-6.5 mm. long, glabrous at apex. S.I.1:t.25(c). K.M.t.24(c). G.F.6:384. (*O. virginica* var. *j.* (Sarg.) Burk.) Japan, N. E. Asia, China. Intr. 1888. Zone V.

4. *O. Knowltonii* Cov. Tree to 10 m.; bark gray; lvs. ovate to elliptic, acute, sometimes obtusish, usually rounded at base, sharply serrate, 2.5-5 cm. long, soft-pubescent beneath, with 5-8 pairs of veins: fruiting catkins about 3 cm. long; nutlets oblong-ovoid, 6 mm. long, pilose at apex. S.S.9:t.446. G.F.7:115. N. Ariz. Intr. 1914. Zone V.

5. *OSTRYÓPSIS* Dene. Deciduous shrubs; buds acute, with many imbricate scales: lvs. ovate, doubly serrate, plicate in bud: staminate fls. in pendulous, oblong-cylindric catkins, naked during winter; each bract with 4-6 stamens; fls. without perianth; filaments bifid at apex; anthers pilose at apex; pistillate fls. in very short spikes, each bract with 2 fls., fl. enclosed in a 3-fid involucre; calyx adnate to the ovary; ovary with one ovule in each cell; style bifid: fr. a small nutlet enclosed in a tubular involucre 3-fid at the apex; cotyledones above ground, green. Fls. appearing with the lvs. (*Ostrya* and Greek *opsis*, appearance.) Two species in China.

*O. Davidiana* Dene. Shrub to 3 m., suckering from the base; young brts. pubescent: lvs. broad-ovate, acuminate, cordate at base, doubly serrate and usually lobulate, 3-7 cm. long, with scattered hairs above, pubescent and gland-dotted beneath; petioles about 5 mm. long; frs. 6-12 in a long-stalked dense cluster; involucre about 1.2-1.8 cm. long, finally splitting open on one side; nutlet ovoid, beaked, about 8 mm. long. L.I.t.3. E.P.IV.61:19. N. and W. China. Intr. about 1865. Zone V. Small shrub similar to a small-leaved

hazel, but may be distinguished by the sessile red glands on the under side of the leaf.

Related species: *O. nobilis* Balf. & W. W. Sm. Differs chiefly in larger, 4-12 cm. long, scarcely lobulate lvs. brownish tomentose beneath. S. W. China. Intr. ?

**6. CORYLUS L. HAZEL.** Deciduous shrubs, rarely trees; buds obtuse, rarely acute, with many imbricate scales: lvs. generally ovate, usually doubly serrate and more or less pubescent, conduplicate in bud: staminate catkins cylindric, pendulous, naked during the winter; fls. without perianth, each bract with 4-8 stamens, filaments bifid, anthers pilose at apex; pistillate inflorescence head-like enclosed in a small scaly bud, with only the red styles protruding; ovaries with 1, rarely 2 ovules in each cell; style bifid to the base: fr. a subglobose or ovoid nut, with ligneous pericarp, included or surrounded by a large leafy variously toothed or dissected involucre, often tubular, in clusters at the end of the brts.; cotyledons thick, fleshy, remaining inclosed in the nut. Fls. appearing before the lvs. in early spring; frs. ripening in autumn. (The ancient Latin name.) About 15 species in N. Am., Eu., and temp. Asia.—Large shrubs or trees, some cult. for their edible nuts and some for ornament.

- A. Involucre spiny: lvs. glabrous except pubescent on the veins beneath, teeth acuminate: winter-buds acute.....Sect. ACANTHOCHELYMIS Spach.
  - 1. *C. tibetica*
- AA. Involucre not spiny: lvs. usually pubescent, teeth scarcely acuminate: winter-buds obtuse.
  - Sect. AVELLANA Spach.
    - B. Involucre divided into linear recurved lobes; petiole about 2 cm. long.
      - C. Involucre campanulate, deeply divided, glandular.....2. *C. Colurna*
      - CC. Involucre tubular, contracted above the nut into a short tube with recurved lobes.
        - 3. *C. chinensis*
    - BB. Involucre irregularly divided into lanceolate to ovate lobes: petiole usually about 1 cm. long.
      - C. Involucre consisting of 2 distinct or partly connate bracts.
        - D. Lobes of involucre dentate-serrate.
          - E. Involucre not or only slightly longer than nut.....4. *C. Avellana*
          - EE. Involucre about twice as long as nut, usually tightly inclosing it.
            - 5. *C. americana*
        - DD. Lobes of involucre triangular-ovate, entire or sparingly dentate..6. *C. heterophylla*
      - CC. Involucre tubular.
        - D. Involucre pubescent, slightly contracted into a wide tube.....7. *C. maxima*
        - DD. Involucre setose, abruptly contracted above the nut.
          - E. Petiole 1.5-2.5 cm. long: anthers reddish.....8. *C. Sieboldiana*
          - EE. Petiole 6-12 mm. long: anthers yellow.....9. *C. cornuta*

**1. C. tibetica Batal. TIBETAN H.** Shrubby tree to 8 m.; brts. glabrous, brown, with conspicuous lenticels: lvs. broad-ovate to obovate, subcordate or rounded at base, long-acuminate, unequally and sharply serrate, 5-12 cm. long, with silky hairs on the veins beneath; petioles 1.5-2.5 cm. long: bracts of staminate fls. acuminate, glabrous at apex: nuts 3-6 with spiny and glabrous involucre forming a bur about 4-5 cm. across; nut subglobose, compressed, 1-1.5 cm. long. V.F.206(h). R.H.1910:203,t(c). M.O.432. (*C. ferox* var. *t.* Franch.) C. and W. China. Intr. 1897. Zone VI. Remarkable for its fruit-clusters which resemble the burs of the chestnut.

*C. t.* × *Avellana* = *C. spinescens* Rehd. Similar in habit and lvs. to *C. tibetica*: involucre of fr. with a few spiny bristles on the face, its lobes and teeth ending in rigid spiny points. Orig. before 1911. Zone V.

The closely related *C. ferox* Wall. with narrower more oblong lvs. and pubescent spiny involucre from the Himal. is tenderer. E.P.IV.61:45. Intr. 1924.

**2. C. Colurna L. TURKISH H.** Tree to 25 m.; bark light yellowish gray; brts. glandular-pubescent, older brs. furrowed, corky: lvs. broadly ovate to obovate, acuminate, cordate at base, doubly serrate or crenate-serrate and

sometimes lobulate, 8-12 cm. long, nearly glabrous above, pubescent on the nerves beneath; petioles 1.5-2.5 cm. long, glandular-pubescent at first: staminate catkins 5-7 cm. long: frs. clustered; involucre deeply divided into linear recurved glandular lobes; nut 1.5-2 cm. across. B.M.9469(c). G.C.40:257(h). Gn.31:260,261. E.H.3:t.147(h). Gt.54:532;62:355(h). S. E. Eu., W. Asia. Intr. 1582. Zone IV. Tree of regular pyramidal habit.—*C. C. glandulifera* DC., var. Petioles, peduncles and involucre glandular-setose. R.I.12:t.638,f. 1303(c).

*C. c. × Avellana* = *C. colurnoides* Schneid. Shrubby tree with short-acuminate, more sharply serrate lvs.; involucre glandular-setose, divided to about the middle into narrow dentate lobes sometimes partly connate. Goeschke, Haseln. t.76. S.H.1:f.83r. (*C. intermedia* Lodd., not Fingerh.) Orig. before 1835.

Closely related species: *C. Jacquemontii* Dene. Lvs. distinctly obovate and sharply serrate; involucre not glandular-bristly. K.B.1913:163,t. (*C. colurna* var. *lacera* A.DC.) Himal. Cult. 1898.

3. *C. chinensis* Franch. CHINESE H. Tree to 40 m.; bark furrowed, light colored; brts. brown, pilose and glandular: lvs. ovate to ovate-oblong, acuminate, very oblique and cordate at base, doubly serrate, not lobulate, 10-18 cm. long, glabrous above, pubescent on the nerves beneath; petiole 1-2.5 cm. long, sometimes longer, pubescent and glandular: frs. 4-6, clustered; involucre, striate, finely pubescent, much contracted above the nut into a short tube divided into linear lobes usually forked at apex; nut subglobose, about 1.5 cm. across. C.C.73. E.P.IV.61:f.14h,15. S.H.2:f.560c,561d. M.O.t.40. C. and W. China. Intr. 1895. Zone V. Tree with spreading brs. forming a broad-oval head.

*C. c. × Avellana* = *C. Vilmorinii* Rehd. Similar to *C. chinensis* in habit: lvs. smaller and less cordate; involucre little constricted above the nut, occasionally split to the base on one side, divided above the apex of the nut into lacinate and toothed nearly upright lobes; nut larger, with thinner shell. Orig. before 1911.

4. *C. Avellana* L. EUROPEAN H. Shrub to 5 m.; brts. glandular-pubescent: lvs. suborbicular to broad-obovate, abruptly acuminate, cordate at base, doubly serrate and often slightly lobulate, 5-10 cm. long, slightly pubescent or nearly glabrous above, pubescent beneath, particularly on the nerves; petioles 8-15 mm. long; staminate catkins 3-6 cm. long: frs. 1-4; involucre shorter or rarely slightly longer than the nut, deeply and irregularly divided into narrow, often toothed lobes; nut globose to ovoid, 1.5-2 cm. long. H.W. 2:28,t.16(c). R.I.12,t.636(c). Eu. Long cult. Zone III? The larger fruited forms of this species are much cult. for the edible nuts.—*C. A. aurea* Kirchn., f. Lvs. yellow; brts. yellowish. Goeschke, Haseln., t.8.—*C. A. fusco-rubra* Dipp., f. Lvs. dull purple or brownish red. Goeschke, Haseln., t.4. (*C. A. f. atropurpurea* Winkl., *C. A. var. purpurea* Bean.)—*C. A. heterophylla* Loud., var. Lvs. pinnately lobed with acute serrate lobes. Goeschke, Haseln., t.5. S.H.1:146,f.83d. (*C. A. f. laciniata* Kirchn., var. *pinnatifida* Hort.)—*C. A. pándula* Dipp., f. With pendulous brs. Goeschke, Haseln., t.7. G.W.2:13; 19:94(h).—*C. A. contórta* Bean, var. With twisted and curled brs. G.C.III. 16:380. Intr. before 1863.—*C. A. grándis* Ait., var. COBNU. Nut large, usually subglobose. R.I.12:t.638,f.1302(c).—*C. A. póntica* (K. Koch) Winkl., var. Lvs. suborbicular, pubescent beneath; petioles short; involucre longer than the nut, with much divided spreading lobes; nut large, broad-ovoid. F.S.21,t.2223-4(c). Goeschke, Haseln., t.13,14,29. Jour. N. Y. Bot. Gard. 14: 13,t.3(h). (*C. p. K. Koch.*) Cauc.

*C. A. × tibetica*; see under No. 1.—*C. A. × Colurna*; see under No. 2.—*C. A. × chinensis*; see under No. 3.—*C. A. × maxima*; see under No. 7.

5. *C. americana* Marsh. AMERICAN H. Shrub to 3 m.; young brts. and

petioles glandular-pubescent: lvs. broad-ovate or oval, short-acuminate, rounded or subcordate at base, irregularly and doubly serrate, 6–12 cm. long, sparingly pubescent above, soft-pubescent beneath; petioles 8–15 mm. long: staminate catkins 3.5–7 cm. long: frs. 2–6, rarely solitary; involucre about twice as long as nut, usually tightly enclosing it, deeply and irregularly lobed, downy and often glandular-bristly; nut subglobose, about 1.5 cm. across. B.B.1:607. Goeschke, Haseln., t.71,72. (*C. calyculata* Dipp.) N. E. to Sask. and s. to Fla. Intr. 1798. Zone IV.

6. *C. heterophylla* Fisch. Shrub or small tree to 7 m.; brts. and petioles glandular-hairy: lvs. orbicular-ovate to obovate, abruptly acuminate from a usually nearly truncate apex, cordate or rounded at base, irregularly serrate and usually lobulate, particularly near the apex, 5–10 cm. long, glabrous above, pubescent on the nerves beneath; petiole 1–2 cm. long: frs. usually 1–3; involucre campanulate, longer than the nut, striate, glandular-setose near the base, with 6–9 triangular, entire or sparingly dentate lobes; nut subglobose, about 1.5 cm. across. S.I.1:t.20(c). N.K.2:t.1. E.P.IV.61:49,f.14b. N. E. Asia, Japan. Intr. 1882 or earlier? Zone V.—*C. h. sutchuenensis* Franch., var. Lvs. less truncate at apex and usually glabrous or glabrescent beneath: lobes of the involucre often dentate and involucre sometimes shorter than nut. C. and W. China. Intr. 1909. Zone V.—*C. h. yunnanensis* Franch., var. Lvs. densely soft-pubescent beneath; petioles 5–10 mm. long, like the young brts. densely pubescent and stipitate-glandular. S. W. China. Intr. about 1910.—The typical form is easily recognized by the broad truncate and abruptly acuminate apex of its lvs., a character usually not so pronounced in the varieties.

7. *C. máxima* Mill. FILBERT. Shrub or sometimes small tree to 10 m.; young brts. and petioles glandular-hairy: lvs. roundish-ovate to broad-obovate, abruptly acuminate, cordate at base, doubly serrate and usually lobulate, 7–14 cm. long; petioles 8–15 mm. long: staminate catkins 5–7 cm. long: frs. 1–3; involucre tubular, about twice as long as nut, downy and setose-glandular at base, at the apex irregularly lobed with serrate lobes; nut ovoid-oblong; kernel with thin red or white skin. H.W.2:30. E.P.IV.61:49,f.14a. R.I.12,t.637(c). (*C. tubulosa* Willd.) S. E. Eu., W. Asia. Long cult. Zone IV.—*C. m. purpurea* (Loud.) Rehd., var. Lvs. dark purple. Goeschke, Haseln. t.57. F.E.21325(h). (*C. m.* var. *atropurpurea* Bean, *C. Avellana* var. *p.* Loud.)

Hybrids of this species and *C. Avellana* are occasionally planted for their fruits. The involucre is more deeply divided and often little longer than the nut, sometimes split nearly to the base on one side. Goeschke, Haseln. t.65–70.

8. *C. Sieboldiana* Bl. JAPANESE H. Shrub to 5 m.; brts. hairy; lvs. elliptic or obovate to oblong, acuminate, usually rounded at base, doubly serrate and slightly lobulate, 5–10 cm. long, nearly glabrous above, pilose on the veins beneath, often with a red blotch in the middle when young; petiole 1.5–2 cm. long: nuts 1–3; involucre tubular, 1.5–4 cm. long, much constricted above the nut, divided at the apex into short entire lobes, densely covered with loosely accumbent bristles; nut conical. S.I.1:t.20(c). N.K.2:t.4. E.P. IV.61:f.16b. (*C. rostrata* var. *S.* (Bl.) Maxim.) Japan. Cult. 1904. Zone V.—*C. s. mandshurica* (Maxim.) Schneid., var. MANCHURIAN H. Lvs. usually cordate at base, more distinctly lobulate, chiefly near apex, 7–12 cm. long, pubescent beneath chiefly on the veins; petiole to 2.5 cm. long: involucre slightly contracted above the nut, to 5 cm. long, with spreading bristles. B.M. 8623(c). N.K.2:t.3. E.P.IV.61:f.14e. (*C. m.* Maxim. & Rupr.) N. E. Asia to

N. China and N. Japan. Intr. 1882. Zone IV. The var. is a vigorous shrub; its large bristly frs. conspicuous in fall.

9. *C. cornuta* March. BEAKED H. Shrub to 3 m.; young brts. slightly hairy: lvs. ovate to obovate, rarely ovate-oblong, acuminate, subcordate at base, densely serrate and sometimes lobulate, 4-10 cm. long, glabrescent above, downy beneath on the nerves; petioles 6-15 mm. long; frs. 1-2; involucre tubular, much constricted above the nut, 2.5-4 cm. long, densely bristly; nut ovoid, 1-1.5 cm. long, thin-shelled. B.B.1:607. G.F.8:345. S.H. 1:f.83i-k,87a-c. (*C. rostrata* Ait.) Que. to Sask., s. to Mo. and Ga. Intr. 1745. Zone IV.

Closely related species: *C. californica* (A.DC.) Rose. CALIFORNIAN H. Similar to the preceding species: leaves more downy beneath, cordate at base: fr. with a short beak about as long or little longer than the nut. E.P.IV.61:f. 14d. A.I.1:510. (*C. rostrata* var. *c.* A.DC.) Wash. to Cal. Intr. 1910. Zone V.

## Fam. 12. FAGACEAE A. Br. BEECH FAMILY

Deciduous or evergreen trees, rarely shrubs; buds with imbricate scales: lvs. alternate, petioled, penninerved, entire, dentate to pinnately lobed, stipulate with usually deciduous stipules: fls. monoecious, usually axillary on the young shoots; perianth 4-7-lobed; staminate spikes slender, each bract with 1 fl.; stamens as many or twice as many as perianth-lobes, rarely more; filaments usually slender; pistillate fls. solitary or in 3's forming spikes or short clusters, sometimes at base of the staminate spikes; ovary inferior, 3- or rarely 6-celled at base, with 3 styles, each cell with 2 ovules; fr. a nut 1-seeded by abortion, solitary or 2-3, partly or wholly enclosed by an involucre or cupula; seed without albumen; cotyledons fleshy.—Six genera with over 600 species in the temp. and subtrop. regions of both hemispheres.

- A. Staminate and pistillate fls. solitary or in stalked heads: involucre 2-4-lobed; nuts triangular: lvs. 2-ranked, entire or shallowly toothed: cotyledons above ground, green.
- B. Staminate and pistillate fls. solitary or 3: lvs. evergreen or deciduous, usually small: involucre with transverse entire or toothed scales.....1. *Nothofagus*
- BB. Staminate fls. in many-fl. heads: pistillate fls. 2: lvs. deciduous, rather large: involucre with prickly, subulate or bract-like appendages, with 2 nuts.....2. *Fagus*
- AA. Staminate fls. in slender spikes; pistillate fls. solitary or in spikes; involucre not or irregularly splitting: cotyledons remaining in the seed.
- B. Staminate fls. in upright spikes.
  - c. Lvs. deciduous, dentate, 2-ranked: ovary 6-celled; 1-3 frs. in one symmetrical prickly involucre: terminal bud wanting.....3. *Castanea*
  - CC. Lvs. evergreen, entire or dentate: ovary 3-celled: terminal bud present.
    - d. Involucre usually spiny, asymmetrical, usually wholly enclosing the 1-3 frs.: lvs. usually 2-ranked.....4. *Castanopsis*
    - DD. Involucre of fr. not spiny, usually cup-shaped; nut always solitary; styles cylindric with the stigma at apex: lvs. not 2-ranked.....5. *Lithocarpus*
  - BB. Staminate fls. in pendulous catkins; styles flattened, with the stigma on the upper surface: lvs. entire to lobed, deciduous or evergreen.....6. *Quercus*

1. **NOTHOFAGUS** Bl. Deciduous or evergreen trees or shrubs: lvs. usually small, 1-5 cm. long, rarely larger, short-petioled, usually plicate in bud, entire or serrate: staminate fls. short-stalked, solitary or in 3-fl. cymes; stamens 8-40; calyx campanulate, 4-6-lobed: pistillate fls. 1-3, in a sessile or short-stalked involucre: nuts 3-angled, usually 3 in a 2-4-lobed involucre bearing outside transverse, entire, toothed or lobed lamellae, with or without gland-tipped appendages. (*Fagus* with prefix *nothos*, Greek for spurious; probably mistake for *notos* south, referring to the southern habitat.) About 17 species in antarctic S. America, Australia and N. Zeal.—Little known in cult. and probably hardy only near the southern limit of our area.

- A. Lvs. evergreen, 1.5-3.5 cm. long.....1. *N. fusca*
- AA. Lvs. deciduous.
  - B. Lvs. 1-3 cm. long.....2. *N. antarctica*
  - BB. Lvs. 3.5-7 cm. long.....3. *N. obliqua*

1. *N. fúscá* (Hook. f.) Oerst. Tree to 35 m.; brts. zigzag, puberulous: lvs. broad-ovate to suborbicular, acute or rounded at apex, cuneate to truncate at base, coarsely dentate, 1.5-3.5 cm. long, glabrous except ciliate on the margin, with usually 3-4 pairs of veins; petioles pubescent, 2-4 mm. long: involucre sessile, scarcely 1 cm. long, 4-lobed, with large toothed lamellae, with 3 nuts. Kirk, For. Fl. N. Zeal. t.90. Gn.88:845. (*Fagus f.* Hook. f.) N. Zeal. Intr. about 1880. Zone VII?

Related species: *N. betuloides* (Mirb.) Bl. Tree with viscid young shoots and ovate, serrulate, very close-set lvs. 1-2.5 cm. long. G.C.33:11. Chile. Intr. 1830.—*N. cliffortioides* (Hook. f.) Oerst. Tree with entire lvs. 6-15 mm. long. Cheeseman, Ill. N. Zeal. Fl. 2:t.183. N. Zeal. Intr. about 1880? Zone VII?—*N. Dombeyi* Bl. Tree: lvs. ovate to ovate-lanceolate, 2-3.5 cm. long, finely toothed, lustrous above, black-dotted on both sides. Chile. Intr. 1916.

2. *N. antártica* (Forst.) Oerst. Tree to 35 m.; brts. tomentulose: lvs. broad-ovate to oblong, obtuse, truncate or cordate at base, irregularly crenulate or serrulate and sometimes lobulate, 1.5-3 cm. long, glabrous except puberulous on the midrib beneath, with 3-4 pairs of veins; petioles puberulous, 2-5 mm. long: involucre 4-lobed, with entire lamellae; nuts 3. B.M.8314(c). B.S.2:98. (*Fagus a.* Forst.) Chile. Intr. 1830. Zone VII?

3. *N. obliqua* (Mirb.) Bl. Tree to 35 m.; brts. glabrous; lvs. ovate to oblong-ovate, obtuse or acutish, rounded or broad-cuneate at base, serrate, lobulate below the middle, 3-7 cm. long, glabrous, with 8-11 pairs of veins; petioles about 6 mm. long; staminate fls. solitary, with 30-40 stamens: involucre 4-lobed, with 2 triangular and one flattened nut. J.L.37:53,f.25. Gn. 83:511;88:831. (*Fagus o.* Mirbel.) Chile. Intr. 1849. Zone VII?

Related species: *N. procéra* (Poepp. & Endl.) Oerst. Tree: lvs. oblong, rounded at both ends, doubly and finely serrate, 3-10 cm. long and 14-18 pairs of veins pubescent beneath. Chile. Intr. 1913. Zone VII?

2. **FÁGUS L. BEECH.** Deciduous trees; bark smooth; buds elongated, acute: lvs. 2-ranked, dentate or nearly entire, plicate in bud: staminate fls. many, in slender-peduncled heads; perianth 4-7-lobed, stamens 8-16; pistillate fls. usually 2, surrounded by numerous bracts united below into a 4-parted peduncled involucre; styles 3, slender, recurved: nuts ovoid, triangular, 1 or 2 in a woody 4-valved involucre covered outside with prickly or bract-like, rarely short and deltoid appendages. Fls. appear with the lvs.; frs. ripen in fall. (The ancient Latin name of the beech.) Ten species in the temp. regions of the n. hemisphere; in Am. s. to Mex.—Ornamental trees with handsome lvs.; the nuts are edible and contain oil. An important timber tree in Eu.

A. Stalk of involucre stout, 5-25 mm. long, pubescent: lvs. green beneath.

B. Appendages of involucre all subulate.

cc. Lvs. with 9-14 pairs of veins, serrate.....1. *F. grandifolia*

cc. Lvs. with 5-9 pairs of veins, denticulate.....2. *F. sylvatica*

BB. Appendages at base of involucre bract-like, linear to spatulate.

cc. Lvs. broadest above the middle, nearly entire; stalk of fr. 2-2.5 cm. long.

3. *F. orientalis*

cc. Lvs. broadest below the middle; stalk of involucre 5-1.5 cm. long.....4. *F. Sieboldii*

BBB. Appendages deltoid, very short and closely appressed.....5. *F. lucida*

AA. Stalk of involucre slender, 2.5-7 cm. long, glabrous or nearly so: lvs. glaucescent beneath.

B. Involucre about as long as nut.

cc. Lvs. pubescent beneath; petioles 1-2 cm. long: appendages of involucre all subulate.

6. *F. longipetiolata*

cc. Lvs. glabrous beneath; petioles 5-10 mm. long; appendages at base of involucre

bract-like.....7. *F. Engleriana*

BB. Involucre about half as long as nut, covered with short deltoid processes: lvs. glabrous

beneath.....8. *F. japonica*

1. *F. grandifolia* Ehrh. AMERICAN B. Tree to 30, rarely to 40 m.; bark light gray; winter-buds lustrous brown: lvs. ovate-oblong, acuminate, usually

broad-cuneate at base, coarsely serrate, 6–12 cm. long, dark bluish green above and light green and usually glabrous below at maturity, silky when unfolding; petiole 3–8 mm. long: involucre with slender straight or recurved prickles, about 2 cm. long; stalk 5–10 mm. long. S.S.9:t.444. Em.182,t(c). G.F.8:125(h). A.G.12:711(h). (*F. ferruginea* Ait., *F. americana* Sweet, *F. atropunicea* Sudw.) N. B. to Ont., s. to Fla. and Tex. Intr. about 1800. Zone III.—*F. g. pubescens* Fern. & Rehd., f. Lvs. more or less soft-pubescent beneath.—*F. g. caroliniana* (Loud.) Fern. & Rehd., var. Lvs. darker green and of firmer texture, ovate to obovate, less coarsely toothed: involucre rufous-tomentose, prickles shorter and fewer. (*F. ferruginea* var. *c.* Loud.) E. Mass. and s. Ill. to Fla. and Tex. Cult. 1836. Zone V.

2. *F. sylvatica* L. EUROPEAN B. Tree to 30 m.; bark gray; winter-buds slightly silky, dull: lvs. ovate or elliptic, acute, broad-cuneate or rounded at base, remotely denticulate, 5–10 cm. long, lustrous dark green above, light green beneath and usually glabrous at maturity, silky and ciliate while young; petiole 5–10 mm. long: involucre about 2.5 cm. long, with usually upright prickles; stalk 1–15 mm. long. H.W.2:42,t.20(c). F.E.33:615(h). M.G.17:579–582(h). E.H.1:t.1–12(h). Centr. and S. Eu., e. to Crimea. Long cult. Zone IV. Numerous forms differing in shape and color of the lvs. and in habit are in cult., of which the following are those best known: *F. s. atropunicea* West., var. PURPLE B. (COPPER B.) With purple lvs. A.G.18:837(h). F.E.13:472(h); 14:874(h). (*F. s.* var. *purpurea* Ait., *F. s. atropurpurea* Kirchn., *F. s. sanguinea* Ktze.); here also belong var. *cuprea* Loud., var. *Riversii* Rehd., *F. s. nigra* Hort., *F. s. purpurea macrophylla* and *F. s. p. major* Hort., differing in the deeper or lighter color of the lvs. and in other slight characters. Known since 1680.—*F. s. tricolor* (Simon-Louis) K. Koch, f. Lvs. nearly white, spotted green, and with pink margin. R.B.12:145,t(c). (*F. s. atropurpurea tricolor* Pynaert.)—*F. s. roseo-marginata* Henry, var. Lvs. purple with an irregular light pink border. Ill. Monatsh. Gartenb. 7:t.10(c).—*F. s. Zlätia* Spaeth. Lvs. yellow when young, finally nearly green.—*F. s. luteo-variegata* West., var. Lvs. variegated with yellow. (*F. s. f. aureo-variegata* Schneid.) Intr. before 1770.—*F. s. albo-variegata* West., var. Lvs. variegated with white. (*F. s.* var. *argenteo-variegata* Henry.) Intr. before 1770.—*F. s. laciniata* Vignet. FERNLEAF B. Lvs. narrowly elliptic to lanceolate, incisedly serrate to deeply lobed, sometimes linear and nearly entire. L.A.3:f.1875. S.H.1:155.f. 911. F.E.18:314(h). B.S.1:552,t(h). (*F. s. incisa* Hort., var. *heterophylla* Loud.)—*F. s. asplenifolia* Duchartre. Similar to the preceding, but lvs. very narrow, often linear. S.H.1:f.91m. (*F. s. f. comptoniaefolia* Kirchn., *F. s. salicifolia* Hort.)—*F. s. Rohanii* Koerber. With purple lvs. similar in shape to *F. s. laciniata*. M.G.23:499. Intr. about 1894.—*F. s. quercifolia* Schneid., f. Lvs. ovate-oblong, with short and broad obtusish lobes often undulate and sometimes slightly toothed. (*F. s. quercoides* Kirchn., not Persoon; the latter is a form with oak-like bark: M.G.24:509. M.D.1924:t.31.)—*F. s. cristata* Loud., var. Slow-growing form with small, clustered lvs. deeply toothed and curled. L.A.3:f.1877.—*F. s. rotundifolia* Cripps. With very small close-set lvs. suborbicular and often subcordate at base, only 1.5–3 cm. long. Intr. 1872.—*F. s. latifolia* Kirchn., f. Lvs. very large and broad, nearly entire, up to 15 cm. long and to 10 cm. broad. (*F. s. f. macrophylla* Dipp., not DC.)—*F. s. fastigiata* K. Koch, f. Tree of fastigiate habit with glabrous glossy lvs. Hesse, Cat. 1913–14,t(h). (*F. s. Dawyckii* Hesse, *F. s. pyramidalis* Hort., not Kirchn.)—*F. s. pendula* Loud., var. With pendulous brs., the larger limbs usually horizontally spreading. Gg.6:258(h). G.F.1:32(h). G.C.51:114(h).

B.S.1:552,t(h).—**F. s. purpúreo-péndula** Rehd., var. A pendulous form with purple lvs. (*F. s. var. purpurea pendula* Jaeg.)—**F. s. tortuosa** Pepin. Dwarf spreading form with twisted and contorted brs. pendulous at the tips. R.H. 1864:130(h). M.D.1911:269(h); 1912:111-3(h); 1913:308-9(h). G.W.14:511(h). (*F. s. remillyensis* Simon-Louis, *F. s. suentelensis* Hort.) Similar forms partly intermediate between this and *pendula* are: *F. s. pagnyensis* Simon-Louis, var. *borneyensis* Henry, var. *miltonensis* Henry, f. *retroflexa* Dipp.

3. **F. orientális** Lipsky. ORIENTAL B. Tree to 40 m.; brts. pubescent: lvs. elliptic to obovate or obovate-oblong, acute or short-acuminate, broad-cuneate or rounded at base, with entire or slightly undulate margin, 6-12 cm. long, glabrous except silky pubescent on the nerves beneath, with 7-10 pairs of veins curving before reaching the margin; petioles pubescent, 5-15 mm. long; involucre about 2 cm. long, the lower prickles changed into spatulate bracts; stalk pubescent, 2-2.5 cm. long. S.H.1:f.88. (*F. sylvatica* var. *macrophylla* DC., *F. macrophylla* Koidz., *F. Winkleriana* Koidz.) Asia Minor, Cauc., N. Persia. Intr. 1904. Zone V.

4. **F. Sieböldii** Endl. SIEBOLD'S B. Tree to 30 m.; young brts. nearly glabrous: lvs. ovate to rhombic-ovate, short-acuminate, broad-cuneate or rounded and sometimes subcordate at base, shallowly crenate, 5-10 cm. long, with 7-10 pairs of veins, at maturity glabrous except slightly pubescent on the nerves beneath; petioles 3-10 mm. long, nearly glabrous, slender: involucre 1.5-2 cm. long, with long bristles, the lower ones changed into linear or spatulate bracts; stalk 5-15 mm. long, pubescent. M.K.t.32(c). S.I.1:t.35(c). (*F. sylvatica* var. *asiatica* DC.) Japan. Intr. 1892. Zone V.

5. **F. lucida** Rehd. & Wils. Tree to 10 m.; bark gray: lvs. ovate to elliptic-ovate, 5-8 cm. long, acute or short-acuminate, rounded to broad-cuneate at base, lustrous green on both sides and glabrous except silky on the midrib above, slightly sinuate, the 8-12 pairs of veins ending into minute teeth in the sinuses; petiole about 1 cm. long; involucre about 8-10 mm. long, brown tomentose, covered with very short closely appressed deltoid mucronate scales; nuts slightly exserted; stalk 5-10 mm. long, rather stout. I.S. 3:t.130. W. China. Intr. 1905. Zone V.

6. **F. longipetiolata** Seemen. Tree to 25 m.; bark pale gray; brts. glabrous: lvs. ovate to ovate-oblong, acuminate, broad-cuneate at base, remotely serrate, 7-12 cm. long, finely and densely pubescent beneath and glaucescent, with 9-12 pairs of veins ending in the teeth; petioles slender, 1-2 cm. long, glabrous: involucre 2-2.5 cm. long, with slender, mostly recurved bristles; stalk 3-6 cm. long, glabrous except near the apex. H.I.20:1936. I.S.1:t.17. C.C.81. (*F. sinensis* Oliv.) C. and W. China. Intr. 1911. Zone V.

7. **F. Engleriana** Seemen. Tree to 23 m., usually smaller, dividing at base into many stems; brts. glabrous: lvs. ovate to elliptic-ovate, rarely oblong-ovate, short-acuminate, broad-cuneate or sometimes rounded and subcordate at base, with sinuate margin, 4-8, rarely to 11 cm. long, glaucescent and glabrous beneath except long silky hairs along the nerves, with 10-14 pairs of veins curving before the margin; petioles slender, 5-10 mm. long, glabrous: involucre about 1.5 cm. long, covered with linear foliaceous bracts; stalk slender, 4-7 cm. long, glabrous. C.C.83. (*F. sylvatica* var. *chinensis* Franch.) C. China. Intr. 1911. Zone V.

8. **F. japonica** Maxim. JAPANESE B. Tree to 25 m., dividing at base into several stems; brts. glabrous: lvs. ovate or elliptic-ovate, short-acuminate, rounded or subcordate, rarely broad-cuneate at base, slightly sinuate-crenate or nearly entire, 5-8 cm. long, glaucescent and glabrous beneath except silky

hairs along the midrib, with 9-14 pairs of veins bending before the margin; petioles about 1 cm. long, glabrous: involucre 6-8 mm. long, with short deltoid processes; nut exserted; stalk slender, glabrous, about 3 cm. long. S.I.1: t.35(c). Japan. Intr. 1905. Zone V.

**3. CASTÁNEA** Mill. CHESTNUT. Deciduous trees, rarely shrubs; bark furrowed; buds with 3-4 scales; brts. without terminal bud: lvs. 2-ranked, serrate, with numerous parallel veins: staminate fls. in erect cylindrical catkins; calyx 6-parted; stamens 10-20; pistillate fls. on the lower part of the upper staminate catkins, rarely on separate catkins, usually 3 in a prickly symmetrical involucre; styles 7-9; ovary 6-celled; nuts large, brown, with a large pale scar at the base, 1-3, rarely 5 or 7 in a prickly involucre, splitting at maturity into 2-4 valves. (The ancient Latin name of the chestnut.) About 10 species in the temperate regions of the n. hemisphere. Monograph by A. Camus, Châtaigniers (1929), cited below as Camus.—Chiefly nos. 1, 3 and 4 are planted in many varieties as fruit trees for their large edible nuts which are an important article of food in some countries; also as ornamental trees for their large handsome foliage and for the attractive staminate flowers. The coarse-grained wood is very durable in the soil. The Chestnut trees like warm situations, well-drained soil and stand drought better than most trees.

A. Nuts usually 2 or 3 in one involucre, usually broader than high.

B. Lvs. glabrous, cuneate at base, 12-24 cm. long: winter-buds glabrous or nearly so.

BB. Lvs. pubescent beneath, at least while young: often rounded at base: winter-buds pubescent.

C. Lvs. without lepidote glands beneath: brts. short-pubescent and with long spreading hairs at least on vigorous shoots.....1. *C. dentata*

CC. Lvs. more or less lepidote-glandular beneath, at least near the nerves: brts. tomentose or puberulous while young.....2. *C. mollissima*

D. Lvs. tomentose beneath, at least while young.

E. Lvs. coarsely serrate, 12-22 cm. long: frs. at end of brts.: tree.....3. *C. sativa*

EE. Lvs. crenate-serrate, 8-16 cm. long: frs. often lateral: usually shrubby.

4. *C. crenata*  
DD. Lvs. pubescent beneath only on the veins, densely lepidote-glandular: usually shrubby .....5. *C. Seguinii*

AA. Nuts solitary, terete and usually higher than broad, only exceptionally 2.

B. Lvs. tomentose beneath, usually elliptic-oblong.....6. *C. pumila*

BB. Lvs. glabrous, usually oblong-lanceolate, long-acuminate, slender-petioled.....7. *C. Henryi*

1. *C. dentata* Borkh. AMERICAN C. Tree to 30 m.; brts. glabrous or nearly so: lvs. oblong-lanceolate, acuminate, cuneate at base, coarsely serrate, 12-24 cm. long, glabrous except minute glands beneath when young: nut 1.5-2.5 cm. across, usually 2 or 3, rarely 5; involucre 5-6 cm. across. S.S.9:t.440-1. Em. 187,t(c). G.F.10:373(h). Am. For. 21:957;26:619;27:43(h). (*C. americana* Raf.) S. Me. to Mich., s. to Ala. and Miss. Cult. 1800. Zone IV.

*C. d. × pumila*: see under No. 6.—*C. d. × crenata*: see under No. 4.—*C. d. × sativa*: see under No. 3.

2. *C. mollissima* Bl. CHINESE C. Tree to 20 m.; sometimes shrubby; brts. short-pubescent and, at least on vigorous shoots, with long spreading hairs: lvs. elliptic-oblong to oblong-lanceolate, 8-15 cm. long, acuminate, rounded or truncate at base, coarsely serrate, whitish tomentose or green and soft-pubescent beneath, at least on the veins, without lepidote glands; petiole short-pubescent and pilose: nuts 2-3 cm. across, usually 2-3, the scar smaller than the base; spines of involucre pubescent. C.C.85. N.K.3:t.2-6. S.H.2: f.563c-d. Camus t.13,14,73,f.8-8. U. S. Inv. 36:t.2,3,(h). (*C. Bungeana* Bl., *C. Duclouxii* Dode, *C. hupehensis* Dode, *C. sativa* var. *m.* (Bl.) Pampan.) China, Korea. Intr. 1853 and 1903. Zone IV.

*C. m. × pumila* = *C. Burbankii* A. Camus. Husk splitting into 4 or sometimes 2 valves; nuts 1-3. Camus,t.73,f.10-15. Orig. 1899.—*C. m. × alnifolia* = *C. Morrisii* A. Camus. Orig. before 1914.

3. *C. sativa* Mill. SPANISH C. Tree to 30 m.; trunk sometimes with a girth of 10 m.: brts. soon glabrous: lvs. oblong-lanceolate, 12-22 cm. long, acute or short-acuminate, broad-cuneate or rounded or sometimes subcordate at base, coarsely serrate, pubescent or tomentose beneath while young and with lepidote glands at least near the veins, glabrous or nearly so at maturity, upright: nuts 2-3 cm. across, 1-3. H.W.2:37(h),t.19(c). E.H.4:t.232-6(h). Gg.3:209(h). S.H.1:158(h). (*C. vesca* Gaertn., *C. vulgaris* Lam.) S. Eu., W. Asia, N. Afr. Long cult. Zone V.—*C. s. aspleniifolia* Loud., var. Part of the lvs. linear with irregularly lobed or crenate margin, others nearly normal but narrower and more deeply serrate. S.H.1:f.91r. G.C.74:309. (*C. s. var. heterophylla* Henry.)—*C. s. prolifera* K. Koch, f. Lvs. narrower, at least the upper ones with persistent tomentum beneath; fr. smaller.—*C. s. pyramidalis* Mottet. Of narrow pyramidal habit. Cult. 1925.—*C. s. fastigiata* A. Camus, var. Of columnar habit.—*C. s. purpurea* Bean, var. Lvs. purple. There are also variegated forms.

*C. s. × dentata* = *C. Blarinhémii* A. Camus; here belongs probably "Paragon." Orig. before 1880.—*C. s. × pumila* = *C. pulchella* A. Camus. Fruits on two year old sprouts: fr. smaller. Jour. Hered. 9:113-6(h,fr). Orig. about 1903.—*C. s. × crenata*; see under No. 4.

4. *C. crenata* Sieb. & Zucc. JAPANESE C. Shrub or small tree to 10 m., occasionally taller; brts. finely pubescent, soon glabrous: lvs. elliptic to oblong-lanceolate, acuminate, rounded or subcordate at base, crenate-serrate, the teeth sometimes reduced to bristles, 8-16 cm. long, usually tomentose and glandular-lepidote beneath, sometimes nearly glabrous, or pubescent only on the nerves: spines of involucre nearly glabrous; nuts 2-3, rarely 5, 2-3 cm. across, the scar covering the whole base. S.I.1:34(c). M.K.t.33(c). Camus t.10-12,73.f.3. E.H.4:t.237. (*C. japonica* Bl., *C. sativa* var. *pubinervis* Mak.) Japan. Intr. 1876. Zone V.

*C. c. × dentata* = *C. Endicottii* A. Camus. Sometimes 7-8 nuts in one husk. Jour. Hered. 13:305-13(h,fr.). Orig. 1908.—*C. c. × sativa* = *C. Coudercii* A. Camus. Tree: lvs. larger: frs. larger, lateral. Camus t.21,22. Cult. 1919.—*C. c. × pumila* = *C. Fleetii* A. Camus. Husks several together, usually with 3 nuts each. Camus t.20,f.11;t.73,f.1-2. Orig. before 1911.

5. *C. Seguinii* Dode. Shrub or small tree to 10 m.; young brts. short-pubescent: lvs. elliptic-oblong or oblong-obovate to lanceolate-oblong, acuminate, rounded or sometimes subcordate or broad-cuneate at base, coarsely serrate, 6-14, rarely to 16 cm. long, green beneath and lepidote-glandular, pilose only on the nerves or sometimes nearly glabrous, with 12-16 pairs of veins; involucre 3-4 cm. across, with sparsely pilose spines; nuts usually 3, rarely 5 or 7, 1-1.5 cm. across. U.S. Inv. 54:t.3(fr). B.D.1908:151,154(fr). S.H. 2:f.563e-f(fr). Camus t.13,f.4-5,t.15-17. (*C. Davidii* Dode.) E. and C. China. Intr. 1853 and 1907. Zone VI?

6. *C. pumila* Mill. CHINQUAPIN. Shrub or small tree; brts. tomentose: lvs. elliptic-oblong or oblong-obovate, acute, rounded or broadly cuneate at base, coarsely serrate or the teeth reduced to bristles, 7-12 cm. long, white-tomentose beneath; involucre 2.5-3.5 cm. across; nut solitary, rarely 2, ovoid, pointed, 1.5-2 cm. long and about 1 cm. across. S.S.9:t.442-3. Gn.88:821(h). M.O.t.39(h). Pa. to Fla. and Tex. Intr. 1699. Zone V.

*C. p. × dentata* = *C. neglecta* Dode. Lvs. less pubescent: fr. larger. B.D. 1908:143,f.9. N. C. Cult. 1923.—*C. p. × sativa*; see under No. 3.

Closely related species: *C. ozarkensis* Ashe. Tree to 20 m.: lvs. 12-20 cm. long, coarsely toothed, white-tomentose, rarely glabrous beneath; fr. densely spiny, about 3 cm. across; nut 1.5-1.7 cm. high. (*C. arkansana* Ashe.) Camus t.74,f.3-6. Ark. to s. w. Mo. Intr. 1891. Zone VI.—*C. alnifolia* Nutt. Low shrub to 0.5 m., with creeping root-stock: lvs. oblong or oblong-obovate, usually obtuse,

5-15 cm. long, thinly tomentose or pubescent; involucre with fewer and shorter rigid spines. Bull. Torr. Bot. Club, 21:t.206. Camus t.19,f.6-8. (*C. nana* Muhl.) Ga. to Fla. and La. Cult. 1906. Zone VI.—*C. a. × mollissima*; see under No. 2.

7. *C. Hénryi* (Skan) Rehd. & Wils. Tree to 25 or 30 m.; brts. glabrous: lvs. oblong-ovate to oblong-lanceolate or lanceolate, long-acuminate, truncate to cuneate at base, with bristle-like teeth, 8-16 cm. long, light green and glabrous and somewhat reticulate beneath, with 12-16 pairs of veins, chartaceous; petioles slender, 1-1.5 cm. long, glabrous: involucre about 2 cm. across with slightly pubescent spines; nut solitary, globose-ovoid, pointed, 1.5-2 cm. high. B.D.1908:156(fr). Camus t.20,f.1-5. S.H.2:f.563h-k,564e. (*C. Vilmoriniana* Dode, *C. Fargesii* Dode, *Castanopsis Henryi* Skan.) C. and W. China. Intr. 1900. Zone V.

4. **C. CASTANÓPSIS** Spach. Evergreen trees, sometimes shrubby; buds with numerous scales: lvs. 2-ranked or 5-ranked, entire or dentate, coriaceous, convolute in bud: staminate fls. in upright simple or branched spikes; calyx 5-6 parted; stamens usually 10 or 12; pistillate fls. usually in separate short spikes, sometimes at the base of the staminate spikes, 1-3 in one involucre; ovary 3-celled; styles 3, terminating in minute stigmas: fr. a nut ripening the second year, 1-3 in an ovoid or subglobose asymmetrical involucre, dehiscent or indehiscent, covered outside with spines or tubercles or interrupted transverse ridges. (Greek *kastana*, chestnuts, and *opsis*, resemblance: alluding to its resemblance to the chestnut-tree.) About 30 species in s. and e. Asia, one in Calif.—Ornamental evergreen tree adapted for cult. only in warmer regions.

*C. chrysophylla* (Hook.) DC. Tree to 35 m., sometimes shrubby; bark deeply ridged; brts. scurfy: lvs. ovate-oblong to oblong-lanceolate, narrowed at ends, entire, 5-14 cm. long, dark green and lustrous above, coated beneath with golden-yellow scales: husk subglobose, dehiscent, densely clothed with rigid spines; nut usually solitary, globose-ovoid, about 1.5 cm. high. S.S.9: t.439. B.M.4953(c). G.C.36:145. Jepson, Silv. Cal. t.74(h). (*Castanea c. Hook.*) Ore. to Calif. and Nev. Intr. 1845. Zone VII.—*C. c. minor* DC., var. Shrubby form with smaller 5-8 cm. long lvs., very golden yellow beneath, often slightly trough-shaped. Zone VII.

None of the Chinese species introduced have proved hardy within the range of this Manual.

5. **LITHOCÁRPUS** Bl. Evergreen trees: buds with few foliaceous scales: lvs. dentate or entire, coriaceous: staminate fls. in upright simple or branched spikes with rudimentary ovary; calyx 4-6-lobed; stamens usually 10-12, much longer than the calyx; pistillate fls. at the base of the staminate spikes or in separate catkins; ovary 3-celled; styles 3, cylindric, stigmatic only at apex: fr. a nut, partly, rarely nearly wholly enclosed by a cup-like involucre, its scales distinct and imbricate or connate into concentric rings. (Greek *lithos*, stone, and *carpos*, fruit, alluding to the hard shell of the nut of the type species, *L. javensis*.) Including *Pasania* (Miq.) Oerst., *Cyclobalanus* (Endl.) Oerst., *Synaedrys* Lindl. About 100 species in s. and e. Asia and in Malaysia, one in W. N. Am.—Ornamental evergreen trees adapted only for warmer temperate regions.

*L. densiflorus* Rehd. TANBARK OAK. Evergreen tree to 25 or rarely 30 m.: brts. tomentose: lvs. oblong or oblong-obovate, acute, cuneate or rounded at base, dentate with callous teeth, 7-12 cm. long, rusty-tomentose beneath, becoming finally glabrate and bluish white; petioles stout, about 1.5 cm. long,

tomentose; pistillate fls. at base of the staminate spikes: frs. 1-2 on a stout peduncle 1-2.5 cm. long; nut ovoid, 2-2.5 cm. long, embraced at base by the shallow cup covered with subulate spreading or reflexed scales. B.M.8695(c). S.S.9:t.438. G.F.5:523(h). J.St.7(h). (*Quercus d. Hook. & Arn., Pasania d. Oerst.*) S. Ore. to Calif. Intr. 1874. Zone VII?—*L. d. montanus* (Mayr) Rehd., var. Shrubby form with entire usually obtuse lvs. 3-5 cm. long. (*Quercus d. var. echinoides* Sarg.) S. Ore. to N. Calif. Intr. ? Zone VII?

None of the Chinese species introduced have proved hardy within the range of this Manual.

6. **QUÉRCUS L. OAK.** Deciduous or evergreen trees, rarely shrubs; buds with many imbricate scales: lvs. short-petioled, penninerved, serrate, dentate, lobed or pinnatifid, rarely entire: staminate fls. in slender pendulous catkins; calyx 4-7-parted; stamens 4-12, usually 6; pistillate fls. solitary or in 2- to many-flowered spikes; ovary 3-, rarely 4-5-celled; styles short or elongated, dilated above and stigmatic on the inner face; fr. a nut (acorn) subglobose to oblong or cylindric, surrounded at base or sometimes nearly inclosed by a cup-like involucre covered outside with imbricate scales or scales connate into concentric rings. (The ancient Latin name of the Oak-tree.) Including *Cyclobalanopsis* Oerst., *Erythrobalanus* (Spach) Schwarz, *Macrobalanus* (Prantl) Schwarz (*Q. §Macrocarpaea* Oerst.) More than 200 species in the temp. regions of the n. hemisphere and in the tropics at high altitudes south to Colombia in America and to the Mal. Archipelago in Asia.—Much planted as ornamental trees on account of their handsome foliage assuming in most species brilliant autumnal tints. Many species are important timber trees and of some the acorns are edible.

- AA. Lvs. toothed or lobed.
  - B. Lobes or teeth bristle-pointed.
    - c. Lvs. lobed: cup with imbricate scales except No. 22.
      - d. Lvs. broadly obovate, 3-5-lobed at apex; more or less rusty-pubescent beneath.
        - 6. *Q. marilandica*
    - DD. Lvs. elliptic to oblong, with 5-9, rarely only 3 lobes (if lvs. narrow, with few irregular lobes or partly entire, see hybrids under Nos. 2 and 3.)
      - E. Lvs. whitish or grayish tomentose beneath, lobes entire or occasionally with few teeth.
        - F. Lobes triangular.
          - g. Lvs. with usually 5 lobes; cup with appressed scales.....7. *Q. ilicifolia*
          - gg. Lvs. with 9-13 lobes; cup with spreading scales.....22. *Q. macrolepis*
        - FF. Lobes narrow, often falcate.....8. *Q. falcata*
      - EE. Lvs. green beneath, glabrous or pubescent.
        - F. Lvs. pubescent beneath at least when young; upper scales of cup loosely imbricated.
          - g. Winter-buds tomentose; lvs. with axillary tufts of hairs beneath.
            - 9. *Q. velutina*
          - gg. Winter-buds puberulous; lvs. without axillary tufts.....10. *Q. Kelloggii*
      - FF. Lvs. glabrous beneath.
        - g. Longest lobes of the lvs. 2-6 times as long as the narrow middle portion; lvs. lustrous.
          - H. Lvs. with conspicuous axillary tufts of hairs beneath.
            - i. Lvs. usually cuneate at base; acorn 8-13 mm. long; cup saucer-shaped .....14. *Q. palustris*
          - II. Lvs. usually truncate at base; acorn 1.5-2.5 cm. high.
            - J. Winter-buds chestnut-brown: cup turbinate, 1.2-1.8 cm. wide.
              - 11. *Q. ellipsoidal*
            - JJ. Winter-buds light yellowish or grayish brown: cup hemispheric or saucer-shaped, 1-3 cm. wide.....12. *Q. Shumardii*

- HH. Lvs. with small axillary tufts; buds whitish pubescent above the middle; acorn inclosed about  $\frac{1}{2}$  by the cup.....13. *Q. coccinea*  
 GG. Longest lobes almost equaling the width of the broadish middle portion of the leaf; lvs. dull.....15. *Q. borealis*  
 CC. Lvs. serrate: cup with spreading or recurved scales.  
 D. Lvs. white-tomentose beneath.....17. *Q. variabilis*  
 DD. Lvs. glabrous beneath or pubescent only on the veins.  
 E. Lvs. glabrous beneath except axillary tufts of hairs, with 10-16 pairs of veins.  
 18. *Q. acutissima*  
 EE. Lvs. pubescent on the veins beneath, with 9-12 pairs of veins.....20. *Q. libani*  
 BB. Lobes or teeth not bristly pointed, but sometimes mucronate.  
 C. Axillary and terminal buds with long filiform persistent stipules; brts. pubescent or tomentose.  
 D. Lvs. with 8-14 pairs of small triangular mucronate teeth; cup with subulate spreading scales .....19. *Q. castaneaeifolia*  
 DD. Lvs. with 4-10 pairs of lobes.  
 E. Lvs. elliptic to oblong, 5-10 cm. long, lobes often acutish: cup with spreading subulate scales .....23. *Q. Cerris*  
 EE. Lvs. obovate, 10-14 cm. long; cup with appressed scales.....36. *Q. macranthera*  
 CC. Axillary buds without persistent stipules: cup with appressed scales except Nos. 21 and 59.  
 D. Lvs. serrate or sinuately dentate.  
 E. Lvs. with small mucronate teeth.  
 F. Lvs. with 15-20 pairs of veins, 10-15 cm. long.....34. *Q. pontica*  
 FF. Lvs. with less than 13 pairs of veins.  
 G. Lvs. short-stalked, usually broad at base.  
 H. Lvs. with 9-12 pairs of veins, acute at apex, auricled at base: cup with spreading scales .....21. *Q. trojana*  
 HH. Lvs. with 7-9 pairs of veins, usually obtuse at apex, broad-cuneate or rounded at base.....38. *Q. luscitana*  
 GG. Lvs. slender-stalked, cuneate at base, usually glaucous beneath.  
 57. *Q. glandulifera*  
 EE. Lvs. with rather large rounded or sometimes acute and gland-tipped teeth.  
 See also EEE.  
 F. Brts. glabrous or nearly so.  
 G. Lvs. glabrous beneath at maturity or pubescent only on the veins or along the midrib.  
 H. Petioles very short; lvs. auricled at base, hairy on the veins beneath.  
 58. *Q. mongolica*  
 HH. Petioles 1-2.5 cm. long; lvs. with brown floccose tomentum along the midrib .....35. *Q. canariensis*  
 GG. Lvs. tomentose, tomentulose or soft-pubescent beneath.  
 H. Lvs. obovate to obovate-oblong.  
 I. Lvs. with 4-8 pairs of veins.  
 J. Lvs. 6-12 cm. long, with 4-7 pairs of veins and usually acute teeth: shrub .....54. *Q. prinoides*  
 JJ. Leaves 10-20 cm. long, with 6-8 pairs of veins: fr.-stalk much exceeding the petiole.....51. *Q. bicolor*  
 II. Lvs. with 10-17 pairs of veins: fr.-stalk short.  
 J. Petioles 1.5-3 cm. long; lvs. with 12-17 pairs of veins.  
 K. Lvs. dark green above, usually tomentose beneath: scales of cup free to the base.....52. *Q. Prinus*  
 KK. Lvs. yellow green above, minutely downy beneath: scales of cup free only at tip.....53. *Q. montana*  
 JJ. Petioles 1-2 cm. long; lvs. with 10-15 pairs of veins.....56. *Q. aliena*  
 HH. Lvs. lanceolate, acuminate.....55. *Q. Muhlenbergii*  
 FF. Brts. pubescent: lvs. obovate, 12-30 cm. long.....59. *Q. dentata*  
 EEE. Lvs. entire or sometimes slightly 3-lobed at apex.....45. *Q. Durandii*  
 DD. Lvs. deeply lobed or pinnatifid.  
 E. Brts. glabrous or nearly so.  
 F. Lvs. glabrous or slightly pubescent beneath.  
 G. Petioles less than 1 cm. long; lvs. usually auricled at base: fr. slender-stalked .....41. *Q. robur*  
 GG. Petioles 1-2.5 cm. long; lvs. usually cuneate at base.  
 H. Lvs. glaucous or glaucescent beneath, 10-16 cm. long, with 3-4 pairs of lobes: fr. stalked.....42. *Q. alba*  
 HH. Lvs. green beneath, 6-12 cm. long.  
 I. Lvs. usually lobed less than halfway to the middle with 4-6 pairs of obtuse lobes: scales of cup not thickened.....40. *Q. petraea*  
 II. Lvs. usually pinnatifid more than halfway to the middle, with 3-5 pairs of acute or acutish lobes: scales of cup thickened.  
 46. *Q. novo-mexicana*  
 FF. Lvs. pubescent or tomentose beneath.  
 G. Lvs. green beneath, soft-pubescent, 6-12 cm. long.....47. *Q. utahensis*  
 GG. Lvs. white-tomentose beneath, sometimes green and soft-pubescent.  
 H. Lvs. usually sinuate-dentate, with 6-8 pairs of lobes, sometimes pinnatifid, 10-15 cm. long: cup much shorter than acorn.....51. *Q. bicolor*

- HH. Lvs. deeply pinnatifid, with 3-4 pairs of lobes, 15-20 cm. long; cup large, usually entirely inclosing the acorn.....49. *Q. lyrata*
- EE. Brts. pubescent or tomentose.
- F. Lvs. 15-30 cm. long.
- G. Lvs. pubescent and green beneath, sinuately lobed, short-stalked; cup with lanceolate spreading scales.....59. *Q. dentata*
- GG. Lvs. white-tomentose beneath, lyrate, deeply lobed below the middle: upper scales of cup subulate, forming a fringe.....50. *Q. macrocarpa*
- FF. Lvs. 5-15 cm. long; cup with small appressed scales.
- G. Lvs. glabrous above or only sparingly stellate-hairy.
- H. Lvs. auriculate at base, 10-18 cm. long, with usually dentate lobes. 37. *Q. Frainetto*
- HH. Lvs. cuneate or rounded at base, rarely subcordate.
- I. Petioles more than 1 cm. long; lvs. 10-15 cm. long...44. *Q. Garryana*
- II. Petioles 1 cm. or less long.
- J. Lvs. soft-pubescent beneath, deeply pinnatifid, 8-12 cm. long. 47. *Q. utahensis*
- JJ. Lvs. usually tomentose beneath, rarely divided more than halfway to the middle, 5-10 cm. long.....39. *Q. pubescens*
- GG. Lvs. pubescent above.
- H. Leaves usually 5-lobed, with broad sinuses and broad lobes, 10-14 cm. long.....48. *Q. stellata*
- HH. Lvs. 7-13-lobed.
- I. Lobes of lvs. broadly ovate to obovate, obtuse, 6-10 cm. long; fr. subsessile, acorn elongated, conical.....43. *Q. lobata*
- II. Lobes of lvs. ovate to ovate-lanceolate, acutish, 6-14 cm. long; fr. stalked; acorn subglobose or ovoid.....38. *Q. pyrenaica*
- II. Lvs. evergreen
- A. Lvs. pubescent below.
- B. Lvs. nearly sessile, subcordate or rounded at base, ovate or elliptic, tomentose beneath. 28. *Q. semecarpifolia*
- BB. Lvs. petioled, cuneate to rounded at base, rarely subcordate.
- C. Lvs. beneath with yellow or yellowish tomentum.
- D. Lvs. orbicular to obovate, 3.5-5 cm. long, with prominent veins...27. *Q. alnifolia*
- E. Lvs. ovate or elliptic to ovate-oblong, 3-10 cm. long, finally glabrous and glaucous beneath.....31. *Q. chrysolepis*
- CC. Lvs. beneath with white or grayish tomentum.
- D. Lvs. entire or spinose-dentate, with 7-10 pairs of veins; bark scaly.
- E. Lvs. usually oblong, obtuse, cuneate at base, rarely acute and rounded at base. 32. *Q. virginiana*
- EE. Lvs. usually ovate to lanceolate, acute, usually rounded at base.....30. *Q. ilex*
- DD. Lvs. with mucronate teeth or lobes and with 5-7 pairs of veins.
- E. Lvs. toothed, evergreen; bark corky.....25. *Q. Suber*
- EE. Lvs. lobed, half-evergreen; bark slightly corky.....26. *Q. hispanica*
- AA. Lvs. glabrous beneath at maturity.
- B. Lvs. acute or obtuse, 2.5-5, rarely to 7 cm. long.
- C. Lvs. serrate, rounded at base.....29. *Q. phillyraeoides*
- CC. Lvs. with spiny-tipped teeth, subcordate at base.
- D. Lvs. 2-10 cm. long; scales of cup appressed.....16. *Q. agrifolia*
- DD. Lvs. 1.5-5 cm. long; scales of cup spreading.....24. *Q. coccifera*
- BB. Lvs. acuminate, 7-10 cm. long.....1. *Q. myrsinaefolia*

Subgen. I. CYCLOBALANOPSIS Prantl. Cupula with the scales connate into concentric rings; styles short; aborted ovules near the apex of the fr.: lvs. evergreen, entire or dentate. (*Cyclobalanopsis* Oerst.)

1. *Q. myrsinaefolia* Bl. Evergreen tree to 18 m.: lvs. lanceolate to oblong-lanceolate, 5-12 cm. long, 1.5-3 cm. broad, acuminate, cuneate at base, serrate, glabrous, lustrous above, glaucescent beneath: frs. in short spikes; acorn ovoid-oblong, 1.5-2 cm. long, inclosed about  $\frac{1}{3}$  by the glabrous cup. S.I.1: t.29(c). N.K.3:t.25. C.Q.t.16.f.7-21. (*Q. Vibreyana* Franch. & Sav., *Q. bambusaefolia* Fort., not Hance.) Japan, E. China. Intr. 1854. Zone (VI). Confused with *Q. acuta*, *Q. glauca* and *Lithocarpus glaber* (*Q. thalassica*). This seems to be the only species of this subgenus which survives in Zone VII.

Subgen. II. ERYTHROBALANUS Spach. Scales of cup not connate into rings, appressed; style elongated, capitate; aborted ovules near apex of fr.; walls of nut tomentose inside; fr. ripening the second year: lvs. deciduous or evergreen, lobed or entire, lobes and apex bristle-pointed.

2. *Q. Phellos* L. WILLOW O. Tree to 30 m.; brts. slender, reddish brown, glabrous; lvs. linear-oblong to lanceolate, acute at ends, 5-10 cm. long, lus-

trous above, pubescent below while young, glabrate at length and light green; fr. nearly sessile; acorn hemispherical, about 1 cm. high, inclosed only at base by the saucer-shaped cup. S.S.8:t.435. M.S.1:t.14(c). H.H.158,159(b). Am. For. 27:461(h). J.L.45:207(h). N. Y. to Fla., w. to Mo. and Tex. Intr. 1723. Zone V. Tree with conical round topped head and willow-like lvs. turning pale yellow in fall.

*Q. P. × borealis maxima* = *Q. heterophylla* Michx. f. Brts. glabrous: lvs. oblong to elliptic, with 3-5 pairs of teeth, or entire, glabrous beneath except axillary tufts of hairs. M.S.1:t.18(c). S.S.8:t.486. N. J. to Tex. Cult. 1822.—*Q. P. × falcata* = *Q. ludoviciana* Sarg. Lvs. oblong, 10-15 cm. long, usually with 3-4 triangular-ovate teeth or lobes near apex or entire, green and pubescent to glabrate beneath. (*Q. subfalcata* Trel.) With the parents. Intr. ?—*Q. l. microcarpa* (Sarg.) Rehd., var. Lvs. oblong-lanceolate, 7-9 cm. long, shallowly lobed. D.L.2:107. (*Q. Phellos microcarpa* Hort., *Q. subfalcata* var. *m.* Sarg.) Cult. 1880. Zone V.—*Q. P. × palustris* = *Q. Schochiana* Dieck. Lvs. oblong to narrow-oblong, usually with 1-3 teeth or lobes on each side, rarely entire, 6-12 cm. long, green and nearly glabrous beneath. Cult. 1896.—*Q. P. × marilandica* = *Q. Rudkinii* Britt. With the parents. Intr. 1925.—*Q. P. × velutina* = *Q. inaequalis* Palmer & Steyer. With the parents. Intr. 1925.

3. *Q. imbricaria* Michx. SHINGLE O. Tree to 20, rarely to 30 m. tall; brts. slender, soon glabrous, light brown: lvs. oblong or oblong-lanceolate, acute or rounded at ends, 7-16 cm. long, with slightly thickened revolute margin, dark green and glabrous above, pale green or brownish and pubescent beneath; petioles 5-15 mm. long: fr. short-stalked; acorn hemispherical, 1-1.5 cm. high, inclosed  $\frac{1}{2}$  to  $\frac{3}{4}$  by the turbinate cup. S.S.8:t.432. M.S.1:t.15(c). H.H.162,163(b). M.M.6:91(h). Pa. to Ga., w. to Neb. and Ark. Intr. 1724. Zone V. Pyramidal while young, round-topped when old, with lustrous lvs. turning russet-red in fall.

*Q. i. × velutina* = *Q. Leana* Nutt. Brts. scurfy: lvs. sinuately toothed, rarely entire, rounded at base, 8-16 cm. long, scurfy beneath. N.S.1:t.bis(c). S.S. 8:t.434. With the parents. Intr. before 1850.—*Q. i. × palustris* = *Q. exácta* Trel. Brts. glabrous: lvs. oblong-lanceolate, coarsely toothed or entire, soon glabrous, 10-15 cm. long: cup turbinate. With the parents. Cult. 1889.—*Q. i. × borealis maxima* = *Q. runcinata* Engelm. Lvs. slender-stalked, elliptic-oblong, 10-16 cm. long, with usually 3 lobes on each side, usually broad-cuneate to nearly rounded at base, glabrous and usually pale green beneath. With the parents. Intr. 1883.—*Q. i. × marilandica* = *Q. tridentata* Engelm. With the parents. Intr. ?

4. *Q. laurifolia* Michx. LAUREL O. Tree to 20, rarely to 30 m.: brts. slender, glabrous, dark brown: lvs. oblong or oblong-obovate, 5-14 cm. long, acute or rarely rounded at ends, entire or sometimes slightly lobed, lustrous and dark green above, light green beneath, puberulous at first, soon glabrous; petioles yellow, 5-8 mm. long: fr. short-stalked; acorn subglobose to ovoid, 1-1.5 cm. long, inclosed only at base by the saucer-shaped cup. S.S.8:t.429,430. M.S.1:t.15(c). H.H.160,161(b). F.E.16:396,t.62(h). Va. to Fla. and La. Intr. 1786. Zone VII? Dense round-topped tree with half-evergreen lustrous foliage.

5. *Q. nigra* L. WATER O. Tree to 25 m.: lvs. obovate, 3-lobed at apex, or sometimes entire, rarely pinnately lobed above the middle, 3-7 long, dull bluish green above, paler beneath, soon glabrous except axillary tufts of brown hairs; petioles 5-10 mm. long: frs. short-stalked; acorn globose-ovoid, 1-1.5 cm. long, inclosed  $\frac{1}{2}$  or  $\frac{3}{4}$  by the saucer-shaped cup; scales acute, closely appressed. S.S.8:t.428. M.S.1:t.19(c). H.H.156,157(b). E.H.5:t.312(h). (*Q. aquatica* Walt., *Q. uliginosa* Wagh.) Del. to Fla., w. to Ky. and Tex. Intr. 1723. Zone VI. Tree with rather slender brs. forming a conical round-topped head. Often planted as an avenue tree.

Related species: *Q. obtusa* (Willd.) Ashe. Tree to 40 m.: lvs. rhombic to rhombic-oblong, rarely oblong-obovate or lanceolate, 6-10 cm. long, dark green and lustrous above; acorn about 1 cm. long; scales obtuse, loosely appressed. S.M.262. (*Q. rhombica* Sarg.) Va. to Fla. and La. Cult. 1927. Zone VII.

6. *Q. marilandica* Muenchh. BLACK-JACK. Tree to 10 or sometimes to 18 m. high: leaves broad-obovate, 10-20 cm. long, and often nearly as broad at apex, rounded at base, 3-5-lobed at apex, with broad, entire or sparingly toothed lobes, dark green and glabrous above, brownish tomentose beneath, finally nearly glabrous and yellowish green; petioles 1-2 cm. long: frs. short-stalked; acorn ovoid-oblong, 2 cm. high, often striate, inclosed  $\frac{1}{2}$  to  $\frac{3}{4}$  by the turbinate cup, its upper scales smaller and forming a thick rim round its inner surface, occasionally reflexed and covering the upper half of the inner surface. S.S.8:t.426,427. M.S.t.20(c). H.H.154,155(b). (*Q. nigra* Wagh., not L., *Q. ferruginea* Michx.) N. Y. to Fla., w. to Neb. and Tex. Intr. before 1739. Zone VI. Tree with stout spreading brs. forming a narrow, often irregular head, with large lustrous lvs. turning brown or yellow in fall.

*Q. m.*  $\times$  *texana* = *Q. Hastingsii* Sarg. Lvs. more deeply lobed, 6-8 cm. long, glabrous: fr. smaller. With the parents. Intr. about 1925. Zone VI.—*Q. m.*  $\times$  *velutina* = *Q. Búshii* Sarg. With the parents. Cult. 1931. Zone V.—*Q. m.*  $\times$  *Phellos*; see under No. 2.—*Q. m.*  $\times$  *imbricaria*; see under No. 3.—*Q. m.*  $\times$  *ilicifolia*; see under No. 7.

Related species: *Q. arkansana* Sarg. Lvs. broad-obovate, 5-8 cm. long, cuneate, slightly 3-lobed at apex, or on sterile branches elliptic to ovate, rounded at base and undulately lobed, stellate-pubescent beneath at first, later glabrous or nearly so: acorn broad-ovoid, 1.5 cm. across. S.T.2:t.152. Ark. Intr. 1909. Zone V.

7. *Q. ilicifolia* Wagh. SCRUB O. Intricately branched spreading shrub, to 3 m., rarely small tree to 7 m.; brts. hoary-pubescent: lvs. obovate or rarely oblong, 5-12 cm. long, broad-cuneate at base, sinuately lobed with usually 2 pairs of broad triangular lobes entire or with few bristly teeth, dark green and glabrous above, whitish tomentulose beneath; petioles 2-3.5 cm. long: fr. short-stalked; acorns globose-ovoid, about 1 cm. high, inclosed about  $\frac{1}{2}$  by the saucer-shaped cup. S.S.8:t.424. M.S.1:t.21(c). (*Q. Banisteri* Michx., *Q. nana* Sarg.) Me. to Va., w. to Ohio and Ky. Intr. about 1800. Zone V. Densely branched spreading shrub with dull dark green foliage.

*Q. i.*  $\times$  *coccinea* = *Q. Robbinsii* Trel. Lvs. 8-12 cm. long, with usually 3 pairs of lobes, slightly tomentose or often glabrescent at maturity beneath: acorns about 12 mm. long, inclosed about  $\frac{1}{2}$  by the cup. With the parents. Intr. 1913.—*Q. i.*  $\times$  *velutina* = *Q. Rehderi* Trel. Lvs. 8-10 cm. long, with 2-3 pairs of lobes, slightly tomentulose or glabrate at maturity beneath: cup with larger tomentulose scales. Rh.3:t.24. With the parents. Intr. about 1905.—*Q. i.*  $\times$  *marilandica* = *Q. Brittonii* W. T. Davis. With the parents. Cult. 1888.

8. *Q. falcata* Michx. SPANISH O. Tree to 25 or occasionally to 30 m.; brts. rusty-tomentose: lvs. elliptic-oblong or obovate, 8-20 cm. long, broad-cuneate or sometimes rounded at base, deeply sinuately lobed, with 3-7 acute lobes gradually narrowed from a broad base, often falcate, entire or repand-dentate, the terminal lobe elongated, dark green and glabrous above, tawny or grayish pubescent beneath, drooping; petioles 2.5-5 cm. long: fr. short-stalked; acorn subglobose, 1-1.5 cm. high, inclosed only at base or sometimes  $\frac{1}{2}$  by the saucer-shaped cup puberulous inside. S.S.8:t.420. M.S.1:t.23(c). G.F.8:104 (b). F.E.29:943(h). (*Q. rubra* L., not Du Roi, *Q. digitata* Sudw., *Q. triloba* Michx., *Q. cuneata* auth., not Wagh.) N. J. to Fla., w. to Mo. and Tex. Intr. before 1763. Zone VI. Tree with stout spreading brs. forming an open round-topped head, with dark green deeply cut drooping lvs.—*Q. f. pagodae-folia* Ell., var. SWAMP SPANISH O. Tree to 40 m.; brts. hoary-tomentose: lvs.

usually rounded at base, less deeply lobed, with 5-11 broader lobes, white-tomentose beneath. S.S.14:t.772. (*Q. p.* Ashe.) Va. to Fla., w. to s. Ill. and Ark. Intr. 1904. Zone VII?

*Q. f.* × *Phellos*; see under No. 2.

Related species: *Q. laevis* Walt. Tree to 20 m.: lvs. similar to those of *Q. falcata* but with petioles 1-2 cm. long, at maturity lustrous and glabrous below; cup turbinate; scales extending above the rim and down the inner surface. S.S. 8:t.417. (*Q. Catesbaei* Michx.) N. C. to Fla. and La. Intr. about 1834. Zone VII?

9. *Q. velutina* Lam. BLACK O. Tree to 30 or occasionally to 50 m.; bark dark brown, inner bark orange; brts. scurfy-tomentose, glabrescent the first winter; buds pubescent: lvs. ovate to oblong, 10-25 cm. long, cuneate to truncate at base, sinuately lobed halfway to the middle or beyond, with 7-9 broad, repand-dentate lobes, lustrous dark green above, brown-pubescent beneath at first, finally often glabrous except in the axils of the veins; petioles stout, 3-6 cm. long, yellow: fr. short-stalked, acorn ovoid, 1.5-2 cm. high, often striate, inclosed about  $\frac{1}{2}$  by the turbinate cup, with loosely imbricated pubescent scales, the free tips of the upper scales forming a short fringe-like border. S.S.8:t.414,415. M.S.1:t.24(c). H.H.148,149(b). Em.160,t(h). G.F. 5:55(h). B.T.289(h). (*Q. tinctoria* Bartr.) Me. to Fla., w. to Minn. and Tex. Intr. about 1800. Zone IV.—Large tree of rapid growth with rather slender brs. forming an open narrow head, and with lustrous lvs. turning dull red or orange-brown in fall. The bark is used for tanning;—*Q. v. missouriensis* Sarg., var. Lvs. with permanent rusty pubescence beneath; cup-scales tomentose. W. Mo. to Ark. Intr. 1905. Zone V.

*Q. v.* × *Phellos*; see under No. 2.—*Q. v.* × *imbricaria*; see under No. 3.—*Q. v.* × *ilicifolia*; see under No. 7.—*Q. v.* × *borealis maxima*; see under No. 15.

10. *Q. Kellöggii* Newb. CALIFORNIAN BLACK O. Tree to 30 m.: bark dark brown or nearly black; brts. hoary-tomentose at first; buds puberulous or nearly glabrous: lvs. oblong, 8-15 cm. long, cuneate or truncate at base, sinuately 7- or rarely 5-lobed about halfway to the middle, with oblong repand-dentate lobes, pubescent at first, at maturity thick and firm, glabrous and lustrous above, glabrous or pubescent beneath or sometimes hoary-tomentose; petioles slender, 3-5 cm. long: fr. short-stalked; acorn ovoid-oblong, 2.5-3.5 cm. long, inclosed about  $\frac{1}{4}$  or  $\frac{3}{4}$  by the deep cup-shaped cup with glabrous loosely imbricated scales. S.S.8:t.416. G.F.9:145(h). (*Q. californica* Coop.) Ore. to Calif. Intr. 1878. Zone VII? Tree with stout spreading brs. forming an open round-topped head.

11. *Q. ellipsoidalis* E. J. Hill. Tree to 25 m.; bark gray, close and smooth or shallowly fissured; brts. tomentose at first; buds slightly puberulous: lvs. elliptic, 8-12 cm. long, truncate to broad-cuneate at base, deeply sinuately 5-6-lobed, with oblong, coarsely repand-dentate lobes, soon glabrous except the sometimes very small axillary tufts beneath; petioles 3-5 cm. long: fr. short-stalked or nearly sessile; acorn ellipsoid to subglobose, 1.2-2 cm. long, inclosed  $\frac{1}{2}$  or nearly  $\frac{1}{2}$  by the turbinate cup with closely appressed pale brown-puberulent scales. S.S.14:t.771. H.H.144,145(b). S. Mich. to Man. and Ia. Intr. 1902. Zone IV. Similar to the Pin Oak in habit.

12. *Q. Shumardii* Buckl. Tree to 40 m.; bark gray or reddish brown, broken into small scaly plates; brts. glabrous; buds glabrous, rarely pubescent, grayish: lvs. obovate to elliptic-oblong, 8-18 cm. long, 5-9-lobed, on the lower brs. usually 7-lobed, with broad, rather short lobes, on the upper brs. 7-9-lobed and deeply divided by broad sinuses more than halfway to the middle, lobes toothed and often lobulate, dark green and lustrous above, lighter

green beneath, with conspicuous axillary tufts of hairs; petioles 4-6 cm. long: fr. short-stalked or subsessile; acorn ovoid to oblong-ovoid, 1.5-3 cm. long, inclosed only at base by the saucer-shaped cup sometimes to 3 cm. across and covered with appressed often tuberculate scales. S.M.243. (*Q. texana* var. *S. Sarg.*) Kans. and s. Mich. to N. C., Fla. and Tex. Intr. 1907. Zone V. Handsome tree with widespreading brs., resembling *Q. coccinea* in foliage and *Q. borealis maxima* in fr.—*Q. S. Schnéckii* (Brit.) Sarg., var. Fr. with deep cup-shaped cup, inclosing about  $\frac{1}{3}$  of the nut, with usually thin, rarely tuberculate scales. S.S.8:t.411 (excl.f.5-7). S.M.244. G.F.7:515. (*Q. S. Brit.*, *Q. texana* var. *S. Sarg.*, *Q. texana* Sarg., in part.) Ill. and Ohio to Tex. Intr. 1897.—*Q. S. acerifolia* Palmer, var. Shrub or small tree: lvs. about as broad as long, 6-10 cm. long, often deeply 3-lobed in outline; acorns 6-12 mm. long, enclosed  $\frac{1}{5}$ – $\frac{1}{3}$  by the shallow cup. Ark. Intr. 1924. Zone V.

*Q. S. Schneckii*  $\times$  *palustris* = *Q. mutabilis* Palmer & Steyer. With the parents. Intr. 1923.

Closely related species: *Q. texana* Buckl. Tree to 10 m.; buds pubescent; lvs. not dimorphous, smaller, 6-9 cm. long, usually 5-lobed, rarely with small axillary tufts of hairs beneath; acorn smaller; cup turbinate. S.M.245. G.F.7:517. Texas. Probably not hardy.—*Q. t. \times marilandica*; see under No. 6.—*Q. Nuttallii* Palmer. Tree to 25 m.: lvs. deeply 5-7-lobed with wide sinuses and rather narrow lobes; acorn oblong-ovoid or short-cylindric, enclosed  $\frac{1}{2}$ – $\frac{1}{2}$  by the usually turbinate cup; scales looser, more pubescent. Miss. and s. e. Mo. to e. Texas. Intr. 1923. Zone V.

13. *Q. coccinea* Muenchh. SCARLET O. Tree to 25 m.; bark gray, the inner reddish; brts. soon glabrous becoming orange-red; buds dark reddish brown, pubescent above the middle: lvs. oblong or elliptic, 8-15 cm. long, truncate or rarely broadly cuneate at base, sinuately pinnatifid, with 7, rarely 9, oblong, sparingly repand-dentate lobes, bright green and glabrous beneath except small axillary tufts of rusty hairs; petioles slender, 3-6 m. long: fr. short-stalked; acorn ovoid, 1.3-2 cm. long, inclosed about  $\frac{1}{3}$ – $\frac{1}{2}$  by the turbinate or hemispheric cup with rather large appressed and glabrate scales. S.S.8:t.412,413. M.S.1:t.25(c). Em.1:164,t.(c). H.H.146,147(b). Me. to Fla., w. to Minn. and Mo. Intr. 1691. Zone IV. Tree with gradually spreading brs. forming a round-topped, rather open head, and with handsome bright green lvs. turning brilliant scarlet in fall.

*Q. c. \times borealis maxima* = *Q. Bänderi* Baenitz. Buds and lvs. intermediate: cup turbinate. Orig. in Eu. before 1900; also spont. with the parents.—*Q. c. \times ilicifolia*; see under No. 7.

14. *Q. palustris* Muenchh. PIN O. Tree to 25 or occasionally to 40 m.; brts. soon glabrous, becoming dark red-brown or orange; buds chestnut-brown, glabrate: lvs. elliptic or elliptic-oblong, 8-12 cm. long, usually cuneate at base, sinuately pinnatifid, with 5-7 oblong to oblong-lanceolate repand-dentate lobes, bright green above, lighter green, lustrous and glabrous beneath except axillary tufts of hairs; petioles slender, 2-5 cm. long: fr. sessile or short-stalked; acorn nearly hemispheric, 1-1.5 cm. across, inclosed about  $\frac{1}{3}$  by the thin saucer-shaped cup; scales closely appressed, puberulous. S.S.8:t.422,423. M.S.1:t.27(c). R.H.1921:438,t.(c). Em.167,t.(h). B.T.284(h). Mass. to Del., w. to Wis. and Ark. Intr. before 1770. Zone IV. Tree with slender spreading brs., usually pendulous at the ends, forming a symmetrical pyramidal head while young, irregular and oblong in older trees. Of rapid growth while young and often used for avenues.

*Q. p. \times borealis maxima* = *Q. Richteri* Baenitz. Lvs. deeply lobed with 4-5 pairs of lobes, cuneate at base: cup saucer-shaped. Orig. before 1900 in Eu.; also spont. with the parents.—*Q. p. \times Phellos*; see under No. 2.—*Q. p. \times imbricaria*; see under No. 3.—*Q. p. \times Shumardii Schneckii*; see under No. 12.

Related species: *Q. georgiana* M. A. Curt. Shrub to 3 m. or small tree: lvs. smaller, less deeply lobed, the lobes entire or with 1 or 2 small teeth: cup thick, cup-shaped. S.S.8:t.425. Ga. Intr. 1876. Zone V.

15. *Q. borealis* Michx. f. Red O. Tree to 20 or 25 m.; brts. soon glabrous, becoming dark red; buds glabrous except at apex: lvs. oblong, 12-22 cm. long, usually cuneate at the base, sinuately 7-11-lobed about halfway to the middle, lobes triangular-ovate or ovate-oblong, with a few irregular teeth, dull green above, grayish or whitish or sometimes pale yellow-green beneath and glabrous except axillary tufts of brownish hairs; petioles 2-5 cm. long: fr. short-stalked; acorn ovoid, 2-2.5 cm. high; cup turbinate or hemispheric, inclosing the acorn about  $\frac{1}{2}$ , 1.5-2 cm. across, with closely appressed puberulous scales. M.S.1:t.26(c). S.M.241. (*Q. ambigua* Michx., f., not H.B.K., *Q. rubra* var. *ambigua* Fern.) N. S. to Pa., w. to Minn. and Iowa. Intr. 1800. Zone IV. Beautiful Oak of rapid growth with stout spreading brs. forming a broad round-topped head and with large lvs. turning dark red in fall. Often planted as shade and avenue tree.—*Q. b. máxima* (Marsh.) Ashe. Tree to 25 or occasionally to 50 m.; fr. larger; acorn 2.5-3 cm. high; acorn inclosed only at base by the saucer-shaped cup 2.5-3 cm. broad. S.S.8:t.409,410. M.S.1:t.28(c). H.H.138,139(b). Em.168,t(h). E.H.5:t.314(h). (*Q. rubra* Du Roi, not L., *Q. m.* Ashe.) N. S. to Fla., w. to Minn. and Tex. Intr. 1724.

*Q. b. m.*  $\times$  *velutina* = *Q. Pösteri* Trel. With the parents. Intr. 1877.—*Q. b. m.*  $\times$  *imbricaria*; see under No. 3.—*Q. b. m.*  $\times$  *coccinea*; see under No. 13.—*Q. b. m.*  $\times$  *palustris*; see under No. 14.

16. *Q. agrifolia* Née. Evergreen tree to 30 m., often shrubby; brts. tomentose: lvs. broad-elliptic to elliptic-oblong, 3-7 cm. long, acute or rounded at apex, usually rounded at base, sinuately spiny-toothed, rarely entire, usually convex, dark green above, paler and rather lustrous beneath, glabrous and with axillary tufts of hairs or stellate-pubescent, subcoriaceous: fr. sessile; acorn conic-ovoid, usually elongated, 2-3.5 cm. long, inclosed  $\frac{1}{4}$ – $\frac{1}{2}$  by the turbinate cup silky-pubescent inside, puberulous outside. S.S.8:t.403. N.S. 1:t.2(c). B.C.5:f.3321,3322. J.S.t.71(h). Calif. Intr. 1849. Zone VII?

A related species is *Q. Wislizeni* A. DC. Tree to 25 m.: lvs. coriaceous, oblong-lanceolate to elliptic, 2.5-4 cm. long, acute or rounded and mucronate at apex, entire or serrulate to sinuate-dentate, with spinescent teeth: fr. usually short-stalked; acorn enclosed usually about  $\frac{1}{2}$  by the thin turbinate cup. S.S. 8:t.406. Calif. and n. Mex. Intr. 1874. Zone VII?—*Q. W.*  $\times$  *Cerris*; see under No. 23.

Subgen III. LEPIDOBALANUS Endl. Cup with the scales not connate into rings, appressed or spreading: aborted ovules near base of fr.; walls of nut glabrous inside (except in No. 31); fr. ripening the first or second year.

Sect. 1. CERRIS Loud. Styles linear, acute, upright or recurved; scales of cup spreading or recurved; fr. biennial: lvs. deciduous, rarely half-evergreen.

17. *Q. variabilis* Bl. Tree to 25 m.; bark yellowish gray, corky, deeply furrowed; brts. soon glabrous; buds acute: lvs. oblong to oblong-lanceolate, 8-15 cm. long, acuminate, usually broad-cuneate at base, crenately serrate with bristle-like teeth terminating the 9-16 pairs of parallel veins, dark green and glabrous above, white-tomentose beneath; petioles 5-25 mm. long: fr. nearly sessile; acorn subglobose or globose-ovoid, 1.5-2 cm. long, little longer than the cup; scales subulate, recurved. S.I.1:t.28(c). N.K.3:t.10. (*Q. chinensis* Bge., not Abel, *Q. Bungeana* Forb., *Q. serrata* Carruthers, not Thunb.) N. China, Korea, Japan. Intr. 1861. Zone V. Tree with distinct foliage resembling that of *Castanea crenata*.

18. *Q. acutissima* Carruthers. Tree to 15 m.; brts. glabrous: lvs. obovate-oblong to oblong, acute, 8-18 cm. long, broad-cuneate or rounded at base,

serrate with bristle-like teeth terminating the 12-16 parallel veins, lustrous and glabrous above, light green and glabrous beneath except axillary tufts of hairs, pubescent only when unfolding; petioles 1.5-2.5 cm. long: fr. sessile; cup with long, spreading and recurving scales, inclosing about  $\frac{2}{3}$  of the nut. S.I.1:t.26(c). N.K.3:t.9. (*Q. serrata* Sieb. & Zucc., not Thunb.) Japan, Korea, China, Himal. Intr. 1862. Zone VI? Tree with chestnut-like foliage.

Related species: *Q. Baronii* Skan. Half-evergreen shrub or small tree: lvs. short-stalked, ovate-oblong to lanceolate-oblong, 4-6 cm. long, with 5-7 pairs of small bristly teeth, glabrous or nearly so beneath except the tomentose midrib. W. China. B.J.29:291. Intr. 1915. Zone VII?

19. *Q. castaneaefolia* C. A. Mey. Tree to 25 m.; brts. tomentulose at first, later glabrous; stipules persistent: lvs. elliptic-oblong to oblong-lanceolate, 7-16 cm. long, acute, cuneate or rounded at base, coarsely serrate with mucronate teeth, dark green above, grayish tomentulose or pubescent, rarely nearly glabrous beneath, with 6-12 pairs of veins; petioles 1.5-2.5 cm. long: fr. sessile; acorn ovoid, 2-3 cm. long, inclosed  $\frac{1}{3}$  to  $\frac{1}{2}$  by the cup-shaped cup; scales recurved, the lower ones ovate. Kotschy, Eich. t.40(c). B.S.2:304,t(h). J.L.45:164(h). Cauc., Persia. Intr. about 1840. Zone VI? Tree with spreading brs. forming a broad round head and with chestnut-like lvs.—*Q. c. incana* Batt., var. Tree of erect pyramidal habit with smaller comparatively broader lvs. 6-12 cm. long. E.H.5:t.323(h). (*Q. c.* var. *algeriensis* Bean, *Q. Afares* Pomel.) N. Afr. Intr. 1869. Zone VII?

20. *Q. libani* Oliv. LEBANON O. Tree to 10 m.; brts. soon glabrous: lvs. oblong-lanceolate, 5-10 cm. long, acuminate, rounded at base, serrate with bristle-tipped triangular teeth terminating the 9-12 pairs of veins, glabrous and dark green above, light green beneath and sparingly pubescent on the nerves or finely short-pubescent all over; petioles 1-1.5 cm. long: frs. 1-2 on thick stalks about 1.5 cm. long; acorn broad-ovoid, about 2.5 cm. across, inclosed about  $\frac{2}{3}$  by the large cup with loosely appressed upright scales. B.S. 2:315. R.H.1872:155. S.L.287. Syria, Asia Min. Intr. 1855. Zone V? Handsome small tree.—*Q. l.* var. *angustifolia* Dipp. is scarcely distinct.

21. *Q. trojana* Webb. Half-evergreen tree to 10 m. or shrubby; brts. scurfy: lvs. ovate-oblong to oblong, 3-7 cm. long, acute, usually rounded at base, sinuately toothed with mucronate teeth, terminating the 8-12 parallel veins, lustrous dark green above, light beneath, sparingly stellate-pubescent while young, finally nearly glabrous; petioles 2-4 mm. long: acorn ovoid, 2.5-3.5 cm. high, inclosed more than  $\frac{1}{2}$  by the large cup with the lower scales ovate and appressed, the middle ones recurved and the upper ones lanceolate and upright or inverted. H.W.2:83. S.H.1:f.170a. (*Q. macedonica* A. DC.) Maced., Albania. Intr. about 1890. Zone VI? Small tree or shrub with bright green rather small half-evergreen lvs.

22. *Q. macrolepis* Kotschy. Tree to 25 m.; brts. yellowish tomentose: lvs. elliptic to oblong, 5-10 cm. long, acute, usually subcordate at base, with 3-6 pairs of triangular, entire, bristle-tipped lobes, at first yellowish tomentose, finally glabrate above; petioles 1.5-3 cm. long: fr. sessile; acorn to 4.5 cm. long, inclosed  $\frac{1}{3}$  to  $\frac{1}{2}$  by the cup-shaped cup 3-4 cm. across; scales large and thickened, the upper ones narrower and reflexed. Kotschy, Eich. t.30(c, as *Q. graeca*). S.H.1:f.108m(l). C.Q.t.55,56. E.H.5:t.322(h). (*Q. Aegilops* Lam., not L.) S. Italy, Balk. Pen., W. Asia. Intr. 1731. Zone VII?

Related species: *Q. Ehrenbergii* Kotschy. Lvs. usually distinctly lobed with acute lobes: acorn ovoid, about 3 cm. long, exceeding the subglobose cup about  $\frac{1}{2}$ ; scales upright or slightly indexed, the lower ovate and mucronate. C.Q.t. 54,f.7-9. Asia Minor. Cult. 1880. Zone VII?

23. *Q. Cérris* L. TURKEY O. Tree to 35 m.; bark dark, furrowed; brts. usually tomentose; buds ovoid, pubescent, surrounded by subulate persistent stipules; lvs. narrow-oblong to obovate-oblong, 6–12 cm. long, acute, rounded or subcordate at base, with 4–9 pairs of mucronate lobes entire or with 1–4 small teeth, dark green and somewhat rough above, light green beneath and stellate-pubescent at first, finally pubescent only on the nerves; petioles 1–2 cm. long; frs. subsessile, 1–4; acorn oblong-ovoid, 2.5–3 cm. high, inclosed about  $\frac{1}{2}$  by the cup-shaped cup covered with subulate recurved scales. H.W. 2:74–76,t.25(c). C.Q.t.62–66. F.E.14:1264,t.41(h). E.H.5:t.316–318(h). S. Eu., W. Asia. Intr. 1735. Zone VI. Ornamental tree with spreading and slender, rather short brs. forming a broad pyramidal head, and with dark green lvs. turning brown late in fall.—*Q. C. laciniata* Loud., var. Lvs. pinnatifid, with acute, usually dentate lobes. C.Q.t.64,f.5,6. S.H.1:f.110c.—*Q. C. péndula* Loud., var. Brs. pendulous; lvs. pinnatifid.—*Q. C. austriaca* Loud., var. Lvs. shallowly lobed, with broad triangular obtusish and mucronate lobes. Kotschy, Eich. t.20(c). C.Q.t.65,f. S.H.1:f.110b,d.—*Q. C. Ambrozyana* (Simonkai) Aschers. & Graebn., var. Stipules caducous; lvs. smaller, half-evergreen, glabrous above, with bristly teeth. Possibly hybrid. Orig. in Hungary before 1909. *Q. C. × Wislizeni* = *Q. kewensis* Osborn. Evergreen tree: lvs. oval to oblong, 5–8 cm. long, deeply lobed, glabrous and lustrous. G.C.90:475(h). Orig. 1914. Zone VII?—*Q. C. × Suber*; see No. 26.

Set. 2. *SUBER* Reichb. Styles linear, acutish, upright or recurved; cup with recurved or loosely appressed scales: fr. ripening the first or second year: lvs. evergreen.

24. *Q. coccífera* L. KERMES O. Evergreen shrub or small tree: young brts. stellate-pubescent, finally glabrous: buds small, brown, nearly glabrous: lvs. rigid, broad-elliptic to ovate-oblong, 1.5–4 cm. long, spiny-pointed, rounded or subcordate at base, undulate and with 2–5 spiny teeth on each side, lustrous and glabrous on both sides; petioles 2–4 mm. long: fr. biennial, short-stalked; cup cup-shaped with short spreading spiny scales, inclosing more than  $\frac{1}{2}$  of the subglobose or ovoid acorn 1.5–3 cm. long. H.W.2:82,t. 25(c). R.I.12:t.643(c). B.S.2:306. S. Eu., W. Asia, N. Afr. Intr. 1683. Zone VII? Evergreen shrub with small lustrous lvs.; the host plant of the kermes insect.

Related species: *Q. calliprinos* Webb. Tree: lvs. usually oblong, mucronate-serrate, rarely spiny or subentire, to 5 cm. long: cup larger, with more elongated scales; acorn usually exserted  $\frac{1}{2}$  or less. C.Q.t.50,51,f.1–5. K.B.1919: 235; 1920:257,t.(h). (*Q. palaestina* Kotschy.) W. Asia. Intr. 1855. Zone VII.

25. *Q. Süber* L. CORK O. Evergreen tree to 20 m.; bark thick and corky, deeply furrowed; brts. yellow-tomentose: lvs. ovate to ovate-oblong, 3–7 cm. long, acute, rounded or subcordate at base, with 4–5 pairs of short teeth, rarely nearly entire, lustrous dark green above, grayish tomentose beneath, rarely glabrescent; petioles 8–15 mm.: fr. short-stalked, annual: acorn ovoid-oblong, 1.5–3 cm. long; cup cup-shaped, its upper scales elongated, upright or sometimes spreading. M.S.1:t.13(c). Kotschy, Eich. t.33(c). C.Q.t.40–47. H.W.2:80,81(h). E.H.5:t.328(h). Am. For. 19:525,527(h). S. Eu., N. Afr. Intr. 1699. Zone VII? Tree with broad round-topped head and short trunk; the thick corky bark is the source of the cork of commerce.—*Q. S. occidentális* (Gay) Arcang., var. Lvs. usually falling in spring; frs. biennial. C.Q.t.48,f.1–8. (*Q. o. Gay.*) S. W. Eu. Intr. about 1826. Zone VII?; said to be hardier than the type.

26. *Q. hispánica* Lam. (*Q. Cérris* × *Suber.*) Half-evergreen tree to 30 m. or shrub; bark thick, slightly corky; brts. tomentose: lvs. subcoriaceous,

ovate-oblong to oblong, 4–10 cm. long, acute, usually rounded at base, with 4–7 pairs of short triangular, mucronate lobes, sparingly pubescent and dark green above, grayish tomentose beneath; petioles 5–10 mm. long: fr. subsessile, biennial; acorn ovoid-oblong; cup large, with stout recurved scales. Kotschy, Eich. t.35(c). H.W.2:82. C.Q.t.77,f.1–25. S.H.1:f.113c-h. Sparingly with the parents in S. France, Italy, Balkan Pen. Intr. 1830. Zone VII? The same cross has originated repeatedly in cult. and has given rise to several distinct variations: *Q. h. Lucombeana* (Sweet) Rehd., var. Pyramidal tree 30 m., with corky bark: lvs. generally longer and narrower and usually more deeply toothed than in the type. S.H.1:f.119c. L.A.3:1852,1853(h). B.S.2:316,t.(h). J.L.45:187(h). (*Q. L.* Sweet, *Q. Cerris* var. *L.* Loud., *Q. exoniensis* Lodd., *Q. pseudosuber* var. *aegylipifolia* DC.) Orig. about 1765 in England.—*Q. h. crispa* (Loud.) Rehd., var. Bark very corky; lvs. smaller, 5–8 cm. long, with wrinkled margin, densely white-tomentose beneath. L.A.3:f.1715,1717c, 1718(h). (*Q. Cerris* var. *c.* Loud., *Q. Lucombeana* var. *c.* Henry.)—*Q. h. heterophylla* (Loud.) Rehd., var. Lvs. oblong, irregularly and deeply lobed, occasionally in the middle with a deep wide sinus on each side: scales of the turbinate cup mostly short. L.A.3:f.1719. (*Q. Lucombeana* var. *h.* Henry.) *Q. h. diversifolia* (Nichols.) Rehd., var. Smaller tree with ascending brs. and very corky bark: lvs. about 5 cm. long and 2 cm. or less wide, usually in the middle with a deep wide sinus on each side, the lower portion with 1–4 lobes, the upper entire or toothed, white tomentose beneath, subcoriaceous: cup hemispheric, with short partly appressed scales. E.H.5:t.339,f.71. (*Q. Ilex* var. *d.* Nichols., *Q. Lucombeana* var. *d.* Henry.)—*Q. h. dentata* (Wats.) Rehd., var. *FULHAM* O. Tree with slenderer brs.; bark less corky: lvs. smaller and broader than those of var. *Lucombeana*, about 8 cm. long and 3.5 cm. broad, rounded and occasionally auricled at base, white-tomentose beneath. W.D. 2:t.93(c). C.Q.t.77,f.26–29. E.H.5:t.319(h),335,f.21. (*Q. Cerris* var. *d.* Wats., *Q. Cerris* var. *fulhamensis* Loud., *Q. Lucombeana* var. *f.* Henry.)—*Q. h. latifolia* (Henry) Rehd., var. Lvs. broader, elliptic, about 9 cm. long and 6 cm. broad, obtuse at apex, with broad shallow teeth, grayish tomentose beneath. (*Q. Lucombeana* var. *fulhamensis* l. Henry.)

27. *Q. alnifolia* Poech. Evergreen shrub or small tree; brts. with yellowish gray pubescence: lvs. orbicular or broad-obovate to elliptic, 2.5–5 cm. long, with few small teeth and 5–8 pairs of prominent veins, the margins of older lvs. deflexed, lustrous dark green above, yellowish or grayish tomentose beneath; petioles pubescent, 5–10 mm. long: cup with lanceolate recurved pubescent scales, inclosing about  $\frac{1}{2}$  of the obovoid-oblong (club-shaped) pointed acorn 2.5–3.5 cm. long. Kotschy, Eich. t.6(c). C.Q.t.40,f.1–14. Gn.40: 95. A.G.13:436. Cyprus. Intr. 1885. Zone VII?

28. *Q. semecarpifolia* Sm. Evergreen tree to 30 m., sometimes shrubby; brts. fasciculate-pilose: lvs. coriaceous, ovate or elliptic-oblong, 3–8 cm. long, rounded at apex, subcordate or rounded at base, entire or sinuately spiny-toothed, glabrous and lustrous above, with a close brownish tomentum beneath, with 6–8 pairs of partly forking veins: frs. 1–3, usually short-stalked; acorn globose-ovoid, 1–2 cm. high, enclosed about  $\frac{1}{2}$  or  $\frac{1}{4}$  by the thin cup-shaped cup; scales villous, loosely appressed, lanceolate, the upper linear, forming a fringe. Brandis, For. Fl. t.64. C.Q.t.36,f.1–16. C.C.102. Himal., S. W. China. (*Q. aquifolioides* Rehd. & Wils.) Himal., S. W. China. Intr. 1900. Zone VII?

Closely related species: *Q. monimotricha* Hand.-Mazz. Shrub to 3 m.: lvs. elliptic-oblong to orbicular-ovate, 1–3.5 cm. long, sinuately spiny-toothed, with

impressed veins and bullate above, densely fasciculate-pilose beneath, finally often glabrescent; acorns about 1 cm. high. (*Q. aquifolioides* var. *rufescens* Rehd. & Wils.) W. China, Upper Burma. Intr. 1908. Zone VII?—*Q. Gilliana* Rehd. & Wils. Evergreen small tree to 7 m. or shrubby; lvs. subsessile, elliptic, rounded at the spiny-pointed apex, 2-5 cm. long, subcordate or rounded at base, glabrous at maturity; fr. sessile, annual; acorn ovoid, about 1.2 cm. long, inclosed nearly  $\frac{1}{2}$  by the cup. C.Q.t.38,f.7-11. W. China. Intr. 1910. Zone VII?—*Q. Engleriana* Seemen. Evergreen tree to 10 m.; lvs. ovate, 6-12 cm. long, acuminate, rounded at base, with few spiny appressed teeth, glabrous at maturity; petioles about 1 cm. long; frs. short-stalked; acorn ovoid, 1 cm. long, cup with thin glabrescent scales. Icon. Pl. Koisikav. 1:t.56. C.Q.t.88,89. (*Q. sutchuenensis* Franch., *Q. obscura* Seem.) C. and W. China. Intr. 1900. Zone VII?

Sect. 3. *Ilex* Loud. Styles short, dilated toward the rounded apex: cup with appressed scales; fr. usually annual: lvs. evergreen, often entire, coriaceous.

29. *Q. phylliracoides* Gray. Evergreen shrub or tree to 10 m.; brts. stellate-pubescent: lvs. broad-elliptic to obovate-oblong, 2.5-6 cm. long, obtuse or acute, rounded or subcordate at base, crenately serrate except at base, glabrous except on the midrib above and at its base below, with about 8 pairs of inconspicuous veins; petioles 2-5 mm. long; fr. subsessile, biennial; cup tomentose within and without; acorn ovoid, 1.3-2 cm. high. S.I.1:t.31(c). C.Q.t.39,f.1-6. (*Q. Ilex* var. *p.* Franch.) Japan, C. and E. China. Intr. about 1862. Zone VII?

30. *Q. Ilex* L. HOLM O. Evergreen tree to 20 m.; bark gray, nearly smooth or finally scaly; brts. tomentose: lvs. ovate to lanceolate, 3-7 cm. long, acute, usually rounded at base, remotely serrate or entire, lustrous dark green and glabrescent above, yellowish or whitish tomentose beneath, rarely glabrescent; petioles 6-15 mm. long; frs. 1-3, usually stalked; acorn ovoid, 2-3.5 cm. high, inclosed about  $\frac{1}{2}$  by the cup-shaped or turbinate cup with thin appressed scales. H.W.2:78,79,t.25(c). Kotschy, Eich. t.38(c). E.H.5:t.324-326(h). Gn.65:320. M.G.1898:275(h). S. Eu. Intr. before 1580. Zone VII? Tree with broad round head and dense dark green foliage; one of the hardiest of the evergreen Oaks. The acorns of var. *rotundifolia* are edible.—*Q. I. angustifolia* Lam., var. Lvs. narrow, lanceolate, entire or nearly so. S.H.1:f.118d.—*Q. I. Fördii* (Loud.) Nichols. Of pyramidal habit; lvs. narrow-oblong, acute at both ends. R.H.1885:352,353.—*Q. I. rotundifolia* (West.) Rehd., var. Lvs. suborbicular to ovate, rounded at base, entire or remotely serrate. (*Q. I.* var. *ballota* A. DC., *Q. r.* Lam.)—*Q. I. microphylla* Aschers. & Graebn. Lvs. very small, to 1 cm. long, serrulate.—*Q. I. crispa* Loud., var. Lvs. small, orbicular, 1-1.5 cm. long, with decurved margin.—*Q. I. gramuntia* (L.) Loud., var. Lvs. suborbicular to broad-elliptic, often subcordate, with slender spiny teeth, 2.5-5 cm. long. (*Q. g.* L.)

*Q. I. × petraea* = *Q. audleyensis* Henry. Tree with subcoriaceous deciduous lvs. entire or sinuately lobed. E.H.5:t.338,f.59,t.327(h). (*Q. Koehnei* Schneid., *Q. Pseudoturneri* Veitch.)—*Q. I. × robur*; see under No. 41.

31. *Q. chrysólepis* Liebm. CALIFORNIAN LIVE O. Evergreen tree to 20, rarely to 30 m.; brts. fulvous-tomentose: lvs. short-petioled, elliptic to oblong-ovate, 3-10 cm. long, acute, broad-cuneate to cordate at base, sinuately spiny-dentate or entire, with revolute thick margins, bright green and glabrous above, glaucous and fulvous-tomentose beneath, coriaceous; petioles 3-10 mm. long, yellow; fr. sessile or short-stalked, acorn ovoid to ovoid-oblong, 1.5-5 cm. long; cup cup-shaped or turbinate, broad-rimmed, with small hoary-pubescent scales often hidden by a thick fulvous tomentum. S.S.8:t.398,399. G.F.5:127(h). S. Ore. to L. Calif. Intr. 1877. Zone VII? Tree with widespreading head and often pendulous brs.—*Q. c. vacciniifolia* (Kellogg)

Engelm., var. Prostrate shrub with small narrow lvs., small acorns and shallow thin cup with slightly pubescent scales. S.S.8:t.400. (*Q. v.* Kellogg.) Calif., high altitudes. Intr. about 1895; probably harder than the type.

32. *Q. virginiana* Mill. LIVE O. Evergreen tree to 20 m.; brts. tomentose: lvs. elliptic to oblong, 4–12 cm. long, obtuse or rarely acute, usually entire, rarely with a few spiny teeth above the middle, with revolute margin, lustrous dark green above, whitish tomentulose beneath; petioles stout, 5–10 mm. long: frs. 1–5, on peduncles 1–8 cm. long; acorn ovoid, about 2.5 cm. long, inclosed about  $\frac{1}{4}$  by the turbinate cup with thin appressed hoary-tomentose scales. S.S.8:t.394,395. M.S.1:t.12(c). H.H.180,181(b). G.F.5:486(h); 8:235 (h). Gg.8:1(h). (*Q. virens* Ait.) Va. to Fla., w. to Mex. Intr. 1739. Zone VII. Tree with nearly horizontal limbs forming a widespreading head; often planted as an avenue tree in the southeastern states; easily transplanted and of rapid growth.

*Q. v.*  $\times$  *lyrata*; see under No. 49.

To this group also belong the following species: *Q. reticulata* H. B. K. Evergreen shrub or small tree to 12 m.; brts. tomentose: lvs. broad-elliptic or obovate, 4–12 cm. long, usually obtuse, rounded or cordate at base, remotely spiny-dentate, fulvous-tomentose and reticulate beneath: frs. usually several on slender stalks; acorn 1–1.5 cm. long, inclosed about  $\frac{1}{4}$  by the hoary-tomentose cup. S.S.8:t.390. S. Ariz. and N. Mex., Mex. Cult. 1883. Zone VII?—*Q. obtusata* H. B. K. Large tree; brts. glabrous: lvs. obovate, 5–12 cm. long, obtuse, cuneate at base, irregularly and sinuately toothed, glabrous, glaucescent and reticulate beneath, falling in spring: frs. stalked; acorn inclosed about  $\frac{1}{2}$  by the pubescent cup. E.H.5:t.333,f.4(l). J.L.41:8,f.5(h). Mex. Cult. 1839. Zone VII?

Sect. 4. GALLIFERA Spach. Like the preceding group, but lvs. thin, deciduous or persistent only until spring, usually coarsely dentate or lobulate.

33. *Q. lusitânica* Lam. LUSITANIAN O. Deciduous shrub or tree to 20 m., with rough scaly bark; brts. pubescent: lvs. usually elliptic or obovate, 5–8 cm. long, obtuse or pointed, rounded at base, with 5–9 pairs of coarse triangular teeth, grayish green above and scurfy pubescent at first, finally nearly glabrous, grayish tomentulose beneath; petioles 5–10 mm. long: frs. 2–3, on stalks 6–25 mm. long; acorn about 2 cm. long; cup hemispheric or turbinate, tomentose. H.I.6:562. Spain, Portugal. Cult. 1835. Zone VII?

Closely related species: *Q. infectoria* Olivier. Half-evergreen tree: differing chiefly in its glabrous or nearly glabrous lvs. and brts.; petioles slender, to 2.5 cm. long. Olivier, Voy. 1:t.14,15. C.Q.t.108–111. (*Q. lusitanica* ssp. *orientalis* A. DC.) W. Asia, Cyprus. Intr. 1850. Zone VII?—*Q. fruticosa* Brotero. Half-evergreen shrub to 1, rarely to 4 m., sometimes partly prostrate: lvs. subsessile, elliptic, 3–5.5 cm. long, rounded or subcordate at base, margin undulate, with 4–7 pairs of triangular mucronate teeth, tomentulose beneath; petioles 2–4 mm. long. G.C.II.1:113. C.Q.t.114. S.H.1:f.108w. (*Q. humilis* Lam., not Mill.) S. W. Eu., N. Afr. Intr. about 1829. Zone VII?—*Q. inermis* Kotschy. Deciduous tree; brts. pubescent: lvs. elliptic-oblong, 3–8 cm. long, obtuse or acute, usually broadly cuneate at base, with 5–9 pairs of shallow teeth, tomentulose beneath or glabrescent; petioles 1–1.5 cm. long; acorn usually inclosed  $\frac{1}{2}$  by the cup. S.H.1:191. C.Q.t.109. (*Q. Veneris* A. Kern.) Cyprus. Intr. 1862. Zone VII?

Sect. 5. ROBUR Reichenb. Styles short, dilated toward the apex and rounded: scales of the cup appressed: lvs. deciduous, usually dark green, deeply lobed, rarely dentate; frs. ripening the first year: bark of trunk dark, deeply furrowed.

34. *Q. pónica* K. Koch. Shrub or small tree; young brts. glabrous, ribbed; terminal bud large, conspicuous: lvs. elliptic to obovate-oblong, 10–15 cm. long, acute, broad-cuneate at base, sharply and irregularly serrate, with 13–17 strong veins, bright green above with yellow midrib, glaucescent beneath and hairy on the veins; petioles 6–15 mm. long, yellow: fr. subsessile; acorn ovoid, inclosed about  $\frac{1}{2}$  by the cup; scales ovate-lanceolate. Gt.40:510.

S.L.291. Armenia, Cauc. Intr. 1885. Zone V. Shrubby oak with distinct rather large lvs.

*Q. p. × robur* = *Q. Hickéllii* A. Camus. Lvs. oblong-obovate, dentate or lobulate with acute or obtuse teeth, pairs of veins about 10. B.D.1933:13. C.Q. t.164.f.9. Orig. 1923.

35. *Q. canariensis* Willd. Tree to 30 m. or more; brts. glabrous or nearly so: lvs. ovate-oblong to obovate, 5-12 cm. long, acute, subcordate at base, coarsely dentate, with 6-13 pairs of obtusish teeth and with 8-14 pairs of veins, lustrous above, at first floccose-tomentose beneath, soon glabrous; petioles 1-2 cm. long: frs. 1-3 on a peduncle 5-10 mm. long; acorn inclosed about  $\frac{1}{2}$  by the hemispheric cup. S.H.1:f.108i,109i. S.M.E.t.41,42. G.M.56:139. E.H.5:t.323,332(h). (*Q. Mirbeckii* Durieu, *Q. lusitanica* var. *M. Guerke*.) Spain, N. Afr. Intr. 1844 or 1845. Zone VII?

36. *Q. macranthera* Fisch. & Mey. Tree to 20 m.; brts. tomentose: lvs. obovate, 6-18 cm. long and to 11 cm. broad, rounded at apex, narrowed toward the base, with 8-10 ovate lobes on each side, the middle lobes the largest, dark green and nearly glabrous above, grayish tomentose beneath; petioles 1-1.5 cm. long, pubescent: frs. 1-4, sessile; acorn about 2 cm. long, inclosed about  $\frac{1}{2}$  by the cup; scales lanceolate, the lower ones very loose, S.H.1:f.108v. S.M.E.t.24. Mus. Cauc. 2,t.4(h). Cauc. and Armenia to n. Persia. Intr. before 1873. Zone V. Tree with rather large lvs.

37. *Q. Frainetto* Ten. Tree to 40 m.; brts. hairy at first, becoming glabrous; lvs. very short-petioled, obovate to oblong-obovate, 10-18 cm. long, narrowed toward the auriculate base, deeply lobed or pinnatifid more than halfway to the middle, with narrow sinuses and usually 7 mostly dentate lobes sometimes 3-lobed at their apex, dark green and glabrescent above, grayish green and pubescent beneath; petioles 2-5 mm. long: frs. 2-5, short-stalked; acorn ovoid-oblong, about 2.5 cm. high, inclosed  $\frac{1}{2}$  to  $\frac{1}{2}$  by the cup-shaped cup; scales rather large and loosely appressed. H.W.2:73(b,h),t.24(c). R.I. 12:t.646(c). C.Q.t.73,74,75,f.1-2. E.H.5:t.331(h). J.L.45:169(h). (*Q. conferta* Kit., *Q. Farnetto* Ten., *Q. hungarica* Hubeny, *Q. pannonica* Hort.) Balkan Pen., s. Italy. Cult. 1838. Zone V. Tree with gradually spreading brs. forming a round-topped open head, and with dark green lvs.

38. *Q. pyrenæica* Willd. Tree to 15, rarely to 20 m., suckering; brts. slender, yellowish tomentose; buds pubescent: lvs. obovate to obovate-oblong, 6-14 cm. long, rounded and auriculate at base, deeply pinnatifid halfway or more to the midrib, with usually 5-6 pairs of rather narrow and acute lobes with few coarse teeth or entire, pubescent above, becoming finally glabrate, yellowish tomentose beneath; petioles 5-20 mm. long: frs. 1-5, subsessile or on a stalk to 2 cm. long; acorn oblong-ovoid, inclosed  $\frac{1}{2}$  to  $\frac{1}{2}$  by the cup-shaped cup with rather loosely appressed tomentose scales. Kotschy, Eich. t.22(c). S.H.1:f.108k,f.109l-l". S.M.E.t.31. E.H.5:t.330(h). (*Q. Tausin* Pers., *Q. Toza* DC., *Q. crinita* Hort., not Lam., *Q. camata* Hort.) S. Eu. Intr. 1822. Zone VI? Tree with slender brs.—*Q. p. pendula* (Dipp.) Schwarz, l. Form with pendulous brs.; lobes of lvs. rather narrow, often with 1 or few coarse broad teeth. (*Q. camata pendula* Hort.)

39. *Q. pubescens* Willd. PUBESCENT O. Shrub or small tree to 15, rarely to 20 m.; brts. pubescent: lvs. obovate to oblong-obovate, 5-10 cm. long, broad-cuneate to subcordate at base, pinnately lobed with 4-8 pairs of usually shallow rounded lobes with undulate sinuses or pinnatifid sometimes halfway or more to the midrib and with acutish lobes, usually glabrous above, grayish green and pubescent or tomentose beneath; petioles 5-10 mm. long: frs. 1-4,

sessile or short-stalked; acorn ovoid, 1.5-2 cm. high, inclosed  $\frac{1}{3}$  to  $\frac{1}{2}$  by the tomentose cup with closely appressed scales. H.W.2:69,71(b,h),t.23(c). Kotschy, Eich. t.34(c). J.L.45:184(h). (*Q. lanuginosa* Thuill., not Lam., *Q. sessiliflora* var. *p.* Loud.) S. Eu., Cauc., W. Asia. Long cult. Zone V. Very variable in lf.-shape and pubescence.—*Q. p. pinnatifida* (Gmel.) Spenner, var. Lvs. 3-6 cm. long, deeply lobed with obtuse, often coarsely dentate lobes, tomentose beneath, silky on the veins. S.H.1:f.122a.—*Q. p. crispata* (Stev.) Schwarz, f. Lvs. 2-3 cm. long, deeply lobed, with acute dentate and crisped lobes, tomentose beneath.

Related species: *Q. Virgiliàna* Ten. Brts. densely appressed-pubescent: lvs. 8-16 cm. long, cordate at base, rarely broad-cuneate, pinnately to sinuately lobed, lobes 5-7, 1-2.5 cm. broad, often with 1-3 broad teeth, pubescent beneath, finally often glabrescent and glaucous; petiole 5-25 mm. long, pubescent: frs. 2-4 on a pubescent stalk 3-8 cm. long; acorn 2-4 cm. long. S.M.E.:t.36. (*Q. robur* var. *Tenorei* DC., *Q. Dalechampii* Wenz., not Ten.) S. E. Eu. to Italy. Cult. 1890. Zone V.

40. *Q. petraea* (Mattuschka) Lieblein. DURMAST O. Large tree, but usually smaller than *Q. robur*; brts. glabrous or slightly pubescent at first: lvs. obovate to obovate-oblong, 8-12 cm. long, cuneate to subcordate at base, with 5-9 pairs of rounded lobes, lustrous and bright green above, grayish green and glabrous beneath or slightly pubescent with branched hairs; petioles 1-2 cm. long, yellow like the midrib, glabrous: frs. nearly sessile or short-stalked; acorn ovoid to ovoid-oblong, enclosed about  $\frac{1}{3}$  by the hemispheric cup with closely appressed tomentose scales. H.W.2:66(h),67(b),t.22. M.S.1:t.2(c). E.H.2:t.92(h). (*Q. sessiliflora* Salisb., *Q. sessilis* Ehrh., *Q. robur* Mill., not L., *Q. robur* ssp. *sessiliflora* A. DC.) Eu., W. Asia. Long cult. Zone IV. Not as much planted as *Q. robur*; it keeps its lvs. longer and succeeds in drier situations.—Very variable: *Q. p. purpurea* (Jaeg.) Schwarz, l. Young lvs. purple, changing to dark green with red veins. (*Q. sessiliflora* var. *rubicunda* Henry.)—*Q. p. mespilifolia* (Wallr.) Schwarz, subf. Lvs. narrow, acute at ends, entire or nearly so. H.W.2:65. (*Q. sessiliflora* *Louettei* Kirchn., *Q. robur* var. *m.* Wallr.)—*Q. p. laciniata* (Lam.) Schwarz, f. Lvs. incisely lobed with narrow irregular lobes pointing forward. Gt.61:495. M.D.1913:137. (*Q. sessiliflora* f. *insecata* Rehd.)—*Q. p. pendula* (Nichols.) Schwarz, l. Brs. pendulous.

*Q. p. × robur* = *Q. rosacea* Bechst. Very variable; lvs. usually auricled at base. Jour. Bot. 48:t.502. M.D.1924:t.3. (*Q. hybrida* Bechst., not Brot., *Q. intermedia* Boenn.) With the parents in Eu. and cult.—*Q. p. × Ilex*; see under No. 30.

Related species: *Q. ibérica* Bieb. Brts. glabrous: lvs. obovate-lanceolate, 8-16 cm. long, regularly sinuately lobed with 8-12 rounded lobes, subcordate or rounded at base, minutely puberulous beneath or finally glabrate; petiole 1.6-2.8 cm. long: fr. 1-3, subsessile or on a stalk to 1.5 cm. long. S.M.E.:t.4. W. Asia. Cult. 1890. Zone V.—*Q. polycarpa* Schur. Lvs. obovate to oblong-lanceolate, 7-12 cm. long, subcordate at base, puberulous beneath when young, finally glabrous, shallowly 5-8-lobed: fr. 1-6, subsessile or stalked; cup with much thickened gibbous scales. S.M.E.t.8. S. E. Eu., W. Asia. Cult. 1900. Zone V.—*Q. Dalechampii* Ten. Brts. glabrous: lvs. oblong to obovate-lanceolate, 8-13 cm. long, deeply sinuately to pinnately lobed, with 5-7 ovate to oblong-lanceolate acutish lobes, truncate to subcordate at base, minutely puberulous at first, soon glabrate or glabrous: fr. 1-3, on a short stalk to 5 mm. long; cup with puberulous, much thickened gibbous scales. S.M.E.t.11. (*Q. aurea* Wierzb.) S. E. Eu. to Italy. Cult. 1900. Zone V.

41. *Q. robur* L. ENGLISH O. Tree to 25, occasionally to 50 m.; trunk thick, with dark deeply furrowed bark; brts. glabrous: lvs. obovate to obovate-oblong, 5-12 cm. long, subcordate or truncate at base, with 3-7 pairs of rounded lobes, glabrous, dark green above, pale bluish green beneath; petioles 4-8 mm. long: frs. 1-5 on a peduncle 3-8 cm. long; acorn ovoid to

ovoid-oblong, 1.5–2.5 cm. long, inclosed about  $\frac{1}{3}$  by the cup-shaped cup. H.W. 2:54(h), 55(b), t.21(c). M.S.1:t.2(c). Em.134,t(h). L.A.3:1742(h). E.H.2:t.81–91, 93–96(h). (*Q. pedunculata* Ehrh., *Q. robur* ssp. p. A. DC., *Q. femina* Mill.) Eu., N. Afr., W. Asia. Long cult. Zone IV. Stately tree with short thick trunk and wide-spreading stout limbs forming an open broad head; the lvs. remaining green until late in fall.—Very variable species with more than 40 garden forms of which the following are the best known: *Q. r. variegata* West., var. Lvs. variegated with white.—*Q. r. purpurascens* (DC.) A. DC. Lvs. purple when young, finally nearly green. Deutsch. Mag. Gart. Blumenk. L875:23,t(c). (*Q. pedunculata* var. p. Loud., *Q. r. f. sanguinea* Schneid.)—*Q. r. atropurpurea* Hartw. & Rümpl., var. Lvs. dark purple or violet-purple. F.S.17:t.1783–84(c). (*Q. r. nigra* Vanh., not var. *nigra* Lam.)—*Q. r. Concórdia* (Kirchn.) Lem. Lvs. bright yellow, particularly when young; habit upright. I.H.14:t.537(c). F.E.13:t.19(h). Orig. 1843.—*Q. r. holophylla* Rehd., f. Lvs. elliptic to oblong, 3–8 cm. long, obtuse, auricled at base, entire; petiole about 1 cm. long. (*Q. ped.* var. *longifolia* Bean, not Kirchn.)—*Q. r. heterophylla* (Loud.) K. Koch. Lvs. elongated, cuneate at base, with few irregular obtusish lobes pointing forward, occasionally curved and bullate, sometimes nearly entire. L.A.3:1733,1734. S.H.1:f.126a–b. (*Q. r. f. laciniata* Schneid., *Q. Fenessei* Hort.)—*Q. r. aspleniifolia* (Kirchn.) Hartw. & Rümpl., var. Lvs. pinnatifid, cuneate at base, with triangular-lanceolate or lanceolate lobes setosely acuminate, occasionally obovate and dentate or linear and nearly entire. S.H.1:f.126f. (*Q. r. f. diversifolia* Schneid.)—*Q. r. filicifolia* (Lem.) Hartw. & Rümpl., var. Lvs. cuneate, irregularly and deeply pinnatifid, with linear lobes directed forward, margins crisped. G.C.II.14:632. S.H.1:126e.—*Q. r. pectinata* (Kirchn.) K. Koch, f. Similar to the preceding but lvs. regularly pinnatifid with somewhat broader lobes. Nederl. Fl. Pom. t.42,f.3(c). S.H.1:f.126d.—*Q. r. pendula* (Loud.) A. DC., var. Brs. pendulous. L.A.3:1733(h). J.L.45:203(h). (*Q. ped. Dauvessei* Hort.)—*Q. r. fastigiata* (Lam.) A. DC., var. Brs. upright, forming a columnar head, like that of the Lombardy Poplar. G.C.41:149(h). J.L.45:203(h). Gt.65:86(h). (*Q. f. Lam.*, *Q. ped.* var. *f. Loud.*, *Q. pyramidalis* Gmel.) Several forms of similar habit but with variations in the foliage are cult.

*Q. r. × New?* = *Q. Türneri* Willd. Half-evergreen tree to 15 m.; brts. stellate-pubescent; lvs. obovate and elliptic, 6–8 cm. long, acute or obtuse, rounded and sometimes slightly auricled at base, remotely sinuately toothed with 5–6 broad, acute and mucronate teeth, dark green and finally glabrous above, glabrous except stellate-pubescent on the veins beneath; petiole 4–8 mm. long, pubescent; frs. 3–7 on a slender tomentose peduncle; acorn ovoid, about 2 cm. long; cup hemispheric, tomentose. Willdenow, Berl. Baumz. t.3,f.2. S.M.E.t.3. J.L.45:217(h). Orig. in England before 1785.—*Q. T. pseudotürneri* (Schneid.) Henry, var. Lvs. longer and narrower, obovate-oblong to oblong, 7–10 cm. long and 4–5 cm. broad, teeth usually longer and narrower, less pubescent beneath. S.H.1:f.126g–h. G.C.II.14:714 (as *Q. glandulifera*). G.W.5:259(h). M.D.1933:t.60(h). (*Q. pseudotürneri* Schneid., *Q. aizoon* Koehne, *Q. austriaca semper-virens* Hort.) This var. is better known in cult. than the type; it is a shrubby tree with handsome dark green lvs. retained in milder climates until spring. Zone VI.—*Q. r. × pontica*; see under No. 34.—*Q. r. × petraea*; see under No. 40.—*Q. r. × montana*; see under No. 53.

Related species: *Q. Haas Kotschy*. Similar to *Q. robur*, but brts. finely pubescent; lvs. larger, with broader lobes, yellowish tomentose beneath when young, acorns to 5 cm. long. Kotschy, Eich, t.2(c). S.M.E.t.21. Asia Minor. Cult. 1870. Zone V or VI.—*Q. Hartwissiana* Stev. Lvs. obovate-oblong, 7–15 cm. long, with 4–6 rounded or acutish and near apex with 3–4 smaller lobes, subcordate at base, thinly puberulous beneath; frs. 1–4, on slender stalks about half as long as lf.; cup tomentose. S.M.E.t.15. Asia Minor to Cauc., E. Balkan Pen. Cult. 1857. Zone V? The tree usually cult. under this name is a var. of

*Q. pubescens*.—*Q. pedunculiflora* K. Koch. Brts. glabrous: lvs. obovate-oblong, 6–12 cm. long, cordate at base, deeply sinuately lobed, lobes 5–7, sometimes with 1–3 broad obtuse teeth, tomentulose beneath, later often glabrescent; petiole 3–10 mm. long: fr. 1–3 on a stalk about half as long as lf.; cup yellowish tomentose. S.M.E.t.20. (*Q. Haas* Wenzig, not Kotschy.) Asia Minor to Transcauc., Balkan Pen. Cult. 1870. Zone V.

Sect. 6. *PRINUS* Loud. Styles short, broad at apex: lvs. deciduous, dentate or lobed: cup with appressed scales, rarely the upper free and subulate: bark usually thin, gray and scaly.

42. *Q. alba* L. WHITE O. Tree to 30 m.; brts. soon glabrous, becoming light reddish brown, often glaucous: lvs. obovate to oblong-obovate, 10–22 cm. long, narrowed at base, with 5–9 oblong and obtuse, usually entire lobes, pubescent when unfolding, soon glabrous, bright green above, glaucescent beneath; petioles 1.5–2.5 cm. long: frs. short- or long-stalked; acorn ovoid-oblong, 2–2.5 cm. high, inclosed about  $\frac{1}{4}$  by the cup-shaped cup with the basal scales much thickened. M.S.1:t.1(c). S.S.8:t.356–358. S.M.301. G.F.3: 91;4:6,7;5:259(h). B.T.333(h). Me. to Fla., w. to Minn. and Tex. Intr. 1724. Zone IV. One of the noblest trees of the n. states, with stout spreading brs. forming a broad open head and bright green lvs. turning deep vinous-red or violet-purple in fall.—*Q. a. latiloba* Sarg., var. Lvs. divided usually less than halfway to the midrib into broad rounded lobes. S.M.302.—*Q. a. repanda* Michx., var. Lvs. with rather shallow sinuses and the frs. usually short-stalked. —The typical form (var. *pinnatifida* Michx.) has the lvs. deeply pinnatifid, with narrow often toothed lobes and usually slender-stalked frs.

*Q. a. × Durandii*; see under No. 45.—*Q. a. × stellata*; see under No. 48.—*Q. a. × macrocarpa*; see under No. 50.—*Q. a. × bicolor*; see under No. 51.—*Q. a. × montana*; see under No. 53.—*Q. a. × prinoides*; see under No. 54.—*Q. a. × Muhlenbergii*; see under No. 55.

43. *Q. lobata* Née. VALLEY O. Tree to 30 m.; brts. grayish, short-pubescent, glabrous the second year: lvs. obovate, 6–8 cm. long, cuneate to subcordate at base, with 7–11 ovate obtuse, sometimes dentate lobes, dark green and stellate-pubescent above, grayish tomentulose beneath; petioles about 1 cm. long, pubescent: frs. nearly sessile; acorn narrowly conic-oblong, 3.5–5 cm. long, inclosed  $\frac{1}{4}$  to  $\frac{1}{3}$  by the cup-shaped cup; upper scales with acuminate free tips, the lower ones much thickened. S.S.8:t.362. J.S.t.61,63–64(h), 62(b). G.F.3:611;10:55,202,205(h). (*Q. Hindsii* Benth.) Calif. Intr. 1874. Zone VII. Tree with widespreading brs. forming a round or oblong head with drooping brts.; scarcely planted outside of Calif.

44. *Q. Garryana* Hook. OREGON O. Tree to 30 m., shrubby at high altitudes; brts. tomentose or pubescent, orange-colored, glabrous the second year: lvs. oblong-obovate, 8–14 cm. long, cuneate or rounded at base, with 3–5 pairs of broad-ovate, obtuse, entire or toothed lobes and with rounded sinuses reaching about halfway to the midrib, dark green and glabrous above, bright green and pubescent or glabrate beneath: petioles pubescent, 1.5–2.5 cm. long: frs. sessile or short-stalked; acorn ovoid, 2.5–3 cm. long, inclosed about  $\frac{1}{2}$  by the rather shallow cup pubescent or tomentose outside; scales with thin pointed free tips, sometimes thickened. N.S.1:t.1(c). S.S.8:t.364, 365. G.F.7:495(h). F.E.32:919(h). B. C. to Calif. Intr. 1873. Zone VI. Tree with spreading or ascending brs. forming a broad compact head.

Related species are: *Q. undulata* Torr. Small tree to 10 m.; brts. tomentose: lvs. persistent elliptic-oblong, 3–7 cm. long, coarsely sinuate-dentate or lobed, the lobes often spinescent, bluish green, stellate-hairy above, pubescent below, firm: acorn oblong-cylindric, 1–1.5 cm. long. Colo. to Nev., n. Mex. and w. Tex. N.S.2:t.3(c). S.S.8:t.385. Intr. 1917. Zone V.—*Q. Havardi* Rydb. Shrub to 1

m.; lvs. thickish, deciduous, similar to the preceding, lobes mucronate: acorn dark brown, 2-2.5 cm. long. Trel., Am. Oaks, t.160. C.Q.t.207,f.6-10. E. Tex. Cult. 1920. Zone V.

45. *Q. Durandii* Buckl. Tree to 25 m.: brts. soon glabrous or puberulous, light grayish brown: lvs. oblong to obovate-oblong, entire or slightly 3-lobed toward the obtuse or acutish apex, 4-10 cm. long, narrowed at base, green and lustrous above, paler and pubescent or whitish-tomentulose beneath; petiole 5-8 mm. long; fr. sessile or nearly so; acorn ovoid, about 1 cm. long, enclosed only at the very base by the saucer-shaped cup; scales thin, acute. S.M.289. (?*Q. sinuata* Walt.) Ga. to Ark. and e. Tex. Intr. 1924. Zone V.

*Q. D.* × *stellata* = *Q. Macnabiana* Sudw. With the parents. Intr. about 1925. Zone V.

46. *Q. novo-mexicana* Rydb. Tree to 10 m. or shrubby; brts. finely pubescent or glabrous, light brown: lvs. obovate to oblong-obovate, 6-10 cm. long, pinnatifid halfway to or nearly to the midrib, similar to those of the preceding species, usually somewhat smaller, glabrous above, puberulous or nearly glabrous below, with whitish, conspicuous veins: acorns 1-1.5 cm. high, obtuse, broad-ovoid to ellipsoid, inclosed  $\frac{1}{2}$  or  $\frac{1}{2}$  by the cup; scales ovate, slightly thickened and slightly pubescent. Bull. N. Y. Bot. Gard. 2:t.27. Mem. Nat. Acad. Sci. 20:t.164,165. (*Q. nitescens* Rydb.) Colo. to Utah and N. Mex. Intr. 1916. Zone VI?

Closely related species: *Q. Gunnisonii* Rydb. Lvs. mostly oblong, lobed halfway to the middle or less, rather dull above. Bull. N. Y. Bot. Gard. 2:t.26,f.3. Colo. to N. Mex. and Utah. Intr. 1916. Zone V.—*Q. Gambelii* Nutt. Lvs. lobed about halfway to the middle, less lustrous: acorns acute, inclosed about  $\frac{1}{2}$  by the cup. S.S.3:t.366-7. Colo. to Utah and N. Mex. Intr. 1894. Zone V.—*Q. leptophylla* Rydb. Tree to 15 m.: lvs. broad-obovate, 10-15 cm. long, with 2-4 pairs of obtuse lobes, the sinuses halfway or less to the midrib, glabrous beneath except on the veins: acorn about 1.5 cm. high, inclosed about  $\frac{1}{2}$  by the cup; scales slightly thickened. B.T.340. S.M.299. Colo. Intr. 1911. Zone V.

47. *Q. utahensis* Rydb. Tree to 15 m.; brts. densely yellowish pubescent, sometimes nearly glabrous in autumn, light brown: lvs. oblong to oblong-obovate, 6-12 cm. long, pinnatifid halfway to or nearly to the midrib, with 3-5 pairs of ovate or ovate-lanceolate, acutish or obtuse lobes usually entire or the middle ones with 1 or 2 teeth, the sinuses rather narrow, dark green and lustrous, sparingly stellate, at maturity glabrate or sometimes rough above, light green and soft-pubescent beneath and reticulate; petioles pubescent, 5-10 mm., rarely to 15 mm. long: frs. 1-2, subsessile; acorn ellipsoid or ellipsoid-oblong, 1.5-2 cm. high, inclosed about  $\frac{1}{2}$  by the cup-shaped cup 1.2-2 cm. wide with ovate pubescent much thickened scales. S.M.297. B.T.339. (*Q. submollis* Rydb.) Colo. to Utah, N. Mex. and w. Tex. Intr. 1916. Zone VI? Small tree with dark green foliage.

48. *Q. stellata* Wagh. Post O. Tree to 20, rarely to 30 m.; bark reddish brown, deeply fissured and scaly: brts. tomentose: lvs. obovate, lyrate-pinnatifid, 10-20 cm. long, usually cuneate at base, rarely rounded, with 2-3 pairs of broad obtuse lobes, the middle pair much larger and mostly with a lobe on the lower margin, separated from the lower lobes by wide, from the upper by narrow sinuses, dark green and rough above, with grayish or brownish, rarely white tomentum beneath, finally glabrescent; petioles 1-2 cm. long: frs. sessile; acorns ovoid, 1.5-2.5 cm. high, obtuse, inclosed  $\frac{1}{2}$  or  $\frac{1}{2}$  by the cup-shaped or turbinate cup; scales thin, acute, loosely appressed, hoary-tomentose. M.S.1:t.5(c). S.S.3:t.363,369. H.H.166,167(b). (*Q. obtusiloba* Michx., *Q. minor* Sarg.) S. Mass. to Fla., w. to Neb. and Tex. Intr. 1819. Zone V. Tree with dense round head and large dark green lvs.

*Q. s. × alba* = *Q. Fernowii* Trel. Lvs. narrower and more regularly lobed, tomentulose beneath: fr. usually short-stalked. S.S.8:t.359. With the parents. Intr. before 1898.—*Q. s. × macrocarpa* = *Q. guadalupensis* Sarg. With the parents. Intr. 1916. Zone V.—*Q. s. × Durandii*; see under No. 45.

49. *Q. lyrata* Walt. OVERCUP O. Tree to 30 m.; brts. pubescent, glabrescent during the first winter: lvs. obovate-oblong, 14–20 cm. long, cuneate at base, deeply lyrate-pinnatifid, with 3–4 pairs of obtuse or acutish lobes, the 2 lower pairs much smaller and usually triangular and separated from the upper pairs by wide sinuses, the large middle pair usually with a small lobe on the lower margin, the terminal lobe usually 3-lobed, dark green and glabrous above at maturity, white-tomentose beneath or green and pubescent: petioles glabrous or pubescent, 1–2 cm. long: frs. sessile or stalked; acorn subglobose or ovoid, 1.2–2.5 cm. high, usually nearly entirely or rarely only ½ inclosed by the cup; lower scales much thickened, the upper thinner, acute and forming a ragged edge. M.S.1:t.6. S.S.8:t.374. H.H.170,171(b). Bull. Torr. Bot. Club 49:t.16,17(h). (SWAMP or SWAMP POST OAK.) N. J. to Fla., w. to Mo. and Tex. Intr. 1786. Zone V. Round-headed tree with short, often pendulous, brs. and large lvs.

*Q. l. × virginiana* = *Q. Comptonae* Sarg. Lvs. oblanceolate, sinuately lobed, thickish with revolute margin: fr. slender-stalked, similar to No. 32. With the parents. Intr. 1920. Zone V.

50. *Q. macrocarpa* Michx. BURR O. Tree to 25 or occasionally to 55 m. tall; bark light brown, deeply furrowed and scaly; brts. stout, densely pubescent at first, later glabrescent, sometimes developing corky wings: lvs. obovate to oblong-obovate, 10–24 cm. long, cuneate or rarely rounded at base, lyrate-pinnatifid, the lower portion of the leaf usually with 2–3 pairs of lobes separated by wide and deep sinuses from the terminal lobe usually very large and with 5–7 pairs of ovate-obtuse lobes or smaller and 3-lobed, dark green and usually lustrous above, grayish or whitish tomentulose beneath: frs. sessile or short-stalked; acorn broadly ovoid or ellipsoid, 2–3.5 cm. high, inclosed ½ or less or more by the large cup, its upper scales ending into slender awns and forming a fringe-like border, the lower ones much thickened. M.S.1:t.3(c). S.S.8:t.371,372. H.H.168,169(b). G.F.2:500(b); 3:407(h). (Mossy Cup OAK.) N. S. to Pa., w. to Man. and Tex. Intr. 1811. Zone II. Tree usually with tall trunk and spreading brs. forming a broad head; the often corky brs. conspicuous in winter.—*Q. m. olivaeformis* (Michx. f.) Gray, var. Lvs. smaller, more deeply divided, often nearly to the midrib, the lobes almost all narrow: acorn smaller, ellipsoid-oblong, enclosed more than ½ by the turbinate cup higher than broad. M.S.1:t.2(c). S.S.8:373. M.G.16:67(h).

*Q. m. × alba* = *Q. Bebbiana* Schneid. Lvs. with usually 5 pairs of less unequal lobes, pubescent beneath: cup scarcely fringed. S.S.8:t.560. With the parents. Intr. 1880.—*Q. m. × stellata*; see under No. 48.—*Q. m. × bicolor*; see under No. 51.—*Q. m. × Muhlenbergii*; see under No. 55.

51. *Q. bicolor* Willd. SWAMP WHITE O. Tree to 20, rarely to 30 m.; bark light grayish brown, scaly; brts. scurfy-pubescent at first: lvs. oblong-obovate to obovate, 10–16 cm. long, narrowed toward the base and acute or rounded, coarsely sinuate-dentate with 6–10 pairs of entire usually obtuse teeth, or sometimes lobed halfway to the midrib, dark green above, whitish tomentose or grayish green and velvety beneath; petioles 1–2 cm. long: frs. 1–2 on slender peduncles 3–8 cm. long; acorn ovoid-oblong, 2–3 cm. high, inclosed about ¾ by the cup. M.S.1:t.7(c). S.S.8:t.380,381. H.H.172,173(b). G.F.4:246(h). E.H.5:t.329(h). (*Q. platanoides* Sudw.) Que. to Ga., w. to Mich. and Ark. Intr. 1800. Zone III. Tree with rather narrow round-topped open head;

easily recognized by the light scaly bark and the numerous brts. on the larger limbs; the lvs. turn yellow-brown or orange or red in fall.

*Q. b. × alba* = *Q. Jackiana* Schneid. Lvs. with rather short lobes, thinly tomentulose or pubescent beneath: fr. usually stalked. With the parents. Intr. 1916.—*Q. b. × macrocarpa* = *Q. Schuettei* Trel. Brs. sometimes with corky wings: lvs. intermediate: cup sometimes short-fringed. Proc. Am. Philos. Soc. 56:t.2,3. C.Q.t.226,f.6,7. With the parents. Intr. 1916.

52. *Q. Prinus* L. BASKET O. Tree to 30 m.; bark light gray, scaly; brts. hairy at first: lvs. obovate to obovate-oblong, 10-16 cm. long, acute or acuminate, cuneate or rounded at base, coarsely and regularly toothed, with 10-14 pairs of obtusish, often mucronate teeth, bright green and lustrous above, grayish tomentulose beneath; petioles 1.5-3.5 cm. long: frs. short-stalked; acorn ovoid-oblong, 2.5-3.5 cm. high, inclosed  $\frac{1}{3}$  to nearly  $\frac{1}{2}$  by the cup; lower scales much thickened and the tips of the upper ones often forming a stiff fringe. M.S.1:t.8(c). S.S.8:t.382,383. H.H.174,175(b). (*Q. Michauxii* Nutt., *Q. Prinus palustris* Michx.) Del. to Fla., w. to Ind., Mo. and Tex. Intr. 1737. Zone V. Tree with round-topped, rather compact head, the lvs. turning rich crimson in fall. It prefers moist soil.

53. *Q. montana* Willd. CHESTNUT O. Tree to 25 or 30 m.; bark dark brown, ridged; brts. pubescent at first or glabrous: lvs. oblong-obovate to lanceolate-oblong, 12-18 cm. long, acutish or acuminate, narrowed toward the acute or rounded base, coarsely crenate-dentate, with 10-15 obtuse teeth, lustrous and bright or yellowish green above, paler beneath and tomentulose when young, often nearly glabrous at maturity; petioles 1.5-3 cm. long, glabrous: frs. 1-2 on peduncles shorter than the petioles; acorn ovoid, 2.5-3.5 cm. high, inclosed  $\frac{1}{2}$ - $\frac{1}{2}$  by the usually tuberculate cup. M.S.1:t.9(c). S.S.8:t.375,376. H.H.176,177(b). G.F.1:510(h). (*Q. Prinus* Engelm., not L., *Q. Prinus* var. *monticola* Michx.) Me. and Ont. to S. C. and Ala. Cult. 1688. Zone IV. Tree with broad irregular head and lustrous lvs. turning dull orange in fall. It grows well in rather dry rocky soil.

*Q. m. × robur* = *Q. Sargentii* Rehd., a tree of vigorous growth, chiefly distinguished from *Q. montana* by the auriculate base of the lvs. and the fewer lobes. Gs.4:26(h). Orig. before 1830.—*Q. m. × alba* = *Q. Saülii* Schneid. Lvs. with 6-8 nearly equal lobes on each side. S.S.8:t.361. Intr. about 1883.

54. *Q. prinoides* Willd. CHINQUAPIN O. Spreading shrub to 2 m., rarely slender tree to 5 m.; brts. soon glabrous: lvs. ovate-oblong to oblong, 6-12 cm. long, acute, cuneate at base, undulate-dentate, with 3-7 pairs of small acute or obtusish teeth, bright green and glabrous above, grayish tomentulose beneath; petioles 5-10 mm. long: frs. sessile; acorn ovoid, 1-1.5 cm. long, inclosed about  $\frac{1}{2}$  by the cup; scales tuberculate. M.S.1:t.11(c). S.S.8:t.378. Em.1:158,t. (*Q. Chinquapin* Pursh.) Me. to Ala., w. to Minn. and Tex. Intr. 1730. Zone V or IV?—*Q. p. rufescens* Rehd., var. Brts. fulvous-pubescent: lvs. smaller, fulvous-villous along midrib beneath, lobes acutish: stamens smaller. (*Q. r. Bickn.*) Mass. to N. C. Intr. 1937.

*Q. p. × alba* = *Q. Faxónii* Trel. With the parents. Intr. ?

55. *Q. Muhlenbergii* Engelm. YELLOW CHESTNUT O. Tree to 20 or occasionally to 50 m. tall; brts. hairy at first, soon glabrous: lvs. oblong to oblong-lanceolate, 10-16 cm. long, acute or acuminate, usually rounded at base, coarsely toothed, with about 8-13 pairs of acute and mucronate, often incurved teeth, dark or yellowish green above, whitish tomentulose beneath; petioles 2-3.5 cm. long: fr. subsessile; acorns globose-ovoid to ovoid, 1.5-2 cm. long, inclosed about  $\frac{1}{2}$  by the thin cup; scales small, appressed. M.S.1:t.10.

S.S.8:t.377. H.H.178,179(b) (*Q. acuminata* Sarg., not Roxb., *Q. Castanea* Willd., not Née.) Vt. to Va., w. to Neb., N. Mex. and Tex. Intr. 1822. Zone V.

*Q. M.*  $\times$  *alba* = *Q. Deamii* Trel. Lvs. rather deeply lobed, with 7-9 pairs of rather acutish lobes, tomentulose beneath: fr. short-stalked. With the parents. Intr. 1916.—*Q. m.*  $\times$  *macrocarpa* = *Q. Hillii* Trel. With the parents. Intr. before 1930.

56. *Q. alièna* Bl. Tree to 20 m. tall or more; brts. glabrous: lvs. oblong-obovate, 10-20 cm. long, obtuse or acutish, cuneate at base, coarsely sinuate-dentate, with 10-15 pairs of usually obtuse teeth, dark yellowish green and glabrous above, whitish or grayish tomentulose beneath; petioles 1-2.5 cm. long, glabrous: frs. 1-3, short-stalked or subsessile; acorn ovoid to ovoid-oblong, 2-2.5 cm. long, inclosed about  $\frac{1}{2}$  by the grayish tomentulose cup; scales thin, acuminate. S.I.1:t.28(c). C.C.98. N.K.3:t.14. Japan, Korea to C. China.—*Q. a. acuteserrata* Maxim., var. Lvs. usually somewhat smaller and narrower and teeth acutish and usually incurved at the gland-tipped apex. Japan, C. China. Intr. 1905. Zone V. Similar in lf. to the Chestnut Oak.

Closely related species: *Q. Fabri* Hance. Tree to 25 m. tall; brts. pubescent and furrowed; lvs. with 6-10 pairs of short rounded lobes, grayish tomentulose and reticulate beneath: acorn cylindric-oblong, 2 cm. long. C.C.96. China. Intr. 1908. Zone VI?

57. *Q. glandulifera* Bl. Tree to 15 m. or occasionally taller; brts. silky-pubescent when young; lvs. oblong-obovate to ovate-lanceolate, 6-15 cm. long, acute, cuneate or rarely rounded at base, with 7-12 pairs of acute gland-tipped teeth, bright green and lustrous above, grayish beneath and appressed silky-pubescent; petioles 6-15 mm. long: frs. 1 or several on a short stalk; acorn ovoid, 1-1.5 cm. high, inclosed about  $\frac{1}{2}$  by the cup. S.I.1:t.26(c). N.K. 3:t.13. M.K.t.37(c). D.L.2:88. (*Q. serrata* Thunb., not auth., *Q. urticifolia* Bl.) Japan, Korea to W. China. Cult. 1877. Zone V. Small tree with lustrous bright green lvs. remaining green until late in fall.

58. *Q. mongolica* Turcz. MONGOLIAN O. Tree to 30 m. tall; brts. glabrous: lvs. very short-stalked and crowded at the ends of the brts., obovate to obovate-oblong, 10-20 cm. long, obtuse, narrowed toward the auricled base, coarsely sinuate-dentate with 7-10 broad usually obtuse teeth, dark green above, paler beneath and pilose on the nerves or nearly glabrous; petioles 4-8 mm. long: frs. short-stalked or subsessile; acorn ovoid or ellipsoid, about 2 cm. long, inclosed about  $\frac{1}{2}$  by the thick cup; scales tuberculate, the uppermost thinner and acuminate forming a short fringe. M.K.t.35(c). D.H. 2:82. N.K.3:t.11. E. Siber., N. China, Korea, N. Japan. Intr. 1879. Zone IV. Tree of vigorous growth with large lvs.; easily recognized by its very short-stalked nearly glabrous lvs. clustered at the end of the brts.—*Q. m. grosseserrata* (Bl.) Rehd. & Wils., var. Lvs. somewhat smaller, usually acutish, with acute or acutish sometimes denticulate teeth: cup with closely appressed scales not fringed. S.I.1:t.27(c). M.K.t.36(c). S.M.E.t.2. (*Q. crispula* Bl., *Q. g.* Bl.) Japan, Saghal. Intr. 1893.

Closely related species: *Q. liaotungensis* Koidz. Lvs. 5-9 cm. long, pinnately 5-7-lobed with obtuse lobes, glabrous, short-petioled: fr. short-stalked. Ic. Pl. Koisikav. 1:t.55. (*Q. mongolica* var. *l.* Nakai.) N. E. Asia. Intr. 1912. Zone V.

59. *Q. dentata* Thunb. Tree to 25 m.; brts. stout, grayish pubescent: lvs. short-stalked, obovate, 10-20 or sometimes over 30 cm. long and up to 20 cm. wide, obtuse, narrowed toward the auriculate or rarely cuneate base, sinuate-dentate, with 4-9 pairs of broad rounded lobes, dark green above and at first short-pubescent, later glabrous, beneath grayish tomentose at first, later light

green and soft-pubescent; petioles 2-5 mm. long; frs. usually clustered and sessile; acorn globose-ovoid, 1.5-2 cm. high, inclosed about  $\frac{1}{2}$  or more by the large cup covered with lanceolate spreading scales. S.I.1:t.27(c). M.K.t. 34(c). N.K.3:t.20. G.F.6:386(h). F.E.14:542,t.29(h). (*Q. obovata* Bge., *Q. Daimio* Hort.) Japan, Korea, N. and W. China. Intr. 1830. Zone V. Round-headed tree with very large lvs.—*Q. d. pinnatifida* (Franch. & Sav.) Matsum., var. Lvs. divided almost to the midrib into linear lobes with crisped margins. Cult. 1880.

### 13. ULMACEAE Mirb. ELM FAMILY

Trees, rarely shrubs with watery juice; buds with imbricate scales: lvs. 2-ranked, alternate, usually oblique at base, pinnately veined, serrate or rarely entire; stipules deciduous: fls. perfect or monoecious; perianth 4-5-, rarely 3- or 6-8-merous, usually more or less connate; stamens as many or rarely twice as many as perianth-lobes; filaments straight; ovary superior, 1-celled, with 1 suspended ovule; style 2-parted: fr. a samara, nutlet or drupe; seed usually without endosperm, with straight or curved embryo; cotyledons flat.—About 15 genera with more than 150 species, distributed through both hemispheres except the polar regions.

- a. Lvs. with 7 or more pairs of parallel veins, the lowest pair not prominent: winter-buds somewhat spreading: perianth more or less connate.
  - b. Fls. perfect, before the lvs. or in autumn; fr. winged: lvs. usually doubly serrate.
    - 1. *Ulmus*
  - bb. Fls. at least partly unisexual, the pistillate ones axillary on the young brts.; stamens 4-5: lvs. simply serrate.
    - c. Fr. muricate, symmetrical; style centric. .... 2. *Planera*
    - cc. Fr. not muricate, oblique; style excentric.
      - d. Fr. obliquely winged: brts. partly rigid and thorny, particularly on young plants.
        - 3. *Hemiptelea*
      - dd. Fr. oblique, not winged: brts. always slender, never spiny. .... 4. *Zelkova*
  - aa. Lvs. 3-nerved at base; pairs of veins usually less than 6; winter-buds appressed: parts of perianth free: fls. unisexual.
    - b. Fr. a small winged nutlet; anthers hairy at apex: veins of lvs. curving before the margin: brts. glabrous, chestnut-brown. .... 5. *Pteroceltis*
    - bb. Fr. a drupe: anthers glabrous: brts. usually grayish brown and pubescent.
      - c. Veins curving before the margin: cotyledons broad. .... 6. *Celtis*
      - cc. Veins straight, ending in the teeth: cotyledons narrow. .... 7. *Aphananthe*

1. ULMUS L. ELM. Deciduous, rarely half-evergreen trees: buds conspicuous: lvs. short-petioled, usually oblique at base, usually doubly serrate: fls. perfect, appearing in spring before the lvs. or in autumn in the axils of the lvs., in fascicles or racemes; calyx campanulate, 4-9-lobed with an equal number of stamens: fr. a compressed nutlet surrounded by a broad rarely narrow membranous wing. Frs. ripening a few weeks after flowering. (The ancient Latin name of the tree.) About 18 species in the temp. regions of the n. hemisphere; in Am. s. to n. Mexico, but absent w. of the Rocky Mts., in Asia s. to the Himal.—Ornamental trees much planted as street or shade trees; of rapid growth and easily transplanted.

- a. Fls. appearing in spring before the lvs.: calyx-lobes short.
  - b. Fls. on slender pedicels, drooping: frs. ciliate.
    - c. Fr. glabrous except the ciliate margin: lvs. ciliate: brs. not corky: fls. fasciated.
      - d. Lvs. widest above the middle, densely pubescent beneath: buds elongated, pointed.
        - 1. *U. laevis*
      - dd. Leaves widest about the middle, often nearly glabrous beneath: buds ovoid, obtusish or acute. .... 2. *U. americana*
    - cc. Fr. pubescent: brs. usually more or less corky: fls. racemose.
      - d. Lvs. not ciliate, 5-10 cm. long: buds pubescent. .... 3. *U. Thomasii*
      - dd. Leaves minutely ciliate, 3-6 cm. long: buds glabrous. .... 4. *U. alata*
  - bb. Fls. short-pedicelled, not pendulous, in dense clusters.
    - c. Buds covered with rusty hairs, obtuse: brts. scabrous: lvs. ciliate: fr. pubescent in the middle. .... 5. *U. fulva*

- cc. Buds pale-pubescent or glabrous; brts. smooth, glabrous or pubescent: lvs. not ciliate; fr. glabrous.
- d. Lvs. doubly serrate, unequal at base, 5-20 cm. long.
- e. Young brts. pubescent: lvs. scabrous above.
- f. Fr. with the seed in the centre, about 2 cm. broad: petioles about 3 mm. long.
- g. Mature brts. reddish brown, hairy while young: lvs. rarely 3-lobed at apex.....6. *U. glabra*
- gg. Mature brts. pale yellowish or grayish brown, glabrous or nearly so while young: lvs. mostly 3-lobed at apex.....7. *U. laciniata*
- ff. Fr. with the seed near the apex, 1.5 cm. broad or less; petioles 4-8 mm. long.
- g. Lvs. broad-elliptic or ovate, 5-7 cm. long: brts. not corky....8. *U. procera*
- gg. Lvs. obovate or elliptic, 7-10 cm. long: brts. often with corky wings.
9. *U. japonica*
- ee. Young brts. glabrous or with few scattered hairs: fr. with the seed above the middle.
- f. Lvs. 7-15 cm. long; petioles 6-8 mm. long.....10. *U. hollandica*
- ff. Lvs. 3.5-8 cm. long.
- g. Petioles 6-12 mm. long; lvs. smooth above, 5-8 cm. long....11. *U. carpinifolia*
- gg. Petioles about 5 mm. long; lvs. slightly scabrous above, 3.5-6 cm. long.
12. *U. Plotii*
- dd. Lvs. simply or nearly simply serrate, nearly equal at base, 2-5 cm. long.
13. *U. pumila*
- aa. Fls. appearing in autumn in the axils of the lvs.; calyx divided beyond the middle.
- b. Lvs. simply serrate, small: fr. glabrous.....14. *U. parvifolia*
- bb. Lvs. doubly serrate, 5-8 cm. long: fr. pubescent.....15. *U. serotina*
- Sect. 1. BLEPHAROCARPUS Dunn. Fls. before the lvs. on elongated unequal pedicels, fascicled; calyx with 5-8 unequal short lobes: fr. ciliate.

1. *U. laevis* Pall. EUROPEAN WHITE E. Tree to 30 m.; bark brownish gray, smooth at first, later scaly and exfoliating, finally furrowed: brts. pubescent usually until the second year; buds elongated, acute: lvs. elliptic or obovate, 6-12 cm. long, acuminate, very unequal at base, sharply and doubly serrate, usually glabrous above, pubescent beneath; petioles 4-6 mm. long: fls. on pedicels 6-20 mm. long; stamens 6-8, exserted; stigma white: fr. ovate, 1-1.5 cm. long, notched, the incision not reaching the nutlet, ciliate. H.W. 2:9(h), t.39(c). R.I.12,t.666(c). I.T.6:t.220. S.H.1:214(h). E.H.7,t.389,390(h). (*U. pedunculata* Foug., *U. effusa* Willd., *U. racemosa* Borkh.—SPREADING E.) C. Eu. to W. Asia. Long cult. Zone IV. Tall tree with spreading brs. forming a broad open head; rarely cult.; very similar to the following species.

2. *U. americana* L. WHITE E. Tree to 40 m.; bark light gray, scaly and deeply fissured; brts. pubescent while young or sometimes nearly glabrous; buds ovoid, obtusish or acute: lvs. ovate-oblong, 7-15 cm. long, acuminate, unequal at base, doubly serrate, glabrous and rough above, pubescent or nearly glabrous beneath; petioles 5-8 mm. long: fls. on pedicels 1-2 cm. long; stamens 7-8, exserted; stigmas white: fr. elliptic, about 1 cm. long, deeply notched at apex, the incision reaching the nutlet, ciliate, M.S.3: 269,t(c). S.S.7:t.311. H.H.182,183(b). G.F.3:443,467(h); 6:175(h). F.E.15: t.46(h). Dame & Brooks, Typ. Elms, 50tt.(h). (*U. alba* Raf.—AMERICAN ELM, WATER ELM.) Nfd. to Fla., w. to foot of Rocky Mts. Intr. 1752. Zone II. Tall tree with the limbs usually gradually spreading outward and forming a wide-spreading head with pendulous brts.; very variable in habit. A favorite avenue tree in the N. E. States.—*U. a. columnaris* Rehd., f. Tree with upright brs. forming a rather wide columnar head. A form with a narrower, more distinctly columnar head is *U. a. ascendens* Slavin, f. Other columnar or narrow pyramidal forms are "Lake City Elm" and "Moline Elm," Nat. Nurseryman 40,6:10(h).—*U. a. pendula* Ait., var. Tree with long pendulous brs.

Sect. 2. CHAETOPTOLEA Schneid. Fls. before the lvs., on slender pedicels, racemose: fr. pubescent and ciliate; seed near apex.

3. *U. Thomasi* Sarg. ROCK E. Tree to 30 m.; brts. pubescent, usually until the second year and developing later usually irregular corky wings; buds

large, acute, pubescent: lvs. elliptic to oblong-obovate, 5-10 cm. long, short-acuminate, unequal at base, doubly serrate, glabrous or somewhat rough above, pubescent beneath, without axillary tufts; petioles 2-6 mm. long: fls. in pendulous racemes to 5 cm. long; stamens 5-8, exserted; stigmas greenish white: fr. elliptic or obovate, 1.5-2 cm. long, with a small notch at apex, pubescent. S.S.7:t.312. H.H.184,185(b). (*U. racemosa* Thomas, not Borkh.—CORK E.) Que. to Tenn., w. to Neb. Intr. 1875. Zone II. Tree with short spreading brs. forming an oblong, round-topped head; of slow growth and rarely planted; the lvs. turn bright yellow before falling.

4. *U. alata* Michx. Wahoo E. (WINGED E.) Tree to 15 m.; brts. nearly glabrous, developing usually 2 broad opposite corky wings; buds acute, glabrous: lvs. ovate-oblong to oblong-lanceolate, 3-6 cm. long, acute or acuminate, doubly serrate, glabrous above, pubescent beneath, with axillary tufts, subcoriaceous; petioles 1-3 mm. long: racemes short, few-fl.; stamens usually 5: fr. ovate-elliptic, about 8 mm. long, narrow-winged, with incurved beaks at apex, villous. M.S.3:275,t(c). S.S.7:t.313. H.H.186,187(b). Va. to Fla., w. to Ill. and Texas. Intr. 1820. Zone VI. Small tree with spreading brs. forming a round-topped oblong head, with small lvs. turning dull yellow before falling. Sometimes planted as a street tree in the s. States.

Sect. 3. MADOCARPUS Dum. Fls. before the lvs. on short pedicels, fascicled; calyx with 4-7 equal short lobes: fr. rarely ciliate: lvs. deciduous.

5. *U. fulva* Michx. SLIPPERY E. Tree to 20 m.; brts. pubescent and scabrous, red-brown or orange; buds large, fulvous-pubescent: lvs. obovate to oblong, 10-20 cm. long, long-acuminate, very unequal at base, doubly serrate, very rough above, densely pubescent beneath; petioles 4-8 mm. long: fls. short-stalked, in dense clusters; stamens 5-9; stigmas pinkish: fr. sub-orbicular to broadly elliptic, 1-2 cm. long, slightly notched, rufous-pubescent in the centre. M.S.3:278,t(c). S.S.7:t.314. H.H.188,189(b). Am. For. 19: 143,t.(h); 22:278(b). (*U. rubra* Michx. f. *U. elliptica* Koehne, not Koch, *U. Heyderi* Spaeth.—RED E.) Que. to Fla., w. to Dak. and Texas. Cult. 1830. Zone III. Tree with spreading brs. forming usually a broad open head, with large lvs. turning dull yellow in fall.

Related species: *U. elliptica* K. Koch. Tree with pubescent brts.; lvs. elliptic to elliptic-oblong, 8-14 cm. long, nearly smooth above, slightly pubescent beneath: fr. obovate, pubescent in the middle. Wolf & Palibin, Opr. Der. Kust. 626(l). Transcauc., Armenia. Intr. ?—*U. macrocarpa* Hance. Small tree or shrubby; brts. pubescent at first, often with 2 corky wings; lvs. broad-obovate or elliptic, 3-7 cm. long, usually abruptly short-acuminate, rough above, slightly pubescent beneath: fr. obovate, 2-2.5 cm. long, pubescent and ciliate. S.H.2: f.566h. C.H.136. N.K.19:t.5. China. Intr. 1908. Zone V.

6. *U. glabra* Huds. WYCH E. Tree to 40 m., without suckers; bark remaining smooth for many years (hence its name "glabra"); brts. pubescent while young, without corky wings; buds obtuse, pubescent: lvs. very short-petioled, oblong-obovate to elliptic or obovate, 8-16 cm. long, abruptly acuminate, very unequal at base, sharply and doubly serrate, scabrous above, pubescent beneath, rarely nearly glabrous; petioles 3-6 mm. long: fls. in dense clusters; stamens 5-6, slightly exserted; stigmas red: fr. obovate or broadly elliptic, 2-2.5 cm. long, with a small notch at apex, glabrous; seed in the middle. H.W.2:7,8(h),t.38(c). R.I.12:t.665(c, as *U. major*). E.H.7: t.394,400(h). G.C.39:152,suppl.(h). (*U. scabra* Mill., *U. montana* With., *U. campestris* L. in part.) N. and C. Eu., W. Asia. Long cult. Zone IV. There are many garden forms of which the following are most often cult.: *U. g. purpurea* (Dipp.) Rehd., f. Lvs. purple when young. (*U. scabra* var. *p.* Dipp.)

—*U. g. atropurpurea* (Spaeth) Rehd., f. Lvs. dark purple. (*U. montana* var. *a.* Spaeth.) Orig. about 1883.—*U. g. lutescens* (Dipp.) Rehd., f. Lvs. yellow. (*U. scabra* var. *l.* Dipp.)—*U. g. cornuta* (David) Rehd., f. Lvs. obovate, often broadly so and, at least on vigorous brts., with 3 or sometimes 5 acuminate lobes at the broad apex; brts. hirsute, red-brown in autumn. H.W.3:7.f.231a. (*U. campestris* c. David, *U. scabra tricuspis* K. Koch, *U. triseriata* and *tridens* Hort., *U. mont.* var. *laciniata* Hort., not Maxim.) Orig. before 1845.—*U. g. crispa* (Willd.) Rehd., f. Lvs. narrow, incisely serrate, with twisted and incurved teeth: of slow growth. S.H.1:f.136y(1). (*U. mont.* var. *crispa* Loud., *U. asplenifolia* Hort., *U. urticaefolia* Audib.) Orig. before 1800.—*U. g. pendula* (Loud.) Rehd., f. Brs. horizontally spreading forming a low flat-topped head with long pendulous brts. G.C.50:221(h). Gn. 86:579(h). E.H.7:t.393(h). (*U. mont.* var. *p.* Loud., *U. mont.* var. *horizontalis* Kirchn.) Orig. about 1816.—*U. g. camperdownii* (Henry) Rehd., f. With pendulous brs. and brts. forming a globose head. G.C.50:221(h). (*U. mont.* var. *pendula* Camperdownii Henry, *U. mont. pendula* Kirchn., not Loud.) Cult. 1850.—*U. g. exoniensis* (K. Koch) Rehd., f. With strictly upright brs. forming a narrow columnar head; lvs. smaller, broadly obovate, coarsely and deeply serrate, wrinkled above and often twisted. L.A.7:t.187a(h). (*U. mont.* var. *fastigiata* Loud., *U. scabra* v. *pyramidalis* Dipp., *U. exoniensis* K. Koch.) Orig. before 1826.—*U. g. nana* (Dipp.) Rehd., f. Dwarf slow growing form with stunted brts. and small lvs., forming a rounded bush rarely more than 2 m. tall. Orig. before 1869.—*U. g. monstrosa* Schneid. Rehd., f. Compact shrub; brts. often fasciated; lvs. 5–8 cm. long, partly pitcher-shaped at base and on a slender stalk to 2.5 cm. long.—*U. g. nitida* (Fries) Rehd., f. Glabrous form with glabrous brts. and glabrous lvs. smooth above. (*U. mont.* var. *n.* Syme.) Spontaneous in Scand. and Eng. Intr. ?

*U. g. × pumila* = *U. arbuscula* Wolf. Shrubby tree with elliptic to elliptic-oblong lvs. 2–7 cm. long (much longer on shoots), nearly equal at base, doubly serrate. Orig. 1902.—*U. g. × carpinifolia*; see No. 10. *U. hollandica*.

Related species: *U. Brandisiiana* Schneid. Brts. finely pubescent when young: lvs. elliptic to elliptic-lanceolate, 6–14 cm. long, long-acuminate, rough on both sides, slightly pubescent beneath at first; petioles 0.5–1 cm. long: frs. in very short racemes, broad-ovate, 12–18 mm. long. N. W. Himal., Afghan. Intr. 1919. Zone V.—*U. Bergmanniana* Schneid. Tree to 23 m.; brts. glabrous: lvs. very short-petioled, obovate-oblong to elliptic, 7–12 cm. long, glabrous: fr. roundish-obovate, about 1.5 cm. long. S.H.2:f.565a-b, 566a-b. C. China. Intr. 1900. Zone V?—*U. B. lasiophylla* Schneid., var. Lvs. pubescent beneath. W. China. Intr. 1908. Zone V?

7. *U. laciniata* (Trautv.) Mayr. Tree to 10 m., rarely taller; brts. glabrous or sparingly hairy when young, becoming pale yellowish brown or grayish brown in fall: lvs. obovate or obovate-oblong, 8–18 cm. long, at the broad apex usually with 3 or sometimes with 5 lobes, very unequal at base, doubly serrate, rough above, usually soft-pubescent beneath; petioles 2–5 mm. long: fls. in dense clusters: fr. elliptic, about 2 cm. long, glabrous; seed in the middle. S.I.2:t.15(c). M.K.t.39(c). N.K.19:t.2,3. (*U. mont.* var. *l.* Trautv., *U. major* var. *heterophylla* Maxim.) Manch., N. China, Japan. Cult. 1900. Zone V. Often confused with *U. glabra cornuta* which may be readily distinguished by the hairy brts. reddish brown at maturity and the presence of the 3-lobed lvs. chiefly on vigorous shoots.—*U. l. nikkoensis* Rehd., var. Lvs. obovate, 6–11 cm. long, sparingly short-pubescent on the veins and veinlets beneath, purple when unfolding. C. Japan. Intr. 1905.

8. *U. procera* Salisb. ENGLISH E. Tall tree to 40 or even 50 m.; suckering; bark deeply fissured; young brts. pubescent, sometimes developing corky

wings; buds ovoid, minutely pubescent: lvs. ovate or broad-elliptic, 5-8 cm. long, short-acuminate, very oblique at base, doubly serrate, with about 12 pairs of veins, dark green and scabrous above, soft-pubescent beneath and with axillary tufts; petioles 4-6 mm. long, pubescent: fls. short-stalked; stamens 3-5; stigmas white: fr. suborbicular, about 1.2 cm. across, with a small closed notch at apex; seed close to the notch. S.E.8:t.1285(c). Em.2:336(h). M.G.15:577(h). E.H.7:t.404,405(h),412,f.14. (*U. campestris* Mill., *U. surculosa* var. *latifolia* Stokes.) Eng., w. and s. Eu. Early intr. to Am. Zone V. Tall tree with straight nearly excurrent stem and spreading or ascending brs. forming an oval or oblong head. Much planted in England and also in this country, particularly in the N. E. States. The lvs. remain green several weeks longer than those of the American Elms.—*U. p. argénteo-variegata* (West.) Rehd., f. Lvs. striped and spotted with white. (*U. camp. var. variegata* Dipp., *U. camp. var. a.* West.) Orig. before 1770.—*U. p. purpurea* (Wesm.) Rehd., f. Lvs. tinged dark purple. (*U. camp. var. p.* Wesm.) Orig. before 1860.—*U. p. purpurascens* (Schneid.) Rehd., f. Lvs. small, 2-3 cm. long, tinged purple. (*U. camp. f. p.* Schneid., *U. camp. var. myrtifolia purpurea* De Smet.) Orig. before 1877.—*U. p. Vanhoúttei* (Schelle) Rehd., f. Lvs. tinged with yellow. (*U. camp. var. V.* Henry, *U. camp. "Louis van Houtte"* Hort.) Orig. about 1836.—*U. p. Berárdi* (Simon-Louis) Rehd., var. Bushy tree with slender upright brs.: lvs. elliptic-oblong, 1.5-3 cm. long, with few large simple obtusish teeth, glabrous; petiole and brts. pubescent: fr. unknown. S.H.1:f.1361-m. (*U. camp. var. B.* Simon-Louis.) Orig. 1863. Similar to *Zelkova Verschaeltii*.—*U. p. myrtifolia* Rehd., f. Lvs. ovate or rhombic-ovate to oblong-ovate, 2-3(-5) cm. long, with nearly simple teeth, loosely pilose on both sides: fr. obovate, 12-15 mm. long. Cult. 1880.—*U. p. viminalis* (Loud.) Rehd., var. Tree with ascending brs. and pendulous brts. slightly pubescent while young: lvs. obovate to narrow-elliptic, 2-6 cm. long, acuminate, incisely doubly serrate, scabrous above, slightly pubescent beneath: fr. unknown. G.C.51:326. S.H.1:f.215n-o. (*U. camp. var. v.* Loud., *U. antarctica* Kirchn., *U. stricta* Hort., not Lindl.) Orig. 1817.—*U. p. aurea* (Morr.) Rehd., f. A form of the preceding var. with yellow lvs. I.H.14:t.513 (c). B.H.16:t.19(c). (*U. Rosseelsii* Hort., *U. camp. a.* Morr.) Orig. before 1866.—*U. p. marginata* (Kirchn.) Rehd., f. A form of *U. p. viminalis* with the lvs. variegated creamy white near the margin. (*U. camp. viminalis m.* Kirchn., *U. camp. var. viminalis variegata* Nichols.) Orig. before 1860.—*U. p. australis* (Henry) Rehd., var. Lvs. thicker and firmer, prominently veined beneath, more cuspidate-acuminate. E.H.7:t.412,f.17. (*U. camp. var. a.* Henry.) S. Eu. Long cult.

9. *U. japonica* (Rehd.) Sarg. JAPANESE E. Tree to 30 m.; young brts. densely pubescent and tuberculate, pale yellowish brown, sometimes developing corky wings: lvs. obovate or elliptic, 8-12 cm. long, acuminate, doubly serrate, with 12-16 pairs of veins, scabrous and pubescent above, pubescent beneath, with small axillary tufts; petioles 4-5 mm. long, densely pubescent: fls. nearly sessile; stamens 4: fr. obovate-elliptic, about 2 cm. long, gradually narrowed at base; seed touching the open notch. S.I.2:t.101(c). C.H.139. N.K.19:t.8 G.F.6:327(h). (*U. campestris* var. *j.* Rehd., *U. Davidiana* var. *japonica* Nakai.) Japan, N. E. Asia. Intr. 1895. Zone V.

Related species: *U. Davidiana* Planch. Brs. usually with 2 broad corky wings: lvs. short-petioled, broad-obovate or elliptic-ovate, 5-10 cm. long, slightly pubescent beneath: fr. elliptic, pubescent in the middle. C.H.141. N.K.19:t.9. N. China. Intr. ?—*U. Wilsoniana* Schneid. Tree to 25 m.; young brts. pubescent, becoming brown and often corky: lvs. elliptic or elliptic-obovate, 4-10 cm.

long, smooth above, finely pubescent or nearly glabrous beneath: fr. obovate, glabrous. S.H.2:f.565e,566c-d. C. China. Intr. 1910. Zone V.

10. × *U. hollandica* Mill. Under this name are united here a number of Elms which are apparently hybrids between *U. glabra* and *U. carpinifolia*, more or less intermediate between these two species. (*U. Dippeliana* Schneid.) As the type of this group may serve the following variety which probably is not different from Miller's *U. hollandica*. Zone IV.—*U. h. major* (Sm.) Rehd., var. DUTCH E. Tree to 40 m. with short trunk and wide-spreading brs. and often pendulous brts.; suckering; bark deeply fissured; young brts. glabrous or with few hairs: lvs. elliptic-ovate or broad-elliptic, 8–12 cm. long, acuminate, very unequal at base, with 12–14 pairs of veins, lustrous dark green and nearly smooth above, sparingly and minutely pubescent and glandular beneath, with conspicuous axillary tufts; petioles 6–10 mm. long: fls. usually 4-merous: fr. elliptic-obovate, 2–2.5 cm. long; the seed touching the notch. R.I.12:t.662(c, as *U. montana*)? E.H.7:t.42,f.15. F.N.2:f.84(h). (*U. m.* Smith, *U. camp.* var. *m.* Planch., *U. scabra* var. *m.* Guerke.) Of unknown origin.—*U. h. végeta* (Loud.) Rehd., var. HUNTINGDON E. Tall tree with usually forked stem and rough bark; suckering; young brts. glabrous or sparingly hairy: lvs. elliptic, 8–12 cm. long, acuminate, very unequal at base, with 14–18 pairs of veins, smooth and glabrous above, glabrous below except small axillary tufts; petioles 6–8 mm. long: fr. elliptic-obovate with closed notch; seed above the middle. E.H.7:t.395(h),t.412,f.16. (*U. v.* Lindl., *U. glabra* var. *v.* Loud., *U. Huntingdoni* Hort.) Orig. about 1750.—*U. h. belgica* (Burgsd.) Rehd., var. BELGIAN E. Tall tree with straight stem and broad crown; bark rough; young brts. more or less pubescent: lvs. elliptic-obovate, often narrowly so, 8–12 cm. long, acuminate, very oblique at base, with 14–18 pairs of veins, slightly scabrous above, soft-pubescent beneath, or only on the veins; petioles 4–6 mm. long: fr. elliptic, 2–2.5 cm. long, seed above the middle. E.H.7:t.412,f.18. (*U. b.* Burgsd., *U. latifolia* Poederle, *U. batavica* K. Koch, *U. camp.* var. *latifolia* Gillek.) Orig. in Belgium; much planted in continental Eu.—*U. h. Dumontii* (Mottet) Rehd., var. Similar to the preceding, but with more ascending brs. forming a narrow head. (*U. belgica* var. *D.* Henry, *U. camp.* var. *D.* Mottet.)—*U. h. Klemmer* (Gillekens) Rehd., var. Tall tree with ascending brs. forming a narrow-pyramidal head; bark smooth; young brts. with short hairs: lvs. ovate, 5–10 cm. long, short-acuminate, oblique at base, with about 12 pairs of veins, glabrous but scabrous above, minutely pubescent beneath; petioles 5–10 mm. long: fr. with the seed close to the notch. (*U. camp.* var. *K.* Gillekens, *U. camp. Clemmeri* Hort., *U. Klemmeri* Spaeth.) Orig. in Belgium where it is much planted.—*U. h. superba* (Morr.) Rehd., var. Narrow-pyramidal tree; bark smooth; young brts. glabrous: lvs. ovate or elliptic-obovate, 8–12 cm. long, very oblique at base, with 15–18 pairs of veins, glabrous and smooth above, glabrous below except small axillary tufts; petioles 6–8 mm. long, sparingly pubescent: fls. 5-merous: fr. elliptic, 1.5–2 cm. long, with the seed near the middle. (*U. montana* var. *s.* Morr., *U. s.* Henry, *U. praestans* Schoch.) Orig. in Belgium.—*U. h. Dauvessiei* (Henry) Rehd., var. Broad-pyramidal tree; brts. hairy: lvs. to 12 cm. long, very unequal at base, soft-pubescent beneath; petiole about 5 mm. long: fr. with the seed near apex. (*U. mont.* var. *D.* Nichols., *U. D.* Henry.) Orig. before 1877.—*U. h. Pitteursii* (Kirchn.) Rehd., var. Vigorous growing tree with large broad-ovate lvs.; said to produce annual shoots to 3 m. long. B.H.2:133, 166. (*U. P.* Kirchn., "Orme Pitteurs" Morr.) Orig. in Belgium.—*U. h. pendula* (W. Mast.) Rehd., var. Tree with ascending brs. and pendulous brts.,

more or less pubescent when young; lvs. firm, elliptic, about 8 cm. long, long-acuminate, very unequal at base, glabrous and smooth above, sparingly pubescent beneath; petioles about 8 mm. long; stamens 3-5; fr. obovate, 2 cm. long, with open notch; seed above the centre. E.H.7:t.412,f.24. (*U. Smithii* Henry, *U. glabra* var. *p.* Loud.) Orig. in England before 1830.—The various hybrids are much planted in Europe, particularly on the continent as shade and street trees.

11. *U. carpinifolia* Gleditsch. SMOOTH-LEAVED E. Tree to 30 m., suckering; bark gray, deeply fissured; brts. slender, glabrous or nearly so while young; buds minutely pubescent; lvs. elliptic to ovate or obovate, acuminate, very oblique at base, doubly serrate, with about 12 pairs of veins, lustrous bright green and smooth above, glabrous beneath except axillary tufts, glandular while young; petioles 6-12 mm. long, usually pubescent; fls. in dense clusters; stamens 4-5; stigmas usually white; fr. elliptic or obovate, cuneate at base, rounded at apex; seed close to the closed notch. H.W.2:3,t.37(c, as *U. campestris*). R.I.12:t.664(c) S.E.8:t.1286(c). E.H.7:t.399,401,402(h). (*U. foliacea* Gilib., *U. nitens* Moench, *U. glabra* Mill., not Huds., *U. campestris* var. *laevis* Spach, *U. surculosa* var. *glabra* Stokes.) Eu., N. Afr., W. Asia. Long cult. Zone IV. A tree with straight trunk and slender ascending brs. forming a pyramidal head, or spreading and forming a round-topped head; brts. often pendulous; foliage bright green. A very variable species with many garden forms: *U. c. variegata* (Dum.-Cours.) Rehd., f. Lvs. marked usually densely with rather small white spots. (*U. camp. v.* Dum.-Cours.)—*U. c. pendula* (Henry) Rehd., f. With slender pendulous brts. (*U. nitens* var. *p.* Henry.)—*U. c. Webbiæna* Rehd., f. Narrow-pyramidal tree with ascending brs.: lvs. small, folded longitudinally. (*U. camp. W.* Lee.)—*U. c. Dampieri* (Wesm.) Rehd., var. Narrow-pyramidal tree: lvs. crowded on short brts., broad-ovate, deeply doubly toothed with crenately serrate teeth. N.V.12:133, t(h). (*U. nitens* var. *D.* Henry.)—*U. c. Wrèdei* (Juehlke) Rehd., f. Like the preceding, but lvs. yellowish. M.G.13:160(h). S.H.1:f.136p. (*U. camp. Dampieri* W. Juehlke. *U. W. aurea* Hort.) Orig. about 1877.—*U. c. cornubiensis* (West.) Rehd., var. CORNISH E. Narrow-pyramidal tree, with ascending brs.; young brts. often pubescent at the nodes; lvs. elliptic or broad-obovate, 5-7 cm. long, dark green and smooth above; petioles about 8 mm. long, pubescent; stigmas pink; fr. narrower than in the type. E.H.7:t.397(h), 412,f.20. (*U. stricta* Lindl., *U. camp. var. stricta* Ait., *U. camp. var. c.* Loud., *U. glabra* f. *fastigiata* Dipp., *U. nitens* var. *stricta* Henry.) S. W. Eng. Long cult.—*U. c. sarniënsis* (Loud.) Rehd., f. JERSEY E. A form of the preceding with more stiffly erect brs. and broader lvs. less conspicuously tufted beneath: stigmas white. G.C.41:150(h); 87:165(h). E.H.7:t.398(h), 412,f.21. B.S.1:86, t(h). F.N.2:f.81(h). (*U. camp. Wheatleyi* Simon-Louis, *U. nitens* var. *W.* Henry, *U. sarniënsis* Lodd., *U. campestris monumentalis* Hort., not Rinz.—WHEATLEY or GUERNSEY E.)—*U. c. umbraculifera* (Trautv.) Rehd., var. Tree with dense globose head; brts. slender, slightly hairy when young; lvs. elliptic or elliptic-ovate, 3-7 cm. long, often slightly rough above; petiole 4-8 mm. long. Gt.30:t.1034(h). M.G.15:579(h). M.D.1910:72,73(h). S.L.372(h). (*U. camp. var. u.* Trautv., *U. densa* Litvin.) Turkest. Cult. 1879.—*U. c. gracilis* (Spaeth) Rehd., f. A form of the preceding with slenderer brs. and smaller lvs. (*U. camp. umbraculifera g.* Spaeth.)—*U. c. Koopmännii* (Spaeth) Rehd., f. Similar to *U. c. umbraculifera* but with an oval head; brs. often corky, brts. paler; lvs. grayish green beneath; petiole 3-5 mm. long. (*U. K.* Spaeth.) Infr. from Turkest. before 1880.—*U. c. suberosa* (Moench) Rehd.,

var. Usually shrubby; the stiff brs. with corky wings: lvs. smaller, often slightly rough above. R.I.12:t.663(c) S.L.2:413(h). (*U. s. Moench*, not Ehrh., *U. camp. var. s. (Moench) Wahlb.*) C. Eu.—*U. c. propendens* (Schneid.) Rehd., f. A form of the preceding with somewhat pendulous brs. and small lvs. 2–3 cm. long. M.G.16:166(h). (*U. suberosa pendula* Lav., *U. glabra var. suberosa f. pr. Schneid.*)—*U. c. italica* (Henry) Rehd., var. Lvs. more coriaceous than in the type, with 14–18 pairs of veins, quite glabrous except axillary tufts beneath. E.H.7:t.411,f.9. (*U. nitens var. i. Henry.*) Italy. Probably tenderer than the type.

*U. c. × glabra*; see *U. hollandica*, No. 10.

12. *U. Plotii* Druce. Tree to 30 m.; suckering; brts. sparingly and minutely pubescent, glabrous the second year: lvs. elliptic to obovate, 3.5–6 cm. long, acute or acuminate, only slightly unequal and often cordate at base, doubly serrate, with 8–10 pairs of veins, dull green above and slightly scabrous and puberulous, densely pubescent beneath at first, later glabrescent, with conspicuous axillary tufts: fls. very short-stalked; calyx with 4–6 pinkish lobes; stigmas pink: fr. narrowly obovate, 1–1.5 cm. long, with open notch. E.H.7:t.403(h),411,f.3. G.C.50:408(h),409;51:235. N.F.2:f.86(h). (*U. minor* Henry, not Mill., *U. sativa* Moss, not Mill., *U. surculosa var. angustifolia* Stokes.) Eu. Zone V.

13. *U. pumila* L. SIBERIAN E. Tree to 25 m. or shrub; bark rough; brts. slender, grayish or grayish brown, pubescent while young or nearly glabrous; stipules broad, often semicordate at base: lvs. elliptic to elliptic-lanceolate, 2–7 cm. long, acute or acuminate, usually nearly equal at base, nearly simply serrate, with the teeth entire or with only one minute tooth, dark green and smooth above, glabrous beneath or slightly pubescent when young, firm at maturity; petioles 2–4 mm. long: fls. very short-stalked; stamens 4–5; anthers violet: fr. suborbicular, 1–1.5 cm. long, with closed notch; seed slightly above the middle. C.C.109. N.K.19:20–22(h),t.6,7. Gn.65:133. S.H.1:f.137m–p, 139i–k. U.S.Im.125:t.204(h). (*U. campestris var. p. Maxim.*) E. Siber., N. China, Turkestan. Cult. 1860. Zone IV. Recommended as a street tree for arid regions.—The typical form is a small-leaved shrub of E. Siberia and Mongolia; the plant of N. China, Manch. and Korea is a tree to 25 m. with round head (*U. manshurica* Nakai); this is the form generally cult.—*U. p. pendula* (Kirchn.) Rehd., var. Brs. slender, pendulous. U. S. Inv. 43,t.2(h).—*U. p. arborea* Litv., var. Tree pyramidal while young, rather loosely branched: lvs. elliptic-ovate to ovate-lanceolate, 4–7 cm. long, teeth mostly with 1 or 2 small teeth, lustrous above, petiole 4–8 mm. long. (*U. turkestanica* Reg., *U. p. var. pinnato-ramosa* Henry.) Turkestan. Cult. 1894.—*U. p. Androssóvi* (Litv.) Rehd., f. Tree with spreading brs. forming a dense broad head; older brs. corky. Sched. Herb. Fl. Ross. 8:t.2(h). (*U. A. Litv.*) Cult. 1934. Similar in habit to *U. carpinifolia umbraculifera*.

*U. p. × glabra*; see under No. 6.

Sec. 4. MICROPTOLEA Spach. Fls. in autumn, fascicled; calyx deeply divided beyond the middle into 4–8 equal lobes: lvs. subpersistent or tardily deciduous.

14. *U. parvifolia* Jacq. CHINESE E. Small tree to 15 or 25 m.; bark smooth or rough; brts. pubescent; stipules linear-lanceolate, narrow at base: lvs. elliptic to ovate or obovate, 2–5 cm. long, acute or obtusish, unequally rounded at base, simply or nearly simply serrate, lustrous and smooth above, pubescent beneath while young, subcoriaceous at maturity; petioles 2–6 mm. long: fls. in August or Sept. in axillary clusters: fr. elliptic-ovate, about 1 cm. long, notched at apex; seed in the middle. S.I.1:t.37(c). M.O.

t.36,f.165(h). R.H.1909:399(h). Mo. Bot. Gard. Bull. 11:t.31(h). (*U. chinensis* Pers.) N. and C. China, Korea, Japan. Intr. 1794. Zone V. Tree with broad round head and small lvs. changing late in fall to red or purple or farther s. remaining green into the winter.—The species described as *U. Sieboldii* and *U. Shirasawana* Daveau (B.F.1914:24,25; S.I.1:t.37,f.1-9) and as *U. coreana* Nakai (N.K.19:t.11) differ little from *U. parvifolia*; all three are in cult.

Related species: *U. crassifolia* Nutt. CEDAR E. Tree to 25 m.; brs. often with 2 opposite corky wings: lvs. ovate to ovate-oblong, 2.5-5 cm. long, acute or obtuse, often nearly simply serrate, subcoriaceous: fls. in short-stalked, 3-5-fl. fascicles: fr. small. S.S.7:t.315. Miss. to Ark. and Tex. Intr. 1876. Zone VII.

Sect. 5. *TRICHOPTOLEA* Schneid. Fls. in autumn, in pendulous glabrous racemes; calyx 6-parted to the base: fr. pubescent and ciliate.

15. *U. serotina* Sarg. RED E. Tree to 20 m.; brts. slender, glabrous or slightly puberulous at first, often developing irregular corky wings: lvs. oblong to oblong-obovate, 5-8 cm. long, acuminate, very oblique at base, doubly serrate, with about 20 pairs of veins, glabrous and lustrous above, pubescent on the veins beneath and somewhat reticulate; petioles about 6 mm. long; stipules narrowed from a broad clasping base, persistent nearly until the lvs. are fully grown: fls. in Sept., axillary in pendulous racemes about 3 cm. long: fr. elliptic, 1-1.5 cm. long, deeply notched, densely ciliate. S.S.14:718. Ky. to Ala., n. Ga. and Ill. Cult. 1903. Zone V. Tree with spreading or pendulous brs. forming a broad head.

2. *PLÁNERA* G. F. Gmel. WATER-ELM. Deciduous tree; winter buds subglobose, minute: lvs. pinnately veined, serrate: fls. polygamo-monoecious; calyx deeply 4-5-lobed; staminate fls. in clusters at base of the young brts.; stamens 4-5; perfect fls. 1-3 in the axils of the young lvs.: fr. a small muricate drupe; cotyledons thick, unequal. (After J. J. Planer, 1743-1789; professor of medicine at Erfurt, Germany.) One species in N. Am.

*P. aquática* (Walt.) Gmel. Tree to 12 m.; brts. puberulous: lvs. ovate to ovate-oblong, 3-6 cm. long, acute, unequal at base, unequally serrate, at maturity glabrous, scabrate above; petioles 3-6 mm. long: fr. ellipsoid, about 8 mm. long, with irregularly crested fleshy ribs. Fls. with the lvs.; fr. iv-v. M.S. 3:283,t.(c). S.S.7:t.316. R.H.1903:351(h). (*P. ulmifolia* Michx.) S. Ill. and Ky. to Fla. and Tex. Intr. 1816, but rare in cult. Zone VII? Small tree with spreading brs. forming a low broad head.

3. *HEMIPTÉLEA* Planch. Deciduous tree; brts. often rigid and spinescent; winter-buds globose-ovoid, minute: lvs. very short-stalked, penninerved, simply serrate: fls. polygamous, short-stalked, in 1-4-fl. clusters on the young brts. in the axils of bracts and lower lvs.; calyx 4-5-parted; stamens usually 4; fr. a small oblique nutlet with a crest-like wing on the upper half; cotyledons broad. (Greek, *hemi*, half, and *ptelea*, the ancient Greek name of the elm; referring to the shape of the wing.) One species in N. E. Asia.

*H. Davidii* (Hance) Planch. Shrubby tree; spines 1.5-10 cm. long, slender or stout, usually leafy, chiefly on young plants; brts. slightly pilose or densely hairy while young, becoming brown or grayish brown: lvs. elliptic to elliptic-oblong, 2-5 cm. long, acute, subcordate at the narrowed base, simply and coarsely serrate, with 8-12 pairs of veins, above at first with scattered hairs each leaving a dark circular depression, sparingly hairy on the veins beneath; petioles 1-3 mm. long: fr. obliquely conical, 2-edged, winged on the upper half, about 6 mm. long. Fl. with the lvs.; fr. viii-x. C.C.121. N.K.19:t.14. I.S. 1:t.21. R.H.1913:29. M.O.35. Gn.90:377(h). (*Planera* D. Hance, *Zelkova*

*D.* (Hance) Hemsl., *Z. Davidiana* Bean.) N. China, Manch., Korea. Cult. 1899. Zone V. Small much-branched tree, often shrubby. In N. China used as a hedge plant.

4. **ZÉLKOVA** Spach. Deciduous trees or shrubs; bark rather smooth, scaly; winter-buds ovoid, acutish, glabrous, with many imbricate dark brown broad scales: lvs. short-petioled, penninerved, simply serrate: fls. polygamous, short-stalked, appearing on the young brts., the staminate ones clustered in the axils of the lower lvs. and bracts, the pistillate fls. solitary or few in the axils of the upper lvs.; calyx 4-5-lobed; stamens 4-5; style eccentric; fr. a short-stalked drupe oblique and broader than high; cotyledons broad. Fls. in spring with the lvs.; fr. in autumn. (Zelkova or Aselkwa, the Caucasian vernacular name of *Z. carpinifolia*.) Syn.: *Abelicea* Reichenb. Five species, including a doubtful one, in W. and E. Asia.

A. Lvs. acute, crenately serrate, with 6-8 pairs of veins.....1. *Z. carpinifolia*  
 AA. Lvs. acuminate, sharply serrate, with 8-14 pairs of veins.....2. *Z. serrata*

1. ***Z. carpinifolia*** (Pall.) K. Koch. Tree to 25 m.; brts. slender, pubescent: lvs. elliptic to oblong, 2-5, rarely to 9 cm. long, acute, rounded or subcordate at base, coarsely crenate-serrate, with 6-8 pairs of veins, dark green and smooth or somewhat rough above, pubescent on the veins beneath; petioles 1-2 mm. long: fr. about 5 mm. across. E.N.III.1:65. Gn.24:371. E.H.4:t.249 (h). B.S.2:694,t(h). (*Z. crenata* Spach, *Z. ulmoides* Schneid., *Planera Richardii* Michx., *Abelicea ulmoides* Ktze.) Cauc. Intr. 1760. Zone VI. Tree similar to the following, but with an ovoid or oblong head.

2. ***Z. serrata*** (Thunb.) Mak. Tree to 30 m.; brts. usually glabrous: lvs. ovate to oblong-ovate, 3-6, or on shoots to 12 cm. long, acuminate or apiculate, rounded or subcordate at base, sharply serrate with acuminate teeth, with about 8-14 pairs of veins, somewhat rough above, glabrous or nearly so beneath; petioles 2-5 mm. long: fr. about 4 mm. across. S.I.1:t.36(c). G.F.6:325. N.K.19:t.12. S.L.391(h). H.B.3:483(h). E.H.4:t.250(h). (*Z. acuminata* Planch., *Z. hirta* Schneid., *Z. Keaki* Mayr, *Planera acuminata* Lindl., *P. japonica* Miq.) Japan. Intr. about 1860, 1862 to Am. Zone V. Tree with short trunk dividing into many upright and erect-spreading stems forming a broad round-topped head.

Closely related species: *Z. sinica* Schneid. Tree to 17 m.: lvs. ovate-oblong, 2-7 cm. long, obliquely rounded or broadly cuneate at base, crenate-serrate with acutish or slightly apiculate teeth, with usually 7-10 pairs of veins: fr. 5-6 mm. across. C. and E. China. Intr. 1908. Zone VI?—*Z. Schneideriana* Hand.-Mazz. Lvs. elliptic-ovate to elliptic-oblong, 3-8 cm. long, crenate-serrate, pubescent beneath, veins 8-12. E. China. Intr. 1920. Zone VI.—A doubtful species is *Z. Verschaffeltii* Nichols. Shrub or small tree: lvs. oval or ovate, 3-6 cm. long, with 6-9 pairs of coarse triangular teeth, rough above, pubescent beneath: fr. similar to that of *Z. carpinifolia*. S.H.1:f.141c. (*Z. japonica* var. *V. Dipp.*, *Ulmus V.* Hort.) Cult. 1886. Possibly a native of the Cauc. and a form of *Z. carpinifolia*.

5. **PTEROCÉLTIS** Maxim. Deciduous tree: lvs. 3-nerved at base: fls. much like those of *Celtis*; anthers pilose at apex; fr. a small nutlet, surrounded by a broad wing, usually emarginate at apex; cotyledons broad. (Greek *pteron*, wing and *celtis*; referring to the winged fr. by which it differs from *Celtis*.) Only the following species known.

***P. Tatarinowii*** Maxim. Tree to 16 m.: bark pale gray, peeling off in long flakes; brts. glabrous, chestnut-brown, with few small lenticels: lvs. ovate to ovate-oblong, 3.5-8 cm. long, acuminate, broad-cuneate at base, irregularly and sharply serrate, glabrous: fr. slender-stalked, suborbicular, 1.5-2 cm. across, emarginate at apex. S.H.1:f.146. C.C.116. C.H.150. V.F.205. N. and

C. China. Intr. 1894. Zone V? Tree with short trunk and a broad wide-spreading head.

6. **CÉLTIS** L. HACKBERRY. Trees or rarely shrubs, deciduous, only the tropical and subtropical species often evergreen: bark usually gray, smooth, sometimes with corky warty excrescences; winter-buds small: lvs. 3-nerved at base, serrate or entire; petioles usually fairly long: fls. polygamo-monoecious, appearing on the young brts., the staminate ones in fascicles toward the base, the perfect fls. above, solitary in the axils of the lvs.: calyx 4-5-lobed; stamens 4-5: fr. a subglobose or ovoid drupe with a firm outer coat, usually scanty pulp and a bony stone with smooth or sculptured surface; embryo with broad folded cotyledons. Fls. with the lvs.; fr. ripening in autumn and often remaining long after leaf-fall. (The ancient Greek name of a tree with sweet fr.) About 70 species in the temp. regions of the n. hemisphere and in the tropics; the species cult. with us belong to the sect. *Euceltis* which contains more than 30 closely related species often difficult to distinguish.—The hackberries are planted as shade trees or for ornament, but do not present any particular ornamental features; a few have edible frs.

- A. Lvs. entire or occasionally with few teeth (serrate in var. of No. 1): stone pitted.
- B. Lvs. ovate to oblong-lanceolate, long-acuminate, usually broad-cuneate at base, thin, glabrous: fr.-stalk longer than petiole.....1. *C. laevigata*
- BB. Lvs. ovate to ovate-oblong, acute or short-acuminate, rounded or subcordate at base: fr.-stalk about as long as petiole.
- C. Lvs. strongly reticulate beneath: fr. orange.....2. *C. reticulata*
- CC. Lvs. scarcely reticulate: fr. purple or tan-color.....3. *C. pumila*
- AA. Lvs. serrate (occasionally entire in No. 6).
- B. Lvs. acuminate.
- C. Lvs. glabrous or nearly so beneath (pubescent on the veins beneath and rough above in a var. of No. 4): fr. on stalks longer than the petioles.
- D. Lvs. green or yellowish beneath.
- E. Petioles slender, about 1 cm. long or longer; lvs. sharply serrate with acuminate teeth: stone pitted.
- F. Lvs. oblong-lanceolate, cuneate at base.....1. *C. laevigata* var. *Smallii*
- FF. Lvs. ovate to oblong-ovate, rounded or subcordate at base..4. *C. occidentalis*
- EE. Petioles stout, less than 1 cm. long; lvs. usually serrate only above the middle.
- F. Brts. glabrous; lvs. perfectly glabrous and lustrous green on both sides, crenate-serrate: fr. purplish black; stone smooth.....5. *C. Bungeana*
- FF. Brts. pubescent: lvs. with appressed hairs and dark green above, lighter beneath, serrate, sometimes entire: fr. orange; stone pitted.....6. *C. Biondii*
- DD. Lvs. grayish or whitish beneath, sharply serrate except at base: fr. black; stone pitted.....7. *C. jessoensis*
- CC. Lvs. pubescent beneath at least on the veins.
- D. Lvs. densely pilose only on the veins, usually serrate only above the middle: frs. several, short-stalked small, orange.....8. *C. labilis*
- DD. Lvs. soft-pubescent beneath: frs. long-stalked, large, over 1 cm. long.
- E. Brts. and lvs. beneath grayish pubescent; lvs. sharply serrate except at base: frs. black, on slender glabrescent stalks.....9. *C. australis*
- EE. Brts. and lvs. beneath yellow-tomentose; lvs. serrate only above the middle: frs. orange, on stout tomentose stalks.....10. *C. Julianae*
- BB. Lvs. rounded or truncate at apex and abruptly cuspidate, coarsely serrate, 5.5-11.5 cm. broad.....11. *C. koraiensis*

1. *C. laevigata* Willd. MISSISSIPPI H. Tree to 30 m.; bark light gray, usually covered with corky warts: brts. glabrous or pubescent at first: lvs. oblong-lanceolate, sometimes ovate, 5-10 cm. long, long-acuminate and usually falcate, broad-cuneate or rounded at base, entire or sometimes with a few teeth, dark green above, slightly paler beneath, glabrous, thin; petioles 6-10 mm. long: fr. 5-7 mm. across, orange-red or finally purple-black, on slender stalks 1-2 cm. long. S.S.7:t.318. G.F.3:41.f.9,11. M.M.7:225(h).227 (b). (*C. mississippiensis* DC., *C. integrifolia* Nutt.) S. Ind. and Ill. to Tex. and Fla. Cult. 1811. Zone V. Tree with spreading often pendulous brs. forming a broad round head.—*C. l. texana* Sarg., var. Brts. often pubescent:

lvs. ovate to ovate-lanceolate, 3.5–7 cm. long, thicker, often pubescent on veins beneath. S.M.325. Kans. to Mo. and N. Mex. Intr. 1922.—**C. l. Smallii** (Beadle) Sarg., var. Tree to 10 m.: lvs. sharply serrate. B.T.357. (C. S. Beadle.) N. C. and Tenn. to Ga. and Ala. Intr. 1909. Zone VI?

2. **C. reticulata** Torr. Small tree to 15 m. or shrub; brts. pubescent: lvs. ovate, 3–7 cm. long, acute or acuminate, rounded or subcordate at base, entire or with few coarse teeth above the middle, scabrous above, conspicuously reticulate and glabrous or somewhat pubescent beneath, firm and thickish; petioles 5–10 mm. long: fr. 7–10 mm. across, orange-red, on stalks about 1 cm. long. G.F.3:41,f.12. S.M.323. (C. mississippiensis var. r. Sarg.) Colo. and Tex. to Wash. and S. Calif. Intr. 1890. Zone V? Small tree with rather rigid spreading brs. or spreading shrub; rarely cult.

Closely related species: **C. Douglasii** Planch. Small tree: lvs. usually oblong-ovate, distinctly acuminate, sharply serrate to nearly entire: fr. on slender stalks usually twice as long as the petioles. S.M.321,f.292. A.I.1:523. (C. rugulosa Rydb.) Colo. to Wash. and Utah. Intr. 1898. Zone V.

3. **C. pumila** Pursh. Shrub or small tree to 4 m.; brts. finely pubescent or at least puberulous while young: lvs. ovate to ovate-oblong, 3–8 cm. long, acute or short-acuminate, rounded or subcordate at base, smooth or slightly scabrous above, light green and nearly glabrous beneath, finely pubescent on both sides while young; petioles 5–10 mm. long: fr. dull orange to purplish, 6–8 mm. thick, on short stalks about as long as the petioles; stone subglobose, shallowly pitted. G.F.3:41,f.10. Bull. Torr. Bot. Club, 27,t.33. (C. occidentalis var. p. Gray.) N. J. to Fla., w. to Kansas, Colo. and Utah. Intr. 1876. Zone V.—**C. p. Deamii** Sarg., var. Lvs. slightly pubescent on the veins beneath, rather thick: pedicels longer. Deam, Shrubs Ind. 149. Ind. Intr. 1919.—**C. p. georgiana** (Small) Sarg., var. Shrub or tree to 10 m.: lvs. rugose above, pilose along the veins beneath and on petioles; pedicels puberulous. S.M.326. B.T. 357. (C. g. Small.) N. J. to Fla., Ala. and Mo. Intr. 1906.

4. **C. occidentalis** L. Tree occasionally to 40 m.; brts. glabrous or puberulous: lvs. ovate to oblong-ovate, 5–12 cm. long, acute to acuminate, oblique and rounded or broad-cuneate at base, serrate except at base, bright green and usually smooth and lustrous above, paler below and glabrous or slightly hairy on the veins; petioles 1–1.5 cm. long: fr. 7–10 mm. thick, orange-red to dark purple, on slender stalks longer than the petioles; stone pitted. S.S. 7:t.317. G.F.3:40,43(h). B.T.354(h). E.H.4:t.251(h).—Que. to Man., s. to N. C., Ala. and Kans. Cult. 1636. Zone II. Tree with straight trunk and spreading rather rigid or sometimes pendulous brs. forming a round-topped head, and with bright green lvs. turning light yellow in fall; the var. *crassifolia* is of more vigorous growth and grows to a taller tree with darker lvs.—**C. o. canina** (Raf.) Sarg., var. Lvs. narrower, oblong-ovate, 8–14 cm. long, long-acuminate, glabrous or rarely pilose on the veins beneath, usually light green; petiole to 1.8 cm. long. S.M.320. (C. c. Raf.) Que. to Ga. and Okl. Cult. 1898.—**C. o. crassifolia** (Lam.) Gray., var. Tree with pubescent brts.: lvs. 9–15 cm. long, usually cordate at base, scabrous above, pubescent on the nerves beneath, of firmer texture. H.H.192,193(b). S.M.321,f.291. (C. c. Lam., C. Audibertiana Spach.) N. Y. to S. C., Tenn. and Kans. Intr. about 1825. Zone V.

5. **C. Bungeana** Bl. Tree to 15 m.; bark light gray, smooth: brts. glabrous: lvs. ovate to ovate-oblong, 4–8 cm. long, acuminate, usually rounded at the oblique base, crenate-serrate usually only above the middle, lustrous bright green and glabrous on both sides; petioles 5–10 mm. long: fr. sub-

globose, 6-7 mm. thick, purplish black, on a slender stalk 1-1.5 cm. long; stone smooth. C.C.113. N.K.19:53,t.17. C.H.153. E.H.4:t.267,f.11. (*C. Davidiana* Carr.) C. and N. China, Manch. and Korea. Intr. 1868. Zone V. Tree with spreading brs. forming a broad round head, and with bright green lustrous lvs.

Related species: *C. Tournefortii* Lam. Tree to 6 m. or shrub; glabrous: lvs. ovate, 3-7 cm. long, acute, rounded or subcordate at base, bluish or grayish green, sometimes slightly pubescent: fr. reddish yellow, about 8 mm. thick; its stalk about as long as the petiole. S.H.1:f.147m-p<sup>1</sup>,148p<sup>1</sup>-p<sup>2</sup>. (*C. orientalis* Mill., not L.) S. E. Eu., W. Asia. Intr. 1739. Zone V.—*C. glabrata* Stev. Differs chiefly from *C. T.* in the more acuminate and sharply serrate lvs. with cuneate base and in the slightly pitted stone. S.H.1:f.147l-l<sup>1</sup>,148s. (*C. Tournefortii* var. *g.* Boiss.) W. Asia. Cult. 1870. Zone VI?

6. *C. Bióndii* Pampan. Tree to 14 m. or shrub; young brts. rufous-tomentulose: lvs. ovate to narrow-elliptic, 5-10 cm. long, acuminate, usually broad-cuneate at the oblique base, crenate-serrate above the middle, sometimes entire, pubescent at first, at maturity nearly glabrous, dark yellowish green above, paler and somewhat reticulate beneath; petioles 3-8 mm. long: fr. often 2 or 3, orange, about 6 mm. across, on stalks 1-1.5 cm. long; stone minutely pitted. C. China. Intr. 1894. Zone VI.—On young plants the lvs. are usually abruptly contracted at the apex into a long and slender entire point. T.M.28:266,f.2,b,g. *C. B.* var. *heterophylla* Schneid. (*C. Leveillei* Nakai.)

Related species: *C. sinensis* Pers. Tree to 20 m.: leaves broad-ovate to ovate-oblong, broad-cuneate at base, crenate-serrate, dark green and nearly smooth above, reticulate and nearly glabrous below; petioles about 1 cm. long: frs. solitary, dark orange, on stalks about as long as the petioles; stone pitted and ribbed. Icon. Pl. Koisik. 1:t.2,f.2. S.H.1:f.147r-r<sup>1</sup>,148r. N.K.19:t.24. (*C. japonica* Planch.) E. China, Korea, Japan. Intr. about 1793. Zone VI?

7. *C. jessoensis* Koidz. Tree to 23 m.; young brts. pubescent: lvs. ovate to ovate-oblong, 5-10 cm. long, long-acuminate, usually rounded at base, sharply serrate except at base, dark green above, whitish or grayish green beneath and sparingly pubescent on the nerves or glabrous; petioles 6-10 mm. long: fr. black, 8 mm. across, on stalks about 2 cm. long; stone pitted. N.K. 19:t.18. M.K.t.40(c). Korea, Japan. Intr. 1892. Zone V.

Related species: *C. cerasifera* Schneid. Tree to 10 m.: lvs. broad-ovate to ovate-lanceolate, short-acuminate, rounded or nearly subcordate at base, coarsely crenate-serrate; petioles 1-1.5 cm. long: fr. about 1 cm. thick, black, bloomy, on stalks 2-2.5 cm. long. C. China. Intr. 1907. Zone V.

8. *C. labilis* Schneid. Tree to 18 m.; brts. yellowish-tomentose; the short fruiting brts. dropping off in autumn or winter: lvs. ovate-elliptic to elliptic-oblong, 5-10 cm. long, short-acuminate, unequally rounded at base, crenate-serrate above the middle, dark green and sparingly appressed-pubescent above, paler or brownish beneath and somewhat reticulate, short-pilose on the nerves; petioles 5-8 mm. long: frs. usually 2-3, subglobose, 7-8 mm. across, on stalks 6-8 mm. long; stone slightly pitted and ribbed. C.H.156. C. China. Intr. 1907. Zone VI? Easily distinguished by the dropping off of the short fruiting brts.

9. *C. australis* L. Tree to 25 m.; brts. pubescent: lvs. elliptic-ovate to oblong-lanceolate, 5-15 cm. long, long-acuminate, broad-cuneate or rounded at the oblique base, sharply serrate, scabrous and dark green above, soft-pubescent and grayish green beneath; petioles 5-15 mm. long: fr. dark purple, 1-1.2 cm. thick, sweet, on a stalk 1.5-2.5 cm. long; stone pitted. H.W.3:11(h), t.40(c). S. Eu., N. Afr., W. Asia. Intr. 1796. Zone VI? Tree with spreading brs. forming an ovoid round-topped head.

Closely related species: *C. caucásica* Willd. Lvs. rhombic-ovate to oblong-elliptic, 3-8 cm. long; fr. dark reddish brown, smaller, on a stalk about 1.5 cm. long. S.H.1:f.147-e<sup>2</sup>, 148t. Cauc., W. Asia. Intr. about 1885. Zone VI?

10. *C. Juliánae* Schneid. Tree to 25 m.; brts. densely yellowish tomentose and hirsute: lvs. broad-ovate to ovate-elliptic, 7-14 cm. long, acuminate, rounded or cuneate at the oblique base, crenate-dentate usually above the middle, slightly scabrous above, yellowish green and soft-pubescent beneath, firm and thick; petioles 1-1.3 cm. long; stamens usually 5: fr. orange, globose-ovoid, 1-1.3 cm. thick; stone nearly smooth. C. China. Intr. 1907. Zone V. Tree with straight trunk and stout spreading brs.; easily distinguished by its dense yellowish pubescence and large lvs.

11. *C. koraiénsis* Nakai. Tree to 12 m.; brts. glabrous or sometimes pubescent, brown: lvs. orbicular-ovate to broad-obovate or obovate, 8-15 cm. long and 5.5-11.5 cm. broad, rounded or subcordate at base, truncate or rounded and abruptly cuspidate at apex, coarsely serrate, the teeth near apex elongated, bright green above, glabrous or sometimes pubescent on the veins beneath; petioles 5-10 mm. long; fr. globose-ellipsoid, about 1 cm. long, dull orange; pedicels 1.5-2 cm. long. J.C.31:t.18. N.K.19:t.21. C.H.155. Korea, Manch., N. China. Intr. 1923. Zone V. Remarkable for the unusual shape of its large lvs. and the large fr.

7. **APHANANTHE** Planch. Deciduous or evergreen trees or shrubs: lvs. petiolate, serrate: fls. monoecious, unisexual, with the lvs., the staminate in axillary dense corymbs at base of the young brts., the pistillate fls. in the axils of the upper lvs., 5-, rarely 4-merous: fr. an ovoid or subglobose drupe; embryo involute with narrow cotyledons. (Greek *aphanes*, inconspicuous, and *anthe*, flower.) Three to 4 species in Australia and E. Asia.

*A. áspera* (Bl.) Planch. Deciduous tree to 20 m.: lvs. ovate to ovate-oblong, 5-9 cm. long, long-acuminate, 3-nerved and rounded at base, simply serrate, the veins straight, parallel, excurrent, scabrous from appressed hairs on both sides; petioles about 5 mm. long: fls. greenish: fr. globose, about 8 mm. thick, black, appressed-pubescent, short-stalked. S.I.1:t.37(c). N.K.19:t.15. S.H.1:f.154. (*Homoioceltis a.* Bl.) Japan, E. China, Korea. Intr. about 1880. Zone VII. Tree with a dense round head.

#### 14. MORACEAE DC. MULBERRY FAMILY

Deciduous or evergreen trees or shrubs, or herbs, with milky juice: lvs. alternate, entire, serrate or lobed; stipules present, sometimes persistent: fls. monoecious or dioecious, small, regular, usually in spikes or heads or affixed to a variously shaped torus, or on the inside of a hollow receptacle; perianth of staminate fls. of 2-6, usually 4, free, or more or less united, parts; stamens as many as sepals and opposite, straight or inflexed and elastic; sepals of pistillate fls. 4, more or less united; stigmas 1 or 2; ovary superior or inferior, 1-celled, with one suspended, amphitropous ovule, rarely basal and orthotropous: fr. a small achene or drupe usually developed by the fleshy perianth, or on a fleshy gynophore, often assembled into an aggregate fr. (syncarp); embryo often curved; cotyledons thick, flat or folded, often very unequal.—About 55 genera and 1000 species, chiefly trop.

a. Fls. in spikes or heads: stipules free, not leaving a ring-like scar: lvs. folded or involute in bud.

b. Lvs. serrate or dentate, undivided or lobed; brs. never spiny: staminate fls. in catkins; stamens inflexed.

c. Syncarp ovoid to cylindric, fleshy, juicy: buds with 3-6 scales.....1. *Morus*

- cc. Syncarp globose; the frs. at maturity exerted on fleshy gynophores: buds with 2-3 scales: lvs. sometimes opposite.....3. *Broussonetia*  
 BB. Lvs. with entire margin: brs. spiny: fls. of both sexes in heads or clusters: syncarp globose with a crustaceous rind.  
 c. Lvs. undivided, 6-16 cm. long: fr. large: filaments inflexed.....2. *Maclura*  
 cc. Lvs. mostly 3-lobed, 3-7 cm. long: fr. about 2.5 cm. across: filaments straight. 4. *Cudrania*  
 AA. Fls. in a hollow receptacle; filaments straight: lvs. entire or lobed, convolute in bud; stipules connate, enclosing the terminal bud, leaving a ring-like scar.....5. *Ficus*

1. **MORUS L. MULBERRY.** Deciduous unarmed trees or shrubs; bark usually scaly; buds with 3-6 imbricate scales: lvs. undivided or lobed, serrate or dentate, with 3-5 nerves at base; stipules lanceolate, deciduous: fls. monoecious or dioecious, both sexes in stalked axillary pendulous catkins; calyx 4-parted; the filaments inflexed in bud, later partly inclosed by the involute sepals; stigmas 2: fr. an ovoid compressed achene, covered by the succulent white to black calyx, aggregating into an ovoid to cylindric syncarp resembling a blackberry; seed albuminous; cotyledons oblong, equal. Fls. with the lvs.; frs. in late summer. (The ancient Latin name of the plant.) About 12 species in the temperate and subtropical regions of the n. hemisphere.—Small trees or shrubs grown for their edible frs. or for their lvs. which constitute the chief food of the silkworm, or planted for ornament.

- A. Lvs. glabrescent or only slightly pubescent below.  
 B. Stigmas sessile or subsessile: lvs. smooth above, with axillary tufts of hairs beneath: usually tree-like .....1. *M. alba*  
 BB. Stigmas borne on a distinct style: lvs. slightly rough above, without axillary tufts beneath: usually shrubby.....2. *M. australis*  
 AA. Lvs. pubescent beneath, scabrous above, usually large and undivided.  
 B. Lvs. deeply cordate, short-acuminate, pubescent beneath, chiefly along the veins. 3. *M. nigra*  
 BB. Lvs. truncate or slightly cordate at base, soft-pubescent beneath.  
 c. Fruiting catkins narrow-cylindric: lvs. coarsely serrate with broad short teeth. 4. *M. cathayana*  
 cc. Fruiting catkins ovoid to oblong: lvs. rather closely and sharply serrate..5. *M. rubra*

1. **M. alba L. WHITE M.** Tree to 15 m.: brts. slightly pubescent at first or glabrous: lvs. ovate to broad-ovate, 6-18 cm. long, acute or short-acuminate, rounded or cordate at base, coarsely toothed with often obtusish teeth, often variously lobed, light green and usually smooth above, pubescent on the nerves beneath or nearly glabrous; petioles 1-2.5 cm. long: pistillate spikes 5-10 mm. long, the staminate about twice as long: syncarp 1-2.5 cm. long, white, pinkish or purplish-violet, sweet, but insipid. Fl.v; fr.vii-viii. R.I.12:t.657(c). H.H.196,197(b). Koidzumi, Rev. Morus, t.10. G.C.75:37(h). China, naturalized in other parts of Asia, in Am. and Eu. Zone IV-V. Small tree with spreading brs. forming a round-topped head and with bright green lvs.; the lvs. of this species are the chief food of the silkworm. Very variable, with many forms and varieties of which the following are the most important: *M. a. macrophylla* Loud., var. Lvs. large, 15-22 cm. long, undivided: fr. red. (*M. Morettiana* Jacq.)—*M. a. skeletoniæna* Schneid., var. Lvs. regularly and deeply divided into narrow long-pointed lobes. S.H.1:f.151b. (*M. a. laciniata* Beiss., not K. Koch.)—*M. a. venôsa* Delile. Lvs. usually rhombic-ovate, cuneate at base, acute or acuminate or sometimes rounded at the apex, irregularly serrate, with strongly marked whitish veins. B.C.4:2070. S.H.1:f.151c. (*M. a. var. nervosa* Loud., *M. urticaefolia* Hort.)—*M. a. pyramidalis* Ser., var. Tree of narrow pyramidal habit; leaves usually lobed. U. S. Im. 36:3,t.(h). (*M. a. fastigiata* Schelle.)—*M. a. pëndula* Dipp., f. With long and slender pendulous brs.; lvs. usually lobed. B.C.4:2070(h). M.G.17:27(h). Gn.86:648(h).—*M. a. tatârica* (L.) Ser. Small tree with bushy head; lvs. small, 4-8 cm. long, lobed or undivided; fr. small, about 1 cm. long, dark red,

sometimes white. B.C.4:2071. Supposed to be the hardiest form.—**M. a. multicaulis** (Perrottet) Loud., var. Strong-growing shrub or bushy tree: lvs. large, 8–15 cm. long, undivided, dull and somewhat rough above, with obtusish teeth: fr. large, nearly black. Ann. Hort. Fromont, 1,t.3. Koidzumi, Rev. Morus, t.8,9. (*M. a.* var. *latifolia* Bur., *M. sinensis* Hort.)

2. **M. australis** Poir. Shrub or small tree to 8 m.; brts. glabrous: lvs. ovate, 6–15 cm. long, acute to long-acuminate, truncate or subcordate at base, sharply or sometimes crenately serrate, undivided or variously lobed, often deeply so, slightly scabrous above, minutely pubescent or nearly glabrous at maturity beneath; petioles slender, 1.5–4 cm. long, glabrous: fls. dioecious, staminate catkins 1.5–3 cm. long, the pistillate 5–10 mm. long; style nearly as long as the stigmas; syncarp 1–1.5 cm. long, dark red, juicy, sweet. Fl.v–v; fr.vi–vii. S.12;t.6,f.1–11(c) Koidzumi, Rev. Morus, t.2,4. (*M. alba* var. *stylosa* Bur., *M. acidosa* Griff., *M. japonica* Bailey, not Sieb., *M. bombycis* Koidz.) China, Korea, Japan. Intr. 1907. Zone V. Broad shrub with spreading brs. or a small bushy tree; its lvs. not used as food for silk-worm; the abundantly produced fruits are palatable.

Related species: *M. mongolica* Schneid. Small tree or shrub: lvs. ovate to oblong-ovate, 8–16 cm. long, caudate-acuminate, cordate at base, coarsely serrate with cuspidate teeth, rarely lobed, smooth above, nearly glabrous: style distinct; fr. red or black. C.H.164. N.K.19:t.33.A. (*M. alba* var. *m.* Bur.) China, Korea. Intr. 1907. Zone V.—*M. m. diabolica* Koidz., var. Lvs. scabrid above, pubescent beneath, often deeply lobed. N.K.19:t.33B. Cult. 1923.

3. **M. nigra** L. BLACK M. Tree to 10 m.; brts. pubescent, becoming brown: lvs. broad-ovate, 6–12 or sometimes to 20 cm. long, acute or short-acuminate, deeply cordate at base, coarsely serrate, usually undivided, sometimes 2–3-lobed, dark green and scabrous above, lighter and pubescent beneath, chiefly along the veins; petioles 1.5–2.5 cm. long: fls. dioecious or sometimes monoecious, the staminate about 2.5 cm. long, the pistillate half as long; syncarp ovoid to oblong, 2–2.5 cm. long, dark red. Fl.v; fr.viii. R.I.12:t.658 (c). B.S.2:86,t(h). M.D.1812:203(h),204,205. G.W.18:434(h). W. Asia. Intr. 1548. Zone VI? Tree with short trunk and widespread brs. forming a broad, rounded, often irregular and picturesque head, with dark green lvs.; sometimes grown for its fruit.

4. **M. cathayana** Hemsl. Small tree to 8 m., or occasionally to 15 m., sometimes shrubby; bark gray, nearly smooth: brts. pubescent at first: lvs. ovate, 8–15 cm. long, short- or long-acuminate, truncate or rarely cordate at base, serrate with broad, often rounded teeth, sometimes 3-lobed, scabrous above, soft-pubescent beneath; petioles 1.5–3 cm. long, pubescent: staminate catkins 3–6 cm. long, pistillate about 2 cm. long: syncarp narrow-cylindric, 2–3 cm. long and about 7 mm. thick, white, red or black. Fl.v; fr.viii. C.H.166. C. and E. China. Intr. 1907. Zone V. Tree with widespread brs. forming a flattened, round head: lvs. not used as silkworm food.

5. **M. rubra** L. RED M. Tree to 20 m.; bark scaly, brown; brts. pubescent at first: lvs. broad-ovate to oblong-ovate, 7–12 or occasionally to 20 cm. long, abruptly long-acuminate, truncate or subcordate at base, rather closely and sharply serrate, scabrous or sometimes nearly smooth above, soft-pubescent beneath; petioles 2–3 cm. long, tomentose at first: staminate catkins 2–5 cm. long, pistillate 2–2.5 cm. long: syncarp 2–3 cm. long, finally dark purple, juicy. Fl.v; fr.vii–viii. M.S.3:232,t(c). S.S.7:t.320. H.H.198,199(h). G.F.7:25(h). Mass. to Fla., w. to Mich., Neb., Kans. and Tex. Intr. 1629. Zone V. Tree with short trunk and stout spreading brs. forming a broad round-topped head, with dark green, rather large lvs. turning bright yellow in autumn.

Occasionally planted for its fruit used as food for hogs and poultry. A large-fruited form is grown as Lampasas Mulberry.—*M. r. tomentosa* (Raf.) Bur., var. Lvs. whitish-tomentose beneath, glossy above. Tex.

Distinct on account of its small lvs. is *M. microphylla* Buckl. Small tree to 7 m. or shrub: lvs. ovate, 3–7 cm. long, often 3-lobed, rounded to subcordate at base, serrate or crenate-serrate, rough above, pubescent or sometimes glabrous beneath; petiole 3–8 mm. long; staminate catkins 1–2 cm. long; fr. ovoid, 1–1.5 cm. long, edible. S.M.331. Tex. to Ariz. and s. to Mex. Intr. 1926. Zone VII?

**2. MACLURA** Nutt. OSAGE-ORANGE. Deciduous tree; brs. with axillary thorns; buds depressed-globose with few imbricate scales: lvs. slender-petioled, entire, involute in bud; stipules minute: fls. dioecious; calyx 4-lobed; staminate fls. pediceled in subglobose or sometimes elongated racemes on long peduncles axillary on spur-like brts.; stamens 4, the filaments inflexed in bud; pistillate fls. sessile in dense globose heads on short peduncles; ovary with a long filiform stigma: drupelets oblong, collected into a large globose syncarp covered by a mamillate rind; seed without albumen; cotyledons oblong, nearly equal. (After Wm. Maclure, an American geologist.) Syn.: *Toxylon* Raf. One species in N. Am.

*M. pomifera* (Raf.) Schneid. Tree to 20 m.; bark deeply furrowed, dark orange; brts. light green, soon glabrous, becoming light brown the first winter; spines 1–2.5 cm. long, stout: lvs. ovate to oblong-lanceolate, 5–12 cm. long, acuminate, broad-cuneate to subcordate at base, lustrous above, soon glabrous; petioles 3–5 cm. long: clusters of staminate flowers 2.5–3.5 cm. long; heads of pistillate fls. 2–2.5 cm. across: syncarp subglobose, 10–14 cm. across, orange; seeds nearly 1 cm. long. Fl.v–vi; fr.ix. N.S.1:t.37(c). S.S.7:t.322,323. H.H.202,203(b). G.C.III.16:693. (*M. aurantiaca* Nutt., *Toxylon pomiferum* Raf.) Ark. to Okla. and Tex. Intr. 1818. Zone V. Medium-sized spiny tree with an open, irregular, round-topped head and bright green lvs. turning clear yellow in fall; the orange-like large frs. are a conspicuous feature. Often used as a hedge plant in the Middle West.—*M. p. inermis* (André) Schneid., var. Form with unarmed brs. R.H.1896:33.

*M. p.* × *Cudrania tricuspidata*; see under 4. *Cudrania*.

**3. BROUSSONÉZIA** Vent. PAPER-MULBERRY. Deciduous unarmed trees or shrubs; buds small, with 2–3 outer scales: lvs. petioled, serrate, undivided or lobed; stipules ovate-lanceolate, distinct, deciduous: fls. dioecious; the staminate in cylindric pendulous catkins, with 4-lobed calyx and 4 stamens inflexed in bud; pistillate fls. in globose heads; perianth tubular, including the stipitate ovary; stigma slender, filiform: syncarp a dense globose head consisting of the frs. with their persistent perianths and bracts; frs. exerted at maturity on fleshy gynophores; endocarp crustaceous; cotyledons oblong, equal. (After T. N. V. Broussonet, a French naturalist; 1761–1807.) Syn. *Papyrus* Lam. Two species in E. Asia.

- A. Petioles 3–10 cm. long; lvs. pubescent.....1. *B. papyrifera*  
 AA. Petioles 1–2 cm. long; lvs. glabrescent.....2. *B. Kazinoki*

**1. B. papyrifera** (L.) Vent. Tree to 16 m.; bark smooth, gray; brts. stout, pubescent: lvs. occasionally opposite, ovate, 7–20 cm. long, acuminate, cordate at base, coarsely dentate, on young plants often deeply lobed, scabrous above, grayish and soft-pubescent beneath; petioles 3–10 cm. long: staminate catkins 6–8 cm. long: syncarps 2 cm. across, orange, the protruding frs. red. Fl.v; fr.ix. S.I.1:t.38(c). B.M.2358(c). H.H.200,201(b). M.D.1915:t.24;1918:t.26(h). (*Morus p. L.*) China, Japan; occasionally naturalized

from N. Y. to Fla. and Mo. Cult. 1750. Zone VI. Small tree with widespread-brs. forming a broad rounded head; often planted for ornament and sometimes as a street tree.—*B. p. laciniata* Ser. Lvs. finely dissected into narrow segments often reduced to the nerves and only at the ends with small narrow lfts. R.H.1878:374(h),375. Gn.15:53. S.L.108(h). (Var. *dissecta* Hort., var. *Billiardii* Hemsl.)—*B. p. leucocarpa* Ser. Fr. white.—*B. p. variegata* Ser. Lvs. variegated with white or yellow.

2. *B. Kazinòki* Sieb. & Zucc. Shrub to 5 m.; brts. slender, often sarmen-tose, soon glabrous, purplish: lvs. ovate to ovate-oblong, 5–20 cm. long, long-acuminate, rounded or subcordate at base, serrate, sometimes 2–3-lobed, scabrous above, slightly pubescent beneath at first, later glabrous; petioles 1–2 cm. long: staminate catkins about 1.5 cm. long: syncarps about 1 cm. across, woolly. I.T.2:t.45. S.H.1:f.151i-k,155d-f. (*B. Sieboldii* Bl., *B. Kaempferi* Sieb. & Zucc.) Korea, Japan. Intr. about 1844. Zone VII.

4. *CUDRÀNIA* Tréc. Deciduous or evergreen trees or shrubs; brs. often thorny; stipules small, distinct; lvs. petioled, entire, sometimes 3-lobed: fls. dioecious in axillary globular heads; perianth of staminate fls. with 4 oblong segments and 2–3 bracts at base; stamens with 4 straight filaments; ovary of the pistillate fls. enclosed by the 4-parted perianth; stigma filiform: syncarp subglobose, fleshy: fr. with a crustaceous pericarp; seed with thin endosperm; cotyledons folded. (From its Malayan name Cudrang, Cudranus of Rumphius.) Syn.: *Vaniera* Lour. Five or 6 species from China to Austr. and New Caled.

*C. tricuspidata* (Carr.) Bur. Shrub or small tree to 8, rarely to 18 m.; brts. glabrous, with slender thorns 5–30 mm. long: lvs. ovate to obovate, 3–8 cm. long, acuminate, rounded at base, sometimes 3-lobed at apex (or tricuspidate on young plants), glabrous, dark green above; petioles 8–15 mm. long: fl.-heads short-stalked, solitary or in pairs; syncarp subglobose, about 2.5 cm. across, with a firm rugose rind, red. R.H.1872:56;1905:363(h). H.I.18:1792. K.B.1888:291,t. (*Maclura t.* Carr., *Vaniera t.* Hu.) China, Korea, Japan. Intr. 1862. Zone VII? Bush or small tree with slender spiny brs.; the lvs. used in China for feeding the silkworm; the fr. is edible. Recommended as a hedge plant for the South.

*C. t.* × *Maclura pomifera* = *Macludrània híbrida* André. Tree; brts. dark brown, with short straight spines; lvs. elliptic, up to 15 cm. long, acuminate, not lobed. R.H.1905:362. Orig. before 1905.

5. *FÍCUS* L. FIG-TREE. Evergreen or rarely deciduous trees or shrubs; unarmed; stipules connate, enclosing the terminal bud, caducous and leaving a ring-like scar: lvs. alternate, rarely opposite, usually entire, rarely serrate or lobed. convolute in bud: fls. monoecious or rarely dioecious, borne inside of a hollow receptacle with a narrow orifice; the staminate fls. with a 2–6-parted perianth and 1 or 2, rarely 3–6 stamens; pistillate fls. usually with more segments; style eccentric, short or filiform; stigma peltate to filiform: syncarp subglobose, ellipsoid or pear-shaped, fleshy; fr. enclosed in the perianth; embryo curved, with equal or unequal cotyledons. (The ancient Latin name.) About 600 species in the trop. and subtrop. regions of both hemispheres.

*F. Càrica* L. FIG. Deciduous tree to 10 m.; brts. stout, glabrous: lvs. 3–5-lobed, rarely undivided, 10–20 cm. long and about as broad, usually cordate at base, palmately nerved, the lobes usually obovate and obtuse at the apex and irregularly dentate, scabrous above and below with stout, stiff hairs;

petioles 2-5 cm. long: receptacle axillary and solitary, pear-shaped, at maturity 5-8 cm. long, greenish or brownish violet. Fr.vii-x. G.O.t.108(c). B.C. 3.t.42(h). M.A.t.129,130(h). W. Asia. Cult. since early times. Zone (VI). Usually a spreading shrub with long, sometimes procumbent brs., rarely a small tree with short stem and widespreading brs. forming a broad flattened head. Grown for its edible fruit which is of great commercial importance; many pomological varieties are distinguished.

## 15. URTICACEAE Endl. NETTLE FAMILY

Herbs, shrubs or trees, with watery juice, sometimes with stinging hairs: lvs. alternate or opposite; stipules usually present: fls. monoecious or dioecious, rarely perfect, usually in axillary cymes, rarely solitary; perianth with 4-5 free or more or less connate segments; stamens as many and opposite the segments; filaments inflexed in bud, uncoiling elastically; ovary 1-celled, with one basal orthotropous ovule; style 1, stigma of various shape: fr. an achene or drupe; seed usually with copious endosperm: embryo straight; cotyledons fleshy, ovate or suborbicular.—More than 40 genera with about 500 species, chiefly trop.

A. Fr. dry: stigma linear: stipules free.....1. *Boehmeria*  
AA. Fr. fleshy: stigma capitate and penicillate: stipules connate, bifid.....2. *Debregeasia*

1. **BOEHMERIA** Jacq. Shrubs, small trees or herbs: lvs. alternate or opposite, 3-nerved at base, serrate; stipules usually free: fls. monoecious or dioecious, in small clusters collected into axillary, usually lax and pendulous spikes or panicles: perianth of staminate fls. 3-5-lobed or -parted; stamens 3-5: pistillate fls. with tubular perianth, 2-4-toothed, inclosing the ovary; stigma filiform: achene crustaceous, inclosed by the perianth; cotyledons ovate. (After G. R. Boehmer, professor at Wittenberg; 1723-1803.) About 50 species in the tropics, also in N. Am. and E. Asia.

**B. nivea** (L.) Gaudich. **RAMIE**. Suffrutescent, to 2 m.; brts. and petioles densely pilose: lvs. opposite, broad-ovate, 8-15 cm. long, acuminate, broad-cuneate to truncate at base, coarsely crenate-serrate, scabrid above, white-tomentose beneath and pilose on the nerves; petioles 2-8 cm. long, unequal: fls. monoecious, in long, often pendent, panicles 5-15 cm. long. Fl.vi-viii; fr.ix-xi. Kew Jour. Bot. 3:t.8. (*Urtica n. L.*) China, Japan, S. Asia. Cult. 1850. Zone (VI). An important fibre plant cult. in La. and Fla.; sometimes planted as an ornamental perennial for its handsome lvs. snowy-white beneath.

2. **DEBREGEASIA** Gaudich. Shrubs or small trees: lvs. alternate, 3-nerved at base, serrate; stipules connate into a single bifid one: fls. monoecious or dioecious, in unisexual globose clusters arranged in axillary cymes: staminate fls. with usually 4-parted perianth and 4 short stamens; pistillate fls. with obovate or urceolate, 4-toothed perianth usually much contracted at the mouth; stigma capitate, penicillate: syncarp globose, consisting of fleshy drupelets; cotyledons short, broad. (After Prosper Justin de Brégeas (1807-), officer on La Bonite when Gaudichaud made his voyage around the world.) Five species in E. and S. Asia, Abyssinia.

**D. longifolia** (Burm.) Wedd. Shrub or sometimes small tree to 6 m.; brts. pubescent: lvs. lanceolate to oblong-lanceolate, 6-16 cm. long, acuminate, serrulate, rugose and scabrous above, white-tomentose beneath; petioles 5-15 mm. long: fr. 5-6 mm. across, orange to red, 2 or more on a short dichotomous

peduncle, Fl.v-vi; fr.vi-vii. R.H.1896:321. G.C.39:232,t. (*D. velutina* Gaudich.) China, Himal., Java. Cult. 1896. Zone VII? Spreading shrub attractive on account of the contrast of the dark green lustrous upper and the snowy-white lower surface of the lvs.

## 16. SANTALACEAE R. Br. SANDALWOOD FAMILY

Parasitic or half-parasitic (or independent?) herbs or shrubs, rarely small trees: lvs. alternate or opposite, undivided, sometimes scale-like; stipules wanting: fls. perfect or unisexual; perianth simple, usually tubular at base, at apex 4-5-, or 3- or 6-lobed; disk epigynous or perigynous; stamens as many as perianth-lobes; anthers 2-celled; ovary usually inferior, 1-celled; ovules 1-4, at the apex of a central placenta: fr. a 1-seeded nut or drupe; seed without testa, with copious endosperm; cotyledons narrow, semi-terete, often short.—Twenty-seven genera with about 250 species in trop. and temp. regions.

- A. Lvs. opposite: staminate fls. in umbels; pistillate solitary.....1. *Buckleya*  
 AA. Lvs. alternate: fls. in racemes or panicles.....2. *Pyrularia*

1. **BUCKLEYA** Torr. Deciduous parasitic shrubs; buds acute with 3-5 pairs of outer scales; lvs. opposite, sessile or short-stalked, entire: fls. dioecious; staminate in small terminal and sometimes also axillary umbels; stamens 4, opposite the sepals and much shorter; pistillate fls. solitary, terminal on short brts., with 4 short deciduous sepals and immediately below but at the apex of the clavate calyx-tube with 4 linear-lanceolate persistent spreading bracts; style short, with 2-4-parted stigma; ovules 3-4: fr. an ellipsoid drupe. (After S. B. Buckley, an American botanist; 1809-1884.) Three species in Japan and China and one in N. Am.

**B. distichophylla** Torr. Shrub to 4 m.: lvs. 2-ranked, sessile, ovate to ovate-lanceolate, 2-6 cm. long, acuminate, cuneate at base, nearly glabrous, ciliolate: fls. small, greenish: fr. ellipsoid, 1.2-1.5 cm. long, yellowish green or dull orange; the terminal bracts dropping at maturity. Fl.v; fr.ix. G.F. 3:237.—N. C. and Tenn., parasitic on the roots of *Tsuga*. Intr. 1842. Zone V. A graceful shrub with slender spreading brs. and bright green two-ranked narrow lvs. Cult. occasionally in botanical collections.

2. **PYRULARIA** Michx. OIL-NUT. Deciduous shrubs or small trees; buds with many imbricate green scales: lvs. alternate, entire: fls. subdioecious in terminal spikes or racemes, 4-5-merous; segments of perianth free above the disk, at base behind the short stamens with a tuft of hairs or a hairy scale: ovary inferior, with 2-3 ovules; stigma capitate: fr. a subglobose or obovoid drupe, rather large; seed subglobose; embryo terete, short. (Diminutive of *Pyrus*, in allusion to the shape of the fruit.) One species in N. Am., 2 in the Himal.

**P. pùbera** Michx. Shrub to 4 m.; the young parts puberulous; brts. stout: lvs. elliptic to obovate-oblong, 5-15 cm. long, acute or acuminate, cuneate at base, minutely punctulate; petioles 5-15 mm. long; staminate spikes many-fld., 2-6 cm. long, pistillate few-fld., short; fls. 5-merous: fr. pear-shaped or subglobose, about 2.5 cm. long, crowned by the ovate calyx-lobes, yellowish, containing an acrid oil as does the whole plant. Fl.v; fr.viii-ix. B.B.1: 641. Pa. to Ga. and Ala.; parasitic on the roots of *Calycanthus*, *Kalmia* and other shrubs. Cult. 1897. Zone VI? Straggling shrub with rather large lvs.; rarely cult. in botanical collections.

## 17. LORANTHACEAE Lindl. MISTLETOE FAMILY

Parasitic green shrubs or herbs, growing mostly on woody plants, rarely terrestrial; brs. usually brittle at base: lvs. opposite, sometimes reduced to scales, rarely alternate, entire, without stipules: fls. dioecious or monoecious, terminal or axillary; perianth of 2-6 parts, simple, rarely differentiated into calyx and corolla and fls. perfect; stamens as many as parts of perianth and opposite: ovary inferior, 1-celled, with 1 orthotropous ovule; stigma 1: fr. a berry; seed without testa, with copious endosperm; embryo terete or angled. —About 21 genera with 600 species in trop. and temp. regions.—Of no economic importance and not objects of horticulture, though many trop. species are highly beautiful. Occasionally cult. in botanical collections.

A. Lvs. flat.

B. Lvs. deciduous, thin; brs. brown: parts of perianth 4-6.....1. *Loranthus*

BB. Lvs. persistent, leathery; brs. green.

C. Fls. in axillary spikes; anthers free, 2-celled, opening with a pore or slit.

CC. Fls. 1-5 in terminal clusters; anthers adnate to the perianth-lobes, opening with many pores.....2. *Phoradendron*

AA. Lvs. scale-like; anthers 1-celled, free; fls. axillary.....3. *Arceuthobium*

1. **LORANTHUS** L. Parasitic trees or shrubs with usually brown terete br.: lvs. opposite, rarely alternate: fls. perfect or unisexual; parts of perianth 4-6, valvate, spreading, sometimes connate below; filaments at least partly free; style filiform: berry globose or ovoid. (Greek *loros*, strap, and *anthos*, flower; referring to the shape of the sepals.) About 200 species in the Old World, chiefly trop.

**L. europæus** L. Deciduous glabrous shrub to 1 m.; brs. dark brown: lvs. opposite, petioled, ovate-oblong, 2-4 cm. long, obtuse: fls. small, yellowish green, in short racemes: fr. about 8 mm. across, yellow. Fl. iv-v; fr. x-xii. R.I.24:t.142. C. Eu., chiefly on Oaks and Chestnuts. Zone V.—Rarely cult. in European collections (see Jour. Bot. 11:90 for cult.).

2. **PHORADENDRON** Nutt. Parasitic shrubs with terete, angled or flattened green brs.: lvs. opposite, leathery, rarely reduced to scales: fls. usually dioecious, extra-axillary and sunk in the joints of axillary or terminal spikes; calyx usually 3-lobed, rarely 2-5-lobed; anthers 2-celled, sessile, opening lengthwise; stigma sessile or subsessile, obtuse: fr. a sessile subglobose berry. (Greek *phor*, thief, and *dendron* tree; referring to the parasitic habit.) About 240 species in N. and S. Am.

**P. flavescens** (Pursh) Nutt. AMERICAN MISTLETOE. Much-branched shrub to 1 m., with terete brs.: lvs. short-petioled, oblong or obovate, 2.5-5 cm. long, obtuse, cuneate at base and 3-5-nerved: spikes axillary, 1-3, 1.5-2.5 cm. long; berry globose, 4-5 mm. across, white. Fl. iv-v; fr. x-(iv). B.B.1:639. Trelease, Gen. Phoradendron, t.24.25. N. J. to Fla., w. to Ohio, Ind., Mo. and Tex. on various deciduous trees. Collected and sold for Christmas greens. Not known to have been cult.

3. **ARCEUTHOBIMUM** Bieb. Small fleshy plants parasitic on coniferous trees: lvs. opposite, scale-like: fls. dioecious in the axils of the scales; staminate fls. with 2-5-parted calyx; anthers sessile, 1-celled, opening by a circular slit; pistillate fls. with 2-parted calyx-limb; style short, with obtuse stigma: fr. an ovoid, flattened berry on a short recurved pedicel. (Greek *arkeuthos*, Juniper, and *bios*, life; the European species lives on Juniper.) Syn.: *Razoumowskya* Hoffm. About 10 species throughout the n. hemisphere.

**A. pusillum** Peck. Plant 0.5–2 cm. high, olive-green to brown: brs. nearly terete when fresh; scale-like lvs. suborbicular, appressed: berry ovoid-oblong, about 2 mm. long. Fl. iv–v; fr. ix. B.B.1:638. *Rhodora* 2:t.12–14. (*Razoumowskya* p. Peck.) Me. to N. Y. and Pa.; on *Picea* and *Larix*. Zone IV. Cult. by grafting infested brs.

**4. VISCUM** L. MISTLETOE. Parasitic shrubs with green brs.: lvs. opposite, leathery: fls. monoecious or dioecious, axillary or terminal, 3–4-merous; anthers adnate to the inside of the calyx-lobes and opening with many pores; pistillate fls. with capitate stigma sessile or on a short style: fr. a globose berry, often with several embryos in one seed. (The ancient Latin name.) About 15 species in Eu., Asia, Afr. and Australia.

**V. album** L. Shrub to 1 m.; brs. terete, regularly dichotomous: lvs. subsessile, obovate to oblong, 3–5 cm. long, obtuse: fls. dioecious, yellowish, terminal, sessile, the staminate in 3–5-fl. clusters, the pistillate 1–3: berries globose, about 8 mm. across, white, translucent, in the angles of the forking brs. Fl. iii–iv; fr. x(–iii). R.L.24:t.139(c). S.E.4:t.635(c). S.H.1:f.161,162l-o. Gn.89:107(h). Eu., N. Asia; on various dicotyledonous and coniferous trees, particularly on *Malus*, *Populus* and also *Pinus*. Zone IV. The true Mistletoe of which the fruiting brs. are imported as Christmas decoration. Often cult. in European botanical collections (for cult. see G.C.II.5:43;9:83. B.H. 21:206. R.H.1887:470).

## 18. ARISTOLOCHACEAE Lindl. BIRTHWORT FAMILY

Herbs or shrubs, often twining: lvs. alternate, often palmately veined, without stipules: fls. perfect, regular or symmetrical; perianth simple, connate, 3-merous, often petaloid; stamens 6–36, free and inserted on the ovary or united with the styler column; styles connate, with 3 or 6 spreading stigmas; ovary inferior, rarely superior, 4–6-celled, each cell with several or many horizontal or pendulous ovules: fr. a capsule; seeds with copious endosperm and small embryo. Five genera with about 210 species, mostly in trop. and subtrop. regions.

**ARISTOLÓCHIA** L. BIRTHWORT. Herbs or deciduous or evergreen shrubs, often twining; buds small, usually several, superposed, with few outer scales: lvs. usually cordate, 5–7-nerved at base, entire, rarely lobed: fls. axillary, symmetrical; perianth usually with long curved tube, inflated at base, constricted at the mouth and enlarged abruptly into a spreading limb, or gradually widened; stamens usually 6, adnate to the thick fleshy style; ovary 6, rarely 4- or 5-celled; style 3- or 6-lobed at apex: fr. a caps. dehiscent into 6 valves; seeds many, flat. (Greek *aristos*, very good, and *lochía*, child-birth, referring to supposed medicinal virtues.) Syn.: *Hocquantia* Dumort. About 180 species in trop. and temp. regions of both hemispheres.

**A.** Fls. glabrous: lvs. reniform, 10–25 cm. long: limb of perianth brownish purple.

1. *A. durior*

**AA.** Fls. and lvs. more or less pubescent.

**B.** Lvs. at least  $\frac{3}{4}$  as broad as long, generally ovate, never lobed.

**c.** Lvs. usually rounded at apex: limb of perianth yellowish..... 2. *A. tomentosa*

**cc.** Lvs. pointed at apex: limb of perianth yellow, dotted with purple. 3. *A. moupinensis*

**BB.** Lvs. variable, partly narrower, ovate to ovate-lanceolate, often lobed at base.

**c.** Pedicel with a leaf-like bract below the middle..... 4. *A. heterophylla*

**cc.** Pedicel with a small bract..... 5. *A. Kuempferi*

1. *A. durior* Hill. DUTCHMAN'S PIPE. Twining to 10 m.: brts. glabrous: lvs. reniform, 10–30 cm. long, pointed or obtuse, dark green and glabrous

above, pale green beneath and pubescent at first, afterward glabrous; petiole 3-7 cm. long: fls. 1 or 2, axillary, on pedicels 3-5 cm. long, with a bract below the middle; perianth about 3 cm. long, its tube U-shaped, yellowish green and glabrous outside, constricted at the mouth and spreading into a 3-lobed smooth, brownish purple limb 1.5-2 cm. across; capsule 6-8 cm. long, 6-ribbed. Fl.v; fr.ix. B.M.534(c). G.F.5:509(h). Gn.28:585(h). (*A. macrophylla* Lam., *A. Siphon* L'Hérit.) Pa. to Ga., w. to Minn. and Kans. Intr. 1783. Zone IV. Vigorous climber with handsome large lvs.; an excellent vine for porches.

Closely related species: *A. manshuriensis* Komar. Young brts. pubescent: lvs. pubescent beneath: perianth about 5 cm. long, yellowish, flushed purple; limb brown-purple, 3 cm. across. N.K.21:t.1. (*Hocquartia m.* Nakai.) Manch., Korea. Cult. 1909. Zone V.

2. *A. tomentosa* Sims. Twining to 10 m.; brts. woolly: lvs. roundish ovate, 10-16 cm. long, usually rounded at apex, dull light green above and pubescent, more densely beneath; petioles 3-7 cm. long, woolly: fls. about 3.5 cm. long, the tube U-shaped, greenish yellow and pubescent outside, with a purple, nearly closed mouth and a reflexed yellow rugose 3-lobed limb about 2 cm. across: fr. about 5 cm. long, 6-ribbed. Fl.vi; fr.ix. B.M.t.1369(c). N. C. to Fla., w. to s. Ill. and Mo. Intr. 1799. Zone V. Vigorous vine similar to the preceding but with smaller lvs. of duller color.

Closely related species: *A. californica* Torr. Lvs. ovate to ovate-oblong, 5-10 cm. long, obtuse; petioles 1-2 cm. long: fls. little contracted at the mouth, slightly pubescent outside; limb 2-lipped, the upper lip of 2 obtuse lobes: fr. 4-5 cm. long, with 6 winged ribs. A.I.1:536. Calif. Intr. 1877. Zone VII?

3. *A. moupinensis* Franch. Twining to 4 m.: brts. densely silky-pubescent, finally glabrous: lvs. broad-ovate, 7-12 cm. long, usually pointed at apex, slightly pubescent above, grayish pubescent beneath; petioles 2-5 cm. long: fls. about 3.5 cm. long; tube U-shaped, pubescent and greenish outside, with yellow mouth and a 3-lobed yellow limb dotted purple: fr. oblong, 7-8 cm. long, with 6 ridges. Fl.vi. B.M.t.8325(c). W. China. Intr. 1903. Zone VI?

4. *A. heterophylla* Hemsl. Twining to 3 m.; brts. finely pubescent: lvs. ovate to ovate-oblong, or hastate-oblong, 4-10 cm. long, acute or acuminate, usually with a pair of rounded lobes at base, dull green above, pubescent beneath: fls. on nearly glabrous stalks 3-5 cm. long with a large leaf-like bract below the middle: perianth about 5 cm. long, U-shaped, yellow and pubescent outside, bright yellow inside the mouth, the limb lurid-purple, 3-lobed, the lower lobe rounded, flat, the 2 upper with recurved margins: fr. 5-7 cm. long, 6-ribbed. Fl.vi. W. China. Intr. 1904. Zone VI? Lvs. less handsome than in the preceding species, but fls. strikingly colored.

5. *A. Kaempferi* Willd. Tall climber; brts. pubescent; lvs. variable in shape, ovate to ovate-oblong, 8-15 cm. long, acute, often with a pair of rounded lobes at base, reticulate and silky-pubescent beneath; petioles 2-6 cm. long, pubescent: pedicel with a small bract; fls. with U-shaped tube, yellow outside, purple inside, with a 2-lipped limb, the upper lip emarginate. Fl.vi-vii. Kaempfer, Icon. Sel. t.49. Japan. Cult. 1854. Zone V.

## 19. POLYGONACEAE Lindl. BUCKWHEAT FAMILY

Herbs, shrubs or trees, sometimes twining: lvs. alternate, sometimes opposite or whorled, simple and usually entire; stipules usually united and forming a sheath (ocrea): fls. small, regular, unisexual or bisexual, solitary or collected into various inflorescences; perianth simple, of 2-6 parts, sometimes in 2 whorls, connate or distinct, persistent and sometimes accrescent; stamens usually 6-9, rarely less or more, usually opposite the sepals; ovary

superior, consisting of 2-4 carpels, 1-celled, with 1 usually orthotropous ovule; styles 3, rarely 2 or 4: fr. a flat or angled achene, often inclosed by the accrescent calyx; seed with copious endosperm; embryo usually eccentric, curved or straight.—Thirty genera with about 700 species, mostly in the temp. regions of the n. hemisphere, few in the Tropics and in the s. hemisphere.

- A. Petioles without ochrea: fls. in involucre clusters forming corymbs or umbels; stamens 9: small under-shrubs ..... 1. *Eriogonum*  
 AA. Petioles with ochrea: fls. in the axils of bracts forming racemes or panicles; stamens usually 6-8.  
 B. Upright shrubs: sepals 4 or 5, the 2 outer ones much smaller..... 2. *Atraphaxis*  
 BB. Twining or rarely prostrate shrubs: sepals or perianth-lobes nearly equal.  
 C. Ocrea conspicuous, membranous: brs. without tendrils: fr. not inclosed by the tubular part of the perianth..... 3. *Polygonum*  
 CC. Ocrea very short, not membranous: brs. often with tendrils: fr. inclosed by the thickened tubular part of the perianth, its stipe-like base with a broad wing.  
 4. *Brunnichia*

**1. ERIOGONUM** Michx. Annual or perennial herbs or subshrubs: lvs. often whorled, usually woolly; ochrea wanting: fls. small, usually perfect, in involucre clusters forming corymbs or umbels, white, pink or yellow; involucre 5-8-lobed; sepals 6, equal or the outer ones larger; stamens 9; styles 3, with capitate stigmas: achene 3-angled. (Name formed analogous to Polygonum, from Greek *erion*, wool, referring to the woolly tomentum of most species.) About 150 species in W. N. Am.—Essentially plants of arid regions requiring in cult. well drained soil and sunny position; well adapted for sunny rockeries. Most species are herbaceous and the few suffrutescent species are of more southern distribution and probably not hardy North.

**E. Wrightii** Torr. Subshrub to 60 cm., with slender brs. upright or procumbent: lvs. lanceolate or elliptic-lanceolate, 1-2 cm. long: fls. white or pink in terminal spike-like panicles 3-6 cm. long. Fl.viii-ix. S.L.197(h). N. Mex. to Calif. Cult. 1904. Zone VII?

**2. ATRAPHAXIS** L. Deciduous shrubs with unarmed or spinescent brs., glabrous: lvs. short-petioled, usually small, with a conspicuous membranous ocrea: fls. small, perfect, white or pinkish, several in the axils of often scale-like lvs., forming terminal racemes; sepals 5 or sometimes 4, the 2 outer smaller and usually reflexed; stamens 8, sometimes 6, connate at base; ovary superior; styles 2-3, free or connate at base: achene 2-edged or 3-angled, inclosed by the enlarged inner sepals; embryo eccentric, slightly curved. (Ancient Greek name for Atriplex.) Syn.: *Tragopyrum* Bieb. About 18 species in C. and W. Asia, Greece and N. Afr.—Small shrubs of usually spreading habit with small lvs. and usually profusely produced white or pinkish fls. in terminal racemes remaining a long time nearly unchanged. Essentially desert plants requiring in cult. well drained soil and sunny position.

- A. Sepals 4; stamens 6; fr. 2-edged: brs. rigid, often spinescent..... 1. *A. spinosa*  
 AA. Sepals 5; stamens 8; fr. 3-angled: brs. unarmed.  
 B. Lvs. 1-3 cm. long.  
 C. Lvs. lanceolate ..... 2. *A. frutescens*  
 CC. Lvs. orbicular-ovate to broad-elliptic..... 3. *A. buxifolia*  
 BB. Lvs. 2.5-8 cm. long, oblong-elliptic to oblong-lanceolate..... 4. *A. Musckketowi*

**1. A. spinosa** L. Rigid shrub to 50 cm., with whitish, usually spinescent, brs.: lvs. ovate to elliptic, 5-10 mm. long, bluish green: fls. about 8 mm. across, white, tinged rose, in small clusters on short lateral brts.; sepals 4, the inner 2 roundish, accrescent, closely appressed to the 2-edged fr. Fl.viii. E.N.III. 1a:23,f.12a-e. S.H.1:255. W. Asia, S. Russia. Intr. 1732. Zone V.

**2. A. frutescens** (L.) K. Koch. Shrub to 80 cm., with slender whitish upright unarmed brs.: lvs. oblong to lanceolate or oblanceolate, 8-30 mm. long,

acute, wavy at the margin, grayish green: fls. whitish, in small clusters at the end of the brts., forming racemes 2-7 cm. long; inner sepals suborbicular, in fr. about 6 mm. across and pinkish. Fl.viii-ix. L.B.5:489(c). B.R.3:254(c). (*A. lanceolata* Meissn., *Polygonum* f. L.) S. Russia to W. and C. Asia. Intr. 1770. Zone III. Attractive small shrub with profusely produced fls. in late summer, changing from white to pinkish.

Related species: *A. Billardiæ* Spach. Low, usually prostrate shrub with often spinescent brts.: lvs. ovate to lanceolate, 3-5 mm. long, obtuse to acute, slightly wavy: fls. rosy-pink, in dense 5-8-fld. racemes. B.M.8820(c). G.C.76:43. S. E. Eu., W. Asia. Cult. 1903. Zone VI?

3. *A. buxifolia* (Bieb.) Jaub. & Spach. Shrub to 60 cm., with rather short, sometimes slightly spinescent brs.: lvs. broad-obovate to broad-elliptic, 1-2.5 cm. long, acute or obtusish, with crisped and wavy margin: fls. pinkish-white, slender-stalked, forming short terminal racemes 2-4 cm. long; inner sepals orbicular, about 8 mm. across in fr. Fl.vii-viii. B.M.1065(c, as *Polygonum crispulum*). Transcauc. to Turkest. Intr. about 1800. Zone V.

4. *A. Muschketovi* Krassn. Shrub to 2.5, of open straggling habit: young brts. pale yellowish brown, older brown with shreddy bark: lvs. elliptic-oblong to oblong-lanceolate, 3-8 cm. long, acute, with crisped margin, light green: fls. white, about 1 cm. across, slender-stalked, in terminal leafy racemes 2-5 cm. long; accrescent sepals about 8 mm. across in fr. Fl.v-vi. B.M.7435(c). B.S.1:225. G.C.78:406,t(c). (*A. latifolia* Koehne, *Tragopyrum lanceolatum* var. *latifolium* Reg.) Turkest. Intr. about 1880. Zone V. The most ornamental species on account of its larger fls. and bright green lvs.

The closely related genus *Calligonum* L. consisting of small-leaved or nearly leafless shrubs resembling *Ephedra* in habit and appearance, is apparently not now in cult. It differs chiefly in the not accrescent sepals, in the larger fr. which is either 4-winged, as in *C. aphyllum* Schneid. (*C. Pallasia* L'Hérit.), or densely covered with branched setae, as in *C. polygonoides* L. These species are native of W. and C. Asia and will be hardy within our area.

3. **POLYGNOM L. KNOTWEED.** Herbs or shrubs often twining: lvs. alternate, petioled; ocrea conspicuous, membranous: fls. small, perfect, usually collected into large terminal spikes or panicles, rarely solitary; perianth 5-parted or 5-lobed, usually pinkish; the 3 outer parts often somewhat larger, accrescent and enclosing the fr. at maturity; stamens usually 8, rarely 5-7, adnate to a disk; styles 2-3, free or more or less connate; stigmas capitate; fr. compressed or 3-angled; embryo eccentric, more or less curved; cotyledons narrow, not folded. (Ancient Greek name, from *poly-*, many, and *gonu*, knee, referring to the numerous joints.) About 150 species throughout the earth, chiefly in temp. regions.

A. Prostrate subshrubs: fls. in terminal spikes.....1. *P. vacciniifolium*

AA. Twining shrubs.

B. Axes of infl. nearly glabrous; fls. pinkish.....2. *P. baldschuanicum*

BB. Axes of infl. minutely scabrous-pubescent; fls. white.....3. *P. Auberti*

1. *P. vacciniifolium* Wall. Prostrate subshrub with long trailing and rooting brs., glabrous: ocrea lacinate, about 1 cm. long, brown; lvs. broad-elliptic to elliptic, 1-2 cm. long, acute at ends, dark green above, glaucescent beneath; petioles 4-6 mm. long: fls. rose-red, in short-stalked slender spikes 5-7 cm. long, borne on short upright brts. Fl.viii-x. B.M.4622(c). Gn.45:159(h); 87:564(h). G.W.9:377(h). Himal. Intr. 1845. Zone VII? A handsome trailing plant, forming carpets with numerous upright rosy-red fl.-spikes; well adapted for rockeries, likes moist position.

Related species: *P. equisetiforme* Sibth. & Sm. Subshrub to 1 m., with ascending striped brs. with lanceolate revolute lvs. 1.5-3 cm. long near the base,

leafless above, and with conspicuous lacerate sheaths, resembling stems of an *Equisetum*: fls. white, in axillary clusters forming terminal spikes, in autumn. S.F.4:t.364(c). Gn.83:517(h);87:604(h). Mediterr. Reg. Cult. 1912. Zone VII?

2. *P. baldschuanicum* Reg. Twining woody climber to 15 m.; brts. glabrous, green, older brs. gray: lvs. broad-ovate or ovate, 4-10 cm. long, acute or acuminate, cordate or hastate at base, glabrous, bright green; petioles 1-3.5 cm. long: fls. white, tinged with pink, 6-8 mm. across, in large terminal panicles at the end of the brs. and of lateral brts.; the 3 outer sepals winged on back, attenuated into a slender stipe; stamens pubescent at base; achene 3-angled, shining black. Fl.vii-ix; fr.ix-x. B.M.7544(c). Gt.37:t.1278(c). G.C.III.21:17;41:399(h). Gn.79:41(h). Gn.M.38:25(h). Bokhara. Intr. 1883. Zone IV. The large panicles of pinkish fls. often cover the upper part of the plant completely in late summer and fall.

3. *P. Auberti* L. Henry. Similar to the preceding, but less woody: lvs. ovate to oblong-ovate, 4-9 cm. long, hastate at base, usually undulate at margin, bright green, reddish when young; petioles 3-5 cm. long: fls. about 5 mm. across, whitish or greenish white, sometimes slightly pinkish, in numerous slender lateral panicles along the upper part of the brs.; anthers white; the 3 outer sepals winged. Fl.vii-rx. R.H.1907:82,83. W. China. Intr. 1899. Zone IV. Vigorous climber with bright green dense foliage handsomer than that of the preceding species.

Related species: *P. multiflorum* Thunb. Less woody: brs. hollow or nearly so: lvs. deeply cordate, 5-12 cm. long, long-acuminate; panicle smaller, slenderer, puberulous; fls. pink, 3 mm. across; stamens glabrous; outer sepals much enlarged in fr. S.H.1:f.169i-m. Japan. Intr. 1881. Less handsome and tenderer.

Closely related genera: *Pteroxygonum* Dammer & Diels. Woody climber; differing chiefly in the not accrescent perianth, the 3-angled fr. being 3-winged at apex and 3-horned at base, with 2-winged pedicel. One species: *P. Giraldii* Dammer & Diels. Brts. sparingly pilose or glabrescent: lvs. long-petioled, cordate-triangular, acute to cuspidate, sparingly pilose on the veins; racemes stalked, pendulous; fls. short-pedicelled. C. China. Cult. 1935. Zone V.—*Polygonella* Michx. Annual or perennial, often suffruticose plants; brts. conspicuously jointed, adnate at base to the internode: lvs. small, linear or narrow: pedicels solitary, in slender panicle racemes; the 2 outer sepals spreading or reflexed; stamens 8; styles 3: embryo straight or nearly so. About 6 species in N. Am.—*P. americana* (Fisch. & Mey.) Small. Subshrub to 0.5 m., glabrous: lvs. linear, 5-20 mm. long; fls. about 4 mm. broad, white or rose, in racemes 2-5 cm. long and forming terminal panicles to 20 cm. long. Gr.M.363. (*P. ericoides* Gray.) S. Mo. to Tex. and Ga. Intr. ?

4. *BRUNNICHIA* Banks. Climbing shrubs; the brts. partly ending in tendrils: lvs. petioled, entire; ocrea very short, not membranous: fls. perfect, small, in large terminal panicle racemes; sepals 5; stamens 7-10, usually 8; styles 3; stigmas 2-cleft at apex; ovule pendulous: fr. obtusely 3-angled, enclosed in the tubular enlarged perianth, below with a long stipe-like winged base; seed deeply 6-grooved, the embryo in one of the angles. (After M. T. Brunnich, a Scandinavian naturalist of the 18th century.) One species in N. Am. and one in W. Afr.

*B. cirrhosa* Banks. Climbing to 8 m.; stems grooved: lvs. ovate to ovate-lanceolate, 5-15 cm. long, acute or acuminate, truncate or subcordate at base, slightly pubescent or nearly glabrous beneath; petioles about 1 cm. long: racemes 3-15 cm. long, forming large terminal panicles; fls. greenish white, 6-7 mm. across; achene oblong-ovoid, lustrous brown, about 6 mm. long, enclosed in the tubular perianth, with the stipe-like broad-winged base 2.5-3 cm. long. Fl.vii-viii; fr.ix-x. E.N.III.1a:35,f.18a-d. B.B.1:677. S. C. to Fla.,

w. to Okl. and Tex. Intr 1787. Zone VII? Vine with handsome dark green lvs.

Related genus: *Muehlenbeckia* Meissn. Usually climbing or sometimes prostrate shrubs or subshrubs: lvs. usually small, with small, loosely sheathing stipules: fls. polygamous or dioecious, small, in axillary fascicles or in spikes, rarely solitary; perianth 5-parted; stamens usually 8; styles 3, short; stigmas usually fimbriate: fr. 3-angled, inclosed in the usually succulent perianth. About 15 species in Austral., Polynes., and S. Am.—*M. complexa* (A. Cunn.) Meissn. Prostrate or climbing subshrub, glabrous, with thin wiry stems minutely warty when young: lvs. orbicular to elliptic, 4-20 mm. long, slender-petioled: fls. 2-3 mm. long, in axillary or terminal short spikes, sometimes panicked: fr. waxy-white, 5-8 mm. across; nutlet black, shining. B.M.8449 (c). N. Zeal. Intr. 1842. Zone (V).—*M. axillaris* (Hook f.) Walp. Young brts. minutely puberulous: lvs. elliptic or ovate to suborbicular, 2-8 mm. long: fls. axillary, solitary or 2, or the staminate in short terminal spikes. Cheeseman, Ill. N. Zeal. Fl.2:t.165. (*M. nana* Hort.) N. Zeal. Cult. 1902. Zone V.

## 20. CHENOPODIACEAE Dumort. GOOSEFOOT FAMILY

Herbs or shrubs, rarely small trees: lvs. usually alternate, entire or irregularly toothed, often fleshy, sometimes reduced to scales; stipules wanting: fls. small, usually greenish, bisexual or unisexual, regular; perianth simple, of 1-5 parts; stamens as many as perianth parts or fewer; ovary superior, 1-celled; ovule 1, amphitropous; styles or stigmas 2, rarely 3 or 4: fr. dry, rarely fleshy, inclosed by the variously shaped perianth; embryo coiled; cotyledons usually long and narrow. About 74 genera with 550 species distributed all over the world.—None of the woody members of this family are of horticultural importance, but as they are almost all plants of alkaline or saline soil, they are useful for seashore planting. The species mentioned below are occasionally found in botanical collections.

- A. Lvs. alternate, rarely opposite.
- B. Lvs. lanceolate to obovate or ovate: fls. unisexual.
- C. Lvs. scurfy or mealy, often glabrescent, without hairs: fruiting bracts usually toothed .....1. *Atriplex*
- CC. Lvs. stellate-pubescent.
- D. Lvs. pubescent while young; fruiting bracts entire, glabrous .....2. *Grayia*
- DD. Lvs. persistently stellate-tomentose: fruiting bracts with 2 horns and densely pilose .....3. *Eurotia*
- BB. Lvs. linear or terete.
- C. Brs. slender: lvs. 4-10 mm. long: fls. bisexual.
- D. Plant pubescent: fr. inclosed in a 4-toothed hairy calyx .....4. *Camphorosma*
- DD. Plant glabrous: fr. inclosed in a 5-lobed calyx .....6. *Suaeda*
- CC. Brs. rigid, spinescent: lvs. 1.5-3 cm. long: fls. unisexual: fr. winged .....5. *Sarcobatus*
- AA. Lvs. opposite, reduced to scales: fr. winged .....7. *Haloxylon*

1. **ATRIPLEX** L. ORACH. Herbs or shrubs: lvs. alternate, rarely opposite, scurfy, mealy or glabrous: fls. unisexual, sometimes mixed with perfect ones, in clusters usually forming terminal spikes or panicles; staminate fls. with 3-5-parted calyx, the pistillate with 2 large bracts and without calyx; stigmas usually 2: seed vertical with annular embryo, enclosed in the enlarged distinct or connate bracts. (Ancient Latin name of the plant.) About 120 species throughout the earth.

**A. canescens** James. Shrub to 1.5 m. with whitish ascending or spreading brs.: lvs. subsessile, linear-lanceolate to oblanceolate or narrow-oblong, 2-5 cm. long, obtuse or acute, entire, grayish green: fls. usually dioecious, the staminate in simple or panicked spikes, the pistillate axillary or spicate: fruiting bracts united nearly to the apex, on each side with 2 longitudinal wings, undulate or dentate, 12-15 mm. broad. Fl.viii. B.B.2:19. Clements, Rocky Mt. Fl.t.10.f.1,2. Bull. U. S. Dept. Agr. Bot. 27,t.6.f.1. (*A. occidentalis* D. Dietr.) S. Dak. and Ore. to Tex. and L. Calif. Cult. 1870. Zone V. One of

the hardiest of the woody species in cult. and rather conspicuous by the grayish white or grayish green color of its foliage.

Related species: *A. Nuttallii* S. Wats. Suffrutescent, with erect or decumbent stems: lvs. oblong or obovate to oblanceolate, 2-4 cm. long, obtuse, grayish green; fruiting bracts united to above the middle, 3-4 mm. long, indurate, irregularly dentate. B.B.2:19. Man. and Sask. to Neb. and Utah. Cult. 1880. Zone II?—*A. confertifolia* (Torr.) S. Wats. Shrub to 1 m.: lvs. ovate to suborbicular, 1-2.5 cm. long, short-petioled: fls. dioecious in small axillary clusters; fruiting bracts united at base, entire, 6-12 mm. long. Jepson, Fl. Calif. f.83. Contr. U. S. Nat. Herb. 25:t.7a(h). N. Dak. and Ore. to Calif. Cult. 1894. Zone V?—*A. Halimus* L. Shrub to 2 m., with upright stout brs.: lvs. rhombic-ovate to ovate-oblong, 1.5-6 cm. long, acutish, silvery gray, petioled: fls. in large terminal panicles, greenish; fruiting bracts connate at base, entire. FLIX. R.I. 24:t.270(c). S. Eu. Intr. 1640. Zone VII?—*A. portulacoides* L. Straggling shrub to 0.5 m.: lvs. opposite, obovate to oblong, about 1 cm. long, grayish: fls. greenish, in slender panicled spikes: fruiting bracts 3-lobed, tubercled. R.I.24: t.271(c). S.E.8:t.1208(c). Seashores of Engl. and Denm. to Mediterr. Cult. 1800. Zone VII?

2. *GRAYIA* Hook. & Arn. Deciduous shrubs, stellate-pubescent: lvs. alternate, entire: fls. usually dioecious; staminate fls. with 3-5-parted membranous calyx, in axillary clusters; pistillate fls. without calyx, inclosed by 2 connate bracts; stigmas 2: fr. nearly orbicular, inclosed by a winged involucre; seed erect; embryo annular. (After Asa Gray, noted American botanist; 1810-1888.) Syn.: *Eremosimum* Greene. Two species in N. Am.

*G. spinosa* (Hook.) Moq. Erect much-branched shrub, to 1 m.; brts. short, often spinescent: lvs. narrow-oblong to oblanceolate, 0.5-4 cm. long, obtuse, pubescent while young, later glabrescent: staminate fls. in dense short spikes; pistillate fls. in dense spikes 2-7 cm. long; fruiting bracts suborbicular, 5-15 mm. long, glabrous, often tinged red. FLIV-V; fr.VII-VIII. H.I.t.271. Jepson. Fl. Calif. f.86. (*G. polygaloides* Hook. & Arn., *Eremosimum spinosum* Greene.) Wyo. and Wash. to Colo. and Calif. Cult. 1897. Zone V?

3. *EURÓTIA* Adans. Low shrubs or subshrubs with stellate pubescence: lvs. alternate, entire, narrow: fls. dioecious, or sometimes monoecious; the staminate fls. in clusters forming spikes; calyx 4-parted; stamens 4; pistillate fls. axillary, solitary or clustered, with 2 bracts connate below and without calyx; stigmas 2: fr. inclosed by the connate bracts forming a long-pilose, 2-horned coat; seed vertical; embryo nearly annular. (Greek *euros*, mould; referring to the pubescence.) About 4 species in N. Am. and in S. Eu. to C. Asia.

*E. lanata* (Pursh) Moq. Subshrub to 1 m., with upright brs., like the lvs. with dense stellate pubescence mixed with simple hairs: lvs. short-petioled or subsessile, linear to lanceolate, 1.5-5 cm. long, obtuse, with revolute margins: fls. usually incompletely dioecious: fruiting bracts about 6 mm. long. FLV-VII; fr.VIII. B.B.2:20.f.1703. Jepson, Fl. Calif. f.87. Contr. U. S. Herb. 25:t.7b(h). Sask. and Wash. to Kans. and Calif. Cult. 1895. Zone V? The long-pilose frs. give to the brs. of the fruiting plant a feathery appearance and make it attractive; also the gray foliage is distinctive.

The related *E. ceratoides* (L.) C. A. Mey. differs chiefly in the broader, less densely pubescent lvs. greenish above, and with scarcely revolute margin. Mediterr. Reg. to C. Asia. R.I.24:t.273(c). S.H.1:264. S.L.175(h). Intr. 1780. Zone VI?

4. *CAMPHORÓSMA* L. Herbs or shrubs, often aromatic: lvs. alternate, terete or semi-terete: fls. perfect or pistillate, axillary and forming spikes; calyx campanulate, 4-toothed; stamens 4; style with 2, rarely 3 stigmas: fr.

included in the campanulate calyx; seed upright; embryo horse-shoe-shaped. (*Camphora*, camphor, and Greek *osme*, odor.) About 7 species from the Mediterr. Reg. to C. Asia.

**C. monspeliaca** L. Subshrub to 0.5 m., with procumbent or ascending woolly brs.; aromatic: lvs. alternate, with clusters of smaller ones in the axils, 4-8 mm. long, subulate, pilose; fls. in dense ovoid to oblong spikes; calyx 2-2.5 mm. long, pilose; styles red: seed black. R.I.24:t.274(c). S. Eu. and N. Afr. to C. Asia. Cult. 1880. Zone VII? Of heath-like appearance, adapted for seaside planting.

Related genus: *Kochia* Roth. Herbs or subshrubs, silky-pubescent: lvs. alternate: fls. perfect or pistillate, axillary, forming terminal spikes; calyx 5-lobed; stigmas 2-3: fruiting calyx depressed, with incurved lobes, winged on back: seed horizontal; embryo annular. About 30 species all over the earth. Possibly in cult. is *K. prostrata* (L.) Schrad. Subshrub to 0.6 m.: lvs. linear to filiform, 5-20 mm. long: fls. 3-5, axillary, forming leafy, paniced spikes: fruiting calyx 4-4.5 mm. across, each lobe with an oval to oblong striate horizontal wing on back. R.I.24:t.276(c). S.H.1:f.174. Mediterr. Reg. to C. Asia. Zone VI.

**5. SARCÓBATUS** Nees. Shrubs with spinescent brs. grayish or yellowish white: lvs. alternate or opposite, linear, fleshy: fls. monoecious or dioecious, without bracts; staminate fls. in cylindric catkins, each fl. consisting of a peltate scale, with 1-3 stamens underneath, without perianth; pistillate fls. sessile, axillary, 1 or 2; perianth turbinate, compressed, confluent with the ovary: fruiting calyx with a broad horizontal wing about the middle; seed erect; embryo spirally coiled, without endosperm. (Greek *sarcos*, flesh, and *batos*, a spiny shrub.) Two species in W. N. Amer.

**S. vermiculatus** Torr. Much-branched rigid shrub to 3 m., glabrous or pubescent: lvs. 1-3 cm. long, the lower ones opposite and shorter and broader: staminate catkins 7-30 mm. long: fr. minutely stellate-pubescent, its body 4-5 mm. long, with the wing above 1 cm. across. Fl.vi-vii. B.B.2:f.1709. E.N.III.1a:78. S.L.336(h). Alb. and N. Dak. to Calif. and N. Mex. Cult. 1895. Zone V.

**6. SUAEDA** Forsk. Herbs or shrubs, upright or procumbent; lvs. alternate, terete, fleshy, glabrous: fls. sessile, in axillary 3-fld. cymes or solitary, with 2 minute bracts, perfect, mixed with unisexual ones; perianth subglobose or urceolate, 5-lobed; stigmas 2-5: fr. enclosed in the spongy or fleshy perianth, its lobes subequal or the 2 or 3 outer ones tubercular on the back, rarely all winged; embryo spirally coiled; endosperm wanting or scanty. (From the Arabian name of *S. baccata* "Suidah.") Syn. *Dondia* Adans. About 40 species, essentially saline plants found on the seacoast of all continents and in inland regions with saline soil.

**S. fruticosa** Forsk. Upright much-branched shrub to 1 m., glabrous, with whitish brs.: lvs. closely set, semi-terete, 5-15 mm. long, obtuse, grayish green: fls. solitary, rarely 3, greenish, small, the upper forming terminal leafy spikes; perianth subglobose, its lobes obtuse or acute, rounded on back; stigmas 3: fr. ellipsoid; seed ovoid, 1.6-1.8 mm. long, lustrous black. Fl.viii-ix. R.I.24:t.289,f.1-6(c). S.E.8:t.1178(c). (*Dondia* f. Druce.) 'Alb. to S. Calif. and n. Mex., also W. and S. Eu., Asia, Afr. Cult. 1789. Zone V? Low shrub of heath-like aspect, for planting in saline or sandy soil.

Related genus: *Salsola* L. Herbs usually annual, rarely shrubs: lvs. usually alternate, sessile or clasping, usually pubescent: fls. perfect, small, with 2 large bracts, axillary, solitary or clustered, the upper ones forming spikes; perianth 5-, rarely 4-6-parted, with oblong or lanceolate segments, in fruit usually horizontally keeled or winged, connate or free at base, usually inflexed at apex.

About 40 species distributed nearly over the earth.—*S. laricina* Pall. Subshrub to 0.5 m., pubescent or glabrescent: lvs. subulate, 5–10 mm. long, obtuse: fls. solitary, in slender spikes; anthers with punctiform appendix: segments of fruiting calyx ovate-oblong, each below the middle with a reniform wing. Pallas, III. Pl. t.13. S. E. Russia to Siber. Cult. 1878. Zone IV?

**7. HALÓXYLON** Bge. Shrubs or small trees with articulate brs.: lvs. reduced to small scales: fls. perfect, axillary, with 2 broad bracts; sepals 5, free; stamens 2–5, inserted on a lobed disk; stigmas 2–5: fr. globose or cylindrical, surrounded by the accrescent sepals, all or some with a horizontal wing on back; seed horizontal; embryo spirally coiled. (Greek, *hal*, salt, and *xylon*, wood; referring to the saline habitat.) About 10 species from the Mediterr. Reg. to C. Asia.

**H. Ammodéndron** (C. A. Mey.) Bge. SAXOUL. Shrub or tree to 6 m., with thick gnarled trunk; brts. light green, slender: scales short-triangular, obtusish, connate, puberulous inside: fruiting calyx with large suborbicular wings. Fl.v; fr.ix. E.N.III.1a:84,f.40a-g,t(h). Ledebour, Icon. t.47. Ural to Persia and Turkest. Intr. 1900. Zone V?

Closely related genus: *Anábasis* L. Herbs or small shrubs: brs. articulate, with opposite, terete, often scale-like lvs.: fls. with small, sometimes subulate, bracts; stamens 5; fruiting calyx with horizontal wings, rarely without; seed vertical. About 18 species from the Mediterr. Reg. to C. Asia.—*A. aphylla* L. Shrub to 0.5 m., with upright green brs.: lvs. scale-like, connate, pubescent inside: fls. axillary, forming terminal spikes: fruiting calyx with 3 wings. Pallas, III. Pl. t.8 (as *A. tatarica*). S. E. Russia to the Altai and Songaria. Cult. 1878. Zone V?

The genus *Salicornia* L. has also articulate brs. and scale-like opposite lvs., but it is succulent and scarcely woody. Herbs or subshrubs: fls. sunk in the fleshy joints; perianth 3–4-toothed, stamens 1 or 2: embryo conduplicate. About 10 species chiefly on the seashore throughout the earth.—*S. perennis* Mill. has prostrate, suffruticose rooting stems. B.B.2:22. S.E.3:t.1183(c). (*S. ambigua* Michx., *S. radicans* Sm.) N. H. to Miss., W. Eu., Algeria. Cult. ? Zone IV.—*S. fruticosa* L. has erect stems to 0.6 m. R.I.24:t.287(c). La., Bahamas, Old World. Intr. about 1800. Zone VII?

## 21. CARYOPHYLLACEAE Reichenb. PINK FAMILY

Herbs, rarely suffruticose; brs. usually swollen at the nodes: lvs. opposite, often connate at base, entire, with or without stipules: fls. regular and usually perfect, mostly in cymes; sepals 4–5, free or united; petals 4–5, sometimes wanting; stamens usually twice as many as sepals or fewer, hypogynous or perigynous; styles 2–5, sometimes united; ovary superior, 1-celled: ovules 1 to many, attached to the base or on a free central placenta: fr. a dehiscent caps., or a 1-seeded utricle, rarely a berry; seeds albuminous, with coiled or curved, rarely straight embryo.—About 75 genera and 1200 species in both hemispheres, most abundant in temp. and colder regions; none of the suffruticose species are of particular ornamental or economic importance.

**SILÈNE** L. CATCHFLY, CAMPION. Annual or perennial herbs, sometimes suffruticose or shrubby: lvs. opposite, without stipules: fls. solitary or in cymes, white, pink or red; calyx 5-toothed or 5-cleft, ovoid to cylindric, 10 to many-nerved; petals 5, with a narrow claw and usually with a scale at base of blade; stamens 10; styles 3–5; caps. dehiscent, with 6–10 teeth at apex; seeds many. (Name probably derived from *Silenos*, companion of Bacchus in Greek mythology.) More than 400 species throughout the n. hemisphere.

*S. chloraefolia* Sm. Woody at base, to 50 cm. tall, with upright or ascending brs., viscid above, otherwise glabrous and glaucescent like the lvs.: lower

lvs. elliptic-spatulate, with the slender petiole 2-3 cm. long, upper sessile, suborbicular and acuminate, 1-2 cm. across: fls. white or pinkish, slender-stalked in loose paniced cymes; calyx 10-nerved, glabrous, pale, 2.5-3 cm. long; petals bifid to middle of blade: caps. oblong, about  $1\frac{1}{2}$  as long as stipe. Fl.vii-viii. B.M.807(c). B.R.1989(c). W. Asia. Intr. 1796. Zone VII.

Related species: *S. fruticosa* L. Woody at base: lvs. oblong-spatulate to oblanceolate, 2.5-6 cm. long, ciliate, grayish green: fls. pink, in panicles, with long-ciliate bracts; calyx glandular-pubescent; petals bifid at apex; caps. about as long as its stipe. S.F.5:t.428(c). S. Eu. Cult. 1877. Zone VII?—*S. Tánakae* Maxim. Suffrutescent, upright, to 60 cm.: lvs. elliptic to lanceolate-spatulate, 2.5-6 cm. long, puberulous; calyx about 2 cm. long, puberulous; petals purple, emarginate, with ciliate claws; caps. about as long as stipe. S. Japan. Intr. 1884. Zone VII?

Other genera with suffrutescent species probably hardy within our area are: *Paronychia* Juss. Herbs or subshrubs: lvs. linear, small, with scarious stipules; fls. small, often clustered, with minute petals or without: fr. a 1-seeded, indehiscent utricle. *P. Jamesii* Torr. & Gr. is a subshrub to 30 cm. tall, from Wyo. and Neb. to Tex.—*Acanthophyllum* C. A. Mey. Subshrubs with linear, rigid and pungent lvs., without stipules: fls. sessile, usually in clusters with 5-nerved calyx and pungent calyx-teeth; petals without crown-scales; stigmas 2; caps. circumscissile, few-seeded. About 15 species in W. and C. Asia.—*A. pungens* (Bge.) Boiss. Low compact subshrub: lvs. subulate, spiny, 2-3 cm. long: fls. with 2 spiny lanceolate bracts, in terminal short-stalked heads: petals pink, with elliptic-oblong limb more than  $\frac{1}{2}$  as long as the puberulous calyx. Ledeb. Ic. Fl. Ross. t.4. (*A. spinosum* C. A. Mey., not *Dianthus spinosus* Desf.) C. Asia. Cult. 1934. Zone V?

## 22. RANUNCULACEAE Juss. BUTTERCUP FAMILY

Herbs or woody plants: lvs. alternate or opposite, often dissected: fls. perfect, rarely unisexual, regular or irregular; sepals 2-15, usually 5; petals 2-15 or wanting; stamens numerous, rarely few; carpels 1-many, usually separate; fr. an achene or follicle, rarely berry-like; seeds with endosperm and a minute embryo.—Forty-eight genera with nearly 1300 species, chiefly in the temp. regions in the n. hemisphere.

- A. Lvs. alternate; sepals imbricate, 5-10: fr. a follicle.  
 B. Fls. large, solitary or few, with 5 or more petals; stamens many.....1. *Paeonia*  
 BB. Fls. small, in compound racemes; petals wanting; stamens 5-10.....2. *Zanthorhiza*  
 AA. Lvs. opposite; sepals valvate, usually 4: fr. an achene.....3. *Clematis*

1. *PAEONIA* L. PEONY. Herbs or deciduous shrubby plants; buds large, with few outer scales: lvs. large, alternate, pinnately dissected: fls. terminal, usually solitary, sometimes several, red, white or yellow; sepals 5, persistent; petals large, 5-10; stamens numerous; carpels 2-5, developing into dehiscent follicles, each with several large seeds. (Ancient Latin name.) About 35 species in Eu., Asia, and one in W. N. Am.

- A. Lfts. not decurrent, the lower ones stalked: fls. white to red, 10-30 cm. across; carpels pubescent.....1. *P. suffruticosa*  
 AA. Lfts. decurrent; carpels glabrous.  
 B. Fls. dark crimson, 5-6 cm. across.....2. *P. Delavayi*  
 BB. Fls. yellow, 5-10 cm. across.....3. *P. lutea*

1. *P. suffruticosa* Andr. TREE P. Shrub to 2 m., with stout brs.: lvs. without the petiole 10-25 cm. long, bipinnate; lfts. broad-ovate to ovate-oblong, stalked or sessile, 3-5-lobed, rarely entire, glaucescent beneath and glabrous or sparingly pubescent; petioles 5-10 cm. long: fls. solitary, 10-30 cm. across, white, rose or red: carpels densely pubescent, partly or nearly wholly enclosed by the disk. Fl.v-vi; fr.ix. Gn.52:325(h). M.G.11:201(h). S.L.245(h). (*P. arborea* Donn, *P. moutan* Sims.) N. W. China, long cult. in China and Japan. Intr. 1789. Zone V. The Tree Peony with its numerous

garden forms is one of the most gorgeous of all ornamental shrubs; they are of slow growth and prefer rich loamy soil.—*P. s. spontanea* Rehd., var. Stoloniferous: lfts. pubescent on the veins beneath, at least toward the base when young, broad-ovate to ovate: fls. 10–12 cm. across, white to pink, with 5–10 petals. N. China. Intr. 1910.—The following are the first garden forms intr.; their lfts. are narrower, usually oblong-ovate and quite glabrous.—*P. s. papaveracea* (Andr.) Bailey, var. Fls. nearly single, large, white, the petals thin and with a blotch of purple near base. A.R.7:463(c). B.M.2175(c). Gn. 52:325,t(c). Intr. 1806. (*P. moutan* p. Andr.)—*P. s. rosea* (Andr.) Bailey, var. Fls. more or less double, sometimes nearly single, rose-colored. A.R.6:373(c). L.B.11:1035(c). (*P. moutan* r. *plena* and r. *semiplena* Andr.) Intr. 1794.—*P. s. Bâksii* (Andr.) Bailey, var. Fls. more or less double; petals pale pink to nearly white at the margin, purplish toward the middle and base. A.R.7:448(c). B.M.1154(c). (*P. moutan* B. Andr.) Intr. 1789.—A cult. form which is probably nearest to the wild form is *P. s. Annéslei* (Sabine) Rehd., f., with almost single purple-pink fls. 10–12 cm. across. Trans. Hort. Soc. 6:482,t(c). (*P. moutan* A. Sabine.) Orig. before 1826.

2. *P. Delavayi* Franch. Subshrub to 1 m., stoloniferous, glabrous: lvs. bipinnatifid, the blade 15–25 cm. long, the segments ovate-lanceolate to lanceolate, 5–10 cm. long, decurrent at base, entire or with a few teeth, glaucous beneath; petioles 10–15 cm. long: fls. usually several, cup-shaped, 5–6 cm. across; petals 5–9, suborbicular to broad-elliptic, of firm texture; carpels included only at base by the disk, glabrous: follicles 2–2.5 cm. long. Fl.vi; fr.ix. G.C.68:93,97,98(fl,h). W. China. Intr. about 1908?—*P. D. angustiloba* Rehd. & Wils., var. Lvs. more finely divided, with narrow-lanceolate or linear-lanceolate segments 5–10 mm. broad: petals broad-elliptic. G.C.53:403. W. China. Intr. 1908. Zone V. The var. is a low shrub with much divided attractive lvs., but the fls. are not showy.

3. *P. lutea* Franch. Subshrub to 1 m., glabrous: lvs. very similar to those of the preceding species: fls. usually solitary, 5–10 cm. across, golden-yellow; outer sepals leaf-like, the inner ones orbicular and yellowish green; petals 6–8, elliptic to obovate, concave, the outer ones irregularly crenate; anthers yellow; carpels 3, glabrous, inclosed only at base by the disk. Fl.vi; fr.ix. B.M.7788(c). R.H.1906:14,t(c). Gn.76:416. (*P. Delavayi* var. *l.* Fin. & Gagnep.) China. Intr. 1886. Zone VI? Particularly valuable on account of the yellow color of its fls.—*P. l. superba* Lemoine. Lvs. bronzy red while young: fls. 8–12 cm. across, with 9–11 petals; filaments dark red. R.H.1906:14,t(c). G.C.44:50,t(c). Intr. 1886.

*P. l. × suffruticosa* = *P. Lemoinei* Rehd. In habit and lvs. similar to *P. suffruticosa*; the form first raised is "L'Esperance" with single flowers, about 20 cm. across; petals 8–10, soft yellow, tinged red and buff particularly toward the base; filaments red, anthers yellow. "La Lorraine" is similar, but double. G.C.57:56,t(c).

2. **XANTHORHIZA** Marsh. **YELLOW-ROOT.** Deciduous low shrub; bark and root yellow and bitter; buds with few outer scales: lvs. alternate, clustered, long-stalked, pinnate or bipinnate: fls. polygamous, brownish purple, in terminal pendulous compound racemes; sepals 5; 5 small 2-lobed nectaries, sometimes called petals; stamens 5–10; carpels 10, 2-ovuled, developing into 1-seeded follicles. (Greek *xanthos*, yellow, and *rhiza*, root.) Syn.: *Zanthorrhiza* L'Hérit. One species in N. Am.

*X. simplicissima* Marsh. Stems sparingly branched, to 0.6 m.: lfts. usually 5, ovate to ovate-oblong, 3–7 cm. long, incisely toothed, sometimes ternate;

racemes 5-10 cm. long; fls. 4 mm. across; sepals ovate, acute. Fl. iv-v. B.M. 1736(c). G.O.t.129(c). S.L.389(h). (*Z. apiifolia* L'Hérit.) N. Y. to Ky. and Fla. Intr. 1776. Zone IV. Suited for borders of shrubberies.

**3. CLÈMATIS L. VIRGIN'S BOWER.** Perennial herbaceous, or suffrutescent or woody plants, often climbing; winter-buds with several pairs of outer scales: lvs. opposite, usually compound,<sup>1</sup> often ending in tendrils, rarely simple: fls. solitary or in panicles or cymes, perfect, rarely dioecious, apetalous; sepals usually 4, rarely 5-8, valvate in bud, rarely imbricate, petaloid; petaloid staminodes sometimes present; stamens numerous; carpels many, developing into 1-seeded achenes with a persistent, usually long and plumose style. (Greek name of a slender vine.) Including *Viorna* Reichenb., *Viticella* Dill. and *Atragene* L. About 230 species, widely distributed through the temp. regions chiefly of the n. hemisphere.

- A. Sepals more or less upright forming a tubular, urceolate or campanulate fl.; stamens appressed, usually pubescent; fls. usually blue, violet, purple or red, rarely yellowish or whitish.
- B. Fls. without petaloid staminodes.
  - C. Lfts. or lvs. entire, sometimes lobed; fls. solitary; stamens, including the connective, densely pubescent.
  - D. Lvs. simple, sessile.....1. *C. integrifolia*
  - DD. Lvs. pinnate, or partly simple and often lobed.
  - E. Style of fr. glabrous or silky.
  - F. Lfts. not reticulate, the terminal one usually present.....2. *C. crispa*
  - FF. Lfts. reticulate beneath, the terminal one usually replaced by a tendril.
    - 3. *C. Pitcheri*
- EE. Style of fr. plumose.
  - F. Pedicels much longer than the sepals.
    - G. Sepals pubescent outside.
      - H. Lfts. reticulate, subcoriaceous.....4. *C. reticulata*
      - HH. Lfts. indistinctly veined, membranous.....5. *C. Viorna*
    - GG. Sepals glabrous outside.
      - H. Fls. purplish .....6. *C. divaricata*
      - HH. Fls. scarlet .....7. *C. texensis*
  - FF. Pedicels shorter than sepals; fls. axillary.....8. *C. fusca*
- CC. Lfts. or lvs. serrate or toothed: stamens pubescent or glabrous.
  - D. Lvs. compound: fls. on the young growth.
    - E. Lvs. ternate: fls. in axillary clusters: upright or sarmentose subshrubs.
      - F. Fls. campanulate, purple to pale rose, 1 or few, axillary; filaments with long hairs .....9. *C. ranunculoides*
    - FF. Fls. tubular, blue to bluish white, in axillary clusters; filaments sparingly pubescent with short hairs or glabrous.....10. *C. heracleifolia*
  - EE. Lvs. pinnate or bipinnate: stamens pubescent.
    - F. Fls. in axillary long-stalked panicles, yellowish.
      - G. Sepals pubescent inside: lvs. glabrous.....11. *C. connata*
      - GG. Sepals glabrous inside: lvs. silky beneath.....12. *C. Rehderiana*
    - FF. Fls. 1-3 in the axils.
      - G. Sepals glabrous outside, tinged violet-purple: lfts. serrate.....13. *C. lasiantha*
      - GG. Sepals slightly pubescent outside, whitish: lfts. small, deeply lobed or dissected .....14. *C. aethusifolia*
  - DD. Lvs. simple: fls. axillary on last year's brs.: stamens glabrous.....15. *C. cirrhosa*
- BB. Fls. with petaloid staminodes, solitary; stamens densely pubescent.
  - C. Lvs. ternate .....16. *C. verticillaris*
  - CC. Lvs. biternate .....17. *C. alpina*
- AA. Sepals spreading (somewhat campanulate in Nos. 40-43); stamens divergent.
  - B. Stamens glabrous (or only with few hairs below the anther or near base; hairy in No. 31).
    - C. Fls. solitary or in fascicles from axillary buds on last year's brs.
    - D. Lfts. or lvs. entire or occasionally lobed: fls. solitary, blue, violet, red or white.
      - E. Style glabrous; sepals obovate, usually 4.
        - F. Fls. 2-5 cm. across; filaments shorter than anthers: lvs. bipinnate.
          - 18. *C. Viticella*
      - FF. Fls. 8-14 cm. across: lvs. pinnate.....19. *C. Jackmani*
    - EE. Style pubescent; sepals 6 or more, elliptic or ovate, large; filaments as long or longer than anthers.
      - F. Pedicels longer than sepals: lvs. glabrous or slightly pubescent beneath.
        - G. Style of fr. silky; fl.-stalk with 2 bracts.....20. *C. florida*
        - GG. Style of fr. plumose; fl.-stalk without bracts.....21. *C. patens*

<sup>1</sup> The term flammuliform has been used in this genus for pinnate lvs. with all or part of the lfts. 3-foliate, and biflammuliform, if the lvs. are bipinnate.

- FF. Pedicels shorter than sepals: lvs. woolly beneath, simple or ternate.  
 22. *C. lanuginosa*
- DD. Lfts. serrate: fls. white or rarely pink, fascicled, from the axils of last year's brs. (sometimes on the young growth in No. 24).  
 E. Lvs. ternate.  
 F. Lvs. glabrous or sparingly pubescent.....23. *C. montana*  
 FF. Lvs. silky beneath: fls. sometimes on the young growth.....24. *C. chrysocoma*  
 EE. Lvs. pinnate; lfts. about 1.5 cm. long.....25. *C. gracilifolia*
- CC. Fls. in axillary or terminal panicles, rarely reduced to 3-fld. cymes, sometimes solitary in No. 33, on the young growth except in No. 26; sepals white, rarely pinkish (bluish in No. 31).  
 D. Lfts. entire or nearly so or occasionally 3-lobed.  
 E. Lvs. 3-foliolate; lfts. always entire.  
 F. Fls. from scaly buds on last year's brs.: lfts. ovate, coriaceous.  
 26. *C. Armandi*  
 FF. Fls. from the young growth: lfts. lanceolate, subcoriaceous.....27. *C. Finetiana*  
 EE. Lvs. pinnate or bipinnate.  
 F. Lfts. 7-11, 8-20 mm. long, silvery white beneath: upright shrub.  
 28. *C. Delavay*
- FF. Lfts. 3-7, larger, green beneath.  
 G. Fls. white: woody climbers.  
 H. Lvs. usually pinnate; lfts. 3-10 cm. long; achenes narrowed at base.  
 29. *C. paniculata*  
 HH. Lvs. usually bipinnate; lfts. 1.5-4 cm. long; achenes rounded at base.  
 30. *C. Flammula*  
 GG. Fls. bluish: upright or sarmentose subshrub.....31. *C. aromatica*
- DD. Lfts. or lvs. serrate or dentate, only occasionally nearly entire.  
 E. Lvs. simple, serrate to pinnatifid: habit upright.....32. *C. songarica*  
 EE. Lvs. compound: habit climbing (except in No. 33).  
 F. Lvs. ternate or biternate.  
 G. Fls. perfect: lfts. ovate to ovate-lanceolate, sparingly incised-dentate.  
 34. *C. aptifolia*  
 GG. Fls. dioecious: lfts. usually ovate, coarsely dentate.....35. *C. virginiana*
- FF. Lvs. pinnate or bipinnate.  
 G. Fls. white: high climbing shrubs.  
 H. Fls. 1-3, axillary: lvs. bipinnate.....33. *C. Fargesii*  
 HH. Fls. in panicles or cymes: lvs. pinnate.  
 I. Sepals pubescent inside: lfts. glabrous or nearly so.  
 J. Fls. dioecious: lfts. firm, usually 1-2.5 cm. broad.  
 36. *C. ligusticifolia*  
 JJ. Fls. perfect: lfts. thin, usually 3-4.5 cm. broad.....37. *C. Vitalba*  
 II. Sepals glabrous inside: lfts. pubescent beneath.....39. *C. greta*  
 GG. Fls. bluish white: plant subshrubby, to 2 m. tall.....38. *C. Joviniiana*
- BB. Stamens with pubescent filaments; fls. yellow or yellowish: lvs. glabrous.  
 C. Lfts. usually entire or lobed, bluish or grayish green: fls. 2-4 cm. across, usually several.  
 D. Sepals pubescent inside: lfts. often oblong or lanceolate.....40. *C. orientalis*  
 DD. Sepals glabrous inside: lfts. usually ovate or oval.....41. *C. glauca*  
 CC. Lfts. serrate: fls. 5-8 cm. across, usually solitary, long-stalked.  
 D. Lvs. pinnate or bipinnate; lfts. dentate with spreading teeth.....42. *C. tangutica*  
 DD. Lvs. biternate; lfts. serrate with the teeth pointing forward....43. *C. serratifolia*

Sect. I. VIORNA Reichenb. Sepals more or less upright, with narrow margin or broad only above the middle; stamens upright, usually pubescent.

Ser. 1. CRISPAE Prantl. Lvs. or lfts. entire: fls. solitary, sometimes 2 or 3; stamens pubescent including the connective.

1. *C. integrifolia* L. Herbaceous or subshrubby, upright, to 1 m.: lvs. sessile, ovate to oblong-ovate, 6-10 cm. long, acute, entire, slightly pubescent beneath or nearly glabrous, green on both sides, thin: fls. terminal, solitary, slender-stalked, 3-4 cm. long, violet or blue to white; sepals above the middle with broad margin and spreading, glabrous outside: frs. with plumose style. Fl.vi-vii. B.M.65(c). R.I.4:t.60,f.4663(c). Fl.vi-viii. S. E. Eu. to W. Asia and Altai. Cult. 1573. Zone V.

*C. i.* × *Viorna*; see No. 6.—*C. i.* × *Jackmani*; see under No. 19.—*C. i.* × *Viticella*; see under No. 18.—*C. i.* × *Fammula*; see No. 31.

Related species: *C. ochroleuca* Ait. Slightly woody at base, about 0.5 m. high: lvs. ovate to oblong-ovate, obtuse, reticulate, glabrous or pubescent beneath: fls. 2-2.5 cm. long, yellowish white, sometimes flushed purple; sepals thick, silky outside, without broad margin: style of frs. with yellowish brown hairs. L.B.7:661(c). T.N.1:t.1(c). (*Viorna o. Small*, *C. ovata* Pursh.) Fl.v-vi; fr. vii-xi. N. Y. to Ga. Cult. 1767. Zone V.—*C. albicoma* Wherry. Stems branched;

brts. with small lvs.: fls. about 2.5 cm. long, purple outside: achenes oblique; style with whitish hairs. Va. to W. Va. Cult. 1928? Zone V.

2. *C. crispa* L. Shrubby climber, to 3 m. high: lfts. 3-7, ovate to ovate-lanceolate, 4-8 cm. long, sometimes lobed or ternate, thin, glabrous: fls. solitary, long-stalked, nodding, bell-shaped, 2-4 cm. long, fragrant, bluish purple; sepals tubulose below, above the middle with a broad wavy margin and spreading, glabrous or nearly so outside: achenes with silky, not plumose styles. Fl.vi-ix. B.M.1160,1816,1860,1892(c). I.H.t.2:t.78(c, as *C. campaniflora*). Gn.34:147,t(c). (*Viorna* c. Small, *C. cylindrica* Sims, *C. Simsii* Sweet.) Va. to Fla. and Tex. Intr. 1726. Zone V. A slender vine with large and handsome fragrant fls.

*C. c. × tewensis*; see under No. 7.

3. *C. Pitcheri* Torr. & Gr. High climbing vine; brts. pubescent: lfts. 3-6 or 7, usually ovate, 3-7 cm. long, entire or deeply 2-3-lobed, occasionally ternate, acute or obtusish and mucronulate, reticulate and somewhat pubescent beneath, the terminal one often changed into a tendril: fls. solitary, long-stalked, urn-shaped, 2-2.5 cm. long, purplish; sepals with recurved and margined tip, pubescent outside: achenes with glabrous or silky styles. Fl.vi-ix. B.M.1816(c, as *C. cordata*). Lavallée, Clemat. t.15. (*C. Simsii* of auth., not Sweet, *Viorna* S. Small.) S. Ind. to Neb. and Tex. Intr. before 1810. Zone V. Not showy and like the preceding lacking the feathery frs., an ornamental feature of most species.—*C. P. Sargénti* (Lav.) Rehd., var. Fls. smaller and paler: lfts. rarely lobed. Lavallée, Clemat. t.18. (*C. S. Lav.*)

*C. P. × tewensis*; see under No. 7.

4. *C. reticulata* Walt. Woody vine to 3 m. high or more: lfts. 3-7, broad-ovate or elliptic to ovate-lanceolate, 3-7 cm. long, obtuse or acute, strongly reticulate and glabrous or pubescent beneath, subcoriaceous: fls. nodding, urn-shaped, about 2 cm. long; sepals with recurved tips, dull yellowish and grayish pubescent outside, pale violet inside: achenes with long plumose styles. Fl.vii. B.M.6574(c). Lavallée, Clemat. t.16. (*Viorna r.* Small.) S. C. to Tex. and Fla. Intr. before 1884. Zone VI?

Related species: *C. versicolor* Small. Lfts. 4-6, oblong or ovate-oblong, entire, glabrous, reticulate, glaucous beneath: fls. glabrous outside, purple. B.B.2:124. Mo. to Ark. Intr. ? Zone V.

5. *C. Viorna* L. Slender woody vine to 3 m.: lfts. 5-7, ovate to ovate-oblong, 3-8 cm. long, obtuse or acute, cuneate to subcordate at base, entire or lobed and sometimes 3-foliate, glabrous or nearly so, deep green: fls. nodding, urn-shaped, 2.5-3 cm. long, dull reddish purple; sepals thick, pubescent outside, with recurved tips: achenes with brownish plumose styles. Fl. v-viii. Lavallée, Clemat. t.17. Gn.54:240. (*Viorna* V. Small.) Pa. and Ohio to Ga. and Ala. Intr. 1730. Zone V.

Related species: *C. Addisonii* Brit. Glabrous and glaucous subshrub to 1 m.: lower lvs. simple, ovate or orbicular-ovate, 5-10 cm. long, obtuse, 2-4-lobed, upper mostly pinnate, tendril-bearing: fls. urn-shaped, purplish 1.5-2 cm. long, glabrous: plumose styles yellow. B.B.2:123. (*Viorna* A. Small.) Va. to N. C. and Tenn. Cult. 1902. Zone V.

6. *× C. divaricata* Jacq. (?*C. integrifolia* *× Viorna*.) Upright bushy subshrubby plant: lvs. pinnate, or simple and deeply and irregularly lobed; lfts. 3-7, sessile and often decurrent, acute or obtusish, glabrous or nearly so beneath: fls. nodding, rather short-stalked, campanulate, about 2.5 cm. long, purplish; sepals spreading and margined above the middle, pubescent or glabrous outside: styles plumose. Fl.vi-vii. Jacquin, Eclog. Pl. Rar. t.13(c). G.W.14:562(h),563. (*C. integrifolia pinnata* Hort.) Orig. before 1805. Zone V.

Related species: *C. troutbeckiana* Spingarn. Lower lvs. elliptic to ovate, 7–10 cm. long, obtuse or refuse at apex, glaucescent beneath, upper lvs. pinnate: bracts of middle peduncle slender-stalked, of lateral subsessile; sepals lavender or pale pinkish purple outside, at the tip and inside pale green. N.H.13:89. Orig. unknown, probably hybrid. Cult. 1932. Zone V.

7. *C. texensis* Buckl. Suffrutescent vine to 2 m.: lfts. 4–8, the terminal one usually replaced by a tendril, broad-ovate, 3–8 cm. long, usually obtuse, subcordate at base, sometimes lobed, glaucous, subcoriaceous: fls. solitary, slender-stalked, urn-shaped, much narrowed at the mouth, 2–3 cm. long, carmine or scarlet; sepals thick, glabrous outside, with slightly spreading tips: achenes with long plumose styles. Fl.vii–ix. B.M.6594(c). Ad.21:675(c). Gt.32:86,t.(c). Gn.19:284,t.(c). R.H.1888:348,t.(c). (*C. coccinea* Engelm., *Viorna c.* Small.) Tex. Intr. before 1878. Zone IV. Handsome vine with bright scarlet fls.—*C. t. major* (Bean) Rehd., var. Fls. to 3.5 cm. long. (*C. coccinea* var. *m.* Bean.)

*C. t.* × *Jackmani* = *C. pseudococcinea* Schneid.: here belongs “Countess of Onslow” (G.C.III.16:9. Gn.52:304,t.fl(c);57:376[h]), “Duchess of York” (Gn.52:304,t.f.2[c]) and “Duchess of Albany” (Gn.52:304,t.f.3[c]).—There are also hybrids with *C. crispata* (see Gn.49:189. M.G.13:500) and with *C. Pitcheri* = *C. Moréllii* Rehd. (see R.H.1893:376,t[c]).

8. *C. fúscata* Turcz. Suffrutescent vine to 4 m.: young brts. pubescent: lfts. 5–7, the terminal one often wanting, ovate to ovate-oblong, 3–6 cm. long, acute, rounded or subcordate at base, glabrous or pubescent beneath: fls. nodding on villous pedicels shorter or as long as the sepals, urn-shaped, 2–2.5 cm. long; sepals thick, with recurved tips, densely brownish pubescent outside, violet inside: achenes with fulvous plumose styles. Fl.vi–viii. Lavallée, Clemat. t.20. N. E. Asia. Intr. about 1860. Zone IV. Interesting and hardy, but not particularly showy.—*C. f. violácea* Maxim., var. Fls. slightly pubescent and violet outside. Gt.13:t.455(c). Manch. Intr. about 1860.

Into this group probably belongs *C. Práttii* Hemsl. Woody vine to 3 m., glabrous: lfts. 3, ovate-oblong, 2–3.5 cm. long, entire, glaucous beneath: fls. solitary, axillary, slender-stalked, tubular, 2 cm. long, bright yellow; styles plumose. W. China. Intr. 1908. Zone VI? Very distinct and graceful vine.

Ser. 2. TUBULOSAE Decne. Upright herbs often woody at base: lvs. ternate; fls. serrate: fls. tubular, in axillary fascicles or in spikes, white to blue; filaments pilose, sometimes glabrous or nearly so.

9. *C. ranunculoides* Franch. Upright herb or sarmentose subshrub to 2 m.; stem pubescent or glabrous: lvs. 3-foliate or 3-parted or partly pinnate; lfts. ovate or broad-ovate to elliptic-oblong, short-stalked or subsessile, 2–7 cm. long, 1–3 cm. broad, acute or acuminate, coarsely or incisedly serrate, sometimes nearly entire, sparingly hairy to nearly glabrous; fls. purple to pale rose, axillary, solitary or several, nodding, on pubescent short or slender pedicels; sepals elliptic-oblong, 10–15 mm. long, recurved, with 3 prominent ribs or narrow wings and tomentulose on back; filaments silky-plumose, 1 cm. long; anthers 2–3 mm. long; achenes short-pubescent. Fls.ix–xi. B.M.9329(c). N.F.2:f.42(h). W. China. Intr. 1906. Zone VII? Very distinct, valuable for its late purple fls.

10. *C. heracleifolia* DC. Upright plant, woody at base, to 1 m.: lfts. 3, broad-ovate, 6–15 cm. long, truncate or broad-cuneate at base, coarsely dentate and often slightly lobed, with mucronate teeth, slightly pubescent: fls. polygamous, in axillary clusters, tubular, 2–2.5 cm. long, blue and pubescent outside; sepals reflexed at apex; filament about as long as anther: achenes with plumose style. Fl.viii–ix. B.M.4269(c),6801(c). F.S.3:t.195(c). (*C. tubulosa* Turcz.) E. China. Intr. 1837. Zone IV. A rather coarse plant with stout stems and clustered blue fls. in size and shape similar to hyacinths; var.

*Davidiana* is the more showy.—*C. h. Davidiana* (Decne.) Hemsl., var. Slenderer and taller: lfts. usually cuneate: fls. dioecious, indigo-blue, fragrant; the sepals tubular only at base, spreading above, not curling back. R.H.1867: 90(c). Gn.49:99;68:273. (*C. D.* Decne.) N. China. Intr. 1868.—*C. h. ichangensis* Rehd. & Wils., var. Lfts. usually rounded at base, sparingly pubescent above, more densely beneath: fls. densely silky outside; sepals curled back at apex, deep blue inside: achenes densely villous. C. and N. China. Intr. 1908.

*C. h.* × *Vitalba*; see No. 38.

The closely related *C. stans* Sieb. & Zucc. with whitish or bluish white flowers from Japan is scarcely woody. B.M.6810(c).

Ser. 3. *CONNATAE* Koehne. Shrubby climbers: lvs. pinnate or bipinnate; lfts. serrate: fls. in axillary panicles, rarely 1-3, campanulate, usually whitish or yellowish; sepals not or only at the tips recurved; filaments pubescent.

11. *C. connata* DC. Climber to 8 m.; brts. glabrous or nearly so: lvs. pinnate; lfts. 3-7, ovate to ovate-oblong, 5-12 cm. long, long-acuminate, cordate at base, coarsely, but rather regularly toothed with rounded mucronulate teeth, not or slightly lobed on one side, rarely 3-lobed, glabrous or slightly pubescent; petioles enlarged at base and surrounding the stem: fls. in slender-stalked panicles 8-12 cm. long and with large leafy bracts, nodding, campanulate, 2-2.5 cm. long, pale yellow; sepals pubescent on both sides, recurved at apex; filaments and connective pubescent: achenes with long plumose styles. Fl.viii-x. Himal., S. W. China. Cult. 1887. Zone VI?

Closely related species: *C. trullifera* Finet & Gagnep. Lfts. 7-9, ovate, 4-10 cm. long, cordate or rounded at base, coarsely and incisely serrate, often 3-lobed, glabrous or nearly so; petioles much enlarged at base and united, forming a flat or cup-like expansion 1-2.5 cm. wide, bloomy: fls. in rather short-peduncled panicles with small subulate bracts; filaments and connective densely pubescent. W. China. Intr. 1903. Zone VI?

12. *C. Rehderiana* Craib. Climber to 8 m.; brts. pubescent: lvs. pinnate; lfts. 7-9, broad-ovate, 4-8 cm. long, acuminate, usually cordate at base, coarsely or incisely toothed, usually 3-lobed, sparingly appressed-pubescent above, more or less silky beneath and conspicuously veined: fls. nodding, fragrant, campanulate, about 1.5 cm. long, pale yellow or yellowish white, in many-fld. short panicles on upright stalks 8-12 cm. long; bracts at base of the panicle ovate to lanceolate, 1-2 cm. long, often 3-lobed; sepals narrow-oblong, downy outside, glabrous within; filaments pubescent: achenes with plumose styles. Fl.viii-x. G.C.48:310;89:289,t(h). Gn.82:363;96:336. J.L. 64:f.37. R.H.1905:438 (as *C. Buchananiana vitifolia*). (*C. nutans* var. *thyrsoides* Rehd. & Wils., *C. nutans* Bean, not Royle.) W. China. Intr. 1898. Zone VI? Vigorous climber with rather large lvs. and fragrant late fls.

Closely related species: *C. Veitchiana* Craib. Differing chiefly in the bipinnate more finely divided lvs.; pinnae 7-9, mostly 3-foliolate or 3-lobed; lfts. ovate to ovate-lanceolate, less pubescent. W. China. Intr. 1904. Zone VI.—*C. Buchananiana* DC. Lfts. usually 5, rarely 3 or 7, coarsely toothed, rarely slightly 3-lobed: fls. 2-3 cm. long; sepals ribbed and tomentose outside, pubescent inside. Himal. Intr. ?

13. *C. lasiandra* Maxim. Climber to 4 m.; young growth viscid: lvs. bipinnate; pinnae 3-7, mostly 3-foliolate or 3-lobed, only the upper ones often simple; lfts. ovate to ovate-lanceolate, 3-8 cm. long, long-acuminate, sharply serrate, glabrous or sparingly pubescent, bright green; petioles enlarged at base and connate: fls. axillary, 1-3, on slender stalks 3-7 cm. long, campanulate, 1.5-2 cm. long, whitish and more or less suffused with dull violet; sepals with recurved tips, glabrous or nearly so outside; stamens about as long as sepals, densely pubescent: achenes with plumose styles. Fl.viii-x.

C. and W. China. Intr. 1900. Zone V. Graceful vine with late rather dull colored and small fls.

Related species: *C. acutangula* Hook f. & Thoms. Large woody climber; stems sharply angled: lvs. bipinnate; pinnae 5-7, the lower ones 3-foliolate: lfts. ovate to ovate-lanceolate, 3-7 cm. long, coarsely toothed and often 3-lobed: fls. in axillary, short-stalked cymes on slender pedicels; sepals slightly pubescent outside and each with 3 longitudinal membranous wings on back. Fl.ix-x. Himal., W. China. Intr. about 1906. Zone VII?

14. *C. aethusifolia* Turcz. Slender woody climber to 2 m.: lvs. pinnate or bipinnate; pinnae 5-9, the lower ones usually pinnate; lfts. small, 5-15 mm. long, deeply dissected into obovate-oblong or linear-oblong, acute or obtusish lobes, bright green, glabrous: fls. 1-3 on axillary slender stalks with a leaf-like bract above the middle, campanulate, about 1.5 cm. long, pale yellow; sepals narrow-oblong, not or little reflexed at apex, minutely pubescent outside: achenes with long plumose styles. Fl.viii-ix. S.H.1:f.186b<sup>1</sup>(l). N. China, Manch. Intr. 1910. Zone V. Much-branched vine with graceful foliage, flowering profusely in fall.—*C. a. latisecta* Maxim., var. Lvs. usually simple pinnate; lfts. to 3.5 cm. long, often 3-fid or deeply lobed and toothed with broad, ovate or obovate lobes. B.M.6542(c). Gt.10:t.342. R.H.1869:10. Gn.45:241. Manch. Intr. 1855. Zone IV.

Ser. 4. *CIRRHOSE* Prantl. Woody climbers: lvs. simple or ternate, serrate: fls. from axillary buds on last year's brs., nodding, campanulate, with an involucre below the sepals; stamens glabrous.

15. *C. cirrhosa* L. Climbing to 3 m., glabrous: lvs. persistent, simple, ovate to ovate-oblong, 2-4 cm. long, obtuse or acute, rounded or subcordate at base, coarsely crenate-serrate, sometimes 3-lobed: fls. 1-2, axillary, broadly campanulate, 3-5 cm. across, yellowish white; sepals broad-elliptic, 2-2.5 cm. long, downy outside; pedicels 1.5-3 cm. long, below the fl. with 2 bracts connate into a cup-shaped involucre: achenes with long plumose styles. Fl.iv-v. B.M.1070(c). L.B.19:t.1806(c). R.H.1924:186,t(c). S. Eu., Asia Minor. Intr. 1596. Zone VII. Desirable on account of its early fls.

Sect. II. *ATRAGENE* (L.) DC. Lvs. ternate to biternate: fls. from axillary buds of last year's brs., solitary, nodding, campanulate, with petaloid staminodes; stamens pubescent.

16. *C. verticillaris* DC. Trailing or climbing to 3 m.: lvs. 3-foliolate; lfts. slender-stalked, ovate to oblong-ovate, 3-8 cm. long, acuminate, rounded or subcordate at base, entire or coarsely toothed, slightly pubescent on the veins beneath: fls. purple or bluish purple, on slender stalks 2-7 cm. long; sepals 4, thin, oblong-lanceolate, 3-4 cm. long, slightly downy outside, strongly veined: staminodes and stamens about half as long as sepals: achenes with long plumose styles. Fl.v-vi. B.M.887(c). B.B.2:126. (*Atragene americana* Sims.) Hudson Bay to B. C., s. to Va. and Utah. Intr. 1797. Zone II? With showy fls. in spring; rare in cult.

Related species: *C. koreana* Komar. Prostrate; lfts. 3, acuminate, 4-8 cm. long, coarsely dentate, the lateral ones ovate, truncate to subcordate at base, sometimes 3-lobed to 3-parted, the terminal one 3-lobed to 3-parted, sparingly pilose on veins beneath and sometimes on the face: fls. dull violet; sepals elliptic to elliptic-lanceolate, 2.5-3.5 cm. long; staminodes spatulate,  $\frac{1}{2}$  to  $\frac{3}{4}$  as long as sepals. Act. Hort. Petrop. 22:t.6. Korea. Cult. 1920. Zone V.—*C. k. lutea* Rehd., f. Fls. yellow. Gs.9:285.—*C. chiisanensis* Nakai. Similar to the preceding: lfts. nearly glabrous: sepals with 3 longitudinal winged keels on back, yellowish. M.I.2:t.107. Korea. Intr. 1917. Zone V.—*C. c. carunculosa* (Gagnep.) Rehd., var. Lfts. hairy above, glabrous beneath: fls. yellow, sometimes flushed red; sepals outside at base with small bract-like appendages forming a kind of involucre. R.H.1915:534. M.O.19. (*C. alpina* var. *c.* Gagnep.) Korea. Intr. 1908. Zone V?

17. *C. alpina* (L.) Mill. Woody climber to 2 m.: lvs. biternate or occasionally simply ternate: lfts. short-stalked or nearly sessile, ovate to ovate-lanceolate, 2-5 cm. long, acute, coarsely serrate, slightly pubescent beneath: fls. on slender stalks 4-12 cm. long, campanulate, violet-blue; sepals narrow-oblong, 3-4 cm. long, minutely downy outside, staminodes spatulate, about half as long as sepals: achenes with plumose styles. Fl. iv-v. B.M.530(c). R.I.4:t.60, f.4662(c). H.W.3:16. G.W.10:82(h). (*Atragene* a. L.) C. and S. Eu. to N. E. Asia. Intr. 1792. Zone V. With early showy fls.—*C. a. sibirica* (L.) Ktze., var. Fls. yellowish white. B.M.1951(c). L.B.14:1358(c). R.H.1855:321,t.(c). (*C. a. alba* Hort., *Atragene* s. L.) Siberia. Intr. 1753. Zone V.

Closely related species: *C. pseudoalpina* (Ktze.) A. Nels. Lfts. usually more or less lobed and incisely toothed with few large teeth or lobes, glabrous beneath: staminodes narrower and fewer usually with a rudimentary anther at apex. S.H.1:f.186c(l). (*Atragene* p. Rydb., *C. alpina* var. *occidentalis* Gray.) Colo. to N. Mex. and Utah. Intr. 1916. Zone VI.—*C. macropétala* Ledeb. Lfts. incisely toothed and often lobed: fls. violet, 4-5 cm. long; staminodes narrow-lanceolate, acuminate, nearly as long as the sepals, longer than stamens. G.C. 77:254. B.M.9142(c). A.B.1937:45. Gn.86:106(f);88:223(h). N. China, Siber. Intr. 1910. Zone V. Has the largest fls. of any species of this section.

Sect. III. VITICELLA Link. Shrubby climbers: lvs. simple to bipinnate with entire or somewhat lobed lfts.: fls. 1-3, axillary or terminal, large; sepals spreading, 4-8, with broad margin folded in in bud; stamens glabrous or with a few hairs below the anthers.

18. *C. Vitiçella* L. Slender woody climber to 4 m.: lvs. usually bipinnate, sometimes pinnate; pinnae 5-7, the lower ones usually 3-foliolate; lfts. ovate to ovate-lanceolate, 1.5-5 cm. long, usually obtuse, rounded at base, sometimes elliptic and acute at ends, entire to 3-lobed, glabrous or nearly so: fls. 1-3, slender-stalked, 3-5 cm. across, purple, rosy-purple or violet; sepals 4, spreading, obovate; filaments as long or shorter than anthers, usually with a few hairs below the anther: achenes large, nearly glabrous except at apex; style short, glabrous. Fl. vi-viii. B.M.565(c), R.I.4:t.65(c). H.W.3:15. Laval-lée, Clemat. t.7. S. Eu. to W. Asia. Cult. 1597. Zone IV. Graceful woody climber flowering profusely in summer.—*C. V. albiflora* Ktze., f. Fls. white (*C. V. alba* Hort., not Carr.)—*C. V. purpurea* Loud., var. Fls. reddish purple. (*C. V.* var. *rubra* Bean.)—*C. V. kermesina* Lem. Fls. bright wine-red.—*C. V. coerulea* Loud., var. Fls. blue-violet.—*C. V. multiplex* G. Don., var. Fls. double, violet-blue. (*C. V. fl. pleno* Hort., var. *pulchella* Jaeg.)—*C. V. nana* Carr. Dwarf form about 1 m. high, bushy.

Several hybrids of this species are known of which *C. V.* × *lanuginosa* = *C. Jackmani* (see No. 19) is the most important. Other hybrids are the following: *C. V.* × *integrifolia* = *C. eriostemon* Decne. Sarmentose subshrub, to 3 m.; upper lvs. often simple, lower ones pinnate, the lowest pair of pinnae usually short-stalked; lfts. similar to those of *C. Vitiçella*: fls. slender-stalked, broad-campanulate, 4-6 cm. across, blue; filaments pubescent except at base: achenes slightly downy; style plumose below the middle, glabrous above. R.H.1852:341, t.(c);1856:341(c, as *C. divaricata*). M.O.23. Lavallée, Clemat.t.10,12. (*C. Hendersonii* Hort., *C. Chandleri* Hort., *C. Bergeronii* Hort., *C. intermedia* Hort.) Origin. about 1830.—*C. V.* × *florida* = *C. venosa* (Carr.) Schneid. Climbing shrub, similar to *C. Vitiçella*: lvs. bipinnate; lfts. ovate, acute, sparingly hairy beneath: fls. large, with 4-6 purple obovate sepals; styles glabrous. F.S.13:t.1364(c). R.H.1860:183(c). (*C. Vitiçella* v. Carr., *C. florida* var. v. Lav.) Orig. before 1860.—*C. V.* × *patens* = *C. Guascoi* Lem. Woody climber; young brts. pubescent: lfts. usually 5, nearly glabrous: fls. solitary, about 8 cm. across, violet-purple, with 4-6 obovate sepals, strongly 3-nerved, tomentose outside; style pubescent. I.H.4:t.117(c). B.H.7:226,t(c). Lavallée, Clemat. t.7bis. (*C. francfurtensis* Lav.) Orig. before 1857.—*C. V.* × *Flammula*; see under No. 30.

Closely related species: *C. campaniflora* Brot. Woody climber to 6 m.; lvs. bipinnate; pinnae 5-9: lfts. ovate to ovate-lanceolate, 2-6 cm. long, acute, entire or sometimes lobed: fls. nodding on pubescent stalks 3-7 cm. long, broad-

campanulate, 1.5-2.5 cm. across, white, tinged with violet; filaments broad, shorter than anthers, with a few hairs below the anthers: achenes with short appressed-pubescent style. Fl.vii-viii. L.B.10:987(c). Gn.31:187,t.(c). Lavallée, Clemat. t.8. Portugal. Intr. 1810. Zone VI.

19. *C. Jackmáni* Th. Moore (*C. lanuginosa* × *Viticella*). Woody climber to 3 m.: lvs. pinnate, the upper ones often simple; lfts. ovate, rather large, usually slightly pubescent beneath: fls. usually 3, slender-stalked, 10-14 cm. across, usually violet-purple; sepals usually 4, sometimes 6, obovate; filaments often shorter than anthers, sometimes pubescent below the anther; styles glabrous or sometimes plumose up to the middle. Fl.vii-x. I.H.11:t. 414(c). F.S.16:t.1629(c). R.H.1868:390(c). Gn.71:507(h). (*C. splendida* Simon-Louis.) Orig. about 1860. Zone V or VI. One of the most important groups of large-flowered Clematis of which numerous forms are in cult., one of the best known being "Mme. André" R.H.1893:180,t.c.

*C. J. × integrifolia* = *C. Durandi* Ktze. Suffrutescent climber to 3 m.: lvs. simple, ovate, 8-12 cm. long, acute, broadly cuneate to subcordate at base, nearly glabrous; petioles 2-5 cm. long: fls. slender-stalked, 8-12 cm. across, dark violet-blue; sepals spreading and recurving, usually 4, rarely more, obovate, with wavy margin; stamens yellow: achenes with plumose styles. Fl.vi-ix. Gn. 49:98,t.(c). G.W.17:108,t.f.2(c). (*C. integrifolia* D. Hort., *C. integrifolia sem-perflorans* Hort.) Orig. before 1874.

20. *C. florida* Thunb. Deciduous or half-evergreen woody climber, to 4 m.: lvs. usually biternate, sometimes ternate; lfts. ovate to ovate-lanceolate, 2-5 cm. long, acute, entire or sometimes with 1 or 2 lobes or with a few teeth, dark green above, slightly pubescent or nearly glabrous beneath: fls. axillary, solitary, on slender pubescent stalks 6-12 cm. long, with 2 entire or lobed leafy bracts near the middle, 5-8 cm. across; sepals spreading, 4-6, ovate, acute, creamy-white with a green band on back; stamens purple, glabrous; styles silky or glabrous above. Fl.vi-vii. B.M.834(c). R.H.1856:41,t.(c). Lavallée, Clemat., t.5. G.C.32:51. (*C. japonica* Makino, not Thunb.) *C. China*; cult. in Japan. Intr. 1776. Zone VI?—*C. f. Sieboldii* D. Don, var. Stamens partly changed into purple staminodes. B.R.24:25(c). Gn.22:142,t.(c):87:340(h). R.N.1915:552,t.(c). (*C. f. var. bicolor* Lindl., *C. S. Paxt.*) Intr. 1837.—*C. f. pléna* D. Don, var. Fls. double, the stamens being changed into greenish white sepals shorter than the outer whorl of sepals. Intr. before 1798.

*C. f. × Viticella*; see under No. 18.

21. *C. patens* Morr. Deciduous woody climber to 4 m.: lfts. 3-5, ovate to ovate-lanceolate, 4-10 cm. long, acute or acuminate, usually rounded at base, entire, slightly pubescent beneath: fls. solitary and terminal on axillary brts. with one pair of long-stalked ternate lvs., 10-15 cm. across, white to violet or violet-blue; sepals 6-8, elliptic to oblong-elliptic, narrowed into a claw at base, not or slightly overlapping; style appressed-pubescent near apex, plumose below. Fl.v-vi. B.R.23:1955(c). P.M.4:t.193(c). Lavallée, Clemat. t.2. (*C. coerulea* Lindl.) China, cult. in Japan. Intr. 1836. Zone VI? This and the preceding species represent groups of the large-flowered Clematis valuable for their early flowering habit, while *C. lanuginosa* and *C. Jackmani* bloom in summer and fall.—*C. p. grandiflora* (Hook.) Rehd., var. Fls. larger than in the type. B.M.3983(c). (*C. coerulea* var. *g.* Hook.)—*C. p. Standishii* (Th. Moore) Rehd., var. Lfts. 3, small: fls. 12-14 cm. across; sepals light lilac-blue, of metallic lustre. (*C. florida* var. *S.* Th. Moore.) By some considered *C. florida* × *patens*.—*C. p. Fortunei* (Th. Moore) Rehd., var. Fls. 8-12 cm. across, on a stout stalk with a whorl of simple or ternate long-stalked lvs. below the fl.: sepals very numerous, rather narrow, creamy white becoming pink; style appressed-pubescent above the middle, plumose below. F.S.

15:t.1553(c). G.C.1863:676. (*C. F. Th. Moore, C. florida* var. *F.* (Th. Moore) Davis.) Intr. about 1860.

*C. p.* × *Viticella*; see under No. 18.—*C. p.* × *lanuginosa*; see under No. 22.

22. *C. lanuginosa* Lindl. Woody climber, not more than 2 m. tall: lvs. ternate or simple, ovate to ovate-lanceolate, 6-12 cm. long, acuminate, rounded or subcordate at base, entire, glabrous above, pubescent beneath, of firm texture: fls. terminal, 1-3 on woolly bractless stout stalks usually shorter than the sepals, white to pale lilac, 10-20 cm. across; sepals 6-8, ovate or elliptic, overlapping, woolly outside; styles long-plumose. Fl.vii-ix. F.S.8: t.811(c). I.H.1:t.14(c). G.C.29:23. Lavallée, Clemat. t.1. China. Intr. about 1850. Zone VI.

From this species most of our large-flowered summer-blooming Clematis have been derived and one of the most important groups of hybrids is that classed under *C. l.* × *Viticella* = *C. Jackmani*; see No. 19.—Another important group is *C. l.* × *patens* = *C. Lawsoniana* Moore & Jackman. The typical form is said to be a cross of *C. patens Fortunei* and *C. lanuginosa*. Lvs. usually ternate: fls. large, on long stalks; sepals 6-8, usually elliptic and overlapping, rosy-purple and dark-veined in the typical form; style plumose. Here belong also *C. L. Symesiana* (Anderson-Henry) Rehd., var.; *C. L. Henryi* (Anderson-Henry) Rehd., var. G.M.43:318. B.C.2:795; *C. L. Gablénzii* (Courtin) Rehd., var. (*C. patens* G. Courtin.) G.Z.14:80,t(c), and many other garden forms. This group of hybrids resembles in many respects *C. Jackmani* which, however, may be distinguished by the usually 4 or sometimes 6, obovate or rhombic sepals, by the styles being glabrous above the middle, and by the fls. appearing usually in 3's.

SECT. IV. FLAMMULA DC. Upright herbs to climbing shrubs: lvs. simple to bipinnate: fls. white, pink or yellow sepals valvate, usually with narrow margin; stamens spreading, glabrous or pubescent at base, without nectaries.

Ser 1. MONTANAE Schneid. Woody climbers: lvs. ternate or pinnate, with serrate lfts: fls. rather large, white, sometimes pink, from axillary scaly buds of last year's branches; sepals with broad margin, folded in in bud; stamens glabrous.

23. *C. montana* DC. Woody climber to 8 m.: lfts. 3, short-stalked, ovate to ovate-oblong, 3-10 cm. long, acute, incisely toothed, occasionally entire, glabrous or nearly so: fls. 1-5, fascicled, on slender stalks 5-10 cm. long, white, usually 2.5-5 cm. across; sepals elliptic-oblong, slightly pubescent outside; stamens yellow: achenes glabrous, with plumose styles. Fl.v. R.H. 1856:161,t(c); 1899:529(h). G.C.III,20:589(h). Gn.60:79(h); 75:371(h); 86:111(h). (*C. anemoniflora* D. Don.) Himal., C. and W. China. Intr. 1831. Zone VI. One of the most beautiful of the early Clematides, particularly *C. m. rubens*.—*C. m. grandiflora* Hook., var. Fls. 5-8 cm. across. B.M.4061(c). M.G.17:423(h).—*C. m. rubens* Ktze., f. Lvs. purplish, particularly when unfolding; fls. rosy-red to pinkish, 5-6 cm. across. R.H.1909:35,t(c). Gn.77:84(h); 87:339,632(h). B.S.1:364(h). Intr. 1900.—*C. m. lilacina* Lemoine. Fls. bluish lilac. G.34:345.—*C. m. Wilsonii* Sprague, var. Lfts. ovate, usually rounded at base, puberulous on the veins beneath: fls. 6-8 cm. across, white; sepals obovate-oblong, pubescent outside. Fl.vi-vii. B.M.8365(c). Gn.82:287. M.G.27:26(h).

*C. m.* × *chrysocoma* = *C. vedrariensis* Vilm. Similar to *C. montana*: fls. 5-6 cm. across, mauve-pink or rose-colored; sepals broad-elliptic. G.C.55:393(h); 61:94. (*C. verrierensis* Gard. Chron.) Orig. before 1912.—*C. v. rosea* (Vilm.) Rehd., var. Fls. light rose-colored, 8-10 cm. across. R.H.1922:214,t(c). (*C. Spooneri* var. *rosea* Vilm.) Orig. 1917.

24. *C. chrysocoma* Franch. Upright and shrubby or climbing to 6 m.; young brts., peduncles and leaves on both sides with dense yellow appressed pubescence: lfts. 3, short-stalked, ovate to elliptic or obovate, 2-5 cm. long, acute or obtuse, rounded or broad-cuneate at base, 3-lobed or coarsely

toothed: fls. fascicled, 1-5 from axillary scaly buds, sometimes 3-5 on a peduncle 4-12 cm. long, or terminal and axillary on the young growth, white, tinged pink, 4-5 cm. across; sepals elliptic, densely silky outside, glabrous inside: achenes pubescent with plumose styles. Fl.vi-ix. B.M.8395(c). M.O.21. W. China. Intr. about 1890. Zone VII. The typical form is often shrubby and continues to bloom from the new growth through August and September, while the variety which has larger fls. only blooms from the old wood.—*C. c. sericea* (Franch.) Schneid., var. Fls. 1 or 2 from axillary buds, not on the young growth, 7-9 cm. across, white; sepals broad-obovate. Fl.vi-vii. M.O. 27. (*C. montana* var. s. Franch., *C. Spooneri* Rehd. & Wils.) W. China. Intr. 1909. Zone VII?

*C. c.* × *montana*; see under No. 23.

25. *C. gracilifolia* Rehd. & Wils. Woody climber to 4 m.: lvs. pinnate; lfts. short-stalked or subsessile, 5-7, ovate to oblong-ovate, 1-2 cm. long, acute, rounded to cuneate at base, with few coarse teeth or 3-lobed, sparingly pubescent: fls. 1-4, fascicled, from axillary buds, on slender pubescent stalks 3-5 cm. long, white, 3-4 cm. across; sepals obovate to oblong-obovate, slightly pubescent outside: achenes glabrous with long-plumose styles. Fl.vi. W. China. Intr. 1910. Zone VI. Similar to *C. montana* but slenderer and with smaller more finely divided lvs.

Ser. 2. RECTAE Prantl. Upright herbaceous plants or woody climbers: lvs. simple to bipinnate; lfts. entire or serrate: fls. white, rarely pink, on the young growth in terminal and axillary panicles, rarely in axillary 3-fld. cymes occasionally reduced to 1 fl. or axillary on last year's brs.; sepals with narrow margin, rarely broad above the middle: anthers usually several times longer than broad and longer than the filaments.

26. *C. Armándi* Franch. Evergreen woody climber, to 5 m.: lfts. 3, on twisted stalks 1-3 cm. long, oblong-ovate to lanceolate, 8-12 cm. long, acuminate, rounded or subcordate at base and 3-nerved, entire, quite glabrous, lustrous above, coriaceous: fls. in leafy or leafless panicles from axillary scaly buds, white, 2.5-3.5 cm. across; sepals 4-5, oblong to oblong-obovate: achenes sparingly hairy with long plumose styles. Fl.v. Nouv. Arch. Mus. Paris II:8: t.2. R.H.1913:65. C. and S. China. Cult. 1907. Zone VII. Evergreen climber with showy white fls. in spring.—*C. A. Biondiàna* (Pavol.) Rehd., var. Infl. sessile; fls. 3.5-6.5 cm. across, with 5-6(-7) sepals. B.M.8587(c). G.C.38:30. Gn.87:631. N.H.17:22. (*C. B. Pavol.*) Intr. 1900.

*C. A.* × *Finetiana* = *C. Jeuneiàna* Symons-Jeune. Similar to *C. Armándi*, but infl. larger and looser. G.C.69:135.

Related species: *C. fasciculiflora* Franch. Evergreen climber to 6 m.; lfts. 3, ovate to ovate-oblong, 4-12 cm. long: fls. in dense axillary fascicles on short woolly stalks 1-2 cm. long, creamy-white, densely woolly outside; anthers much shorter than filaments: achenes glabrous. S. W. China. Cult. 1910. Zone VII?

27. *C. Finetiàna* Lévl. & Vant. Subevergreen climber, to 4 m.: glabrous: lfts. 3, on twisted stalks, oblong-ovate to lanceolate, 5-10 cm. long, acuminate, subcordate or rounded at base, 3-nerved, entire, thinly coriaceous: infl. an axillary 3-fld. cyme or a few-fld. raceme with small lanceolate bracts; pedicels 2-4 cm. long: fls. about 3 cm. across; sepals lanceolate, nearly glabrous, white, greenish outside; outer filaments as long or longer than the linear anthers: achenes pilose; style plumose, fulvous. Fl.vi. B.M.8655(c). (*C. Pavoliniana* Pamp.) E. to W. China. Intr. 1908. Zone VII.

*C. F.* × *Armándi*; see under No. 26.

The following more or less closely related species have been intr., but are probably all tender: *C. Meyeniàna* Walp. Lfts. 3, ovate to ovate-oblong, 5-12 cm. long, usually cordate at base, glabrous: fls. 2-2.5 cm. across, in many-fld.

panicles with small subulate bracts: achenes hairy. B.R.599(c). B.M.7897(c). Japan, S. E. China, Indochina. Cult. 1821.—*C. quinquefoliata* Hutchins. Young brts., infl. and lvs. sparingly pubescent: lvs. pinnate, with 5 lanceolate lfts.; cymes 3-9-fld., leafy; filaments several times longer than anthers. V.F.3. (*C. Meyeniana* var. *heterophylla* Gagnep.) C. China. Intr. 1899.—*C. chinensis* Osbeck. Lvs. pinnate; lfts. usually 5, ovate to oblong-lanceolate, 2-6 cm. long, rounded at base, slightly pubescent when young: fls. 1.5-2 cm. across, in many-fld. axillary leafless panicles; filaments partly longer than anthers. Retzius, Observ. 2:t.2. C. China to Indochina. Intr. 1900.—*C. uncinata* Champ. Lvs. bipinnate or sometimes pinnate; pinnae usually 5, the lower ones 3-foliolate: lfts. ovate to ovate-lanceolate, 4-10 cm. long, glabrous, glaucescent beneath: fls. about 2.5 cm. across, white, fragrant, in many-fld. leafless panicles: achenes oblong-lanceolate, glabrous. H.I.1533. (*C. leiocarpa* Oliv.) C. China. Intr. 1901.—A form with emarginate lfts. and leafy infl. is *C. u. retusa* Sprague, f. B.M. 8633(c). Cult. 1915.

28. *C. Delavayi* Franch. Upright shrub to 1.5 m.: lvs. pinnate, 3-10 cm. long; lfts. 7-11, subsessile, ovate to oblong-ovate, 8-20 mm. long, acute, rounded at base, dark green above, densely silky and silvery-white beneath: fls. white, 2-3 cm. across, in terminal 3- to several-fld. cymes, on slender silky pedicels 2-5 cm. long; sepals 4-6, obovate-oblong, rounded at apex, with broad margin, densely silky outside; filaments longer than anthers: achenes pubescent; styles plumose. Fl.vii-viii. M.O.22. W. China. Intr. 1908. Zone VI? Distinct species, resembling more a white-flowered *Potentilla* than a *Clematis*.

29. *C. paniculata* Thunb. Vigorous woody climber to 10 m.: lvs. ternate or pinnate; lfts. 3-5, ovate, 3-10 cm. long, acute, subcordate or rounded at base, entire or sometimes lobed, glabrous: fls. about 3 cm. across, white, fragrant, in many-fld. axillary and terminal panicles; sepals oblong, nearly glabrous outside; filaments longer than the linear-oblong anthers: achenes margined, thinly appressed-pubescent; styles plumose. Fl.ix-x. G.F.3:621; 5:91(h); 9:75,185(h). R.H.1902:86. Gn.57:155. M.G.1898:487-9(h). (*C. recta* var. *p.* Ktze., *C. Flammula robusta* Carr.) Japan. Intr. 1864? Zone V. Desirable fast growing climber with white fragrant fls. profusely produced in fall.—*C. p. dioscoreaeifolia* (Lévl. & Vant.) Rehd., var. Lfts. generally ovate and cordate, usually rounded and mucronate at apex, in the floral region often emarginate, of thickish texture; sepals broader, obovate-oblong to oblong. (*C. d.* Lévl. & Vant.) Korea. Intr. 1911.

Closely related herbaceous species: *C. recta* L. Upright to 1 m.: lfts. 5-7, ovate to lanceolate, rounded or cuneate at base: fls. 2-3 cm. across, in terminal panicles. R.I.4:t.61(c). Middle and S. Eur., N. Asia. Cult. 1597. Zone III?—*C. r. plena* Lemoine. Fls. double. R.H.1860:512.—*C. r. mandshurica* (Rupr.) Maxim., var. Usually decumbent, to 1.5 m.; lfts. usually larger, often subcordate at base, reticulate: fls. 3-4 cm. across, in axillary and terminal panicles; sepals usually 6. R.H.1909:423(h). N. E. Asia. Cult. 1889.—*C. angustifolia* Jacq. Upright to 1 m.: lvs. pinnate to bipinnate; lfts. oblong to narrow-lanceolate, attenuate at base, often deeply divided into narrow lobes, strongly veined: panicle terminal; sepals 6, oval to oblong. R.I.4:t.62(c). L.B.t.918(c). N. Asia. Intr. 1787. Zone III?

30. *C. Flammula* L. Woody climber to 5 m.: lvs. usually bipinnate, sometimes pinnate; pinnae usually 5, the lower ones usually 3-foliolate or 2-3-lobed; lfts. broad-ovate to narrow-lanceolate, 1.5-4 cm. long, acute or sometimes obtuse, usually rounded or cuneate at base, often lobed, but otherwise entire, bright green, glabrous: fls. white, fragrant, 2-3 cm. across, in large many-fld. panicles; stamens white; anthers shorter than filaments: achenes minutely appressed-pubescent; styles plumose. Fl.viii-x. R.I.4:t.63(c). H. W.3:14. Gn.58:319(h); 76:23(h). (*C. Pallasii* J. F. Gmelin.) Mediterr. Reg. to Persia. Cult. 1590. Zone VI. With profuse fragrant white flowers in fall.—

**C. F. rotundifolia** DC., var. Lfts. broader, obtuse. R.I.A:6.62,f.4666(c). (*C. fragrans* Ten.) Mediterr. Reg. Zone VII?

*C. f. × Viticella* = *C. violacea* DC. Climbing shrub to 4 m.: lvs. bipinnate or pinnate; lfts. entire: fls. about 3 cm. across, pale violet, in terminal panicles; sepals often 6; style pubescent. Ann. Soc. Bot. Gand. 1:t.45(c). Orig. before 1840. Zone VI or V?—*C. v. rubro-marginata* (Cripps) Rehd., var. Sepals 4, white, with reddish violet margin. (*C. Flammula rubro-marginata* Cripps, *C. r. Jouin.*) Orig. before 1883.—*C. F. × integrifolia*; see No. 31.

31. *C. aromatica* Lenné & Koch (*C. Flammula × integrifolia*). Upright or sarmentose subshrub to 2 m.: lvs. pinnate; lfts. 3-7, short-stalked, ovate to elliptic, 3-6 cm. long, acute, rounded to broad-cuneate at base, entire, glabrous: fls. 3-4 cm. across, bluish violet, fragrant, on slender stalks about 5 cm. long, in loose terminal cymes; sepals oblong, spreading and reflexed; stamens with a few hairs below the anthers: achenes pubescent; styles plumose. Fl.vii-ix. (*C. coerulea odorata* Hort., *C. daurica* K. Koch, not Patrin.) Lavallée, Clemat. t.9. R.H.1877:15. Orig. before 1850. Zone V.

32. *C. songarica* Bge. Upright shrub to 1.5 m., in cult. often sarmentose and suffruticose: lvs. simple, lanceolate to linear-lanceolate, 3-8 cm. long, acute, attenuate at base, serrate with spreading teeth or occasionally pinatifid near base, sometimes entire, glaucous or grayish green, glabrous; petioles 8-20 mm. long: fls. yellowish white, 2-2.5 cm. across, on slender pedicels 2-4 cm. long, in terminal cymes; anthers very narrow, longer than the filaments: achenes pubescent; styles plumose, glabrous toward the apex. Fl.viii-ix. S.H.1:f.183x-x<sup>4</sup>, 186d. (*C. Gebleriana* Bong.) Siber. to Turkestan. Intr. before 1880. Zone V. Distinct species, but not very ornamental and rarely cult. The var. *integrifolia* Ledeb. with entire lvs. is not in cult.

Closely related species: *C. fruticosa* Turcz. Upright shrub: lvs. narrowly oblong to lanceolate, 2-5 cm. long, entire or incisedly dentate (var. *lobata* Maxim.), green: fls. 1 or 3 on axillary short brts., light yellow, 2.5-5 cm. across; pedicels short or to 5 cm. long; sepals glabrous or pubescent outside: filaments glabrous, linear, longer than the anthers. N. China, Mong. Intr. ? Zone IV?

33. *C. Fargesii* Franch. Woody climber to 6 m.: lvs. bipinnate; pinnae 5-7, the lower ones 3-foliate; lfts. ovate, 2-5 cm. long, acute, usually rounded or truncate at base, irregularly incisely serrate and lobed, sparingly silky-pubescent: fls. 3.5-5 cm. across, pure white, in 3-fld. cymes or solitary, on slender pedicels with the peduncle 7-18 cm. long; sepals usually 6, obovate, rounded and mucronate at apex, outside tinged yellowish and slightly pubescent; anthers shorter than filaments: achenes glabrous; styles plumose. Fl.vi-ix. Gn.89:659(h). W. China. Intr. 1911. Zone V. Handsome vine with large pure white flowers.—*C. F. Souliei* Finet & Gagnep., var. Lfts. usually narrower, sometimes broad-cuneate at base, nearly glabrous: fls. 5-7 cm. across, often solitary. B.M.8702(c). W. China. Intr. 1911.

34. *C. apiifolia* DC. Woody climber to 3 m.: lvs. ternate, or occasionally biterminate; lfts. ovate to ovate-lanceolate, 4-7 cm. long, acuminate, rounded or broad-cuneate at base, coarsely toothed and often lobed, pubescent on the veins beneath or nearly glabrous: fls. dull white, 1.5-2 cm. across, in axillary panicles with the peduncle 5-12 cm. long; anthers oblong: achenes pubescent, 5-8 in small fruiting heads with the rather short plumose styles about 3 cm. across. Fl.ix-x. S.H.1:f.183z-z<sup>4</sup>, 186e. Japan. Intr. about 1863. Zone V. Not as showy as some allied species; valuable for its late fls.—*C. a. obtusidentata* Rehd. & Wils., var. Lfts. broader and larger, coarsely toothed, with large rounded teeth, pubescent beneath: infl. larger. C. China. Intr. 1907.

Closely related species: *C. Pierottii* Miq. Lvs. mostly biterminate; lfts. ovate to ovate-lanceolate: infl. usually cymose, few- to many-fld.; achenes glabrous

except the ciliate margin. G.F.5:139 (as *C. brevicaudata*). Japan. Cult. 1890. Zone V.

Ser. 3. **VITALBAE** Prantl. Similar to the preceding group: woody climbers: lvs. always compound: fls. perfect or dioecious, small, white; anthers elliptic-oblong, not more than twice as long as broad, several times longer than the filaments.

35. *C. virginiana* L. Climbing to 6 m.: lvs. ternate, rarely pinnate with 5 lfts.; lfts. ovate, 5-9 cm. long, acuminate, rounded or subcordate at base, coarsely toothed, nearly glabrous: fls. dioecious, dull white, 2-3 cm. across, in axillary leafy panicles; sepals obovate-oblong to spatulate, pubescent outside; anthers elliptic: achenes pubescent, in large fruiting heads with the plumose heads about 5 cm. across. Fl.viii-ix. B.B.2:122. Gd.W.t.12(c). N.S. to Man., s. to Ga. and Kans. Intr. 1720. Zone IV.—*C. v. missouriensis* (Rydb.) Palmer & Steyer., var. Lfts. usually 5, ovate or broad-ovate, 5-9 cm. long, appressed-pubescent beneath. Neb. to Mo. Intr. ?

36. *C. ligusticifolia* Nutt. Climbing to 6 m.: lvs. pinnate; lfts. 5-7, ovate to lanceolate, 3-7 cm. long, acuminate, truncate to cuneate at base, coarsely toothed and often 3-lobed, sparingly strigose or glabrous, yellowish or bright green, of thickish texture: fls. dioecious, white, about 2 cm. across, in terminal and axillary cymes: achenes densely pubescent, with plumose styles, in large heads. Fl.viii-ix. B.B.2:122. Jour. Intern. Gard. Club, 3:229(h). B. C. and N. D. to N. Mex. and Calif. Cult. 1880. Zone V.

37. *C. Vitalba* L. **TRAVELERS' JOY**. Climbing to 10 m.: lvs. pinnate; lfts. usually 5, the lowest pair occasionally 3-foliolate, ovate to ovate-lanceolate, 3-10 cm. long, acute or acuminate, rounded or subcordate at base, coarsely toothed or sometimes entire, occasionally 3-lobed, slightly pubescent or nearly glabrous, thin: petiolules 1-3 cm. long: fls. about 2 cm. across, white, faintly fragrant, in axillary and terminal panicles; sepals densely pubescent outside: achenes pubescent, with long plumose styles, in large heads. Fl.vii-ix. R.I.4:t.64,f.4667(c). H.W.3:13. M.G.1898:319(h). Eu., N. Afr., Cauc. Long cult. Zone IV. Strong growing vine, profusely blooming in summer.

Related species: *C. Gouriiana* Roxb. Lfts. 5-7, ovate to ovate-oblong, 3-8 cm. long, long-acuminate, usually subcordate at base, often entire, glabrous or pubescent, chartaceous; petiolules 5-10 mm. long: fls. 1.5-2 cm. across. Wight, Icon. t.933-4. (*C. Vitalba* var. *G. Ktze.*) Himal., China. Intr. 1901. Zone VI? —*C. G. Finetii* Rehd. & Wils., var. Lvs. glabrous: achenes glabrous. C. & W. China. Intr. 1907.—*C. brevicaudata* DC. Lvs. bipinnate; pinnae 5-7, the lower 3-foliolate, occasionally only 3-lobed: lfts. ovate to ovate-oblong, 3-7 cm. long, coarsely toothed or sometimes entire, glabrous or pubescent: fls. 1.5-2 cm. across, nearly glabrous outside, on long and slender pedicels in axillary loose cymes; sepals elliptic: achenes in small heads with the rather short plumose styles about 3 cm. across. Manch. to W. China. Has been confused with *C. apifolia* and *C. Pierottii*; doubtful if in cult.

38.  $\times$  *C. Jouiiana* Schneid. (*C. heracleifolia*  $\times$  *Vitalba*). Subshrubby climber, to 3 or 4 m.: lvs. ternate or pinnate; lfts. 3-5, ovate, 5-10 cm. long, acuminate, rounded or truncate at base, coarsely toothed, slightly pubescent: fls. white at first, finally suffused with lilac, 2.5-3 cm. across, in terminal and axillary cymes forming a large terminal panicle; sepals spreading, linear-oblong, pubescent outside; anthers shorter than the filaments. Fls. viii-x. B.S.1:362. S.H.1:280,f.1851-14. Gn.66:365,71:506(h, as *C. grata*). Orig. before 1900. Zone IV. Vigorous climber blooming profusely in fall.

39. *C. grata* Wall. Vigorous climber: young brts. pubescent: lvs. pinnate; lfts. usually 5, the lowest pair sometimes 3-foliolate, broad-ovate, 3-6 cm. long, acute or acuminate, truncate or subcordate at base, coarsely and in-

cisely toothed, pubescent on both sides or glabrous above: fls. white, about 2 cm. across, on pedicels 1-2 cm. long, in terminal and axillary rather dense, pubescent panicles or cymes; sepals oblong, densely pubescent outside, glabrous inside; buds obovoid, obtuse; filaments longer than anthers: achenes pubescent, with long plumose styles. Fl.ix-x. Wallich, Pl. As. Rar. 1,t.98(c). (*C. Vitalba* var. *g.* Ktze.) Himal. Intr. ? Vigorous climber similar to *C. Vitalba*.—*C. g. lobulata* Rehd. & Wils., var. Lfts. with coarser and fewer teeth, often 3-lobed or 3-fid, densely pubescent on both sides. C. and W. China. Intr. 1907. Zone VI?—*C. g. argenticulida* (Lévl. & Vant.) Rehd., var. Lfts. occasionally only 3, larger, 5-9 cm. long, with few large teeth, glabrescent above. (*C. g. var. grandidentata* Rehd. & Wils.) C. and W. China. Intr. 1907.

Ser. 4. ORIENTALES Prantl. Woody climbers: lvs. biternate or pinnate to bipinnate: fls. yellow, solitary or few; filaments pubescent, longer than the linear-oblong anthers; achenes pubescent, with long plumose styles.

40. *C. orientalis* L. Slender woody climber to 6 m.: lvs. pinnate or bipinnate, the lower pinnae usually 3-foliolate, sometimes 5-foliolate, or 3-fid; lfts. ovate to oblong-ovate or lanceolate, 1.5-5 cm. long, lobed or coarsely toothed, glabrous or minutely pubescent: fls. yellow, 3-5 cm. across, solitary or few on slender stalks 4-10 cm. long; sepals elliptic to oblong-elliptic, pointed, spreading and finally somewhat reflexed, pubescent inside and usually outside: achenes pubescent with long plumose styles. Fl.viii-ix. B.M.4495 (c). Lavallée, Clemat. t.21. R.H.1855:321,t(c); 1899:530. Gn.45:240,t(c); 52:501(h). (*C. cruz-flava* Cock., *C. graveolens* Lindl.) Persia to Himal.; escaped in N. Mex. Intr. 1731. Zone VI? Slender climber with glaucescent finely divided lvs. and profuse yellow fls. in fall.

41. *C. glauca* Willd. Slender woody climber, glabrous: lvs. pinnate to bipinnate; lfts. elliptic to lanceolate, 1.5-5 cm. long, 2-3-lobed, otherwise entire, very glaucous: fls. yellow, 3.5-5 cm. across, solitary or few on slender pedicels 3-8 cm. long; sepals elliptic to elliptic-oblong, pointed, glabrous on both sides, open-campanulate at first, finally spreading, not recurving: achenes pubescent, with long plumose styles. Fl.viii-ix. Willdenow, Berl. Baumz. t.4,f.1. R.H.1890:561. (*C. orientalis* var. *g.* Maxim.) W. China to Siber. Cult. 1752. Zone V. Similar to *C. orientalis*, but hardier.—*C. g. akebioides* (Maxim.) Rehd. & Wils., var. Lfts. ovate to ovate-lanceolate, 2-3-lobed and irregularly crenately toothed: fls. bronzy-yellow. W. China. Intr. 1904.—*C. g. phaeantha* Rehd., f. A form of the preceding var. with the fls. dull violet outside. Cult. 1918.—*C. g. angustifolia* Ledeb., var. Lfts. narrow-oblong to linear-oblong, or 2-3-lobed with narrow lobes. (*C. intricata* Bge.) Siber., N. China. Intr. 1905.

42. *C. tangutica* (Maxim.) Korsh. Woody climber to 3 m.; young brts. usually slightly villous: lvs. pinnate or bipinnate; lfts. oblong-lanceolate to lanceolate, 3-8 cm. long, serrate with spreading teeth, sometimes deeply 2-3-lobed, glabrous, bright green: fls. large, bright yellow, usually solitary on slightly pubescent stalks 8-15 cm. long; sepals ovate-lanceolate, 3-5 cm. long, long-acuminate, glabrous on both sides, open-campanulate at first, finally spreading: fruiting head with the plumose styles about 6 cm. across. Fl.vi, and usually again in fall. B.M.7710(c). R.H.1902:528,t(c). G.W.14:651(h). (*C. orientalis* var. *t.* Maxim., *C. eriopoda* Koehne, not Maxim.) Mong. to N. W. China. Cult. 1890. Zone V. The handsomest of the yellow-fl. clematises; also the large heads of feathery frs. are attractive.—*C. t. obtusiuscula* Rehd. & Wils., var. Lfts. smaller: sepals elliptic to elliptic-ovate, obtusish to short-acuminate, 2.5-3 cm. long. J.L.47:193. N. W. China. Intr. 1910.

43. *C. serratifolia* Rehd. Woody climber to 3 m.: lvs. biternate; lfts. ovate-lanceolate to lanceolate, 3-6 cm. long, acuminate, serrate with the teeth pointing forward, and sometimes 2-3-lobed, glabrous, bright green: fls. 1-3, yellow, large, on slender stalks 4-6 cm. long; sepals ovate-lanceolate to oblong, 2-2.5 cm. long, acuminate, glabrous outside, slightly villous inside; filaments purple, much longer than the oblong anthers; head of frs. about 6 cm. across. Fl.viii-ix. Korea. Cult. 1909. Zone V. Similar to *C. tangutica*, with smaller fls., blooming later and more profusely.

## 23. LARDIZABALACEAE Lindl. LARDIZABALA FAMILY

Woody plants, mostly twining: lvs. alternate, compound, estipulate: fls. polygamous or unisexual, regular, in racemes, rarely solitary: sepals 6, rarely 3, petaloid; petals wanting, but nectaries often present; stamens 6; carpels 3-9, superior, free, with numerous ovules arranged in longitudinal rows; carpels baccate in fr., dehiscent or indehiscent; seed with copious endosperm and a small straight embryo.—Seven genera with about 20 species in E. Asia, Himal. and Chile.

- A. Lvs. pinnate: upright shrub.....1. *Decaisnea*  
 AA. Lvs. digitate: twining shrubs.  
 B. Lfts. 3-9, subequal and all distinctly stalked.  
 C. Lvs. evergreen; lfts. acute or acuminate: sepals 6.....2. *Holboellia*  
 CC. Lvs. deciduous; lfts. emarginate: sepals 3.....3. *Akebia*  
 BB. Lfts. 3, the terminal one generally obovate, cuneate at base, the lateral ones of different shape and sessile or short-stalked; carpels 3, many-seeded.....4. *Sinofranchetia*

1. *DECAISNEA* Hook. & Thoms. Upright shrub with stout sparingly branched stems: winter-buds large, ovoid, with 2 outer glabrous scales: lvs. odd-pinnate; lfts. opposite, entire: fls. polygamous, in elongated racemes forming panicles terminal on lateral brts.; pedicels slender; sepals 6, lanceolate, long-acuminate, petaloid; nectaries wanting; stamens 6, in the staminate fls. with long filaments connate into a column, short and nearly distinct in the pistillate fl.; pistils 3, free, developing into oblong fleshy follicles dehiscent along the ventral suture and with numerous seeds in 2 rows imbedded in a white pulp. (After Joseph Decaisne, French botanist; 1809-1882.) Two species in the Himal. and W. China.

D. *Fargèsii* Franch. Shrub to 5 m., glabrous: lvs. 50-80 cm. long; lfts. 12-25, short-petioled, ovate to ovate-oblong, 6-14 cm. long, acuminate, broad-cuneate or rounded at base, glaucous beneath: panicle drooping, 25-50 cm. long; pedicels about 1 cm. long; fls. pendulous, campanulate, greenish, 2.5-3 cm. long: fruiting carpels cylindric, curved, 5-10 cm. long and about 2 cm. thick, blue, bloomy; seeds ovoid, flattened, about 1 cm. long, black. Fl.vi; fr.x. B.M.7848(c). R.H.1900:270,271,273. G.C.73:161. G.W.17:533(h),534(fr). W. China. Intr. 1893. Zone (V). Shrub with stout stems and large pinnate lvs.; fls. inconspicuous, but the large blue fruits are attractive; they are insipid, but eaten in China.

2. *HOLBOELLIA* Wall. Evergreen twining shrubs, glabrous: lvs. long-petioled, digitate; lfts. 3-9, entire, stalked: fls. monoecious, in few-fl. axillary racemes; sepals 6, petaloid, obtusish, fleshy; nectaries 6, small; staminate fls. with 6 free stamens and a rudimentary ovary; pistillate fls. with small staminodes and 3 carpels developing into indehiscent fleshy pods with numerous black seeds in several rows. (After F. L. Holboell, once superintendent of the Botanic Garden at Copenhagen.) Five species in China and Himal.

H. *grandiflora* Réaumur. Climbing to 6 m.: lfts. 3-7, oblong to oblanceolate.

ceolate, 6–14 cm. long, acuminate, usually cuneate at base, dark green above, glaucous and reticulate beneath; petiolules 1–4 cm. long; fls. campanulate, 2–3 cm. long, white, fragrant; pedicels 2.5–3 cm. long; staminate fls. with oblong-ovate, obtuse outer sepals, in the pistillate fls. broad-elliptic and acutish, the inner sepals narrower; fr. purple, 8–12 cm. long, edible. Fl.v.—W. China. Intr. 1908. Zone VII? Valued chiefly for its fragrant white fls., the largest in the genus.

Related species: *H. Fargèsii* Réaumur. Lfts. 5–9, oblong-lanceolate to oblanceolate, 5–12 cm. long, glaucous below, with inconspicuous veins; fls. 1.5–2 cm. long, the pistillate purplish, the staminate greenish white. H.I.29:2848. (*Stauntonia longipes* Hemsl.) C. China. Intr. 1907. Zone VII?—*H. coriacea* Diels. Lfts. 3, ovate or elliptic to oblong, 5–8 cm. long; pale green below with the veinlets invisible; fls. about 1 cm. long, on slender pedicels, the staminate white, the pistillate purple. G.C.71:270(h); 77:391(h). C. China. Intr. 1907. Zone VII?

Of the closely related genus *Stauntonia* DC. which differs chiefly in the connate stamens and the thinner, acuminate sepals, only *S. hexaphylla* Decne. is in cult. Lfts. 3–7, oval to oblong-ovate, short-acuminate, rounded at base, 4–9 cm. long, reticulate and whitish beneath, coriaceous; fls. 1.5–2 cm. long, white, tinged with violet. S.Z.1:t.76(c). G.C.11.5:597. N.K.21:t.2. Japan, Korea. Intr. 1876. Zone VII?

3. **AKÉBIA** Decne. Deciduous or half-evergreen twining shrubs, glabrous: buds with many imbricate glabrous scales: lvs. long-petioled, digitate; lfts. 3–5, stalked, emarginate at apex: fls. monoecious, in axillary racemes, the pistillate at the base, the staminate ones smaller, at the end of the raceme; sepals 3; stamens 6, with subsessile anthers; carpels 3–12, developing into ovoid-oblong fleshy pods opening along the ventral suture, with numerous black seed in several rows. (Akebi, its Japanese name.) Two species in eastern Asia.

A. Lfts. 5, entire.....1. *A. quinata*  
 A. Lfts. 3, sinuately toothed or entire.....2. *A. trifoliata*

1. ***A. quinata*** (Houtt.) Decne. Climbing to 10 m. or more, glabrous: lfts. 5, obovate or elliptic to oblong-ovate, 3–6 cm. long, emarginate, rounded or broad-cuneate at base, glaucous beneath: fls. slender-stalked, fragrant, the pistillate purplish brown, 2.5–3 cm. across, with broad-elliptic sepals, the staminate rosy purple, much smaller, on pedicels 5 mm. long; fr. 6–8 cm. long, purple-violet, bloomy. Fl.v; fr.ix-x. B.M.4864(c). G.F.4:137(fr.) N.K.21:t.3. Gn.51:151. H.B.1:157(h). C. China to Japan and Korea. Intr. 1845. Graceful vine with fragrant dark colored fls. in spring; the showy fruits are but rarely produced in cult.

*A. quinata* × *trifoliata* = ***A. pentaphylla*** (Mak.) Mak. Lfts. 3–5. With the parents in Japan; orig. also in Am. in 1932.

2. ***A. trifoliata*** (Thunb.) Koidz. Climbing to 6 m. or more: lfts. 3, broad-ovate to ovate, 3–7 cm. long, emarginate, usually rounded or truncate at base, undulate or sinuately dentate, sometimes entire, glaucescent or greenish beneath: pistillate fls. maroon-red, 2–2.5 cm. across, the staminate smaller, numerous, pale purple, on pedicels 1–3 mm. long; fr. 6–8 cm. long, pale purple, edible. Fl.v. B.M.7485(c). S.Z.1:t.78(c). A.G.1891:140. G.W.13:438. (*A. lobata* Decne.) C. China to Japan. Intr. before 1890. Zone V. Similar to the preceding species, but less handsome.—***A. t. australis*** (Diels) Rehd., var. Lfts. ovate to ovate-oblong, entire or nearly so, subcoriaceous: pistillate fls. to 3 cm. across. C. and W. China. Intr. 1907. Probably tenderer.

4. **SINOFRANCHÉTIA** Hemsl. Deciduous twining shrub: terminal buds large, with about 9 imbricate mucronate glabrous outer scales: lvs. long-

stalked, 3-foliolate; the lateral lfts. short-stalked, oblique: fls. unisexual, probably dioecious, short-pedicel, in long, bractless racemes; sepals 6, obovate; nectaries 6; stamens (or staminodes in the pistillate fl.) free, 6; carpels 3, developing into ellipsoid many-seeded berries; seeds ovoid, compressed. (After Adrien Franchet, French botanist, who described many new Chinese plants; 1834-1900.) Monotypic.

*S. chinensis* (Franch.) Hemsl. Climbing to 10 m., glabrous: lfts. 3, large, short-acuminate, dark green above, glaucescent beneath with yellowish veins and darker veinlets, subchartaceous, the terminal one rhombic-obovate to broad-obovate, cuneate at base, on a stalk 2-3 cm. long; the lateral ones obliquely ovate, 7-11 cm. long, very oblique at base and nearly rounded, short-stalked: racemes with the peduncle 10-30 cm. long: fls. 5-6 mm. across, whitish, on pedicels 2-3 mm. long: about 2 cm. long, lavender-purple; seeds 5-6 mm. long, black. Fl.v; fr.ix-x. H.I.29:2842. (*Holboellia* c. Diels.) C. and W. China. Intr. 1907. Zone VII? With large lvs. resembling those of *Phaseolus* in size and shape.

## 24. SARGENTODOXACEAE Stapf. SARGENTODOXA FAMILY

Deciduous twining shrub; buds with several imbricate scales: lvs. alternate, long-petioled, 3-foliolate: fls. dioecious, campanulate, in pendulous racemes on slender petioles with 2 minute bractlets; sepals 6, petaloid; nectaries 6, minute, suborbicular; staminate fls. with 6 stamens and few to many aborted carpels in the centre; filaments short, anthers oblong; pistillate fls. with very numerous spirally arranged 1-ovuled subulate-lanceolate free carpels on a globose or oblong torus and with 6 staminodes: fr. consisting of an ovoid torus with numerous stipitate subglobose berry-like carpels, each with a globose-ovoid seed truncate at base, with copious endosperm and a small straight embryo.—One monotypic genus in China.

**SARGENTODÓXA** Rehd. & Wils. Characters of the family. (After C. S. Sargent, director of the Arnold Arboretum; 1841-1927; Greek *doxe*, glory.)

*S. cuneata* (Oliv.) Rehd. & Wils. Climbing to 7 m. or more: lfts. 3, unequal, short-acuminate, light green below, the terminal one rhombic-ovate, cuneate at base, 7-12 cm. long, on a stalk 5-10 mm. long, the lateral ones slightly larger, subsessile, semi-ovate, very oblique at base and palmately 2-3-veined: staminate fls. 1-1.2 cm. long, greenish yellow, fragrant, in pendulous racemes 10-15 cm. long; pedicels about 1.5 cm. long: mature carpels about 8 mm. long, dark blue and bloomy, on a fleshy stipe to 12 mm. long; seed 5 mm. long. Fl.v; fr.ix-x. B.M.9111,9112(c). (*Holboellia* c. Oliv., partly.) E. and C. China. Intr. 1907. Zone VII? With large lvs. resembling those of *Phaseolus*; valued for its fragrant yellowish fls.

## 25. BERBERIDACEAE Torr. & Gray. BARBERRY FAMILY

Herbs or woody plants: lvs. alternate, simple or compound; petioles dilated at base or stipulate: fls. perfect, solitary, or in cymes, racemes or panicles: sepals and petals imbricated, usually in whorls of 3, rarely 2 or 4; stamens free, as many as petals and opposite to them; filaments short; anthers opening with 2 valves, rarely by a longitudinal slit: ovary superior, consisting of one carpel, with few to many ovules, rarely only one, on the ventral suture or at base; style short or wanting; stigma usually peltate: fr. a berry or pod;

seeds anatropous, with endosperm; embryo usually small, straight.—Ten genera with more than 200 species distributed through the n. hemisphere, only *Berberis* extending in S. Amer. to the Straits of Magellan.

- A. Lvs. compound, evergreen; unarmed shrubs.
- B. Lvs. tripinnately compound; lfts. entire; fls. white.....1. *Nandina*
- BB. Lvs. simply pinnate; lfts. usually toothed; fls. yellow.....2. *Mahonia*
- AA. Lvs. simple or occasionally 3-foliate: deciduous or evergreen: spiny shrubs, rarely unarmed.
- B. Lvs. usually simple with occasional 3-foliate lvs. mixed in: unarmed half-evergreen shrub.....3. *Mahoberberis*
- BB. Lvs. always simple, deciduous or evergreen: usually spiny shrub.....4. *Berberis*

1. **NANDINA** Thunb. Evergreen shrub: lvs. usually thrice pinnate; rachis articulate; lfts. entire: fls. in large terminal panicles; sepals in numerous whorls of 3, gradually passing into the white petals; nectaries 3 or 6; anthers opening with longitudinal slit: fr. a 2-seeded globular berry. (Its Japanese name.) Monotypic.

**N. doméstica** Thunb. Upright shrub with unbranched stems, glabrous: lvs. 30–50 cm. long; lfts. subsessile, elliptic-lanceolate, 3–10 mm. long, acuminate, cuneate at base, coriaceous: fls. about 6 mm. across, white, in upright panicles 20–35 cm. long: fr. globular, 8 mm. across, bright red or purplish, rarely white. Fl.vi–vii. B.M.1109(c). Gn.23:329;58:13. R.H.1923:340,t(c). G.M.51:665. C. China to Japan. Intr. 1804. Zone VII? Evergreen shrub with graceful foliage tinged red when unfolding, changing to purple in autumn; chiefly valued for its large panicles of bright red fr.

2. **MAHONIA** Nutt. Evergreen unarmed shrubs, rarely small trees: terminal buds with numerous persistent pointed scales: lvs. alternate, odd-pinnate, rarely 3-foliate; lfts. usually spinose-dentate, the lateral sessile; stipules minute, subulate: fls. yellow in usually many-fld. racemes or panicles springing from the axils of the bud-scales; sepals 9; petals 6: ovary usually with few ovules: fr. dark blue and bloomy, rarely red or whitish. (After Bernard M'Mahon, a prominent American horticulturist; 1775–1816.) Syn.: *Odostemon* Raf. About 50 species in N. and C. Am. and in E. and S. Asia.—Most species are susceptible to the Black Stem Rust (Wheat Rust) of cereals, but Nos. 1, 2 and 5 are immune or highly resistant.

- A. Lfts. leathery, 3–13.
- B. Petioles 2–5 cm. long; lfts. 3–9, spinulose-dentate.
- c. Lvs. dull green above; plant rarely exceeding 0.25 m., stoloniferous.....1. *M. repens*
- cc. Lvs. lustrous dark green above; plant 1–2 m. high.....2. *M. Aquifolium*
- BB. Petioles 5–15 mm. long; lfts. 7–13, sinuately spiny-toothed.....3. *M. pinnata*
- AA. Lfts. rigidly coriaceous, sinuately spiny-toothed.
- B. Lfts. 3–7, 1–2.5 cm. long: racemes few-fld.....4. *M. Fremontii*
- BB. Lfts. 9–19, large.
- c. Stem scarcely 0.25 m. high; petioles 4–12 cm. long.....5. *M. nervosa*
- cc. Stems tall: petiole short.....6. *M. Bealii*

1. **M. repens** (Lindl.) G. Don. Stoloniferous shrub, to 0.25 m. high: lfts. 3–7, broad-ovate to ovate, 3–6 cm. long, spinulose-dentate, dull bluish green above, with distinct papillae below, leathery; petioles 2–3 cm. long: racemes 3–7 cm. long, clustered at end of the brs.: fr. black, bloomy, 6–7 mm. thick. Fl.v; fr.ix. B.R.1176(c). L.B.19:1847(c). (*Berberis* r. Lindl., *B. Aquifolium* Brit.; *Odostemon Aquifolium* Rydb., *B. nana* Greene.) B. C. to N. Mex. and Calif. Intr. 1822. Zone V. Low suckering shrub, less handsome than *M. Aquifolium*; the lvs. not changing to red in fall.—**M. r. rotundifolia** (May) Jouin, var. Shrub to 1 m.: lfts. usually 5–7, broad-ovate, finely and sparingly serrate or nearly entire. R.H.1907:163. Gs.4:222. (*Berberis rotundifolia* Herveyi Hort.)—**M. r. subcordata** Rehd., f. Lfts. 5–7, crowded and overlapping,

broad-ovate, subcordate at base, with few mucronate spreading teeth.—*M. r. macrocarpa* Jouin, var. Upright, to 1 m.: lfts. 5-7, spiny-dentate, slightly lustrous; fr. larger. This is possibly a hybrid of this species and the following.

2. *M. Aquifolium* (Pursh) Nutt. Shrub to 1, rarely 2 m. tall: lfts. 5-9, ovate to oblong-ovate, 3.5-8 cm. long, rounded or truncate at base, sinuately spiny-dentate, lustrous dark green above, rarely dull, without distinct papillae below, stiff and leathery; petioles slender, 2-5 cm. long: racemes fascicled, erect, 5-8 cm. long, at end of the brs.: fr. bluish black, bloomy, about 8 mm. across. Fl. iv-v; fr. ix. B.R.1425(c). L.B.18:1718(c). S.B.II.1:t94(c). Gn.86:260(h). (*Berberis* A. Pursh, *B. nutkana* Kearney.) B. C. to Ore. Intr. 1823. Zone V. With dark green lvs. becoming purplish in fall, and bright yellow fls. in spring; prefers a partly shaded position.—*M. A. juglandifolia* Jouin, var. Lfts. usually 7, often subcordate, smaller and of thicker texture; rachis usually red.

*M. A. × Fortunei* = *M. heterophylla* (Zab.) Schneid. Lfts. 5-7, lanceolate, 4-8 cm. long, spiny-toothed, lustrous above. (*Berberis* h. Zabel, not Juss., *B. toluacensis* Hort.) Origin unknown.—*M. A. × pinnata*; see under No. 3.—*M. A. × Berberis vulgaris* = *Mahoberberis Neuberti*; see p. 225.

Related species: *M. gracilis* (Hartw.) Fedde. Shrub to 1.5 m.; lfts. 5-11, ovate to ovate-lanceolate, 3.5-6 cm. long, entire or obscurely crenulate-denticulate, lustrous above; fr. with distinct style. S.H.1:f.201,k,l. Mex. Cult. 1900? Zone VII?

3. *M. pinnata* (Lag.) Fedde. Upright shrub to 4 m.: lfts. 7-13, ovate to ovate-lanceolate, sinuately spiny-toothed, slightly lustrous above, without distinct papillae and green beneath; petioles very short: fls. pale yellow, in fascicled racemes 6-8 cm. long, axillary along the stem: fr. globose-ovoid, purplish black. B.M.2396(c). B.R.702(c). R.H.1907:162. (*Berberis* p. Lag., *B. Aquifolium* var. *fascicularis* Bean, *M. fascicularis* DC.) Calif. and N. Mex. to Mex. Intr. 1819. Zone VII. Taller than *M. Aquifolium* and with similar foliage, but duller.

*M. p. × Aquifolium* = *M. Wagneri* (Jouin) Rehd. Upright shrub to 2.5 m.: lfts. 7-11, usually ovate-oblong, with 4-7 teeth on each side, dark green and slightly lustrous above; petioles 5-30 mm. long: fls. and fr. like *M. pinnata*. M.D.1910:89(h). (*M. pinnata* var. *W.* Jouin.) Orig. before 1863. Zone VI? Similar in habit to *M. pinnata*, but hardier.

4. *M. Fremontii* (Torr.) Fedde. Shrub to 4 m.: lfts. 3-7, ovate-oblong to lanceolate, 1.5-4 cm. long, with few large spiny teeth on each side, dull bluish green, rigidly coriaceous; petiole very short: fls. pale yellow, on slender pedicels to 2 cm. long in the axils of minute lanceolate bracts in few-fl. racemes: fr. subglobose, 8-15 mm. across, bluish black. Fl.v-vi; fr.viii. G.F.1:497. B.C.4:1971. (*Berberis* F. Torr.) W. Tex. to Colo. and Calif. Cult. 1895. Zone VI. Upright shrub with pale bluish green small foliage and comparatively large bluish black fruit.

Closely related species: *M. haematocarpa* (Woot.) Fedde, chiefly distinguished by its red fruit about 8 mm. across. M.G.32:89(h). (*Berberis* h. Woot.) N. Mex., Colo. Intr. 1916. Zone VII? Handsome in fr. which like that of the following species is used for jams.—*M. Swaseyi* (Buckl.) Fedde. Shrub to 1.5 m.: lfts. 5-11, elliptic to oblong-lanceolate, thinner, reticulate: infl. with broad-ovate bracts about 5 mm. long: fr. about 1 cm. across, red. Jour. Hered. 12:427. (*Berberis* S. Buckl.) Tex. Intr. 1917. Zone VII?—*M. trifoliolata* (Moric.) Fedde. Shrub to 2.5 m.: lfts. 3, rigid; petiole 5-50 mm. long: fr. red. B.R.31:10(c). F.S.1:t.56(c). (*Berberis* t. Moric.) N. Mex. and Tex. to Mex. Intr. 1839. Zone VII.

5. *M. nervosa* (Pursh) Nutt. Shrub to 0.5 m. tall, usually lower; the stem with conspicuous persistent lanceolate bud-scales 2-3 cm. long: lvs. with the stalk 18-40 cm. long; lfts. 11-19, obliquely ovate to ovate-lanceolate, 4-8 cm.

long, with 3-5 nerves at base, sinuately spiny-dentate, lustrous above, pale beneath, rigidly coriaceous; petioles 5-12 cm. long: fls. bright yellow in erect racemes 10-20 cm. long: fr. ovoid, dark blue, bloomy, about 8 mm. across. Fl.v-vi; fr.vii-viii. B.M.3949(c). B.R.1426(c). L.B.18:1701(c). (*Berberis n. Pursh.*) B. C. to Calif. Intr. 1822. Zone V. With large lustrous lvs.

6. *M. Bealei* (Fort.) Carr. Shrub to 4 m., with stout upright stems: lvs. 30-40 cm. long; lfts. 9-15, roundish ovate to ovate-oblong, 5-12 cm. long, with 2-5 large spiny teeth on each side, the lateral ones very oblique at base, the lowest pair much smaller and close to the base of the petiole, the terminal lft. stalked, truncate or subcordate at base, larger, dull dark bluish green above, glaucescent beneath, rigidly coriaceous; petioles 1-2 cm. long: fls. lemon-yellow, fragrant, in fascicled upright stout racemes 8-15 cm. long, fls. crowded, on pedicels about 5 mm. long, with small bracts at base: fr. bluish black. B.M.4846,4852(c). F.S.6:t.79. Gn.87:574(h);88:107(h);89:171. M.O.60(h). (*M. japonica* var. *B. Fedde*, *Berberis B. Fort.*) China. Intr. 1845. Zone (V). With large lvs. and large clusters of pale yellow fragrant fls. In cult. usually as *M.* or *Berberis japonica*.

Related species: *M. japonica* (Thunb.) DC. Similar to *M. Bealei*; lfts. usually ovate-oblong, 4-10 cm. long, with 1-3 teeth on the upper and 5-6 teeth on the lower side, mostly pointing forward, yellowish green beneath, less rigid: racemes 10-20 cm. long, rather lax, the fls. nodding, on slender pedicels 6-7 mm. or sometimes to 1 cm. long, with conspicuous ovate bracts: fr. dark purple, bloomy. Thunberg, Icon. Pl. Jap. 4:t.2. Gn.89:171. Cult. in Japan, rare in western gardens.—*M. Fortunei* (Lindl.) Fedde. Shrub to 1.2 m.: lfts. 7-13, lanceolate to linear-lanceolate, cuneate, with 5-15 teeth on each side, 6-12 cm. long; petiole 2-5 cm. long, green beneath. S.H.1:201,f.u-v. China. Intr. 1846. Zone VII.—*M. F. × Aquifolium*; see under No. 2.—Probably not hardy within our area is *M. napaulensis* DC. With up to 25 ovate to ovate-lanceolate lfts. lustrous above. P.F.3:t.79(c). (*B. nepalensis* Spreng.) Himal., India. Cult. 1850.

3. *× MAHOBERBERIS* Schneid. Unarmed half-evergreen shrub; a hybrid between *Mahonia Aquifolium* and *Berberis vulgaris*, the only one known so far between these two genera. Resembles *Mahonia* in the unarmed brs., in the solitary, not fascicled lvs. on the shoots and the occurrence of 3-foliate or pinnate lvs.; the influence of *Berberis* is shown in the usually simple lvs., thinner and serrulate on the older brs., while those of the shoots are more coriaceous and sinuately spiny: fls. and frs. not known.

*M. Neuberti* (Baumann) Schneid. Shrub to 2 m.: lvs. usually simple, obovate-oblong or oblong, 3-7 cm. long, cuneate at base, serrulate or those of the shoots sinuately spiny, or compound with 3-5 lfts. (*Berberis N. Baumann*, *M. N. var. ilicifolia* Schneid.) Orig. before 1854.—*M. N. latifolia* Schneid., var. Lvs. of the shoots broader, truncate or broad-cuneate at base. (*B. latifolia*, *B. ilicifolia* Hort., not Forst.)—Subevergreen shrub of little ornamental value.

4. *BÉRBERIS* L. BARBERRY. Evergreen or deciduous spiny shrubs, rarely small trees; the inner bark and wood yellow: lvs. alternate, simple, those of the shoots changed into usually 3-parted spines, the normal lvs. appearing in fascicles on short axillary spurs: fls. yellow in elongated or umbel-like, rarely compound racemes, or solitary or fascicled; sepals 6, with 2 or 3 bractlets below; petals 6, often smaller than the sepals and usually with 2 nectariferous glands at base; stamens 6, irritable, the anthers opening with 2 valves; ovary with 1 to many ovules; stigma sessile or on a short style: fr. a 1- to several-seeded red to black berry. (Name derived from the Arabic

name of the fr.) About 175 species, particularly well developed in E. and C. Asia and in S. Am., few in N. Am., Eu. and N. Afr.—Almost all species are desirable ornamental shrubs with handsome foliage, evergreen in some species and in many deciduous ones assuming bright tints in fall, with conspicuous, mostly bright yellow fls. in spring, and variously colored, often scarlet frs. in fall and often persisting during the winter. Unfortunately most species are alternate hosts of the pernicious wheat rust or black stem rust (*Puccinia graminis*) of cereals, and their propagation and distribution is prohibited in the northern central and some adjoining states, except the following which are immune or highly resistant: Nos. 1, 3, 5, 6, 6 x 10, 12, 13, 13 x 35, 14, 17, 20, 35, 43, 46, and *B. candidula*, *sanguinea*, *aemulans*, *Edgeworthiana*, *Beaniana* and *B. Potaninii*.

## I. Lvs. evergreen or half-evergreen

- A. Lvs. entire.  
 B. Lvs. elliptic to obovate; fls. solitary.....1. *B. buxifolia*  
 BB. Lvs. narrow-oblong to linear.  
 C. Fls. 1-2; lvs. linear.....2. *B. empetrifolia*  
 CC. Fls. 2-6 in peduncled umbels; lvs. narrow-oblong.....3. *B. stenophylla*  
 AA. Lvs. dentate (sometimes entire in Nos. 4, 26, and 28).  
 B. Brts. pubescent, puberulous or verruculose.  
 C. Lvs. green beneath; brts. pubescent or puberulous.  
 D. Lvs. evergreen, 1-3 cm. long, obovate; fls. in racemes.....5. *B. Darwinii*  
 DD. Lvs. half-evergreen, 2.5-3 cm. long; fls. in panicles.....26. *B. Chitria*  
 CC. Lvs. glaucous or glaucescent beneath.  
 D. Fls. in racemes or panicles; lvs. 2.5-3 cm. long; brts. puberulous.....23. *B. Lycium*  
 DD. Fls. 1-2; lvs. 1-2.5 cm. long; brts. verruculose.....6. *B. verruculosa*  
 BB. Brts. glabrous; fls. in fascicles or solitary.  
 C. Lvs. thinly coriaceous.  
 D. Lvs. glaucous beneath.  
 E. Brts. angled; lvs. half-evergreen.  
 F. Lvs. obovate to broad-elliptic with several teeth on each side.  
 FF. Lvs. usually obovate-oblong with 1-2 teeth on each side or entire.  
 16. *B. concinna*  
 4. *B. heterophylla*  
 EE. Brts. terete; lvs. evergreen.  
 F. Lvs. elliptic to elliptic-oblong, spiny-toothed; fls. yellow.....7. *B. pruinosa*  
 FF. Lvs. lanceolate, with 1-2 small aristate teeth on each side; fls. whitish, tinged red .....8. *B. triacanthophora*  
 DD. Lvs. green beneath, lanceolate to narrow-lanceolate.  
 E. Young brts. reddish; fr. bloomy; pedicels 2-3.5 cm. long.....9. *B. Veitchii*  
 EE. Young brts. yellowish; lvs. rarely more than 1 cm. broad.  
 F. Fr. ovoid, bloomy, with sessile stigma; pedicels 1-2 cm. long.  
 10. *B. Gagnepainii*  
 FF. Fr. subglobose, jet-black, with distinct style; pedicels 0.5-1 cm. long.  
 11. *B. atrocarpa*  
 CC. Lvs. strongly coriaceous, rigid, narrow-elliptic to oblong-lanceolate.  
 D. Lvs. green beneath.  
 E. Brts. terete, reddish when young; lvs. slightly reticulate beneath.  
 12. *B. Sargentiana*  
 EE. Brts. slightly angled, yellowish brown when young; lvs. with the veinlets invisible.....13. *B. Julianae*  
 DD. Lvs. glaucous or white beneath (except in var. of No. 14).....14. *B. Hookeri*

## II. Lvs. deciduous

- A. Fls. solitary or fascicled or sometimes in few-fl. umbels (in very short dense panicles in No. 22).  
 B. Lvs. all entire, small.  
 C. Young brts. glabrous; lvs. not reticulate; fls. slender-stalked.....35. *B. Thunbergii*  
 CC. Young brts. puberulous; lvs. reticulate; fls. in very short-stalked dense clusters.  
 22. *B. Wilsonae*  
 BB. Lvs. dentate or only partly entire.  
 C. Fls. solitary on short pedicels not exceeding 5 mm.  
 D. Lvs. green and reticulate beneath, finely toothed.....16. *B. sibirica*  
 DD. Lvs. glaucous beneath, often entire; brts. usually bloomy.....15. *B. dictyophylla*  
 CC. Fls. on slender pedicels or in umbels.  
 D. Lvs. with rather remote teeth, often entire.  
 E. Brts. terete or nearly so, red-brown and lustrous the second year; fr. bluish black and bloomy.  
 F. Lvs. obovate to obovate-oblong, 1-1.5 cm. broad, bright green, usually toothed .....36. *B. virescens*

- FF. Lvs. broad-elliptic to obovate, 1.5-2.5 cm. broad, grayish green, usually entire ..... 32. *B. heteropoda*
- EB. Brts. grooved or angled, dull brown or gray.
- F. Fls. 1-2.
- G. Brts. puberulous: lvs. entire or with 1 or 2 teeth on each side. .... 21. *B. angulosa*
- GG. Brts. glabrous: lvs. spiny-dentate. .... 17. *B. concinna*
- FF. Fls. several, occasionally 1 or 2.
- G. Fls. 2-8, on a peduncle, rarely 1; pedicels 1-2.5 cm. long.
- H. Fr. with distinct style: fls. usually 2-5; lvs. usually serrate.
- HH. Fr. with sessile or subsessile stigma: fls. 3-8; lvs. usually entire.
- GG. Fls. in dense clusters: lvs. entire or 3-toothed at apex, 0.6-2 cm. long. .... 19. *B. yunnanensis*
- DD. Lvs. closely setose-serrulate.
- E. Brts. grooved, dull grayish: lvs. obovate: fls. usually 2.... 20. *B. circumserrata*
- EE. Brts. angled, red-brown: lvs. oblong-obovate: fls. in 3-6-fld. umbels. .... 22. *B. Wilsonae*
- AA. Fls. in panicles. (AAA follows)
- B. Brts. angled: lvs. not exceeding 3.5 cm.
- C. Infl. 1-4 cm. long, upright. .... 23. *B. aggregata*
- CC. Infl. 5-12 cm. long, pendulous. .... 24. *B. polyantha*
- BB. Brts. terete; lvs. 3-8 cm. long; infl. 5-12 cm. long.
- D. Brts. glabrous: lvs. deciduous.
- E. Fr. red: lvs. acute, serrate. .... 27. *B. Francisci-Ferdinandi*
- EE. Fr. purple-black, bloomy: lvs. obtuse, often entire. .... 33. *B. oblonga*
- DD. Brts. puberulous: lvs. half-evergreen, often entire.
- E. Lvs. green beneath: infl. paniculate; peduncle 2-4 cm. long. .... 28. *B. Chitria*
- EE. Lvs. glaucescent beneath: infl. racemose or paniculate; peduncle usually short. .... 28. *B. Lycium*
- AAA. Fls. in simple racemes. (See also species under No. 27.)
- B. Lvs. glabrous.
- C. Brts. glabrous.
- D. Lvs. entire, all or most of the flowering brs.: brts. brown or purplish the second year.
- E. Brts. grooved or angled: fr. bright red.
- F. Lvs. obovate to obovate-oblong, glaucescent beneath.
- G. Racemes umbel-like; 3-10-fld.: lvs. always entire. .... 35. *B. Thunbergii* var.
- GG. Racemes usually many-fld.; pedicels 1-2 cm. long; lvs. often serrate. .... 34. *B. Silva-Taroucana*
- FF. Lvs. oblanceolate or oblong: racemes many-fld.
- G. Bracts at least  $\frac{1}{2}$  as long as the short pedicels: lvs. entire.
- H. Pedicels 1-2 mm., in fr. sometimes to 4 mm. long: racemes dense; fls. 3-4 mm. across. .... 31. *B. Vernae*
- HH. Pedicels 3-5 mm. long, in fr. sometimes 1 cm. long: racemes not dense; fls. about 6 mm. across. .... 37. *B. Poiréti*
- GG. Bracts much shorter than the slender pedicels: lvs. sometimes dentate. .... 38. *B. chinensis*
- EE. Brts. terete or slightly angled.
- F. Racemes short, 5-7-fld.; ovules 4-6, long-stipitate: fr. bluish black. .... 32. *B. heteropoda*
- FF. Racemes dense, many-fld.; ovules 2-3, subsessile
- G. Fr. dark red, bloomy: lvs. with stomata above. .... 30. *B. turcomanica*
- GG. Fr. pale red: lvs. without stomata above. .... 29. *B. nummularia*
- DD. Lvs. serrate or dentate.
- E. Brts. brown, red or purple the second year.
- F. Lvs. remotely dentate or serrulate, occasionally entire; veinlets usually indistinct beneath.
- G. Fr. bright red.
- H. Pedicels 4-10 mm. long.
- I. Lvs. glaucescent beneath, often obtuse.
- J. Brts. slightly verruculose: pedicels as long or longer than the short-ovoid fr. .... 39. *B. canadensis*
- JJ. Brts. smooth: pedicels usually shorter than the oblong-ovoid fr. .... 44. *B. Henryana*
- II. Lvs. light green beneath, acute, elliptic-oblong to oblanceolate.
- J. Brts. nearly terete: fr. globose-ovoid, about 6 mm. long; pedicels 5 mm. long. .... 40. *B. Fendleri*
- JJ. Brts. grooved: fr. oblong-ovoid, 1 cm. long; pedicels about 1 cm. long. .... 38. *B. chinensis*
- HH. Pedicels 1-2 cm. long: lvs. broad-obovate to elliptic, glaucescent beneath. .... 34. *B. Silva-Taroucana*
- GG. Fr. dark purple, bloomy, oblong-ovoid: racemes few-fld.: brts. terete. .... 36. *B. virescens*
- FF. Lvs. densely serrulate, never entire, reticulate beneath.
- G. Lvs. serrulate, obovate to obovate-oblong: racemes usually many-fld.

- h. Brts. grooved: lvs. rounded at apex, grayish green beneath: fr. subglobose ..... 43. *B. koreana*  
 HH. Brts. terete or nearly so: lvs. acute or obtuse, light green beneath: fr. oblong-ovoid.  
 i. Lvs. all short-stalked: racemes short, nodding. 42. *B. Bretschneideri*  
 ii. Lvs. of fertile brts. mostly on slender stalks 2-4 cm. long: racemes upright, 5-7 cm. long. .... 45. *B. dasystachya*  
 GG. Lvs. densely ciliate, narrow-elliptic to oblong or oblong-obovate: racemes 3-6-fld., umbellate ..... 41. *B. Sieboldii*  
 EE. Brts. gray or grayish yellow the second year: fr. oblong-ovoid.  
 f. Brts. nearly terete, grayish yellow: fr. purplish blue; style distinct. 25. *B. aristata*  
 FF. Brts. grooved, gray: fr. scarlet or purple; stigma sessile.  
 G. Lvs. reticulate beneath, densely ciliate-serrate; petals slightly emarginate. 49. *B. amurensis*  
 GG. Lvs. setulose-dentate, not reticulate: petals entire at apex. 50. *B. vulgaris*  
 CC. Brts. puberulous: lvs. usually oblanceolate, often entire: fls. slender-stalked, in racemes: fr. bluish black. .... 28. *B. Lycium*  
 BB. Lvs. pubescent, acute: racemes slender; pedicels very short.  
 C. Brts. and rachis of infl. pubescent.  
 D. Lvs. slightly pubescent above, 2.5-5 cm. long: brts. brown. .... 46. *B. Gilgiana*  
 DD. Lvs. densely pubescent above, 4-8 cm. long: brts. gray. .... 47. *B. mitifolia*  
 CC. Brts. and rachis glabrous: lvs. glabrous above, 4-8 cm. long. .... 48. *B. Giraldui*  
 Ser. 1. BUXIFOLIAE Schneid. Lvs. evergreen, small: fls. solitary or 2-5 fascicled; ovules 2-12; stigma sessile.

1. *B. buxifolia* Poir. Evergreen upright shrub to 3 m.; brts. brown, usually puberulous; grooved; spines 3-fid or simple, usually not longer than 1.5 cm.: lvs. obovate to elliptic, 1-2.5 cm. long, spiny-pointed, cuneate at base, entire: fls. 1-2, orange-yellow, on slender pedicels 2-2.5 cm. long: fr. subglobose, dark purple. B.M.6505(c). L.B.20:1941(c). G.W.7:414. (*B. dulcis* Sweet.) Chile, Strait of Magellan to Valdivia. Intr. 1826. Zone (V). Compact shrub, one of the hardiest of the evergreen barberries.—*B. b. nana* Mouillef., var. Dwarf compact form.—*B. b. pygmaea* (Koehne) Usteri. Dwarf tufted form with slender unarmed brts., and partly juvenile, stalked and serrate lvs.—*B. b. spinosissima* Reiche, var. Spines to 3 cm. long, usually longer than the lvs.

2. *B. empetrifolia* Lam. Evergreen shrub to 0.5 m.; brts. slender, often prostrate, slightly angled, glabrous, often bloomy: spines 3-fid or simple, 5-15 mm. long: lvs. linear, 5-20 mm. long, spiny pointed, entire and strongly revolute at the margin, bright green; fls. 1-2, golden-yellow, 8 mm. across, on slender pedicels 5-15 mm. long: fr. nearly black. B.R.26:27(c). S.B.4:350 (c). Chile to Strait of Magellan. Intr. 1827. Zone VI? Suited for the rocky.

*B. e.* × *Darwinii*; see No. 3.

Related species: *B. linearifolia* Phil. To 3 m. high; brts. angular: lvs. linear-oblong to narrow-elliptic, 2-4 (-6) cm. long, dark green above, glaucescent below, slightly recurved at margin: fls. 3-7, orange to crimson, 1.5 cm. across: fr. ellipsoid, dark blue-black. B.M.9526(c). Chile. Intr. 1927. Zone VII.—*B. l.* × *Darwinii*; see under No. 5.

3. × *B. stenophylla* Lindl. (*B. Darwinii* × *empetrifolia*.) Evergreen shrub to 3 m.: brts. slender, terete, puberulous; spines usually 3-fid, 3-7 mm. long: lvs. narrow-lanceolate, 1.5-2.5 cm. long, spiny-pointed, with revolute margin, dark green above, whitish beneath: fls. golden yellow, 1 cm. across, in small fascicles or short 2-6-fld. racemes; pedicels 5-10 mm. long: fr. subglobose, 6-7 mm. across, black, bloomy. F.M.4:252(c). G.C.III.7:619. R.H. 1906:417;1913:535,t(c). Gn.86:259,408(h);87:92(h). Orig. before 1864. Zone (V). Many forms reverting more or less to one or the other parent have been raised from seed.

Ser. 2. ACTINACANTHAE Schneid. Lvs. evergreen or half-evergreen, usually toothed: fls. solitary or fascicled or in umbel-like racemes; ovules 2-6; style short or wanting.

4. *B. heterophylla* Juss. Half-evergreen shrub to 1.5 m.; brts. yellowish brown, glabrous, grooved; spines 3-7-fid, 1-2 cm. long; lvs. narrowly obovate and entire, or obovate with 3-5 large spiny teeth, 1-3 cm. long; fls. solitary; pedicel about 8 mm. long; sepals and petals incurved; fr. black, bloomy. H.E.1,t.14(c). Chile to Strait of Magellan. Cult. 1823. Zone VII? Very spiny straggling shrub.

Related species: *B. actinacantha* Mart. Half-evergreen; brts. pubescent; spines 3-parted or sometimes leaf-like; lvs. broad-obovate to oblong, 1-3 cm. long, sparingly spiny; fls. 3-6, fascicled. B.R.31:55(c). Chile. Intr. before 1845. Zone VII.—*B. hakeoides* (Hook. f.) Schneid. Evergreen shrub to 4 m.; spines small or leafy; lvs. suborbicular, 1.5-3 cm. long, rounded or subcordate at base, spiny-toothed; fls. in dense subglobose clusters; fr. bluish black. B.M.6770 (c). G.C.29:295. B.S.1:241. (*B. congestiflora* var. *h.* Hook. f.) Chile. Intr. 1861. Zone VII?

Ser. 3. *ILICIFOLIAE* Schneid. Lvs. evergreen, usually toothed; fls. racemose; ovules 3-5; style distinct.

5. *B. Darwinii* Hook. Evergreen upright shrub to 3.5 m.; brts. subterete, red-brown, short-pilose; spines slender, 3-7-parted, 3-7 mm. long; lvs. obovate to obovate-oblong, 1-3 cm. long, cuneate at base, remotely spiny-toothed and usually 3-spined at apex, lustrous and dark green above, light green beneath; fls. golden-yellow, tinged with red, in pendulous racemes 4-10 cm. long; fr. ovoid, about 8 mm. long, dark purple, with long style. B.M.4590(c). F.S.7: t.663(c). R.H.1913:525,t.f.1(c). Gn.86:260(h). Chile. Intr. 1849. Zone VII? With lustrous dark green lvs. and golden-yellow fls. in spring.

*B. D.* × *linearifolia* = *B. illogensis* Sandwith. Lvs. rhombic-elliptic or rhombic-obovate with few unequal teeth to linear and entire; fls. in racemes or umbels; pedicels 5-15 mm. long. Argentine. Cult. 1933.—*B. D.* × *empetrifolia*; see No. 3.

Related species: *B. ilicifolia* Forst. Evergreen straggling shrub with grooved glabrous or puberulous brts.: lvs. obovate, 2-5 cm. long, with a few spiny teeth toward the apex; fls. orange-yellow, in dense short racemes. B.M.4308(c). S. Chile. Intr. about 1843. Zone VII?

Ser. 4. *WALLICHIANAE* Schneid. Lvs. evergreen, elliptic to narrow-lanceolate; fls. solitary or fascicled, 2-25; ovules 1-8; style very short or wanting; fr. purple-violet or black.

6. *B. verruculosa* Hemsl. & Wils. Evergreen shrub to 1.5 m. high; brts. terete, densely verruculose; spines slender, 3-parted, 1-2 cm. long; lvs. elliptic or ovate to ovate-lanceolate, 1.5-2.5 cm. long, remotely spiny-toothed with revolute margin, lustrous dark green above, glaucous beneath; fls. 1-2, 1.5 cm. across, golden-yellow; pedicel 5-10 mm. long; fr. ellipsoid, about 8 mm. long, violet-black, bloomy; stigma sessile. B.M.8454(c). M.G.32:34(h). S.L. 27(h). W. China. Intr. 1904. Zone (V). Dense shrub with glossy dark green lvs. and large yellow fls.

*B. v.* × *Gagnepainii* = *B. Chenaütii* Chenault. Brts. slightly verruculose; lvs. narrow-oblong, 2-3.5 cm. long, spiny-toothed, glaucous beneath. Cult. 1928.

Related species: *B. candidula* Schneid. Dwarf shrub; brts. glabrous; lvs. elliptic, 1.5-3 cm. long, with few spiny teeth, white beneath; fls. solitary, pedicel 1-1.5 cm. long. V.F.15. Gs.13:26,f.3. (*B. Wallichiana* var. *pallida* Bois.) C. China. Intr. 1894. Zone V.—*B. v.* × *Gagnepainii* = *B. hybrido-Gagnepainii* Suringar. Lvs. about 4 cm. long, spiny-toothed, glaucous beneath. Gs.13:26,f.7. Cult. 1929.

7. *B. pruinosa* Franch. Evergreen shrub to 3 m.; brts. terete, yellowish or brownish yellow; spines stout, 3-parted, 1-3 cm. long; lvs. strongly coriaceous, obovate or elliptic to elliptic-oblong, 2.5-5 cm. long, spiny-toothed, lustrous dark green above, white beneath; fls. 3-25; pedicels about 1 cm. long, fascicled or on a short peduncle; fr. oblong-ovoid, 6-7 mm. long, bluish black,

bloomy. N.H.9:39. S. W. China. Intr. 1894. Zone VII? Handsome evergreen shrub of vigorous growth.

*B. p. × diaphana?* = *B. Vilmorinii* Schneid., which differs chiefly in the grooved brts., in the thinner and smaller lvs. with smaller and more numerous teeth and in the few-fl. inf. Orig. before 1905.

8. *B. triacanthophora* Fedde. Shrub to 1.5 m., with spreading slender brs.; brts. reddish, becoming red-brown the 2d year; spines slender 1-2.5 cm. long: lvs. lanceolate to narrow-lanceolate, 2-5 cm. long, 4-8 mm. wide, with 1-5 small setose teeth on each side, bright above, glaucous or glaucescent beneath: fls. 2-5, fascicled, subglobose, 7-8 mm. across, whitish, tinged red; pedicels slender, 1.2-3 cm. long: fr. ellipsoid, 7-8 mm. long, blue-black, slightly bloomy. Fl.v. C. China. Intr. 1907. Zone V. One of the hardiest of the evergreen barberries.

9. *B. Veitchii* Schneid. Evergreen shrub; brts. subterete, reddish when young, yellowish gray the second year; spines stout, 3-parted, 2-5 cm. long: lvs. lanceolate, 6-12 cm. long, sinuately spiny-toothed, dark green above, lighter beneath, with indistinct veinlets, thinly coriaceous: fls. 1 cm. across, in 4-8-fl. fascicles; pedicels 2-3.5 cm. long; ovules 2-4: fr. oblong, 1-1.2 cm. long, black, bloomy. Veitch, Novelties, 1907:13. Gs.13:26,f.1. (*B. acuminata* Veitch, not Franch.) C. China. Intr. 1900. Zone VI?

*B. V. × vulgaris?* = *B. Vanfleëtii* Schneid. Brts. slightly terete: lvs. elliptic, acute, spinose-serrate, with 8-12 teeth on each side, chartaceous: fls. in umbel-like racemes: fr. dark cherry-red, slightly pruinose. Orig. before 1915.

10. *B. Gagnepainii* Schneid. Evergreen shrub to 2 m.; brts. terete, slightly verruculose, yellowish gray; spines slender, 3-parted, 1-2 cm. long: lvs. narrow-lanceolate, 3-10 cm. long, sinuately spiny-serrate, with revolute margin, light green beneath and indistinctly veined, thinly coriaceous: fls. in fascicles of 3-10, 1 cm. across, bright yellow; pedicels 1-2 cm. long: fr. ovoid, 8-10 mm. long, bluish black, bloomy, with nearly sessile stigma. B.M.8185(c). G.C.46:226. M.G.32:1(h). Gn.89:585(h). (*B. acuminata* Stapf, not Franch.) W. China. Intr. 1904. Zone (V).

*B. G. × verruculosa?* see under No. 6.—*B. G. × candidula?* see under No. 6. Closely related species: *B. sanguinea* Franch. Brts. smooth, grooved; lvs. narrower, often nearly linear, with revolute margin and fewer teeth (6-15 pairs): pedicels and outside of fls. red. V.F.16. W. China. Intr. 1898. Zone VII?—*B. replicata* W. W. Sm. Brts. terete, yellowish; lvs. 2-3.5 cm. long, about 8 mm. wide, with 1-6 pairs of teeth, strongly revolute: fr. black. B.M.9076(c). J.L.49:t.13(h). S. W. China. Intr. 1917.—*B. taliensis* Schneid. Brts. grooved, yellowish: lvs. oblong-lanceolate, 2-3.5 cm. long, 10-12 mm. wide. W. China. Intr. ?1921. Zone VII?

11. *B. atropurpurea* Schneid. Evergreen shrub to 2 m.; brts. yellowish, grooved; spines 1-4 cm. long: lvs. lanceolate or oblanceolate to oblong-lanceolate, 2.5-7 cm. long, unequally spiny-serrate with spreading teeth, yellowish green beneath with indistinct veins, coriaceous: fls. 6-12, fascicled, 8-12 mm. across; pedicels 5-10 mm. long; fr. short-ovoid, 5 mm. long, jet-black, not bloomy at maturity, with a short, but distinct style. B.M.8857(c). (*B. levis* Bean, not Franch.) W. China. Intr. 1909. Zone VII?

Related species: *B. levis* Franch. Lvs. with fewer aristate subequal teeth pointing forward: fr. bloomy. W. China. Intr. ?—*B. sublevis* W. W. Sm. Brts. angled: lvs. subcoriaceous, linear- to narrow-lanceolate, spinose-serrulate, veins visible beneath: fr. red? G.C.101:437. (*B. Wallichiana* var. *microcarpa* Hook. f. & Thoms.) S. W. China, E. Himal. Cult. 1935.

12. *B. Sargentiana* Schneid. Evergreen shrub to 2 m.; brts. terete, reddish while young, yellowish gray or grayish brown the 2nd year; spines rigid, 3-parted, 1-3 cm. long: lvs. elliptic-oblong or oblong to oblong-lanceolate, 4-10

cm. long, rather closely spiny-serrate, dark green above, light green and slightly reticulate beneath, firmly coriaceous: fls. fascicled, yellow, about 1 cm. across; pedicels 1-2 cm. long; ovary 2-3-ovuled: fr. ovoid, 6-7 mm. long, bluish black, slightly bloomy; stigma sessile. C. China. Intr. 1907. Zone VI?

Related species: *B. Soulieana* Schneid. Brts. gray, subterete: lvs. narrow-lanceolate, usually spiny-serrate, 4-10 cm. long, 8-15 mm. broad, pale and indistinctly or scarcely veined beneath: fr. ovoid, bloomy, with short style; pedicels 1-1.5 cm. long. (*B. stenophylla* Hance, not Lindl., ? *B. sanguinea* Lemoine, not Franch.) C. China. Intr. 1897. Zone VI?—*B. insignis* Hook. f. & Thoms. Brts. subterete, red-brown: lvs. oblong-lanceolate, 5-12 cm. long, acuminate, spiny-serrate, green beneath, with elevated secondary veins; pedicels 5-10 mm. long; ovules usually 4: fr. ovoid-oblong, black. Sikkim-Himal. Cult. ?—*B. i. tongloensis* Schneid., var. Brts. yellowish gray. Intr. about 1850? Zone VII?—*B. dumicola* Schneid. Lvs. elliptic-lanceolate to elliptic-oblong, 4-10 cm. long, densely and unequally serrulate: fls. small, reddish outside: fr. 1-2-seeded, with short style. W. China. Intr. 1921. Zone VII?

13. *B. Juliānae* Schneid. Evergreen shrub to 2 m.; brts. slightly angled, yellowish when young, light yellowish gray or yellowish brown the 2nd year; spines rigid, 3-parted, 1-3 cm. long: lvs. narrow-elliptic to lanceolate or oblanceolate, 3-6 cm. long, spiny-serrate, dark green above, much paler and indistinctly veined beneath, rigidly coriaceous: fls. fascicled; pedicels 1-2 cm. long; ovules 1-2: fr. ovoid-oblong, about 8 mm. long, bluish black, bloomy, with a short, but distinct style. M.G.32:35(h). S.L.103(h). C. China. Intr. 1900. Zone (V). Of upright habit; one of the hardiest evergreen barberries.

*B. J. × Thunbergii* = *B. mentorénsis* L. M. Ames. Brts. strongly grooved: lvs. subcoriaceous, elliptic-ovate, 2-4.5 cm. long, sparingly spinulose toothed, pale beneath: fls. 1-2: fr. ellipsoidal, dull dark red. H.B.13:48(h). Orig. 1924. Zone V.

Closely related species: *B. Bergmanniae* Schneid. Lvs. smaller, 3.5-6 cm. long, sinuately serrate with 3-8 strong teeth on each side, pale and lustrous beneath: fr. very bloomy, on reddish pedicels about 1 cm. long. W. China. Intr. 1908. Zone VII?

14. *B. Hoökeri* Lem. Shrub to 2 m.; brts. slightly grooved, grayish brown: lvs. elliptic to oblong-lanceolate, 2.5-7 cm. long, acuminate, sinuately spiny-serrate, white beneath, secondary veins elevated: fls. 3-6, clustered, greenish yellow, about 1.8 cm. across; pedicels 1-2 cm. long; ovules usually 3, stipitate: fr. oblong, 1 cm. long, black-purple; stigma sessile. B.M.4656,9153(c). N.F. 1:f.18(h). (*B. Wallichiana* Hook., not DC.) Himal. Cult. 1859. Zone VII.—*B. H. viridis* Schneid., var. Lvs. green beneath.

Related species: *B. hypokérina* Airy-Shaw. Shrub to 75 cm.: lvs. oblong-elliptic, to 15 cm. long, sinuately spiny-serrate, silvery white beneath: fls. 6-10; ovules about 4: fr. blue-violet; stigma subsessile. Burma. Cult. 1930. Zone VII?—*B. Cóiia* Schneid. Brts. subterete: lvs. elliptic-oblong, to 7 cm. long, closely serrate, lustrous above, white beneath: ovules 4-5: fr. bluish black, slightly bloomy. Burma. Cult. 1928.—*B. calliantha* Mulligan. Shrub to 1 m.: lvs. elliptic to elliptic-oblong, 2-6 cm. long, impressed-reticulate above: fls. 1-3, 2.5 cm. across; pedicels 2-4 cm. long; ovules 7-9: fr. ovoid to oblong-ovoid, 1-1.3 cm. long. G.C.97:390,391. N.F.10:f.85. S.E. Tibet. Intr. 1925. Zone VII?

Ser. 5. *ANGULOSAE* Schneid. Lvs. usually deciduous, often papillose beneath: fls. usually 1-3, rarely 5; ovules 2-8; style wanting or very short: fr. red or pink.

15. *B. dictyophýlla* Franch. Deciduous shrub to 2 m.; brts. slightly angular, usually reddish and very glaucous while young, red-brown the second year; spines 3-parted, 5-15 mm. long: lvs. obovate to obovate-oblong, 1-2.5 cm. long, usually entire and rounded at the apex, sometimes spiny-toothed, bright green and reticulate above, chalky-white beneath: fls. solitary, pale yellow, 1.5 cm. across, short-stalked: fr. ovoid, 1 cm. long, red, with short, but distinct style. Franchet, Pl. Delav. t.11. (*B. d. f. albicaulis* Hesse.) W. China.

Cult. 1890. Zone (V).—*B. d. epruinosa* Schneid., var. Brts. more strongly angled, not bloomy: lvs. glaucescent or nearly green beneath. Intr. 1910.—*B. d. approximata* (Sprague) Rehd., var. Lvs. 0.6–1.5 cm. long, mostly spiny-toothed: fls. smaller. B.M.7833(c). B.S.1:239(as *B. dictyophylla*). (*B. a.* Sprague.) Intr. about 1892.

16. *B. sibírica* Pall. Deciduous shrub, to 0.5 m.; brts. angled, gray or grayish brown the second year; spines 3–5-, or sometimes 7–11-parted, slender, 3–8 mm. long: lvs. obovate to obovate-oblong, 1–2.5 cm. long, sinuately spiny-toothed with spreading teeth, green and reticulate beneath: fls. 1–2, 1 cm. across, on short pedicels, nodding: fr. ovoid, 7 mm. long, red. B.R.6:487(c). G.O.t.64(c). S.H.1:309,f.194t-u. Siberia. Intr. before 1781. Zone IV?—Low densely branched shrub with small bright green lvs.

*B. s. × vulgaris*; see under No. 50.

17. *B. concinna* Hook. f. Deciduous or half-evergreen shrub, to 1 m.; brts. grooved, pale brown the second year; spines 3-parted, 1–2 cm. long: lvs. obovate, 1–3.5 cm. long, remotely spiny-dentate, bright green above, white and reticulate beneath: fls. 1–2, 1–1.5 cm. across; pedicels 2–3 cm. long: fr. oblong, 1.5–2 cm. long, red. B.M.4744(c). Sikkim-Himal. Intr. about 1850. Zone VI? Desirable shrub with handsome lvs., white beneath, and large bright yellow fls.

18. *B. diáphana* Maxim. Deciduous shrub to 1 or 2 m.; brts. rather stout, grooved, yellowish or yellowish gray; spines 8–30 mm. long: lvs. obovate to oblong-obovate, 2–3.5 cm. long, obtusish, spinose-serrulate or sometimes entire, glaucous and reticulate beneath: fls. bright yellow, 1.5 cm. across, solitary or 2–5 on a common peduncle; pedicels 1.5–2 cm. long; ovules 6–12: fr. ovoid-oblong, often attenuated at apex, with short style, 1–1.5 cm. long, bright or pale red, slightly bloomy. B.M.8224(c, as *B. yunnanensis*). S.T.2:t.109. M.G.32:90(h.fr.). W. China. Intr. 1894. Zone V. Lvs. turning scarlet in fall.

*B. d. × pruinosa*; see under No. 7.

Related species: *B. aemulans* Schneid. which differs chiefly in the reddish or purplish brts.: fr. 1.5–1.8 cm. long; pedicels 2–3 cm. long, 1–3, without or very short peduncle. W. China. Intr. 1908. Zone V.—*B. Tischleri* Schneid. Brts. reddish or purple: lvs. rarely entire: inf. a 4–10-fl. raceme; ovules 3–5: fr. about 1 cm. long, with distinct style. W. China. Intr. 1910. Zone VI?

19. *B. yunnanensis* Franch. Shrub to 2 m.; brts. reddish or yellowish, grooved; spines to 2.5 cm. long: lvs. obovate to obovate-oblong, 2–3.5 cm. long, obtuse or acutish, usually entire, on shoots often sparingly spinulose-serrate, slightly reticulate and green beneath: fls. 3–8, pale yellow, 1.5 cm. across, in short racemes or nearly umbellate, peduncled or sessile; pedicels 1–2.5 cm. long: fr. ovoid, 1.5 cm. long, bright red, with sessile or subsessile stigma. S.H.1:f.198h-n;2:f.573c. W. China. Cult. 1904. Zone VI.

Related species: *B. Faxoniána* Schneid. Brts. slightly angled, often reddish: lvs. obovate-oblong, 1.5–3 cm. long, with 4–10 spreading teeth on each side: inf. 2–6-fl. fr. ellipsoid, purple, with a very short style. Origin unknown, probably intr. from W. China before 1900. Zone V.—*B. consimilis* Schneid. Brts. grooved, yellowish brown, gray when older: lvs. obovate-oblong, 1.5–2 cm. long, spinulose-dentate: inf. 3–8-fl.; ovules usually 4: fr. ellipsoid, purple; stigma sessile. Origin unknown, cult. since 1904.—*B. tsarongensis* Stapf. Brts. red to brown: lvs. obovate or elliptic to oblanceolate, 1.5–3.5 cm. long, entire or spinose-dentate with 1–4 teeth on each side: fls. 7–8 mm. across, in 3–8-fl. fascicles or umbel-like racemes; pedicels 5–15 mm. long: fr. oblong-ellipsoid, 1 cm. long, dark red. B.M.9332(c). W. China. Intr. 1917. Zone VI?

20. *B. circumserrata* Schneid. Upright shrub to 1 m.; brts. grooved, yellowish or slightly reddish; spines 1–5-parted, to 2.5 cm. long: lvs. obovate to obovate-oblong, 1.5–3.5 cm. long, rounded at apex, cuneate at base, densely

spinulose-serrate, those of the shoots sometimes nearly entire, reticulate and whitish beneath: infl. 1-3-fld.; peduncle to 2.5 cm. long; fls. yellow, 1 cm. across; ovules usually 4: fr. ellipsoid-oblong, 1.3-1.5 cm. long including the distinct style, yellowish red. N. W. China. Intr. 1911. Zone V. Similar to *B. diaphana*, but lvs. densely serrulate.

21. *B. angulosa* Wall. Upright shrub to 1.5 m.: brts. grooved, puberulous; spines 1-5-parted, to 1.5 cm. long: lvs. obovate to oblong-obovate, 1.5-3.5 cm. long, with 1-3 spiny teeth on each side or entire, slightly revolute, whitish beneath: fls. solitary, globose, 1.5 cm. across, orange-yellow, on stalks 1-2.5 cm. long, or in short 2-4-fld. racemes: fr. ellipsoid, 1.5 cm. long, red. B.M. 7071(c). Himal. Intr. about 1850. Zone VI?

Related species: *B. suberecta* Ahrendt. Brts. glabrous: lvs. elliptic-obovate to elliptic-oblong, 1.2-3 cm. long, remotely setose-dentate: infl. 5-6-fld.; pedicels 6-10 mm. long: fr. oblong-ovoid, 1 cm. long, deep rosy-red; stigma subsessile. (*B. Giraldi* hort., not Hesse.) Orig. unknown. Cult. 1939.

Ser. 6. POLYANTHAE Schneid. Lvs. deciduous or half-evergreen: infl. paniculate, sometimes reduced to a short and dense raceme: fr. red; ovules 2-5; style distinct.

22. *B. Wilsónae* Hemsl. & Wils. Deciduous or half-evergreen shrub: brts. with very short internodes, angled, puberulous at first, yellowish or brownish red, brown or grayish brown the second year; spines 3-parted, slender, 1-2 cm. long: lvs. oblanceolate, 6-20 mm. long, obtuse or sometimes acutish and mucronulate, dull pale green above, glaucescent beneath, reticulate on both sides: fls. about 7 mm. across, golden yellow, in 3-many-fld. dense fascicles, or in short dense panicles not exceeding 1.5 cm.; pedicels 2-4 mm. long: fr. subglobose, 5-6 mm. long, salmon- or coral-red, often paler on one side, with short distinct style. B.M.8414(c). Gs.1:180,t(c),185. G.C.42:372. Gn.89:537. R.H.1920:9(h). W. China. Intr. 1903. Zone (V). Low, densely branched, very spiny shrub; sometimes prostrate, with small lvs. assuming brilliant autumnal tints and with profuse light red berries.—*B. W. Stapfiana* Schneid., var. Brts. glabrous: lvs. oblanceolate to obovate-oblong, mucronulate: infl. 4-7-fld.: fr. ellipsoid. B.M.8701(c). (*B. Stapfiana* Schneid.) W. China. Cult. 1894. Zone VII?—*B. W. subcaulialata* Schneid., var. Brts. glabrous, strongly angled: lvs. obovate to oblong-obovate, occasionally with 1 or few teeth near the apex, whitish beneath: infl. 6-8-fld. R.H.1920:29(h). G.C.79:24. Gn.85:501. (*B. s.* Schneid., *B. Coryi* Veitch.) W. China. Intr. 1894. Zone VII?—Probably "Tom Thumb," a dwarf dense form, is a form of this species. Gn. 87:555(h).

*B. W. × ? aggregata* = *B. rubrostilla* Chittenden. Lvs. obovate-spatulate, 1-2 cm. long, entire and partly spiny-toothed; fr. ovoid, scarlet, about 1.5 cm. long, in pendulous few-fld. panicles or racemes, to 2 cm. long. G.C.60:236. Gn. 80:563;85:580. J.L.42:f.65. Orig. before 1916.—Here belong probably: "Comet" with ovoid coral-red frs. in dense, profusely produced clusters. G.C.75:59. Gn. 87:578.—"Autumn Beauty" with coral-red frs. in short panicles. G.C.74:209.—"Lady Beatrice Stanley" with subglobose coral-red frs. in short, dense, pendulous panicles. G.C.72:283. Gn.86:569.—Other named forms see Gn.85:566,567, 581.

Related species: *B. parvifolia* Sprague. Low dense shrub: lvs. obovate-oblong to obovate, 5-15 mm. long, remotely spiny-dentate or sometimes entire, glaucescent: fls. 6 mm. across, in dense 2-10-fld. racemes shorter than lvs., pedicels 2-5 mm. long; fr. broad-ellipsoid, 6 mm. long, red, bloomy. W. China. Cult. 1896. Zone V.—*B. àrido-cálida* Ahrendt. Lvs. broad-elliptic to obovate, sparsely spiny-serrulate, often entire on shoots: pedicels 1-2 mm. long: fr. elliptic-oblong. N. W. China. Intr. 1916. Zone V?

23. *B. aggregata* Schneid. Shrub to 3 m.; brts. strongly angled, puberulous, grayish brown the second year; spines 3-parted, slender, 1-2 cm. long:

lvs. obovate to obovate-oblong, 1-2.5 cm. long, spinulose-serrate or sometimes sparingly spiny-toothed, rarely entire, reticulate and glaucescent beneath: fls. pale yellow, about 6 mm. across, in sessile dense panicles 1-4 cm. long; pedicels 1-3 mm. long: fr. globose-ovoid, 5-6 mm. long, red, bloomy, with distinct style. Gn.88:645. S.L.101. M.G.32:82(fr.)83(h). (*B. Geraldii* Veitch.) W. China. Intr. 1908. Zone V. Densely branched shrub, handsome in fr.—*B. a. Pratii* (Schneid.) Schneid. Lvs. to 3.5 cm. long, usually obovate, often entire: panicles 3-6 cm. long, subsessile, or to 10 cm. long and peduncled. B.M.8549(c). S.L.102(h). (*B. P. Schneid.*, *B. brevipaniculata* Bean, not Schneid.) W. China. Intr. 1904. Zone V.—*B. a. recurvata* Schneid., var. Lvs. usually oblong-obovate, often entire: panicles, including the 1.5-3.5 cm. long stalk, 4.5-10 cm. long, cylindric, its lower brts. very short, 2-4-fld.; pedicels recurved in fr.: fr. subglobose, about 5 mm. long, scarlet. W. China. Intr. 1908. Zone V.

*B. a. ?*  $\times$  *Wilsonae*; see under No. 22.

Related species: *B. Edgeworthiana* Schneid. Lvs. elliptic to elliptic-lanceolate, 1.5-3 cm. long, acute, spiny-serrate, green beneath and coarsely reticulate: infl. 1.5-3 cm. long: fr. oblong, 8-10 mm. long, red; stigma subsessile. N. W. Himal. Intr. 1920. Zone VI?

24. *B. polyantha* Hemsl. Upright shrub to 4 m.; brts. angled, glabrous or slightly puberulous, grayish brown or dull brown the second year; spines solitary or 3-parted, 1-2 cm. long: lvs. obovate or broad-obovate, 1.5-3 cm. long, rounded at apex, spiny-dentate, rarely entire, dull green above, glaucescent or glaucous below, finely reticulate on both sides, fls. deep yellow, about 1 cm. across, in pendulous much-branched panicles 5-12 cm. long; pedicels 1-5 mm. long: fr. oblong-ovoid, 7-8 mm. long, 3-4 mm. thick, salmon red, narrowed into a distinct style. Gn.84:583;85:581. G.C.62:183;72:263. Gs.13:193. W. China. Intr. 1904. Zone VI? Distinct with its large panicles of deep yellow fls.

Ser. 7. TINCITORIAE Schneid. Lvs. deciduous or half-evergreen, usually obovate-oblong or obovate-lanceolate: fls. in umbel-like or simple racemes or in panicles; ovules 1-4, style usually distinct.

25. *B. aristata* DC. Deciduous shrub to 3 m.; brts. nearly terete, gray or yellowish brown the second year: spines simple or 3-parted, to 3 cm. long: lvs. obovate-elliptic or obovate to obovate-oblong, 2.5-6 cm. long, acute or obtuse, spiny-dentate or sometimes entire, light green or whitish beneath and slightly reticulate, chartaceous at maturity: fls. bright yellow, often reddish outside, in 10-25-fld. racemes 5-10 cm. long: fr. oblong, about 1 cm. long, red or finally purple, bloomy, with short style; pedicels shorter or as long as the fruit. Bentley & Trimen, Med. Pl. 1:t.16(c). B.S.1:235. N. W. Himal. Intr. about 1820. Zone V.—*B. a. coriaria* (Royle) Schneid., var. Young brts. grooved. B.R.27:46(c). (*B. c.* Royle, *B. aristata* var. *floribunda* Bean, partly.) N. W. Himal. Intr. 1835.

*B. a. ?*  $\times$  *vulgaris* = *B. macracantha* Schrad. Tall shrub to 4 m.; brts. grooved or nearly terete, usually yellowish gray the second year; spines to 3 cm. long; lvs. usually obovate, remotely spinulose-serrate; racemes long, 10-20-fld.; fr. ellipsoid, purple; style short or wanting; the lower pedicels longer than frs. (? *B. alkuthiensis* Usteri.) Orig. about 1830.

Related species: *B. kewensis* Schneid. Brts. angled, red-brown: lvs. narrow-elliptic to elliptic-obovate, 2.5-5 cm. long, spiny-serrate, glaucescent and distinctly veined beneath: infl. 4-8 cm. long; fls. 10 mm. across: fr. oblong-ovoid, 1 cm. long, dark violet, bloomy, with short style. Orig. unknown, possibly hybrid. Cult. 1889. Zone (V).

26. *B. Chitria* Lindl. Deciduous or half-evergreen shrub, to 3 m. or occasionally to 6 m.; young brts. terete or slightly grooved, puberulous, yellowish

gray to reddish brown the second year; spines; usually simple, to 3 cm. long; lvs. obovate or elliptic to obovate-lanceolate, 2.5–8 cm. long, acute or acutish, entire or with 1–5 teeth on each side, bright green beneath, slightly reticulate on both sides: infl. paniculate, pendulous, many-fl., peduncled; pedicels 5–10 mm. long; fls. pale yellow, about 1 cm. across; ovules 4–5, stipitate: fr. elliptic-oblong, 1.2 cm. long, dark red or purple, bloomy, with distinct style. B.R.9:729(c). B.M.2549(c). (*B. aristata* Sims, not DC.) Himal. Intr. 1920. Zone VII?

*B. ? c. × ?* = *B. Spaethii* Schneid. Brts. subterete, glabrous: lvs. elliptic to ovate-oblong or obovate, spinulose-serrate, light green or grayish beneath: infl. paniculate or racemose: fr. purple, bloomy, with very short style. Origin unknown; cult. 1902.

27. *B. Francisci-Ferdinándi* Schneid. Shrub to 3 m.; brts. nearly terete or slightly angled, purplish when young, red-brown the second year; spines usually simple, to 2.5 cm. long; lvs. ovate to ovate-lanceolate, 2–7 cm. long, spiny-dentate, rarely nearly entire, green beneath and somewhat lustrous, slightly reticulate; petioles 5–15 mm. long; fls. about 8 mm. across, in pendulous peduncled panicles 5–12 cm. long; pedicels to 1 cm. long; ovules 2, subsessile; fr. ellipsoid, 1.2 cm. long, scarlet, with very short style. B.M.9281(c). W. China. Intr. 1900. Zone V. Conspicuous with its drooping panicles of scarlet frs.

Related species: *B. Beaniàna* Schneid. Brts. slightly angled, reddish while young, gray when older; spines 3-parted, to 2 cm. long; lvs. elliptic-lanceolate, acute, 2–4 cm. long, spiny-dentate, whitish beneath: fls. 6 mm. across, in 10–20-fl. panicles to 4 cm. long; ovules 3–4, subsessile: fr. about 1 cm. long, purple, bloomy; stigma sessile. B.M.8781(c). G.C.72:351. Gn.83:591. (*B. Veitchii* Hort. Veitch.) W. China. Intr. 1904. Zone VI?

Related species with racemose infl.: *B. Jamesiàna* Forr. & W. W. Sm. Lvs. obovate to oblong-obovate, 1–3 cm., on shoots to 10 cm. long, entire or spinulose-serrulate, finely reticulate: fls. 6 mm. across, in pendulous racemes 2–10 cm. long, sometimes branched at base: fr. globose, coral-red. B.M.9298(c). G.C.78:168. W. China. Intr. 1913. Zone VII?—*B. leptoclada* Diels. Brts. purple, bloomy: lvs. obovate to oblong-obovate, 1–2 cm. long, obtuse and mucronate, entire or with few spiny teeth, reticulate: racemes few-fl., slender-peduncled; pedicels to 1 cm. long; fr. with short style. W. China. Cult. 1928. Zone VII.—*B. pallens* Franch. Brts. purple-brown, grooved: lvs. oblanceolate, 1.5–3 cm. long, obtuse and mucronate, entire or with few teeth, glaucescent beneath, reticulate: fls. 1 cm. across, in sessile, 5–12-fl. racemes, 2–5 cm. long; pedicels 5–20 mm. long; fr. oblong-ovoid, 1 cm. long, bluish purple, bloomy, with distinct style. W. China. Intr. 1929. Zone VI?

Ser. 8. ASIATICAE Schneid. Lvs. evergreen or half-evergreen, pale green or whitish and papillose beneath: fls. in racemes, panicles or fascicles; ovules 3–5, sessile; style short.

28. *B. Lycium* Royle. Half-evergreen shrub to 3 m.; brts. terete, puberulous, yellowish gray, gray the second year; spines 3-parted, to 2 cm. long; lvs. oblanceolate to obovate-lanceolate, 2–5 cm. long, acute or obtuse and mucronulate, entire or with few teeth, light green above, glaucescent and papillose beneath: fls. bright yellow, in 10–20-fl. racemes, usually elongated, sometimes paniculate, to 10 cm. long, rarely short and umbel-like; pedicels to 2 cm. long; fr. ellipsoid, 8–12 mm. long, purple, bloomy, with distinct style. B.M.7075(c). (*B. ruscifolia* Lav., not Lam., *B. elegans* Hort.) Himal.: Kashmir to Nepal. Intr. about 1850. Zone VII.

Related species: *B. lycioides* Stapf. Brts. glabrous: lvs. oblanceolate, entire or slightly toothed, glaucescent, but not papillose beneath: infl. usually paniculate; fls. 1 cm. across; pedicels 5–10 mm. long; fr. ellipsoid-oblong, 1–1.2 cm. long, black-purple, with blue-white bloom. B.M.9102(c) Himal. Cult. 1925. Zone VII?

Ser. 9. INTEGERRIMAE Schneid. Lvs. deciduous, petioled, lanceolate to broad-

obovate, entire or serrate, usually grayish green and reticulate on both sides: racemes elongated, dense, spike-like; ovules 2-4, subsessile or short-stipitate: fr. red; stigma sessile.

29. *B. nummulària* Bge. Shrub to 3 m. tall; brts. terete, purple and bloomy when young, purplish brown the second year; spines usually simple, 1-3 cm. long: lvs. oblong-obovate to oblanceolate, 2-4 cm. long, obtuse or acutish, gradually narrowed into a petiole 5-15 mm. long, entire or rarely with a few teeth, glaucescent and reticulate on both sides, subchartaceous; fls. yellow, 5-6 mm. across, in dense many-fl. racemes 3-5 cm. long; ovules 2-3; pedicels 3-6 mm. long in fr.: fr. globose-ovoid, 5-6 mm. long, red or pale red. Turkest., N. Persia. Intr. before 1878. Zone V. Spreading shrub with pale bluish green lvs.—The form described above is var. *pyrocàrpa* (Reg.) Schneid.; the typical form differs in its broad-obovate lvs. S.H.1:f.198p-q.

Closely related species: *B. iliénsis* Popov. Lvs. oblong-lanceolate to lanceolate-spatulate; pedicels 5-7 mm. long, 4-6 times longer than bracts. C. Asia. Intr. 1936. Zone V.

30. *B. turcomànica* Karelín. Shrub to 3 m.; brts. nearly terete or slightly grooved, usually purple and bloomy while young, purplish brown the second year; spines simple or 3-parted, 1-2.5 cm. long: lvs. very unequal, petioled, obovate-oblong, 2.5-4 cm. long, obtuse, narrowed at base into a petiole 1-2.5 cm. long, entire or sparingly spinulose-serrate, glaucescent on both sides and reticulate: fls. bright yellow, about 8 mm. across, in 12-25-fl., usually rather dense racemes 4-7 cm. long; ovules 3-4, subsessile; pedicels to 1 cm. long: fr. ellipsoid, to 9 mm. long, dark red, bloomy. S.H.1:f.198r-v'. Turkest. and N. Persia to Armenia. Cult. 1880. Zone V. Similar to the preceding species.—*B. t. integerrima* (Bge.) Schneid., var. (*B. i.* Bge.) has the lvs. papillose beneath, while the typical form and the following var. have no papillae.—*B. t. densiflora* Schneid. Racemes denser; pedicels to 6 mm. long. Nouv. Mem. Soc. Nat. Mosc. 12:t.3.f.2. (*B. d.* Boiss. & Buhse, *B. integerrima* var. *serratifolia* Boiss.) N. Persia. Intr. before 1906. Zone V.

31. *B. Vèrnæ* Schneid. Shrub to 2 m.; brts. grooved, purplish; spines usually simple and short, sometimes to 3 cm. long: lvs. very unequal, spatulate to oblanceolate, 1-2.5 cm. long, rarely to 4 cm. long, obtuse, rarely acute, nearly always entire, green and slightly reticulate on both sides: fls. yellow, 3-4 mm. across, in dense racemes with the short peduncle 1.5-4 cm. long; pedicels 1-3 mm. long; ovules 2, sessile: fr. globose, about 5 mm. across, pale red. B.M.9089(c). M.G.32:82. (*B. Caroli* var. *hoanghensis* Schneid.) N. W. China. Intr. 1910. Zone V. Graceful spreading shrub with dense racemes of small fls.

Ser. 10. HETEROPODAÆ Schneid. Lvs. deciduous, petioled, usually entire: fls. in fascicles or in umbel-like or elongated racemes, sometimes compound at base: ovules 2-6, stipitate: fr. bluish black.

32. *B. heterópoda* Schrenk. Shrub to 2 m.; brts. terete, brown, lustrous, grayish brown the second year; spines simple or 3-parted, to 2.5 cm. long, sometimes wanting: lvs. broad-ovate to obovate or elliptic, 2-5 cm. long, obtuse, abruptly contracted at base into a petiole to 2 cm. long, entire or finely serrate, grayish green above, glaucous beneath, slightly reticulate on both sides: fls. orange-yellow, fragrant, 1.2 cm. across, in short, 3-8-fl. umbel- or fascicle-like racemes; pedicels to 1.5 cm. long; ovules 4-6, long-stipitate: fr. subglobose or ovoid, about 1 cm. long, black, bloomy; stigma sessile; seeds usually 3. G.F.8:455. B.C.1:591. Turkest. Intr. 1876. Zone V. Spreading shrub with bluish green lvs. and fragrant fls.

*B. h.* × ? *vulgaris* = *B. notabilis* Schneid. Tall upright shrub; brts. slightly grooved, grayish brown while young; lvs. obovate to obovate-oblong, nearly always serrate: racemes elongated, 14–20-fld.; fls. smaller: fr. elliptic-ovoid, dark red, bloomy. Orig. 1895.

33. *B. oblóna* (Reg.) Schneid. Shrub to 2 m. or more; brts. terete or slightly grooved, chestnut-brown, lustrous, little changing the second year; spines simple or 3-parted, 5–15 mm. long; lvs. very unequal, obovate-oblong to elliptic, 2–5.5 cm. long, obtuse, abruptly contracted at base, entire or remotely serrulate, grayish green above, glaucescent beneath, slightly reticulate on both sides; fls. yellow, about 1 cm. across, in 10–20- or occasionally to 50-fld. panicles; pedicels 6–10 mm. long; ovules 2–3, short-stipitate: fr. ellipsoid, about 1 cm. long, purplish black, bloomy, with a very short style; seed usually 1. (*B. heteropoda* var. *o.* Reg.) Turkest. Intr. about 1874. Zone V. Similar to the preceding species, but with larger infl.

Ser. 11. TSCHONOSKYANAE Schneid. Similar to the preceding group, but fr. red and ovules 2, subsessile.

34. *B. Silva-Taroucana* Schneid. Shrub to 3 m.; brts. grooved, reddish brown, older grayish; spines usually simple, small or wanting; lvs. obovate-oblong to oblong-lanceolate, 1.5–5.5 cm. long, obtuse, usually contracted at base into a petiole to 2 cm. long, entire or remotely serrate, green above, pale and pruinose beneath, slightly reticulate on both sides: fls. yellow, about 8 mm. across, in 8–12-fld. racemes 3–7 cm. long; pedicels 1–2 cm. long; fr. globose-ovoid, to 1 cm. long, scarlet; stigma sessile. W. China. Intr. 1908. Zone V.

Closely related species: *B. Mouillacana* Schneid. which differs chiefly in the lvs. being lustrous green beneath and in the purplish brown brts.: pedicels 5–13 mm. long. W. China. Intr. 1908. Zone V.

Ser. 12. SINENSES Schneid. Brts. more or less purplish or red-brown the second year: lvs. deciduous, lanceolate to obovate, usually entire or remotely toothed: fls. in racemes, sometimes short, fascicle-like, rarely solitary; ovules 1–2; fr. usually red; stigma sessile.

35. *B. Thunbergii* DC. Much-branched shrub to 2.5 m.; brts. strongly grooved, yellowish or purplish red, purple-brown the second year; spines usually simple, 5–18 mm. long; lvs. very unequal, obovate to spatulate-oblong, 1–3 cm. long, obtuse, rarely acute, narrowed at base into a petiole 2–10 mm. long, quite entire, bright green above, glaucescent beneath: fls. yellow, reddish outside, 8–10 mm. across, solitary or 2–4 and fascicled or umbellate and peduncled; pedicels 6–10 mm. long; fr. ellipsoid, about 1 cm. long, bright red. B.M.6646(c). G.F.2:53. A.F.8:526(h). (*B. sinensis* K. Koch, not Desf., *B. japonica* Hort.) Japan. Intr. about 1864. Zone V. Dense shrub much used for hedges; lvs. turning scarlet in fall, the bright red frs. remaining nearly unchanged during the winter.—*B. T. argenteo-marginata* Schneid., f. Lvs. variegated with white. G.C.49:10 (as "Silver Beauty").—*B. T. atropurpurea* Chénault. Lvs. deep purple.—*B. T. minor* Rehd., var. Low dense form, scarcely exceeding 0.5 m.; lvs. 1 cm. or less long. M.G.32:90(h). S.L.99(h). (*B. T.* var. *Dawsonii* Bean.) Orig. before 1900.—*B. T. erecta* Rehd., f. TRUEHEDGE B. Brs. strictly upright forming a dense column. H.B. 13:48(h).—*B. T. pluriflora* Koehne, f. Infl. subumbellate, 4–10-fld.—*B. T. Maximowiczii* (Reg.) Reg., var. Lvs. narrower, usually acute, green beneath.

*B. T.* × *vulgaris* = *B. ottawensis* Schneid. It differs chiefly in the 5-many-fld. umbellate or sometimes racemose infl., in the often serrulate lvs. and in the yellowish brown, rarely purplish brts.; from *B. vulgaris* it may be distinguished by the color of the brts., by the obovate often entire lvs. usually not exceeding 3 cm., and by the shorter, usually subumbellate infl. (*B. auricoma* Lemoine.)

Cult. 1889.—*B. o. purpurea* Schneid., var. Lvs. purple or purplish.—*B. T. × Juliana*; see under No. 13.

36. *B. viréscens* Hook. Shrub to 3 m. with slender upright brs.; brts. terete, lustrous red-brown the second year; spines simple or 3-parted, slender, 1–2 cm. long: lvs. obovate to obovate-oblong, 1.5–3 cm. long, rounded or mucronate at apex, remotely toothed or entire, bright green above, glaucous beneath: fls. pale yellow, in few-fl. peduncled, usually umbel-like racemes; pedicels slender, about 1 cm. long: fr. oblong, about 1 cm. long, purple, bloomy. B.M.7116(c). Sikkim-Himal. Intr. about 1850. Zone V.—*B. v. macrocarpa* Bean, var. Fr. larger, nearly black.

Related species: *B. oritrépha* Schneid. Brts. brighter red; spines stouter and longer: lvs. more reticulate, partly setose-serrate, glaucescent beneath: umbel-like racemes 3–6-fl., often subsessile. N. China. Intr. 1911. Zone V.

37. *B. Poiréti* Schneid. Shrub to 2 m.: brts. slender, grooved, purplish brown; spines small, usually simple, about 5 mm. long; lvs. oblanceolate to narrow-ob lanceolate or lanceolate-spatulate, 1.5–4 cm. long, acute and mucronulate, cuneate at base, entire, bright green above, light or grayish green beneath, slightly reticulate: fls. bright yellow, reddish outside, about 6 mm. across, in peduncled, 8–15-fl. racemes: pedicels in fr. about 5 mm. long; bracts 2.5–3.5 mm. long: fr. ovoid-oblong, about 1 cm. long, bright red. B.S.1:248. (*B. sinensis* DC., partly, not Desf., *B. sinensis* var. *angustifolia* Reg.) N. China, Amurl. Intr. about 1860. Zone IV. Shrub with spreading brs. and dense racemes of bright yellow fls.

*B. ? P. × canadensis* = *B. durobrivensis* Schneid., with reddish brown brts., small spines, serrulate lvs. obovate-oblong to oblanceolate and the racemes often with longer stalked fls. at the base. Orig. before 1906.

Related species differing in having the bracts much shorter than the pedicels: *B. Boschänii* Schneid. Spines to 1.8 cm. long: lvs. obovate, 1–2 cm. long: fr. ellipsoid, about 5 mm. long, coral-red. W. China. Intr. 1908. Zone VI?—*B. thibética* Schneid. Brts. slightly angled; spines to 2.5 cm. long: lvs. obovate-oblong, 1–2.5 cm. long, entire or with few teeth: fr. ellipsoid, about 1 cm. long, red, with short style. W. China. Intr. 1903. Zone VI?—*B. Lecômteii* Schneid. Lvs. oblong-obovate, to oblanceolate or lanceolate, obtusish, entire: fls. in short racemes, sometimes subumbellate: fr. ellipsoid, crimson. W. China. Cult. 1927. Zone VI?—*B. lepidifolia* Ahrendt. Lvs. linear-ob lanceolate, 1.5–4.5 cm. long: infl. subumbellate; pedicels 5–10 mm. long: fr. ovoid, blue-black, slightly bloomy, 5–6 mm. long; style very short, but distinct. W. China. Intr. 1923? Zone VII?

38. *B. chinensis* Poir. Shrub to 3 m.; brts. grooved, purple- or red-brown; spines simple or 3-parted, 5–18 mm. long: lvs. oblanceolate to obovate-lanceolate, 1.5–4 cm. long, acute or obtusish, entire or with few teeth, bright green above, pale green or slightly glaucescent beneath, slightly reticulate on both sides: fls. 6–8 mm. across, in peduncled, 10–12-fl. racemes to 7 cm. long; pedicels in fr. 7–15 mm. long, much longer than the bracts: fr. ellipsoid to elliptic-oblong, about 1 cm. long, dark red and often bloomy. B.M. 6573(c). G.O.t.63(c, as *B. canadensis*). (*B. sinensis* Desf., *B. spathulata* Schrad., *B. sanguinolenta* Schrad., *B. Guimpeli* K. Koch & Bouché, *B. serotina* Lge.) Caucas. Cult. 1808. Zone V. Similar to the preceding, but with somewhat broader leaves.

*B. ? c. × vulgaris* = *B. laxiflora* Schrad. Brts. grayish brown the first, grayish the second year: lvs. obovate-oblong, 2–5 cm. long, remotely serrulate or sometimes entire: racemes 4–9 cm. long, usually nearly sessile. Orig. before 1838.—*B. l. oblanceolata* Schneid., var. Lvs. oblanceolate, rather densely serrulate. Orig. unknown; before 1880.—*B. l. Langeana* Schneid., var. Brts. purplish brown, grayish brown the second year: lvs. obovate-oblong, 2–6 cm. long, remotely dentate. (*B. Guimpeli* Hort., not Koch.) Orig. unknown.—*B. ? c. × amurensis* = *B. Meehanii* Schneid. Brts. angled, grayish brown or brownish, grayish the second year; spines usually simple, to 2 cm. long: lvs. obovate to

elliptic, 2.5–4 cm. long, densely serrulate, reticulate beneath: racemes 4–9 cm. long: fr. ellipsoid, red, slightly pruinose. Orig. unknown (distributed by Meehan as *B. concinna*).

Related species: *B. crataegina* DC. Young brts. nearly terete, brown, grayish the second year; spines usually simple: lvs. oblong-ovate to oblanceolate, 1–4 cm. long, entire or with few teeth: racemes 6–20 fld.: fr. ellipsoid, purple-black. S.H.1:f.197r-t. Asia Minor. Intr. 1835, but doubtful if now in cult. Zone V.—*B. cretica* L. Much-branched shrub, sometimes procumbent; brts. nearly terete, purplish; spines usually 3-parted, 5–20 mm. long: lvs. oblanceolate to obovate-oblong, 8–15 mm. long, obtuse or acutish, entire, slightly reticulate: fls. in 2–7 fld. fascicles or short racemes: fr. purple-black, with short style. S.F.9:t.342(c). S.H.1:f.194d-f. Greece. Intr. 1703. Zone VII?

39. *B. canadensis* Mill. Upright shrub to 2 m.; brts. brown to dull purple, slightly angled, grayish the second year; spines usually 3-parted, to 1.2 cm. long: lvs. obovate to obovate-oblong, 2–5 cm. long, usually obtuse, remotely spinulose, grayish white beneath, with indistinct veins, firm at maturity: fls. bright yellow, in 5–15 fld. racemes 2–4.5 cm. long; pedicels 5–10 mm. long: fr. ellipsoid to short-ellipsoid, 7–9 mm. long, scarlet. Gr.G.1:t.31. G.W.1:101,t(c). B.B.2:127. (*B. pisifera* Raf., *B. caroliniana* Loud., *B. angulizans* Massias.) Va. to Ga. and Mo. Cult. 1730. Zone V.—Lvs. turn scarlet in fall and the bright red frs. remain a long time unchanged. Often confused with *B. vulgaris*.

*B. ? c. × vulgaris* = *B. declinata* Schrad. Brts. yellowish or brownish, tinged violet, brownish gray the second year: lvs. obovate-oblong to elliptic-obovate, remotely serrate or subentire, grayish beneath: racemes often umbel-like, usually peduncled, 3–5 cm. long; pedicels partly whorled, 5–7 mm., the lower to 1 cm. long: fr. elliptic-oblong, about 1 cm. long, blood-red. Orig. before 1830.—Var. *oxyphylla* Schneid. differs chiefly in the acute, densely serrulate lvs. Origin unknown, possibly a hybrid of *B. canadensis* and *B. amurensis*.—*B. ? c. × Fendleri* = *B. Rehderiana* Schneid. Brts. slender, red-brown, slightly angled; spines 3–5-parted: lvs. obovate to oblong-obovate, 2–3 cm. long, spinulate: racemes peduncled, 3–15 fld.: fr. subglobose, 5–6 mm. across, bright red, lustrous, persisting nearly unchanged through the winter. Orig. about 1880. Zone V.—*B. c. × Poireti* = *B. durobrivensis*; see under No. 37.

40. *B. Fendleri* Gray. Shrub to 1.5 m.; brts. slender, red-brown, lustrous, nearly terete; spines 3–5-parted, to 1.2 cm. long: lvs. obovate-lanceolate to obovate-oblong, 2–3.5 cm. long, acute, entire or remotely spinulose, lustrous above, green and reticulate beneath: fls. bright yellow, tinged red outside, in short 6–10 fld. slender-peduncled racemes; pedicels 4–6 mm. long: fr. short-ellipsoid, 5–6 mm. long, bright red, lustrous. Clements, Rocky Mtn. Fl. t.4,f.3. S.H.1:f.197h-l. Colo. to N. Mex. Cult. 1880. Zone (V). Attractive in fall with its bright red lustrous fr. and its lvs. changing to scarlet.

*B. ? F. × canadensis*; see under No. 39.

41. *B. Sieboldii* Miq. Shrub to 1.5 m.; brts. angled, two-edged toward the end, slender, red-brown the second year; spines slender, 3-parted, to 1.2 cm. long: lvs. elliptic to oblong, 3–8 cm. long, obtuse or acutish, densely ciliate, green beneath: fls. pale yellow, in 3–6 fld. peduncled, umbel-like racemes: fr. subglobose, 5–6 mm. long, bright red, lustrous. S.T.1:t.14. S.L.100(h). Japan. Intr. 1892. Zone V. Distinct species with the lvs. at first purplish and marked with green veins, changing to vinous red in fall; the frs. remain nearly unchanged until spring.

42. *B. Bretschneideri* Rehd. Spreading shrub, to 4 m.; brts. nearly terete or slightly grooved, reddish brown the second year; spines simple or 3-parted, 5–15 mm. long: lvs. obovate-elliptic to obovate-oblong, 3–8 cm. long, usually obtuse, attenuate at base, densely setose-serrate, light green or purple glaucescent beneath and reticulate: racemes peduncled, 2.5–4 cm., rarely to 5 cm. long, 10–15 fld.; pedicels 6–10 mm. long: fr. ellipsoid, 1–1.2 cm. long,

purple, slightly bloomy. S.T.2:t.110. Japan. Intr. 1892. Zone V. Similar to *B. vulgaris* but with red-brown, nearly terete brts.

43. *B. koreana* Palib. Shrub to 2 m.; brts. grooved, reddish and bloomy, dark brown the second year; spines usually simple, 5–10 mm. long: lvs. obovate or elliptic, 2.5–7 cm. long, rounded at apex, cuneate at base, rather densely spinulose-serrulate, paler and reticulate beneath, subchartaceous at maturity: racemes rather short and dense, without the slender peduncle 2–3.5 cm. long; pedicels 4–6 mm. long: fr. subglobose, about 6 mm. long, bright red. J.C.26,1:t.5. N.K.21:t.7. Gn.88:645. M.G.32:92(h),93. Korea. Intr. 1905. Zone V. The lvs. change to deep red in fall; the frs. retain their bright color a long time.

44. *B. Henryana* Schneid. Shrub to 2 or 3 m.; brts. slightly angled, yellow or dark brown the second year; spines simple or 3-parted, to 3 cm. long: lvs. petioled, elliptic to broad-obovate-oblong, 2–5 cm. long, usually obtuse, entire or with few teeth to spinulose-dentate, grayish green and bloomy beneath, slightly reticulate; petioles, 3–12 mm. long: racemes peduncled, 2.5–6 cm. long, 10–20-fld.; pedicels 6–9 mm. long; fls. 9–10 mm. across: fr. ellipsoid, 9 mm. long, blood-red, slightly bloomy. C. China. Intr. 1907. Zone V. Shrub with slender brs., similar to *B. vulgaris*.

Closely related species: *B. Dielsiana* Fedde; it differs chiefly in the narrower, acute lvs., greener beneath, in the longer raceme sometimes compound at base, and in the more brightly colored frs. W. China. Intr. 1910. Zone V.

Ser. 13. DASYSTACHYAE Schneid. Lvs. usually long-petioled and rounded at base, broad, serrulate: racemes erect, dense; ovules 1–2: fr. red; stigma sessile.

45. *B. dasystachya* Maxim. Upright shrub to 4 m.; brts. reddish or light brown, terete or slightly angular, red-brown the second year; spines usually simple, 5–15 mm. long, rarely to 3 cm.: lvs. long-petioled, suborbicular or broad-ovate to broad-elliptic, 3–5 cm. long, obtuse, usually rounded at base, ciliate-serrate, glaucescent beneath; petiole 1–3 cm. long: racemes upright, slender, with the peduncle 5–6 cm. long; pedicels about 5 mm. long; peduncle 1–1.5 cm. long; fls. about 6 mm. across: fr. ellipsoid, 6–7 mm. long, coral-red. Maximowicz, Fl. Tangut. t.7,f.1–7. G.C.79:325. S.H.2:f.573f,574l. C. and N. W. China. Intr. 1893. Zone V. Distinct on account of its broad, long-petioled lvs. similar to those of *B. heteropoda*, but bright green.

Closely related species: *B. kansuensis* Schneid. Brts. bright red, slender: lvs. more remotely and less setosely serrate, those at base of infl. broad, often sub-orbicular, subsessile, usually entire: fls. about 8 mm. across: pedicels 3–10 mm. long. N. W. China. Intr. 1910. Zone V?

Ser. 14. BRACHYPODAE Schneid. Lvs. and usually the infl. pubescent: racemes dense, spike-like.

46. *B. Gilgiana* Fedde. Shrub to 2 m.; brts. grooved, slightly pubescent, yellow or purplish brown, red-brown the second year; spines usually 3-parted, 5–25 mm. long: lvs. elliptic or elliptic-obovate to oblong, 2.5–4.5 cm. long, acute, attenuate at base, remotely serrate, dull green and slightly pubescent or glabrous above, grayish green and pubescent beneath: fls. about 6 mm. across, bright yellow, in dense racemes 2.5–3.5 cm. long, on slender puberulous peduncles 1.5–2 cm. long; pedicels 1–3 mm. long; bracts shorter: fr. oblong-obovoid, 8–10 mm. long, deep blood-red, slightly bloomy. (*B. pubescens* Pampan.) N. C. China. Intr. 1910. Zone V.

47. *B. mitifolia* Stapf. Shrub to 2 m.; young brts. finely grooved, minutely pubescent, grayish; spines simple or 3-fld, 1–2.5 cm. long: lvs. obovate or elliptic-obovate to oblong, 3–6 cm. long, acute or obtuse, minutely spinulose-serrulate or entire, bright green and sparsely puberulous above, pubescent

beneath chiefly on the veins: fls. 8-10 mm. across, in dense pubescent racemes 3-6 cm. long, sometimes branched near base; peduncle 1-2 cm. long; pedicels 2-4 mm. long, as long as the red subulate bracts; outer whorl of sepals oblong-lanceolate, puberulous, red; fr. oblong-ellipsoid, 10-12 mm. long, crimson. B.M.9236(c). Gn.87:555. M.G.32:90. G.C.74:251. (*B. brachypoda* Schneid., not Maxim.) C. China. Intr. 1907. Zone V. Distinct with its spike-like racemes and pubescent lvs.

Related species: *B. brachypoda* Maxim. Young brts. angled: lvs. obovate, 3-6 cm. long, obtuse or acutish, strongly spinulose-dentate, chartaceous, often rugose above and pubescent when young, strongly reticulate beneath and pilose chiefly on the veins: infl. 2-4 cm. long; pedicels 1 mm. long; fr. ovoid, 5-6 mm. long, scarlet. Maxim. Fl. Tangut. t.7. N. W. China. Intr. 1926. Zone V.

48. *B. Giráldii* Hesse. Shrub to 2 m.; brts. slightly angled, glabrous, yellowish brown or dark brown; spines usually simple, sometimes to 2.5 cm. long: lvs. rhombic-ovate or oblong-ovate, 4-10 cm. long, acute, serrulate, dark green above and nearly glabrous, pubescent and bright green and reticulate beneath, reddish when unfolding: racemes spike-like, pendulous, to 10 cm. long including the peduncle, glabrous; pedicels 2-3 mm. long; fls. pale yellow, 9 mm. across: fr. ellipsoid, purple. M.D.1913:267. N. C. China. Intr. about 1900. Zone V. Similar to the preceding species, but lvs. and racemes larger.

Ser. 15. *VULGARES* Schneid. Brts. yellowish gray or gray, grooved: lvs. deciduous, serrate or dentate: racemes usually long and many-fld., pendulous; ovules 2-3; stigma sessile: fr. red or purple, usually bloomy.

49. *B. amurénsis* Rupr. Shrub to 3.5 m.; brts. grooved, yellowish gray, gray the second year; spines usually 3-parted, 1-2 cm. long: lvs. elliptic to obovate-oblong, 3-8 cm. long, obtuse or acute, densely and irregularly setose-serrulate, reticulate and bright green, rarely glaucescent beneath: racemes to 10 cm. long, 10-25-fld., pendulous; pedicels 5-10 mm. long; fr. ellipsoid, about 1 cm. long, bright red, often bloomy. N.K.21:t.5. S.H.1:f.200k-m. (*B. vulgaris* var. *a.* Reg.) N. E. Asia. Intr. before 1860. Zone II. Lvs. brighter green than those of *B. vulgaris* and habit more upright.—*B. a. japonica* (Reg.) Rehd., var. Lvs. broader, often rounded at apex, more densely serrulate and distinctly reticulate beneath: raceme shorter, 6-12-fld., slightly nodding. G.F.3:249. (*B. Regeliana* Koehne.) Japan. Intr. before 1875.

Related species: *B. dictyonera* Schneid. Young brts. reddish, older gray: lvs. elliptic- to oblong-obovate, 1.5-3 cm. long, spiny-serrulate, strongly and densely reticulate, grayish beneath: infl. short, 4-7-fld.: pedicels 2-4 mm., in fr. 6-10 mm. long; fr. ovoid or obovoid. N. W. China. Intr. 1911. Zone V.

50. *B. vulgaris* L. Shrub to 2.5 or occasionally taller; brts. strongly grooved, yellowish or sometimes yellowish red while young, gray the second year; spines usually 3-parted, 1-2 cm. long: lvs. elliptic-obovate to obovate-oblong, 2-4 cm. long, obtuse, rarely acutish, attenuated into a petiole to 1 cm. long, greenish and slightly reticulate beneath: racemes short-stalked, 4-6 cm. long; pedicels 5-12 mm. long; fr. ellipsoid or elliptic-oblong, 8-12 mm. long, bright red or purple. E.B.1:t.51(c). R.I.3:f.4486(c). H.W.3:17, f.243. Eu., frequently naturalized in N. Am. Long cult. Zone III.—*B. v. marginata* Reg., var. Lvs. margined with white. (*B. v. argenteo-marginata* Usteri.)—*B. v. aureo-marginata* Reg., f. Lvs. margined yellow.—*B. v. atropurpurea* Reg., f. Lvs. deeply purple (*B. v.* var. *purpurea* Bertin, not DC.) Gt.9:t.278,f.1(c).—*B. v. lutea* DC., f. Fr. bright yellow.—Var. *B. v. alba* West., var. Fr. white or yellowish white. N.D.3:t.52(c). (*B. v. leucocarpa* Ktze.)—*B. v. enúclea* West., var. Fr. without seeds. (*B. v.* var. *asperma*

Willd., *B. v. apyrena* Schrad.)—*B. v. dulcis* Loud., var. Fr. sweet or but slightly acid. (*B. v. var. edulis* Jaeg.)

*B. v. × sibirica* = *B. emarginata* Willd. Densely branched shrub to 1 m. or taller; brts. angled, yellowish or purplish, yellow-gray the second year; spines sometimes 5-7-parted: lvs. obovate-oblong to obovate-lanceolate, 1.5-4 cm. long, acute or obtuse, setosely serrulate, grayish beneath: racemes dense, 1-3.5 cm. long, 5-16-fld.; pedicels 5-8 mm. long; fls. 8-10 mm. across; petals emarginate; fr. ellipsoid, about 1 cm. long, deep red, slightly bloomy, sometimes with very short style. G.O.t.68(c). (*B. vulgaris* var. *e.* Gord.) Orig. unknown, about 1800.—*B. e. britzensis* Schneid., var. Young brts. brownish: lvs. more densely serrulate: racemes to 4 cm. long. Orig. unknown.—Probably also a hybrid with *B. sibirica*, but much nearer the latter species is *B. provincialis* Schrad. Brts. grooved, yellowish brown, grayish brown the second year; lvs. obovate-oblong to narrow-oblong, 1.2-2.5 cm. long, finely setose-serrulate, green and reticulate beneath: racemes 1-3 cm. long, sometimes subumbellate, 6-12-fld.; pedicels 3-6 mm. long; fls. 6-8 mm. across; fr. 8-9 mm. long with sessile stigma. (*B. vulgaris* var. *p.* Audib.) Orig. before 1830.—*B. p. serrata* Schneid., var. Low shrub; lvs. lanceolate or oblanceolate, 1-2 cm. long, acute, setose-serrulate with 6-10 teeth on each side, grayish green beneath and reticulate: fr. red, about 7 mm. long. (*B. s.* Koehne, *B. microphylla* var. *s.* Hort.)—*B. v. × Veitchii*; see under No. 9.—*B. v. × aristata*; see under No. 25.—*B. v. × heteropoda*; see under No. 32.—*B. v. × Thunbergii*; see under No. 35.—*B. v. × chinensis*; see under No. 38.—*B. v. × canadensis*; see under No. 39.—*B. v. × Mahonia Aquifolium* = *Mahoberberis Neuberti*; see p. 225.

Closely related species: *B. aetnensis* Presl. Dwarf shrub, to 0.5 m.; spines stout, to 3 cm. long: lvs. 1.5-3 cm. long, sometimes nearly entire: racemes 5-15-fld. (*B. vulgaris* var. *a.* Reg.) Moris, Fl. Sard. t.5. S. Eu. Cult. 1894. Zone VII?

## 26. MENISPERMACEAE DC. MOONSEED FAMILY

Woody or suffruticose plants, mostly twining: lvs. alternate, usually palmately veined and often lobed: fls. dioecious, small, regular, usually in axillary racemes or fascicles, often paniced; sepals usually 6 in 2 whorls; petals 6, usually smaller than sepals, sometimes wanting; stamens usually 6, or more, free or connate; anthers 2- or 4-celled; carpels usually 3, each with 1 half-inverted ovule, developing into sessile or stipitate, much curved drupes with a usually sculptured bony or chartaceous endocarp; embryo usually curved; cotyledons flat or semiterete.—About 200 species in 63 genera, chiefly in the Tropics, in N. Am. n. to Man., none in Eu.

- A. Lvs. not peltate, entire or lobed; stamens 6-12.
- B. Lvs. deeply cordate at base and deeply 5-7-lobed; sepals 9; petals 0; drupes 2.5 cm. long ..... 1. *Calycocarpum*
- BB. Lvs. rounded or subcordate at base, entire or shallowly 3-7-lobed; sepals and petals 6; drupes 1 cm. or less long.
- C. Lvs. ovate to ovate-oblong, entire and obtuse or 3-lobed; fr. in clusters or spikes. .... 2. *Cocculus*
- CC. Lvs. broad-ovate, entire and acuminate or 5-7-lobed: stamens 9-12: fr. in pendulous panicles to 15 cm. long. .... 3. *Sinomenium*
- AA. Lvs. peltate, sometimes slightly so, shallowly palmately 3-7-lobed: stamens 12-24; sepals 4-10; petals 6-9. .... 4. *Menispermum*

1. **CALYCOCARPUM** Nutt. Twining deciduous shrub; lvs. long-petioled, palmately lobed: fls. greenish, in large panicles; sepals 9; petals wanting; stamens 12; anthers 2-celled; pistillate fls. with 6 staminodes; carpels 3, with a short thick style: drupe ellipsoid or subglobose; stone deeply hollowed out on one side and erosely toothed on the margin of the cavity, convex and smooth on the other. (Greek *calyx*, cup, and *carpos*, fruit, referring to the cup-like stone.) One species.

C. *Lyoni* Nutt. High climbing; glabrous or slightly pubescent: lvs. broad-ovate or orbicular in outline, 10-20 cm. long, broad-cordate at base, deeply palmately 3-7-lobed, with ovate to oblong, acute or acuminate, repand or

entire lobes, bright green beneath: fls. in peduncled loose panicles 10–20 cm. long: drupe about 2.5 cm. long, black. Fl.v–vi; fr.viii. E.P.IV.94:129. Gr.G. 1:t.30. B.B.2:130. Ill. to Kans., s. to Fla. and Tex. Intr. 1879 or before. Zone VI? Strong growing vine with large leaves.

**2. CÔCCULUS DC.** Twining or erect shrubs, deciduous or evergreen: lvs. entire or lobed: fls. in panicles or racemes; sepals and petals 6; stamens 6–9; anthers 4-celled; staminodes 6 or 0; carpels 3–6; style cylindric, with lateral stigma: drupes obovoid or subglobose; stone compressed, transversely ribbed. (Diminutive of Greek *kokkos*, berry.) Syn.: *Cebatha* Forsk. Eleven species in E. and S. Asia., Afr., Hawaii Isls., and N. Am.

A. Fr. red: petioles 1.5–4 cm. long: lvs. glabrous above: petals emarginate or entire at apex.  
 AA. Fr. bluish black: petioles 1–2 cm long: lvs. pubescent on both sides: petals bifid at the apex ..... 1. *C. carolinus*  
 ..... 2. *C. trilobus*

**1. C. carolinus (L.) DC. CAROLINA MOONSEED.** Twining to 4 m.; brts. pubescent: lvs. orbicular- to triangular-ovate, 5–9 cm. long, obtuse and mucronulate at apex, rounded to subcordate at base, entire or shallowly 3–5-lobed, pubescent and glaucescent beneath: fls. in short or sometimes spike-like panicles to 10 cm. long: fr. red, 6–8 mm. long. Fl.vi–viii. Gr.G.1:t.28. S.H.1:327. (*Cebatha carolina* Brit.) Va. and Ill. to Fla. and Tex. Intr. 1732. Zone V.

**2. C. trilobus (Thunb.) DC.** Twining to 4 m.; brts. pubescent: lvs. usually ovate, sometimes ovate-oblong, 4–9 cm. long, obtuse and mucronate or acutish, rounded to cordate at base, entire or 3-lobed with the middle lobe usually elongated, pubescent on both sides: fls. in axillary cymes, sometimes forming an elongated terminal spike: frs. subglobose, 7 mm. across, black, bloomy, forming usually dense peduncled clusters. Fl.vi–viii; fr.x. B.M.8489 (c). I.T.6:t.231. B.S.1:376. S.H.1:f.205k-n. (*C. Thunbergii* DC.) Japan, China, Philipp. Isls. Intr. before 1870. Zone V. Much-branched twining shrub keeping its lvs. green until late in fall.

**3. SINOMENIUM Diels.** Deciduous twining shrub: lvs. long-petioled and palmately lobed or entire: fls. inconspicuous, in large panicles; sepals 6; petals 6; stamens 9–12; anthers 4-celled; pistillate fls. with 9 staminodes; carpels 3; style recurved with lobulate stigma: drupe excentric; stone curved with a tubercled dorsal rib and numerous transverse ribs. (*Sina*, China, and Greek *men*, moon; meaning Chinese moonseed.) One species.

**S. acutum (Thunb.) Rehd. & Wils.** Twining to 6 m.; brts. glabrous, striped: lvs. ovate, 6–15 cm. long, acuminate, rounded or cordate at base, entire or 3–7-lobed, usually with rather narrow elongated lobes, glabrous and dark green above, glaucescent and slightly pubescent beneath or nearly glabrous: fls. in panicles 10–20 cm. long: drupe compressed, 6–7 mm. across, bluish black. Fl.vi; fr.x. G.C.52:411. (*Menispermum a.* Thunb., *Cocculus diversifolius* Miq., *C. heterophyllus* Hemsl. & Wils., *S. diversifolium* Diels.) Japan, C. China. Intr. 1901. Zone VI? Vigorous climber with large handsome foliage.—**S. a. cinereum** (Diels) Rehd. & Wils., var. Lvs. pubescent above and densely grayish pubescent beneath. Intr. 1907.

**4. MENISPERMUM L. MOONSEED.** Twining suffruticose plants: lvs. long-petioled, peltate, 3–7-lobed: fls. small, in peduncled racemes or panicles, sepals 4–10; petals 6–9, suborbicular, shorter than the sepals, stamens 12–18, rarely 24; anthers 4-celled; pistillate fls. with 6–12 staminodes; carpels 2–4,

with broad sessile stigma: drupes 2-3; stone compressed, reniform or crescent-shaped, crested on back; endosperm copious; cotyledons semiterete, remaining enclosed in the seed. (Greek *men*, moon, and *sperma*, seed.) Two species in N. Am. and E. Asia.

- A. Young growth pubescent: petiole attached just inside the margin.....1. *M. canadense*  
 AA. Young growth glabrous: lvs. distinctly peltate.....2. *M. dauricum*

1. *M. canadense* L. COMMON M. Climbing to 4 m.; brts. finely pubescent when young; lvs. slender-petioled, orbicular-ovate, 10-20 cm. long, acute or obtuse, rounded or truncate at base, entire or shallowly angulate-lobed, slightly pubescent beneath or nearly glabrous at maturity; petioles 5-15 cm. long; panicles loose, without the slender peduncle 2-6 cm. long; sepals 6-10; drupe subglobose, about 8 mm. across, bluish black. Fl.v-vi; fr.x-xi. B.M. 1910(c). E.P.IV.94:256. F.E.28:261(h). G.W.1:63(h). Que. and Man. to Ga. and Ark. Cult. 1646. Zone IV. Attractive in fall with its bluish black fr. resembling small grapes.

2. *M. dauricum* DC. Twining to 4 m.; brts. glabrous: lvs. orbicular-ovate, 6-12 cm. long, acute or acuminate, angulate-lobed, rarely entire, quite glabrous, glaucous beneath; petioles 3-12 cm. long; fls. in slender-stalked, short, often umbel-like panicles; sepals in the terminal fls. usually 6, in the lateral, 4; drupes about 1 cm. across, black, in dense clusters. Fl.vi; fr.x(-v). G.F.5:233. B.C.4:2034. E. Asia. Intr. 1883. Zone IV. Similar to the preceding, but lvs. and fruiting clusters smaller; spreading by suckers.

## 27. TROCHODENDRACEAE Prantl. TROCHODENDRON FAMILY

Trees or shrubs; buds large, acute, with many imbricate scales: lvs. alternate, long-petioled, penninerved, serrate: fls. perfect, without perianth, in fascicles or racemes; stamens numerous; carpels 5-many, free or immersed in the fleshy torus; stigmas linear; ovules 1 to many on the introrse ventral suture: fr. a samara or a dehiscent follicle; seed with copious endosperm and small embryo.—Two genera with 4 species in E. Asia.

- A. Lvs. deciduous: fls. in small clusters before the leaves: fr. a samara.....1. *Euptelea*  
 AA. Lvs. evergreen: fls. in terminal racemes: fr. consisting of dehiscent follicles.

### 2. *Trochodendron*

1. *EUPTÉLEA* Sieb. & Zucc. Deciduous shrubs or small trees; buds with dark brown lustrous scales: lvs. dentate: fls. before the lvs., slender-stalked, in fascicles from axillary buds; stamens numerous with linear-oblong red anthers; carpels many, stipitate, oblique, with decurrent stigma, developing after the stamens have dropped; ovules 1 or few; carpels developing into stipitate obliquely winged samaras, 1-4-seeded. Fr.ix-x. (Greek *eu*, well, handsome and *ptelea*, elm; referring to the shape of the fruit.) Three species in E. Asia and Himal.

- A. Lvs. coarsely and unequally dentate.....1. *E. polyandra*  
 AA. Lvs. fairly regularly sinuate-dentate.....2. *E. Franchetii*

1. *E. polyandra* Sieb. & Zucc. Shrub or tree to 15 m.; brts. reddish brown: lvs. roundish-ovate, 6-12 cm. long, cuspidate, broad-cuneate or nearly rounded at base, light green beneath, with a few scattered hairs on the veins; petioles 2-5 cm. long: carpels usually 1-seeded, incl. the slender stipe-like base 1.2-1.5 cm. long. S.Z.t.72(c). S.I.1:t.41(c). B.C.2:1174. Gng.16:162. Japan. Cult. 1877. Zone V. Slender tree with handsome foliage reddish when unfolding, changing to red and yellow in autumn.

2. **E. Franchétii** Van Tiegh. Tree to 15 m.; brts. dark grayish brown: lvs. roundish-ovate to ovate, 5–12 cm. long, cuspidate, broad-cuneate at base, grayish green and sparingly pubescent beneath; petioles 2–5 cm. long: samaras 1–3-seeded. H.I.28:2787. I.S.I.:t.22. C.C.130. (*E. Davidiana* Hemsl., not Baill.) C. China. Intr. 1896. Zone V. Similar to the preceding.

Closely related species: *E. pleiosperma* Hook. f. & Thoms. Lvs. glaucescent and papillose beneath, of firmer texture; samaras with stipe to 2 cm. long. C.C. 131. (*E. Davidiana* Baill.) E. Himal., W. China. Cult. 1922. Zone VII.

2. **TROCHODÉNDRON** Sieb. & Zucc. Evergreen tree; terminal bud large, pointed, with imbricate scales: lvs. alternate and clustered, long-petioled, crenate: fls. perfect, without perianth, in terminal, upright racemes; stamens numerous, spreading, with long filaments; carpels 5–10, in a whorl, inserted on a fleshy torus; stigmas short, linear, spreading; ovules many: fr. consisting of 5–10 follicles, partly immersed in the torus and dehiscent at the free apex; seeds linear, several in each follicle. (Greek, *trochos*, wheel, and *dendron*, tree; referring to the aspect of the spreading stamens.) One species in E. Asia.

**T. aralioides** Sieb. & Zucc. Tree to 20 m., with spreading brs., glabrous: lvs. rhombic-obovate to elliptic-lanceolate, 8–15 cm. long, obtusely acuminate, cuneate at base, crenate-serrate, dark lustrous green above, paler beneath, coriaceous; petioles 3–7 cm. long: fls. about 1.5 cm. across, bright green, on slender pedicels 1.5–3 cm. long, forming racemes 6–8 cm. long: fr. brown, 1.5–2 cm. across. Fl.vi; fr.x. B.M.7375(c). S.I.I.:t.42(c). G.C.III.15:725. M.O.t.3. J.H.27:867(h). Japan, Korea. Cult. 1894. Zone VII. Usually a spreading shrub in cult.

## 28. CERCIDIPHYLLACEAE Van Tiegh. KATSURA-TREE FAMILY

Deciduous tree developing short spurs bearing the flowers and a solitary lf.; buds with 2 outer scales: lvs. opposite or subopposite on the shoots, solitary on the spurs, petioled, palmately veined, crenate-serrate: fls. dioecious, developing from axillary buds or spurs before the lvs., with small bracts and without perianth (what is called fl. here is by some botanists considered to represent an infl.); staminate fls. nearly sessile with slender filaments and linear red anthers; pistillate fls. pedicelled, consisting of 3–5 carpels with long purple styles, their sutures extrorse, developing into dehiscent many-seeded pods; seeds small, winged, with copious endosperm and small embryo. One monotypic genus in E. Asia.

**CERCIDIPHYLLUM** Sieb. & Zucc. KATSURA-TREE. Characters of the family. (*Cercis* and Greek *phyllon*, leaf; referring to the shape of the lvs.)

**C. japonicum** Sieb. & Zucc. Tree to 10, occasionally to 30 m., usually divided from the base into several stems, glabrous: lvs. suborbicular or broad-ovate, 5–10 cm. long, obtusish, cordate or subcordate at base, crenate-serrate, dark bluish green above, glaucescent beneath; petiole 2–3 cm. long: pods 1.5–2 cm. long. Fr.x. S.I.I.:t.41(c). M.K.t.42,43(c). G.F.7:106,107(h). Gn. 88:373,374(h). S.L.120(h). Japan. Intr. 1865. Zone IV. Ornamental tree of rather dense pyramidal habit, with slender, ascending, later spreading brs. and handsome foliage, purplish when unfolding, changing to bright yellow and partly scarlet in fall.—**C. j. sinense** Rehd. & Wils., var. Tree to 40 m., usually with a single trunk: lvs. somewhat hairy on the veins beneath; petiole

about 2 cm. long: pods gradually narrowed at apex, 1-1.5 cm. long. C.C.135. C. and W. China. Intr. 1907. Zone (V).

## 29. MAGNOLIACEAE Jaume St. Hil. MAGNOLIA FAMILY

Trees or shrubs; lvs. deciduous or evergreen, entire or lobed; stipules present or wanting; fls. regular, usually perfect, hypogynous; sepals 3, often not differing from the petals, rarely 4; petals 6 or more, rarely wanting; stamens numerous, spirally arranged, rarely 4; carpels usually spirally arranged, rarely in a whorl; ovary 1-celled, with 1 to several ovules; seeds anatropous; carpels developing into follicles, samaras or berries. Incl. *Winteraceae* and *Schisandraceae*.—Ten genera with about 80 species in the temp. and subtemp. regions of Am. and Asia.

- A. Stipules present, large, enclosing the succeeding young lf.: fls. perfect: trees or shrubs.
  - Subfam. MAGNOLIOIDEAE (DC.) Harms.
  - B. Lvs. entire, acute or acuminate: ripe carpel a dehiscent follicle.....1. *Magnolia*
  - BB. Lvs. lobed, truncate at apex: ripe carpel a samara.....2. *Liriodendron*
  - AA. Stipules wanting.
    - B. Fr. capsular, dehiscent: fls. perfect: trees or upright shrubs.
    - C. Lvs. penninerved, evergreen: fls. with many petals.
      - Subfam. ILLICIOIDEAE (DC.) Harms.
      - 3. *Illicium*
    - CC. Lvs. palmately 5-7-nerved, deciduous; fls. apetalous, 4-merous.
      - Subfam. TETRACENTROIDEAE Harms.
      - 4. *Tetracentron*
- BB. Fr. of berrylike carpels: fls. unisexual: twining shrubs.
  - Subfam. SCHIZANDROIDEAE (Gray) Harms.
  - C. Carpels after anthesis spicate.....5. *Schisandra*
  - CC. Carpels after anthesis capitate.....6. *Kadsura*

1. **MAGNOLIA L.** Deciduous or evergreen trees or shrubs: buds with a single scale, the terminal much larger than the lateral ones: lvs. petioled, entire, large; stipules adnate to the petiole and enclosing the young successive lf., their scar encircling the stem: fls. terminal, large, solitary, the bud enclosed in a stipular spathe; sepals 3, often petaloid; petals 6-15; stamens numerous; carpels numerous, adnate to a usually elongate torus developing into a cone-like fruit consisting of dehiscent 1-2-seeded carpels; seeds suspended at maturity for some time by long thin threads. (After Pierre Magnol, director of the Botanic Garden at Montpellier; 1638-1715.) Syn.: *Kobus* Nieuwl. About 35 species in N. and C. Am. and in E. Asia and Himal.

- A. Fls. after or with the lvs.: fr. subglobose to oblong, cone-like, usually symmetrical.
- B. Lvs. deciduous or half-evergreen.
  - C. Fls. greenish or yellow: lvs. 18-25 cm. long, scattered.
    - D. Brts. glabrous or nearly so: fls. greenish, 6-8 cm. high.....1. *M. acuminata*
    - DD. Brts. densely pubescent: fls. canary yellow, 4-5 cm. high.....2. *M. cordata*
  - CC. Fls. white, large.
    - D. Lvs. cordate at base.
      - E. Leaf-buds and brts. tomentose: lvs. scattered, 50-75 cm. long.
        - 3. *M. macrophylla*
    - EE. Leaf-buds and brts. glabrous: lvs. crowded at end of the brts.
      - F. Lvs. acute: tips of mature carpels nearly straight.....4. *M. Fraseri*
      - FF. Lvs. obtusely pointed: tips of mature carpels incurved.....5. *M. pyramidata*
    - DD. Lvs. cuneate at base, rarely rounded or subcordate.
      - E. Lvs. 12-60 cm. long, crowded at end of the brts.: buds and brts. glabrous.
        - F. Fr. 6-10 cm. long; carpels whitish during anthesis: lvs. gradually narrowed at base.....6. *M. tripetala*
        - FF. Fr. 12-16 cm. long; carpels purple: lvs. usually abruptly contracted at base.
          - 7. *M. obovata*
  - EE. Lvs. 7-16 cm. long, scattered.
    - F. Lvs. obovate or broadly elliptic, often rounded at base, 4-11 cm. broad; sepals pink.
      - G. Young brts., petioles and peduncles pubescent: fls. 8-10 cm. across, slender-stalked.....8. *M. Sieboldii*
      - GG. Young brts., petioles and peduncles glabrous or nearly so: fls. 12-15 cm. across, on stout peduncles.....9. *M. Watsoni*

- ff. Lvs. elliptic or ovate-oblong to oblong-lanceolate; fls. pure white.  
 g. Lvs. acute or acuminate, deciduous; pedicel 1.5-3 cm. long. 10. *M. Wilsonii*  
 gg. Lvs. obtusish or obtusely short-acuminate, glaucous and nearly glabrous beneath, sometimes half-evergreen; pedicel 1-1.5 cm. long. 11. *M. virginiana*  
 bb. Lvs. evergreen, ferrugineous-pubescent beneath; fls. 15-20 cm. across. 12. *M. grandiflora*  
 aa. Fls. appearing before the lvs.: fr. cylindric, usually curved, unsymmetrical.  
 b. Sepals 3, much smaller and narrower than petals, greenish (except in No. 16); petals 6.  
 c. Fls. white.  
 d. Lvs. oblong-lanceolate or narrowly elliptic; broadest below the middle; leaf-buds glabrous ..... 13. *M. salicifolia*  
 dd. Lvs. obovate to obovate-oblong, broadest above the middle; leaf-buds slightly pubescent ..... 14. *M. Kobus*  
 cc. Fls. purple, rarely nearly white.  
 e. Sepals small, lanceolate, greenish; petals purple ..... 15. *M. liliflora*  
 dd. Sepals usually half as long as petals and more or less petaloid; fls. sometimes nearly white ..... 16. *M. Soulangeana*  
 bb. Sepals and petals alike.  
 c. Sepals and petals obovate to oblong-obovate, 9-12, rarely more, 2 cm. or more broad.  
 d. Lvs. abruptly acuminate; sepals and petals 9 ..... 17. *M. denudata*  
 dd. Lvs. usually rounded and often emarginate at apex; sepals and petals 12 or more. 18. *M. Sargentiana*  
 cc. Sepals and petals narrow- or linear-oblong, 12-18, up to 1.5 cm. broad; lvs. 4-10 cm. long ..... 19. *M. stellata*  
 Subgen. **MAGNOLIASTRUM** DC. Fls. after the lvs.: buds with one bud-scale; fr. globose-ovoid to oblong, symmetrical; carpels crowded, beaked.

1. *M. acuminata* L. CUCUMBER-TREE. Pyramidal tree to 30 m.; bark dark brown, furrowed; brts. glabrous or slightly pubescent, red-brown, lustrous; buds pubescent; lvs. elliptic or ovate to oblong-ovate, or sometimes oblong-obovate, 10-24 cm. long, short-acuminate, rounded or acute at base, soft-pubescent and light green beneath; petioles 2.5-3.5 cm. long; fls. campanulate, 6-8 cm. high; petals obovate-oblong, greenish yellow, bloomy; sepals lanceolate, much smaller, soon reflexed; fr. ovoid to oblong, 5-8 cm. long, red. Fl.v; fr.viii-ix B.M.2427(c). L.B.418(c). S.S.1:t.4.5. F.E.20:64,t.102(h). E.H.6,t.358(h). N. Y. to Ga., w. to Ill. and Ark. Intr. 1736. Zone IV. Pyramidal tree with rather short brs. upright at first, later spreading, and with inconspicuous fls., but attractive red fr. in late summer.

2. *M. cordata* Michx. Shrub or round-headed tree to 10 m.; bark dark brown, scaly; brts. densely pubescent; lvs. oblong-obovate to elliptic, 8-15 cm. long, 6-11 cm. broad, short-acuminate or obtuse, broad-cuneate to rounded, rarely subcordate, at base, pubescent and pale beneath; petiole 1-2 cm. long; fls. on short pedicels, campanulate, 4-5 cm. high; sepals ovate, soon reflexed; petals obovate-oblong to oblong, yellow; fr. oblong-ovoid, 2.5-3.5 cm. long, dark red. B.R.325(c). L.B.474(c). S.S.1:t.6. S.M.345. (*M. acuminata* var. *c.* Sarg.) Ga. Intr. 1801. Zone V. Fls. more conspicuous than in the preceding species.

3. *M. macrophylla* Michx. LARGE-LEAVED CUCUMBER-TREE. Tree to 18 m.; brts. tomentose at first; buds tomentose; lvs. oblong-obovate, 30-80 cm. long, obtuse, subcordate-auriculate at base, glaucescent and finely pubescent beneath; petiole 4-10; fls. cup-shaped, 25-30 cm. across, fragrant, creamy-white; petals 6, oblong-obovate, 12-20 cm. long, reflexed above the middle, purplish at base, thick; sepals somewhat shorter than petals; fr. globose-ovoid, pubescent, 6-8 cm. long, rose-colored. Fl.v-vi. B.M.2981(c). S.S.1:t.7.3. G.C.28:324. Gn.33:539. G.F.8:165(h). F.E.14:23(h). Ky. to Fla., w. to Ark. and La. Intr. 1800. Zone (V). Round-headed tree with stout spreading brs., with large lvs. and large fls.

Closely related species: *M. Ashei* Weatherby. Shrub or tree to 8 m.: lvs. subappressed-pubescent beneath on midrib; fls. smaller; petals 10-14.5 cm. long, usually acute or acutish; fr. ovoid-cylindric, 5-11 cm. long. Jour. N. Y. Bot. Gard. 34:151. Fla. Cult. 1933. Zone VI.

4. *M. Fraseri* Walt. Tree to 15 m.; brts. and buds glabrous; lvs. spatulate-obovate, 20–50 cm. long, acute, cordate-auriculate at base, glaucescent beneath, glabrous; petioles 4–7 cm. long; fls. 20–25 cm. across, creamy white, fragrant; petals 6–9, 8–12 cm. long, oblong-obovate, contracted below the middle; sepals 3, caducous, shorter than petals; fr. ovoid-oblong to oblong, 8–12 cm. long, rose-red. Fl.vi. B.M.1206(c). S.S.1:t.11,12. H.H.210,211(b). Gn.44:935. F.E.33:1071(h). (*M. auriculata* Lam.) Va. to Ga. and Ala. Intr. 1787. Zone V. Tree with wide-spreading brs. forming an open head, with large bright green lvs., large white fls. and attractive rose-colored fr.

5. *M. pyramidata* Bartr. Tree to 10 m., glabrous; closely related to the preceding species: lvs. obovate, 14–22 cm. long, obtusely short-acuminate, auriculate at base, glaucescent beneath; petioles 2–4 cm. long; fls. 8–12 cm. across; petals gradually narrowed to the base; sepals much shorter: fr. oblong, 5–7 cm. long. Fl.vi. B.R.t.407(c). L.B.11:1092(c). S.T.1:t.51. Ga. to Fla. and Ala. Cult. 1825. Zone VI? Pyramidal tree with ascending brs.

6. *M. tripetala* L. UMBRELLA MAGNOLIA. Tree to 12 m.; brts. and buds glabrous; lvs. oblong-obovate, 25–60 cm. long, acute or short-acuminate, usually cuneate at base, pale and pubescent beneath, at least while young; petioles 1.5–3 cm. long; fls. 18–25 cm. across, white, of heavy odor; petals 6–9, oblong-obovate, 8–12 cm. long; sepals shorter, finally reflexed, light green; filaments purple; fr. ovoid-oblong, 7–10 cm. long, rose-colored. Fls.v-vi. L.D. 3:198(c). S.S.1:t.9,10. H.H.208,209(b). Gn.33:539. C.L.5:494. (*M. umbrella* Lam.) Pa. to Ala., w. to Ark. and Miss. Intr. 1752. Zone IV. Tree with widespreading brs. forming an open head, with large lvs. and large fls.; easily grown and often used as stock for species of this subgenus.

*M. t. × virginiana* = *M. Thompsoniana* (Loud.) Sarg. Buds glabrous; lvs. elliptic to oblong, 12–22 cm. long, acute, glaucescent and pubescent beneath; fls. 12–15 cm. across, fragrant sepals shorter than petals. Fl.vi-vii. B.M.2164(c). G.F.1:269. Gn.24:511. (*M. glauca* var. *T. Loud.*, *M. glauca* var. *major* Smith.) Orig. 1808. Zone VI.

7. *M. obovata* Thunb. (not Willd. and later authors). Tree to 30 m.; brts. purplish, glabrous, like the buds: lvs. obovate, 20–40 cm. long, usually abruptly contracted at base, obtusely pointed, glaucescent and pubescent beneath at least while young; petioles 2.5–4 cm. long; fls. cup-shaped, 14–16 cm. across, white, fragrant; petals 6–9, obovate, leathery; sepals similar, but shorter, sometimes pink outside; filaments and pistils bright crimson; anthers 1.6–1.8 cm. long; fr. cylindric-oblong, 14–20 cm. long, scarlet. Fl.v-vi. B.M. 8077(c). M.D.1904:1,t(c). M.K.t.44(c). G.F.1:305. (*M. hypoleuca* Sieb. & Zucc.) Japan. Intr. 1865. Zone V. Similar to *M. tripetala*, but of more pyramidal habit and with showier fls.

Closely related species: *M. officinalis* Rehd. & Wils. Brts. yellowish or grayish yellow; anthers 1–1.2 cm. long; fr. 10–12 cm. long. C. China. Intr. 1900. Zone VI?

8. *M. Sieboldii* K. Koch. Small tree to 10 m.; young brts. and buds appressed-pubescent: lvs. broad-elliptic or obovate to obovate-oblong, 6–15 cm. long, obtusely pointed, glaucescent beneath and pubescent at first, with 6–10 pairs of veins; petioles 1–2 cm. long, silky-pubescent while young, like the midrib beneath; fls. cup-shaped, 7–10 cm. across, white, fragrant, on a slender pubescent stalk 3–6 cm. long; petals usually 6, obovate; sepals somewhat shorter, reflexed, pink; carpels few, crimson like the filaments; fr. ovoid, 3–4 cm. long. Fl.vi-vii. B.M.7411(c). N.K.20:t.23. G.C.58:276(fr.);101:379, t(c). M.G.1913:484(h). (*M. Oyama* Kort, *M. parviflora* Sieb. & Zucc., not Bl.) Japan, Korea. Intr. about 1865. Zone (V) VI. A handsome species with showy fls.

9.  $\times$  *M. Watsoni* Hook. f. (*M. obovata*  $\times$  *Sieboldii*). Similar to the preceding: brts. glabrous or nearly so: lvs. obovate to oblong-obovate, 10-18 cm. long, finely pubescent beneath, with 10-15 pairs of veins; petiole about 2.5 cm. long: fls. 10-14 cm. across, on stout pedicels usually 2-3 cm. long, glabrous or nearly so; carpels many: fr. larger. B.M.7157(c). Gt.48:t.1459(c). Gn.24:508(c, as *M. parviflora*). G.C.III.17:517. Orig. in Japan. Cult. 1889. Zone (V). Fls. large, fragrant with crimson center and pink sepals.

10. *M. Wilsonii* (Fin. & Gagnep.) Rehd. Shrub or small tree to 8 m.; brts. and buds pubescent: lvs. ovate-oblong to oblong-lanceolate, 6-12 cm. long, acute or acuminate, rounded or sometimes subcordate at base, glabrous above, silky-tomentose beneath; petioles pubescent, 1.5-4 cm. long: fls. cup-shaped, 10-12 cm. across, white, fragrant, on pedicels 1.5-2 cm. long; sepals and petals 9, obovate, of equal size, thin; filaments crimson; carpels green: fr. oblong-cylindric, about 6 cm. long. Fl.vi. B.M.9004(c). R.H.1923:338. (*M. parviflora* var. *W.* Finet & Gagnep.) W. China. Intr. 1908. Zone (V) VI. Distinct and handsome.—*M. W. taliensis* (W. W. Sm.) Rehd., f. Lvs. glaucescent and glabrescent beneath except the rufous-pilose midrib. (*M. Nicholsoniana* Rehd. & Wils., *M. t.* W. W. Sm.) Intr. 1908.

*M. W. \times sinensis* has been raised about 1927. N.F.10:f.33.

Closely related species: *M. globosa* Hook. & Thoms. Lvs. ovate or broad-elliptic to elliptic-oblong, to 25 cm. long, obtuse to acute, rufous-pubescent beneath on the midrib and when young elsewhere; petiole rufous-pubescent: pedicels 3-6.5 cm. long, rufous-pubescent; carpels green. B.M.9467(c). N.F.10:f.92. (*M. tsarongensis* W. W. Sm. & Forrest.) E. Himal. to W. China. Intr. 1919. Zone VII.—*M. sinensis* (Rehd. & Wils.) Stapf. Brts. and petioles pubescent: lvs. obovate to elliptic or oblong-obovate, 10-20 cm. long and 6-16 cm. broad, rounded or short-pointed at apex, grayish or whitish villous beneath: fls. 12-15 cm. across; pedicels 2.5-6 cm. long, loosely villous or nearly glabrous; carpels crimson. G.C.89:408. N.F.5:f.3(h). (*M. globosa* var. *sinensis* Rehd. & Wils., *M. Nicholsoniana* Hort., not Rehd. & Wils.) W. China. Intr. 1908. Zone VII?

11. *M. virginiana* L. SWEET BAY. Deciduous shrub, or half-evergreen tree to 20 m. in the South; brts. slender, glabrous; buds pubescent: lvs. elliptic to oblong-lanceolate, 7-12 cm. long, acute or obtuse, broad-cuneate at base, rarely rounded, glaucous beneath and silky pubescent at first; petioles slender, 1-2 cm. long, glabrous: fls. subglobose, 5-7 cm. across, white, fragrant; petals 9-12, obovate, sepals shorter and thinner, spreading: fr. ellipsoid, 4-5 cm. long, dark red. Fl.vi-vii. Em.603,t(c). L.B.215(c). S.S.1:t.3. G.F.10:403. (*M. glauca* L.: SWEET or SWAMP BAY, BEAVER-TREE.) Mass. to Fla. and to Tex., near the coast. Intr. 1688. Zone V. Handsome shrub with lustrous lvs. persisting south until spring and with white fragrant fls.—*M. v. australis* Sarg., var. Young brts. and petioles densely silky-pubescent; pedicels tomentose. N. C. to Fla. and Tex.

*M. v. \times grandiflora* Freeman. Lvs. evergreen: fls. 12-15 cm. across. N.H. 16:161. Orig. 1930.

12. *M. grandiflora* L. BULL BAY. Evergreen pyramidal tree to 30 m.; brts. and buds rusty-pubescent: lvs. obovate-oblong or elliptic, 12-20 cm. long, obtusely short-acuminate or obtusish, cuneate at base, lustrous above, ferrugineous-pubescent beneath, firmly coriaceous; petioles stout, about 2 cm. long: fls. cup-shaped, 15-20 cm. across, white, fragrant, on a stout, tomentose pedicel; petals usually 6, rarely 9-12, obovate, thick; sepals 3, petaloid; filaments purple: fr. ovoid, 7-10 cm. long, rusty-tomentose. Fl.v-viii. S.S. 1:t.1,2. Gn.33:538. F.E.17:788,781(h). J.L.46:315(h). (*M. foetida* Sarg.) N. C. to Fla. and Tex. Cult. 1734. Zone VII. A magnificent evergreen tree, much planted in the warmer regions of this country and of Europe, with large

lustrous lvs. and very large fragrant white fls.—*M. g. lanceolata* Ait., var. Lvs. oblong-elliptic to oblong-lanceolate, less rusty beneath: of narrow pyramidal habit. B.M.1952(c). L.B.814(c). (*M. g. var. exoniensis* Loud.) There are many other named varieties and forms of which *M. g. gallsioniensis* K. Koch is said to be the hardiest.

Related species: *M. Delavayi* Franch. Tree to 10 m.; young brts. finely pubescent: lvs. ovate to ovate-oblong, 20–30 cm. long, dull green above, puberulous and glaucous beneath; petioles 3–8 cm. long: fls. 15–20 cm. across, white, petals usually 7; sepals 3, reflexed: fr. about 12 cm. long. B.M.8282(c). Millais, Magnol. 32,t(h). I.S.2:t.66. S. W. China. Intr. 1900. Zone VII?

Subgen. II. *GWILLIMIA* Rottler. Fls. before the lvs: buds with 2 bud-scales: fr. cylindric, unsymmetrical, usually curved and twisted; carpels distant, with semiorbicular valves, not or rarely beaked.

13. *M. salicifolia* (Sieb. & Zucc.) Maxim. Slender tree to 10 m.; brts. and leaf-buds glabrous, slightly glaucous; fl.-buds densely pubescent: lvs. elliptic-ovate to oblong-lanceolate, 7–12 cm. long, acuminate, broad-cuneate at base, with about 12 pairs of veins, light green above, glaucous and sparingly appressed-pubescent beneath; petiole slender, about 1–2 cm. long: fls. on short glabrous stalks, about 12 cm. across, white or purple at base outside, fragrant; petals 6, narrowly oblong-obovate, 5–6 cm. long; sepals lanceolate, about half as long as petals, greenish white: fr. cylindric, 4–7 cm. long. Fl.v-v. B.M.8483(c). S.I.1:t.40(c). G.F.6:67. G.C.51:223. Japan. Intr. 1892. Zone V.—*M. s. fasciata* Millais, var. Brs. upright forming a densely branched broadly columnar shrub. Millais, Magnol, 213,t(h).

*M. s. × stellata* = *M. Proctoriana* Rehd. Lf.-buds short-pubescent: lvs. broadest at or above the middle, green beneath: petals 6–12. Orig. 1928.

Closely related species: *M. Biondii* Pampan. Lvs. green beneath; petiole 5–15 mm. long; pedicel silky-pubescent: fr. 8–13 cm. long; seed deeply concave on the ventral side. R.H.1924:41(h). (*M. aulacosperma* Rehd. & Wills.) C. China. Intr. 1908. Zone VI?

14. *M. Kobus* DC. Tree to 10 m., usually shrubby in cult.; brts. glabrous; leaf-buds slightly, fl.-buds densely pubescent: lvs. broad-obovate to obovate, 6–10 cm. long, abruptly pointed, tapering to the cuneate base, light green beneath and pubescent on the veins, finally glabrous or nearly so; petioles 1–1.5 cm. long: fls. about 10 cm. across, white; petals 6–9, oblong-ovate, with a faint purple line at base outside; sepals narrow, about 1.5 cm. long, caducous: fr. cylindric, 10–12 cm. long. Fl.v-v. B.M.8428(c). S.I.1:t.39(c). G.C.37:264. S.T.2:t.126. (*M. Thurberi* Hort., *M. kobushi* Mayr.) Japan: Hondo. Intr. 1865. Zone V.—*M. K. borealis* Sarg., var. Pyramidal tree to 25 m.: lvs. larger, 6–15 cm. long: fls. about 12 cm. across, pure creamy white. M.K.t.45(c). N.K.20:t.24. G.F.6:66. B.C.4:1968. Japan: Hokkaido, N. Hondo. Intr. 1892. Zone IV. The hardest of the Asiatic Magnolias, but not blooming freely while young.

*M. K. × stellata*; see under No. 19.

15. *M. liliflora* Desrouss. Shrub to 3 m.; brts. glabrous, except near the tips; buds pubescent: lvs. obovate or elliptic-ovate, acute or short-acuminate, tapering at base, 10–18 cm. long, dark green and sparingly pubescent above, light green beneath and finely pubescent on the nerves: fls. large, campanulate, purple outside and usually white inside, on very short and stout pedicels; petals 6, oblong-obovate, obtuse, 8–10 cm. long; sepals lanceolate, about ½ as long, greenish, caducous: fr. oblong. Fl.v-vi. B.M.390(c). N.K.20:t.25. Gn.46:49. (*M. purpurea* Curt., *M. obovata* Willd. and later authors, not Thunb., *M. discolor* Vent., *M. denudata* Schneid., not Desrouss.) China, much cult. in Japan. Intr. 1790. Zone (V). Shrub with very showy purple

fls. appearing in succession and partly with the lvs.; var. *nigra* seems to be harder than the type.—**M. 1. grácilis** (Salisb.) Rehd., var. Small shrub with slender brs. and narrower leaves and smaller dark purple fls. Salisbury, Parad. Lond. t.87(c). (*M. gracilis* Salisb.) Intr. 1804 from Japan.—**M. 1. nigra** (Nichols.) Rehd., var. Fls. larger, about 12 cm. long, dark purple outside and light purple inside. Gn.25:276,t(c). (*M. Soulangeana* var. *n.* Nichols.) Intr. 1861 from Japan. Zone (V).

16.  $\times$  **M. Soulangeana** Soul. (*M. denudata*  $\times$  *liliflora*.) Large shrub or small tree: lvs. obovate, more or less pubescent beneath: fls. campanulate, more or less purplish, rarely white, scentless or fragrant; sepals usually petaloid, half as long or sometimes nearly as long as petals. Fl.v. B.R.14:t.1164(c). S.B.1:t.260(c). B.S.2:74,t(h). Gn.76:135(h);80:243(h). (*M. conspicua* var. *S. Lindl.*) Orig. 1820. Zone V. The forms of this hybrid are much more planted than either of the parents; they belong to the most gorgeous of the early flowering shrubs.—Among the numerous forms one of the most distinct is **M. S. Lénnei** (Topf) Rehd., var. Lvs. broad-obovate, pubescent on the nerves beneath: fls. rosy-purple outside, white inside; petals obovate, fleshy; sepals petaloid, narrower and paler and about half as long as the petals. F.S. 16:t.1693-94(c). R.B.1:145,t(c). (*M. Lénnei* Topf.)—**M. S. rubra** (Nichols.) Rehd., f. Similar, but of lighter, more rose-red color. F.R.1:16,t(c). (*M. rustica rubra* Nichols.)—Forms with white or nearly white fls. are var. *specabilis* (Millais, Magnol. 228,t.) and *alba* (*M. S. alba superba*). G.3:449.—White fls. tinged purple outside toward the base have *M. S. Alexandrina* (R.B.26:t.217(c). R.H.1912:317), *M. S. Brozoonii* (G.34:429,431; N.F.4:f.19), *speciosa*, *Candolleana* and others.

17. **M. denudata** Desrouss. Tree with spreading brs., to 15 m.; young brts. and buds pubescent: lvs. obovate to obovate-oblong, 10-15 cm. long, short-acuminate, tapering at base, sparingly pubescent above; light green beneath and minutely pubescent chiefly on the nerves and slightly reticulate: fls. large, finally open campanulate, 12-15 cm. across, white, fragrant; petals and sepals alike, 9, oblong-obovate, concave, fleshy: fr. cylindric, 8-12 cm. long, brownish. Fl.iv-v. B.M.1621(c). L.B.12:t.1187(c). Gn.34:276,t(c);47:402(h);51:474(h). C.L.3:173. M.G.20:253. (*M. conspicua* Salisb., *M. Yulan* Desf., *M. precia* Loisel.) C. China. Intr. 1789. Zone V.—**M. d. purpurascens** (Maxim.) Rehd. & Wils., var. (excl. the Chinese plant). Fls. rose-red outside, pink inside; carpels and filaments rose-red. Ito, Shokubuts. 1:t.8(c). Japan. Intr. ? Zone V?

**M. d.  $\times$  Campbellii** = **M. Veitchii** Bean. Lvs. obovate, 15-30 cm. long, downy on the veins beneath; petiole 2-2.5 cm. long, pubescent: fls. pink, with 9 petals, about 15 cm. long. Orig. 1907. Zone VII?—**M. Campbellii** Hook. f. & Thoms. is not hardy within our area.

Closely related species: **M. Sprengeri** Pampan. Pyramidal tree to 20 m.: lvs. obovate, 12-17 cm. long, short-acuminate at the rounded apex, cuneate; fls. saucer-shaped, about 20 cm. across; sepals and petals 12, rose-carmine outside, white and flushed or streaked pink inside, much narrowed at base, outer obovate, inner narrower. B.M.9116(c). (*M. S. diva* Stapf, *M. denudata* var. *purpurascens* of Rehd. & Wils., in part.) C. China. Intr. 1901. Zone VII. Fls. very showy, resembling those of the tender Himalayan *M. Campbellii* Hook. f. & Thoms.—**M. S. elongata** (Rehd. & Wils.) Stapf, var. Lvs. oblong-obovate: fls. white; sepals and petals narrower, oblong-obovate. G.C.97:249,t. C. China. Intr. 1901.

18. **M. Sargentiana** Rehd. & Wils. Tree to 25 m.; brts. glabrous; buds oblong-ovoid, villous or glabrescent: lvs. subcoriaceous, obovate, 10-20 cm. long, 6-10 cm. broad, rounded or acutish, sometimes emarginate at the apex, cuneate or broad-cuneate, dark green, reticulate and somewhat shiny above,

pale green, reticulate and grayish villous beneath, with 8-12 pairs of veins; petioles 2-4.5 cm. long: fls. open-campanulate, rosy-pink outside, paler inside; sepals and petals 12, the outer about 7.5, the inner to 12 cm. long and 6 cm. broad: fr. cylindric, 10-14 cm. long, usually twisted. N.F.4:f.4,5(h). W. China. Intr. 1908. Zone VII. The showy fls. are similar to those of *M. denudata*, but pink.

Related species: *M. Dawsoniana* Rehd. & Wils. Tree to 12 m.: lvs. obovate or elliptic-obovate, 8-14 cm. long, obtuse or apiculate, more leathery and more reticulate, glabrous: fls. unknown. W. China. Intr. 1908. Zone VII.

19. *M. stellata* (Sieb. & Zucc.) Maxim. Shrub or small tree: young brts. and buds densely pubescent: lvs. obovate or narrow-elliptic to oblong-obovate, 4-10 cm. long, obtusely pointed or obtusish, gradually tapering at base, glabrous and dark green above, light green and reticulate beneath and glabrous or appressed-pubescent on the nerves; petioles 3-10 mm. long: fls. short-stalked, about 8 cm. across, white, fragrant; petals and sepals alike, 12-18, narrow-oblong, spreading and finally reflexed: fr. about 5 cm. long, twisted and with only a few fertile carpels. Fl.iii-iv; fr.ix-x. B.M.6370(c). R.H.1878:270,t(c). B.S.1:83,t(h). G.C.39:260(h),261. Gn.78:117;79:150(h). F.E.15:t.53(h). (*M. Halliana* Hort., *Buergeria* s. Sieb. & Zucc.) Japan. Intr. 1862. Zone V. Wide-spreading shrub with a profusion of early white fragrant fls.; flowering when quite small. It should have a sheltered position, as the delicate flowers are susceptible to the effects of high wind, rain and frost.—*M. s. rosea* Veitch. Petals suffused outside with pink. R.B.30:85,t(h). J.H. 27:865(h).

*M. s. × Kobus* = *M. Loebneri* Kache. Lvs. larger, more obovate: fls. larger, with about 12 petals. Orig. before 1910.—*M. s. × salicifolia*; see under No. 13.

2. **LIRIODÉNDRON L. TULIP-TREE.** Deciduous trees; buds covered by the 2 coherent stipules which are also conspicuous on the growing shoot and envelop each successive leaf: lvs. long-petioled, with a broad truncate apex and usually 1 or 2 broad lobes on each side: fls. terminal, solitary, campanulate; sepals 3, spreading; petals 6, upright; stamens numerous, with extrorse linear anthers and slender filaments; carpels numerous, densely imbricated on a spindle-shaped column developing into a cone-like brown fr.; each carpel consisting of a 1-2-seeded nutlet with a long narrow wing, finally separating from the spindle; seed albuminous with a minute embryo. (Greek *lirion*, lily, and *dendron*, tree.) Two species in N. Am. and China.

A. Filaments about 1 cm. long; petals 4-5 cm. long: mature carpels acute at the apex.

AA. Filaments about 5 mm. long; petals 3-4 cm. long: mature carpels obtuse or obtusish at the apex ..... 1. *L. Tulipifera*  
..... 2. *L. chinense*

1. *L. Tulipifera* L. Tree to 50 m., rarely to 60 m.; glabrous: brts. brown: lvs. saddle-shaped, 7-12 cm. long and about as broad, the broad truncate apex with a short-acuminate lobe on each side and usually 1 or 2, rarely 3 or 4, acute or short-acuminate lobes on each side near the rounded or truncate base, pale green beneath; petioles slender, 5-10 cm. long: fls. tulip-shaped, 4-5 cm. long; sepals ovate-lanceolate, greenish white, spreading, deciduous; petals oblong-obovate, greenish white with a broad orange band near base; stamens slightly shorter than the petals: fr. 6-8 cm. long; carpels 2.5-3.5 cm. long. Fl.v-vi; fr.x. B.M.275(c). S.S.1:t.13. Em.2:605,t. B.S.2:35. E.H.1:t.24-27(h). G.C.55:255(h). Mass. to Wisc., s. to Fla. and Miss. Cult. 1663. Zone IV. Beautiful tree of pyramidal habit with large lvs. of unusual shape turning clear yellow in autumn, and with large fls. conspicuous on account of their size and shape though not brightly colored; in its

native forest it is a tall tree with a columnar trunk destitute of brs. for a considerable height.—*L. T. aureo-marginatum* Scherwin. Lvs. edged yellow. F.S.19:t.2025(c);20:t.2181(c).—*L. T. obtusilobum* Michx., var. With one rounded lobe on each side at base.—*L. T. integrifolium* Kirchn., f. Lvs. rounded at base, without lobes. S.H.1:f.218g(1).—*L. T. fastigiatum* Jaeg., var. Tree with upright brs. forming a narrow-pyramidal head. (*L. T. pyramidale* Lav.)

2. *L. chinense* (Hemsl.) Sarg. Tree to 16 m., similar to the preceding; brts. gray: lvs. usually more deeply lobed, often halfway or more to the middle, with usually one pair of acuminate lobes near base, glaucescent and papillose beneath: fls. cup-shaped, green without, yellow within; petals 3-4 cm. long; filaments 5 mm. long: fr. 7-9 cm. long, with obtuse or obtusish carpels. S.T.1:t.52. H.I.28:2785. G.C.34:370;44:429(h). Jour. Hered. 9:274 (h). C. China. Intr. 1901. Zone VII?

3. **ILLÍCIUM** L. ANISE-TREE. Evergreen aromatic small trees or shrubs, glabrous: winter-buds with several outer scales: lvs. alternate, coriaceous, entire, minutely punctate, exstipulate: fls. perfect, axillary, solitary; sepals 3-6, petaloid; petals numerous, the inner ones narrower, in 3 to several series; stamens many in several series, on short thick filaments; carpels 6-18, in one whorl; style recurved: fr. star-shaped, a whorl of crustaceous 1-seeded follicles finally dehiscent; testa of seed smooth, lustrous. (Latin *illicium*, allurement, referring to the aromatic odor of the plant.) About 10 species in E. and S. Asia and Malaysia and 2 in U. S.

1. *floridanum* Ellis. Shrub to 3 m.: lvs. elliptic to elliptic-lanceolate, 6-15 cm. long, acuminate, cuneate, dark green above, pale beneath, obscurely veined; petiole 1-2 cm. long: fls. purple, nodding, 3-5 cm. across; pedicel 1.5-5 cm. long; sepals ovate or oblong, obtuse, membranous; petals 20-30, narrow-lanceolate to linear, 1.5-2 cm. long: fr. 2.5-3 cm. long broad. B.M. 439(c). N.D.3:t.47(c). Gn.36:151. Fla. to La. Intr. 1771. Zone VII.

4. **TETRACÉNTRON** Oliv. Deciduous tree; buds slender, pointed, upright-spreading with 2 outer sheathing scales: lvs. slender-petioled, palmately 5-7-nerved, crenulate-serrate, estipulate: fls. small, perfect, sessile, in slender pendulous racemes, apetalous; sepals 4, ovate, imbricate; stamens 4, opposite to the sepals, exserted; carpels 4, connate along the ventral suture; styles 4; ovules pendulous, several in each cell: fr. a 4-celled, deeply lobed dehiscent capsule; seeds linear-oblong. (Greek *tetra*, four, and *kentron*, spur; referring to the 4 spur-like appendages of the fr.) One species.

*T. sinense* Oliv. Tree to 30 m., with smooth, rufous or gray bark: lvs. ovate to elliptic-ovate, 7-12 cm. long, acuminate, subcordate or rounded at base, closely serrulate with obtuse teeth: racemes 8-16 cm. long, short-stalked; fls. yellowish, minute; stamens 1.5 mm. long: fr. brown, about 4 mm. long. Fl.vi-vii. H.I.19:t.1892. C.C.133. I.S.1:t.23. C. and W. China. Intr. 1901. Zone (V) VI. Similar to *Cercidiphyllum* but easily distinguished by the alternate lvs.

5. **SCHISÁNDRA** Michx. Deciduous or evergreen twining shrubs, more or less aromatic; buds with several imbricate scales: lvs. slender-petioled, entire or denticulate, estipulate: fls. in few-fld. axillary clusters, slender-stalked, dioecious; sepals and petals 7-12, not differentiated; stamens 5-15, more or less connate; carpels numerous, densely imbricate in flower, developing into berries disposed on an elongated receptacle and forming a drooping

spike. (Greek *schizein*, to cleave, and *aner*, *andros*, man; referring to the cleft anthers of the type species.) Syn. *Schizandra* DC. About 12 species in E. and S. Asia and one in N. Am.

- A. Pedicels 1.5-7 cm. long; stamens connate only at base: lvs. generally obovate, cuneate at base.  
 B. Lvs. glaucous beneath.....1. *S. Henryi*  
 BB. Lvs. green beneath.  
 C. Lvs. thickish: stamens with the free part of the filament as long as the anthers.....2. *S. grandiflora*  
 CC. Lvs. thin, membranous: stamens with short filaments.  
 D. Fr. black; seeds tuberculate: petioles often as long as the limb.....3. *S. nigra*  
 DD. Fr. red; seed smooth: petioles about half as long as the limb.  
 E. Stamens many .....4. *S. sphenanthera*  
 EE. Stamens 5 .....5. *S. chinensis*  
 AA. Pedicels 5-10 mm. long; stamens connate into a globose head: lvs. ovate-lanceolate; petiole 5-15 mm. long.....6. *S. propinqua*

1. *S. Henryi* Clarke. Glabrous; brts. angled or winged, brown: lvs. broad-elliptic or ovate, 6-10 cm. long, short-acuminate, broad-cuneate or rounded at base, remotely denticulate, lustrous above, glaucous beneath, leathery; petioles 2-4 cm. long; fls. 1.5 cm. across, white, on slender stalks 4-7 cm. long; fr. red, 5-7 cm. long. G.C.38:162. (*S. hypoglauca* Léveillé.) W. China. Intr. 1900. Zone VII?

Related species: *S. glaucescens* Diels. Differs in its subterete brts., thinner obovate lvs. gradually narrowed toward the base, shorter petioles and the orange-red fls. C. China. Intr. 1907. Zone VII?—*S. pubescens* Hemsl. & Wils. Young subterete brts., petioles and under side of lvs. densely puberulous. C. China. Intr. 1907. Zone VII?

2. *S. grandiflora* (Wall.) Hook. & Thoms. Glabrous; stems subterete, brown: lvs. obovate or sometimes ovate to oblong-obovate, 6-10 cm. long, acuminate, cuneate at base, light green beneath, leathery: fls. 2.5-3 cm. across, pinkish; petals suborbicular; pedicels 2-3 cm. long; fr. scarlet, 12-20 cm. long. Fl.v-vi. Wallich, Tent. Fl. Nep. t.14(c). Ann. Bot. Gard. Calcutta, 3:t.69a. Temp. Himal. Not yet intr.—*S. g. cathayensis* Schneid., var. Lvs. usually smaller, more distinctly denticulate, sometimes glaucescent beneath and scarcely reticulate: fls. about 2 cm. across, fleshy-pink to blood-red. (*S. grandiflora* Fin. & Gagnep., not Hook. & Thoms.) W. China. Intr. 1907. Zone VII?—*S. g. rubriflora* (Rehd. & Wils.) Schneid., var. Lvs. distinctly denticulate: fls. dark red, about 3 cm. across; pedicels 2-3 cm. long; fr. 8-12 cm. long. R.H.1925:450. M.O.t.4. G.C.78:271. (*S. r.* Rehd. & Wils.) Intr. 1908. Zone VII?

3. *S. nigra* Maxim. Glabrous; brts. terete, brown or grayish brown: lvs. broad-ovate to elliptic or obovate, 5-7 cm. long, short-acuminate, cuneate or sometimes rounded at base, light green beneath, membranous; petioles 2-4 cm. long; fls. about 1.5 cm. across, white; pedicels 2-3 cm. long; fr. black, 2-5 cm. long; seeds tuberculate. Fl.v-vi. N.K.20:t.19. Japan, Korea. Intr. 1892. Zone V.

4. *S. sphenanthera* Rehd. & Wils. Glabrous; brts. red-brown, terete: lvs. elliptic or obovate to obovate-oblong or ovate-lanceolate, 5-10 cm. long, acuminate, cuneate at base, denticulate, light green beneath and glabrous, rarely pubescent on the veins; petioles 1-3 cm. long; fls. orange, about 1.5 cm. across; pedicels 2-4 cm. long; stamens 10-15, anthers emarginate or truncate at apex: fr. 6-8 cm. long, red. Fl.v-vi. B.M.8921(c). M.O.t.4. C. and W. China. Intr. 1907. Zone V?—*S. s. lancifolia* Rehd. & Wils., var. Brts. angled: lvs. lanceolate, long-acuminate. W. China. Intr. 1908.

5. *S. chinensis* (Turcz.) Baill. Climbing to 8 m.; brts. brown, slightly angled: lvs. broad-elliptic to broad-obovate to obovate, 5-10 cm. long, acute

or short-acuminate, cuneate at base, denticulate, lustrous above, light green and sometimes glaucescent beneath and usually slightly pubescent on the veins while young; petioles 1.5–3 cm. long: fls. 1.5 cm. across, creamy white or pinkish, fragrant; petals ovate-oblong; stamens 5, emarginate at apex: fr. scarlet, 3–10 cm. long. Fl.v–vi; fr.viii–ix. Gt.11:t.382. F.S.15:t.1594(c). N.K.20:t.20. G.C.50:2. M.G.14:568(fr.). (*Maximowiczia sinensis* Rupr.) N. E. Asia, Japan. Intr. 1858. Zone V. Vine with dense bright green foliage, attractive in autumn with its racemes of scarlet berries, but only produced if a male plant is near.

6. *S. propinqua* (Bl.) Hook. f. & Thoms. Brts. angled: lvs. ovate or elliptic to oblong-lanceolate, 7–12 cm. long, short-acuminate, broad-cuneate or nearly rounded at base, remotely denticulate or serrulate, rarely entire, pale green or glaucescent beneath, leathery; petiole 1–1.5 cm. long, rarely 2 cm.: fls. orange, about 1.5 cm. across; petals oblong; pedicels 5–10 mm. long, bracteolate: fr. scarlet, about 15 cm. long. B.M.4614(c). (*Sphaerostema propinquum* Bl.) Himal., Malay Arch. Cult. 1828. Zone VII?—*S. p. sinensis* Oliv., var. Lvs. oblong- or ovate-lanceolate to lanceolate, 6–10 cm. long, long-acuminate, rounded or broad-cuneate at base: fls. smaller, yellowish. Fl. vii–ix. C. and W. China. Intr. 1907. Zone VII?

The N. American *S. coccinea* Michx. occurring from S. C. to Tex. is apparently not hardy within our area.

6. *KADSŪRA* Juss. Evergreen twining shrubs; buds with several imbricate scales: lvs. slender-stalked, dentate to entire, estipulate: fls. unisexual, axillary, usually solitary, slender-stalked; sepals and petals 9–15, gradually changing from the small and green sepals to the larger white or pinkish petals; stamens numerous, distinct or coalescent into a globular head; carpels numerous, 2–3-ovuled, developing into berries forming a globose head. (The Japanese name of the plant.) About 10 species in trop. and sub trop. S. and E. Asia.

*K. japonica* (L.) Dun. Climbing to 4 m., glabrous; lvs. elliptic to oblong-lanceolate, 5–10 cm. long, acuminate, cuneate at base, remotely dentate or denticulate, dark green above, lighter beneath; petioles 1–2 cm. long: fls. cup-shaped, about 2 cm. across, yellowish white, on slender stalks 1–5 cm. long: fr.-cluster scarlet, 2–3 cm. across. Fl.vi–ix. S.Z.1:t.17(c). N.K.20:t.21. Japan, Korea. Intr. 1846. Zone VII. Handsome in fall with its large scarlet fruiting heads.

### 30. CALYCANTHACEAE Lindl. CALYCANTHUS FAMILY

Deciduous or evergreen shrubs, with aromatic bark; buds scaly or naked: lvs. opposite, short-petioled, entire, penninerved, estipulate: fls. perfect, solitary, short-stalked, perigynous; parts of perianth numerous, spirally arranged, not differentiated into sepals and petals; stamens 5–30; anthers extrorse, innate; filaments short; carpels numerous, inserted inside of a hollow receptacle with the styles protruding, 1–2-ovuled, developing into one-seeded achenes inclosed by the urn-shaped receptacle, capsule-like at maturity, obovoid or ellipsoid; seeds without endosperm; cotyledons spirally rolled, broadly reniform, much broader than long, auriculate at base.—Two genera with 5 or 6 species in N. Am. and E. Asia.

A. Stamens 10–30; fls. brownish red; buds hidden or free.....1. *Calycanthus*  
 AA. Stamens 5 or 6; fls. yellowish white: buds free.....2. *Chimonanthus*

1. *CALYCANTHUS* L. Deciduous shrubs; buds hidden by the base of the petioles or free; fls. terminal on short lateral brts.; stamens 10–30; brown

or yellowish brown: fr. contracted at the mouth or campanulate. (Greek *kalys*, calyx, and *anthos*, flower.) Syn.: *Butneria* Duh. Three or 4 species in N. Am.

- A. Buds hidden; anthers oblong: fr. contracted at the mouth.  
 B. Lvs. densely pubescent beneath.....1. *C. floridus*  
 BB. Lvs. glabrous or slightly pubescent beneath.....2. *C. fertilis*  
 AA. Buds free; anthers linear: fr. campanulate.....3. *C. occidentalis*

1. *C. floridus* L. CAROLINA ALLSPICE. Shrub to 3 m.: lvs. ovate or elliptic to narrow-elliptic, 5-12 cm. long, acute or acuminate, rarely obtuse, cuneate or rounded at base, grayish green and densely pubescent beneath; petiole about 5 mm. long: fls. dark reddish brown, about 5 cm. across, fragrant: fr. obovoid, 6-7 cm. long, usually much contracted at the mouth. Fl.vi-vii. B.M.503(c). Gn.21:184;33:392. S.L.112(h). Va. to Fla. Intr. 1726. Zone IV. Chiefly grown for its sweet-scented fls.; all parts and particularly the wood when dry exhale a camphor-like fragrance.—*C. f. ovatus* Ait., var. Lvs. ovate to ovate-oblong, rounded or subcordate at base. L.I.t.24.

Closely related species: *C. Möhrii* Small. Lvs. broad-elliptic or elliptic-ovate, broad-cuneate to subcordate at base: fls. purple, 5-6 cm. across: receptacle little contracted at the mouth. Tenn. to Ga. and Ala. Intr. 1906. Zone V.

2. *C. fertilis* Walt. Shrub to 3 m.; glabrous or slightly pubescent: lvs. elliptic or ovate to elliptic-oblong, 6-15 cm. long, acuminate or acute, cuneate or rounded at base, glaucous beneath: fls. greenish purple to reddish brown, 3.5-5 cm. across: fr. obovoid, 5-7 cm. long, contracted at the mouth. Fl.vi-vii. B.R.5:404(c). L.D.3:172(c). (*C. glaucus* Willd.) Pa. to Ga. and Ala. Intr. 1806. Zone V. Similar to the preceding, but not quite as hardy and not as fragrant.—*C. f. ferax* Rehd., var. Lvs. usually elliptic-oblong, green beneath. B.R.6:481(c). (*C. laevigatus* Willd.)—*C. f. nanus* (Lois.) Schelle, f. Low shrub: lvs. elliptic-ovate to ovate-oblong, 4-8 cm. long, green beneath. N.D.1:t.48(c). (*C. nanus* Lois.)

3. *C. occidentalis* Hook. & Arn. Shrub to 3 m.: lvs. ovate to oblong-lanceolate, 8-20 cm. long, acute or acuminate, rounded or subcordate at base, scabrous above, green and glabrous or slightly pubescent beneath; petioles about 5 mm. long: fls. brownish purple, changing to a tawny color at the tips of the sepals, 5-7 cm. across, fragrant; anthers linear: fr. ovoid-campanulate, not contracted at the mouth, 4-5 cm. long. Fl.vi-vii. B.M.4808(c). F.S.11:t. 1113(c). Gn.33:392. (*C. macrophyllus* Hort.) Calif. Intr. 1831. Zone VI.—Of more straggling growth than the preceding species and with larger lvs. and fls., but blooming less profusely and less hardy.

2. **CHIMONANTHUS** Lindl. Deciduous or evergreen shrubs; buds with many imbricate scales: lvs. glabrous: fls. appearing long before the lvs., on very short scaly stalks from axillary buds on brs. of the previous year; sepals numerous, imbricate, yellow; stamens 5 or 6, short: fr. constricted at the mouth. (Greek *cheimon*, winter, and *anthos*, flower, referring to its flowering during the winter.) Syn.: *Meratia* Lois. Two species in China.

*C. praecox* (L.) Link. Shrub to 3 m.: lvs. elliptic-ovate to ovate-lanceolate, 7-15 cm. long, acuminate, rounded or cuneate at base; petioles about 5 mm. long: fls. about 2.5 cm. broad, very fragrant, the outer sepals yellow, the inner striped purplish brown; fr. ellipsoid, about 4 cm. long. Fl.xii-iii. B.M.466(c). L.D.3:t.173(c). G.C.III.11:213. Gn.87:36(f,h). M.O.t.2(h). (*C. fragrans* Lindl., *Calycanthus praecox* L., *Meratia p.* Rehd. & Wils.) China. Intr. 1766. Zone VII. Desirable shrub on account of its fragrant fls. produced in mild seasons during the winter.—*C. p. grandiflorus* (Lindl.)

Mak., var. Lvs. usually larger, occasionally to 20 cm. long; fls. about 3-3.5 cm. across, purer yellow, not as fragrant. R.H.1924:11,t(c). B.R.6:451(c). (*C. fragrans* var. *g.* Lindl.)

### 31. ANNONACEAE Rich. CUSTARD-APPLE FAMILY

Deciduous or evergreen trees or shrubs: lvs. alternate, simple, entire, penninerved, exstipulate: fls. perfect, rarely unisexual, hypogynous, rarely perigynous: perianth usually of 9 parts in 3 whorls; stamens usually numerous, spirally arranged; carpels usually numerous, distinct, rarely connate, 1- to many-ovuled, usually berry-like at maturity; seeds with copious ruminate endosperm and a small embryo.—More than 70 genera with more than 600 species, chiefly in the trop. regions of Asia, Afr., Am., Austral.—Only one species of the N. American genus *Asimina* is hardly within our area.

**ASÍMINA** Adans. Deciduous or evergreen-shrubs, rarely trees; buds rather small, with 2-3 outer scales, brown-tomentose: lvs. usually large: fls. axillary, solitary or few, nodding, on short stalks: sepals 3, caducous, smaller than the petals; petals 6, the inner ones smaller and usually upright; filaments short; carpels 3-15, many-ovuled, with recurved styles: fr. of one or few oval to oblong berries with large compressed seeds in 1 or 2 ranks. (Assiminier, a French-Indian name.) Eight species in N. Am.

**A. triloba** (L.) Dun. PAWPAW. Small tree to 12 m.: brts. fulvous-pubescent while young, later glabrous and brown: lvs. obovate-oblong, 15-30 cm. long, short-acuminate, usually gradually narrowed into a petiole 5-10 mm. long: fls. 4-5 cm. across, lurid purple, on short fulvous-pubescent stalks about 1 cm. long; sepals ovate, acute, greenish pubescent outside; outer petals broad-ovate, rounded and later reflexed at apex; the inner upright, much smaller, pointed: carpels in fr. ellipsoid to oblong, 5-7 cm. long, greenish yellow at first, finally brown; seeds 2-2.5 cm. long. Fl.v-v; fr.x-x. B.M.5854(c). S.S.1:t.15,16. G.F.8:495. G.C.74:293,295(h). R.H.1911:134,135. (*Annona t. L.*, *Uvaria t.* Torr. & Gr.) N. Y. to Fla., w. to Neb. and Tex. Intr. 1736. Zone V. Small tree with large drooping lvs. and fls. of lurid purple color; the frs. are edible. It prefers rich and humid soil. Interesting as the only hardy member of the large tropical family of Annonaceae.

### 32. LAURACEAE Lindl. LAUREL FAMILY

Deciduous or mostly evergreen trees or shrubs, all parts containing an aromatic oil: lvs. usually alternate, simple, entire or lobed, usually with pellucid dots, exstipulate: fls. perfect or unisexual, regular, usually small; perianth usually of 6 parts, in 2 similar whorls; stamens in 3-4 whorls of 3 each, often partly staminodial; anthers opening by valves; ovary usually superior, 1-celled, 1-ovuled; ovule pendulous, anatropous; style 1; stigma 2-3-lobed: fr. a drupe or a berry, with the pedicel often thickened below the fruit; seed without endosperm; embryo straight, with large fleshy cotyledons.—About 45 genera with 1000 species chiefly in trop. and subtrop. regions.

- A. Lvs. persistent, penninerved: fls. perfect.  
 B. Fls. in few-fld. cymes; calyx persistent under the fr. .... 1. *Persea*  
 BB. Fls. in umbels enveloped before anthesis in an involucre: calyx deciduous. 2. *Umbellularia*  
 AA. Lvs. deciduous, often 3-lobed, rarely lvs. persistent and fls. unisexual.  
 B. Fls. in corymbs or umbel-like racemes; anthers 4-celled: lvs. 3-nerved at base. 3. *Sassafras*  
 BB. Fls. in umbel-like sessile or stalked clusters; anthers 2-celled: lvs. penninerved or 3-nerved, rarely persistent. .... 4. *Lindera*

1. **PÉRSEA** Mill. Evergreen trees; buds naked; lvs. entire, penninerved, revolute in bud; fls. in small panicles or cymes; calyx 6-parted, persistent; stamens 12, the 3 of the inner whorl sterile and gland-like; the first 2 whorls with introrse, the third whorl with extrorse anthers; anthers 4-celled; ovary sessile, with slender style: fr. a berry with the persistent calyx-lobes at base. (An ancient name of an oriental tree.) Syn.: *Tamala* Raf. About 50 species in trop. and subtrop. Am. and 1 in the Canary Isls.

**P. Borbônia** (L.) Spreng. RED BAY. Tree to 12 m.; bark furrowed; brts. soon glabrous: lvs. oblong to lance-oblong, 5-10 cm. long, obtusely pointed, cuneate at base, glaucescent beneath, glabrous; petioles 5-10 mm. long; fls. in peduncled several-fld. cymes, the peduncle about as long as the petiole: fr. subglobose, about 1.2 cm. long, dark blue or nearly black. N.D.2:t.33(c). S.S.7:t.301. H.H.220,221(b). (*P. caroliniensis* Nees, *Notaphoebe borbonica* Pax: BULL. BAY.) S. Del. to Fla., in swamps. Intr. 1739. Zone VII. Attractive in fall with its bluish black frs. on red stalks.

2. **UMBELLULÀRIA** Nutt. Evergreen aromatic tree; buds naked: lvs. entire, penninerved, involute in bud; fls. perfect, on short pedicels in many-fld. stalked umbels enclosed before anthesis by an involucre of 5-6 imbricate scales; calyx 6-parted, deciduous; stamens of the third whorl with 2 conspicuous glands at base, those of the fourth whorl reduced to minute staminodes; style shorter than calyx-lobes. (From Latin *umbellula*, an umbellet; in reference to the inflorescence.) One species.

**U. californica** (Hook. & Arn.) Nutt. CALIFORNIAN LAUREL. Tree to 25 m., with scaly bark: lvs. short-petioled, ovate-oblong to lanceolate, 5-12 cm. long, obtusely acuminate, broad-cuneate at base, dark green and lustrous above, glaucous or glaucescent and reticulate beneath, glabrous at maturity: fls. yellowish green, in umbels about 1.5 cm. across; peduncle 1-2.5 cm. long: fr. ovoid, 2-2.5 cm. long, yellow green, sometimes purplish. Fl.x-v; fr.ix-x. B.M. 5320(c). S.S.7:t.306. J.St.10(h). (*Oreodaphne* c. Nees.) Calif. to Ore. Intr. 1829. Zone VII. Handsome tree with a dense head of lustrous foliage. —**U. c. péndula** Rehd., f. Tree with spreading brs. forming a broad head with pendulous brts. J.St.76(h).

3. **SÁSSAFRAS** Nees. Deciduous trees; buds with few imbricate outer scales: lvs. entire or 1-3-lobed at apex, 3-nerved at base, involute in bud; fls. dioecious, unisexual or apparently perfect, in several-fld. racemes before the lvs.; calyx 6-parted; staminate fls. with 9 stamens in 3 whorls, those of the inner whorl with a pair of stalked glands at base, with or without staminodes and with or without pistil; anthers 4-celled, opening with 4 valves or 2-celled; pistillate with an ovoid ovary, slender style and 6 rudimentary stamens or with 9 stamens and 3 staminodes: fr. an ovoid drupe supported by a club-shaped fleshy pedicel. (Spanish *sassafras* = Saxifraga, referring to its supposed medical properties.) Three species in N. Am., China and Formosa.

**S. álbidum** (Nutt.) Nees. SASSAFRAS. Tree to 20 or occasionally 38 m., with deeply furrowed bark; brts. and buds glabrous and glaucous: lvs. ovate to elliptic, 8-12 cm. long, entire or 1-3-lobed at apex, acutish or obtuse, cuneate at base, bright green above, glabrous and glaucous beneath; petioles 1.5-3 cm. long: fls. yellow, 7 mm. across, in racemes 3-5 cm. long; staminate fls. without staminodes and without rudimentary pistil: fr. ovoid, 1 cm. long, bluish black, bloomy, its fleshy stalk bright red. Fl.iv-v; fr.ix. Em.360,t.(c). S.S.7:t.304,305. G.C.76:96,97(h). B.S.2:501,t.(h). (*S. officinale* var. *albidum*

Blake). Mass. to S. C. and Tenn. Cult. 1630. Zone IV. Handsome pyramidal tree with bright green lvs. of distinct and peculiar shape turning orange and scarlet in fall and with attractive dark blue red-stemmed fr.—*S. a. molle* (Raf.) Fern., var. Buds and young brts. pubescent: lvs. glaucescent and silky pubescent beneath at least while young. (*S. officinale* Nees & Eberm., *S. varifolium* Ktze.) Me. to Ont. and Mich., s. to Fla. and Tex. Cult. 1930.

Related species: *S. Tzumu* Hemsl. Brts. and lvs. pubescent while young or glabrous; lvs. more pointed, sometimes to 20 cm. long; petioles to 6 cm. long; racemes with the peduncle 4–8 cm. long; fls. apparently perfect, with 9 fertile stamens and 3 staminodes. C.C.150. H.I.29:2833. Jour. Hered. 9:275(h). (*Pseudosassafras* T. Lecomte.) C. China. Intr. 1900. Zone VII?

4. **LINDERA** Thunb. Deciduous or evergreen aromatic trees and shrubs; buds with few to several imbricate scales: lvs. entire or 3-lobed, penninerved or 3-nerved at base, convolute in bud: fls. dioecious or polygamous in axillary clusters, with an involucre of 4 deciduous scales; sepals 6, rarely more; staminate fls. with 9 stamens; anthers 2-valved; pistillate fls. with a globose ovary and 9–15 staminodes: fr. a subglobose drupe. (After Joh. Linder, Swedish physician; 1676–1723.) Syn.: *Benzoin* Fabric.; including *Daphnidium* Nees and *Aperula* Bl. About 60 species in temp. and subtrop. E. and S. Asia; 2 in N. Am.

A. Lvs. penninerved, always entire.

B. Lvs. deciduous.

c. Fls. before the lvs. on very short pedicels: pedicel of fr. 1 cm. long or less.

d. Petiole 5–15 mm. long: fr. scarlet; buds with 2–3 outer pale scales. . . 1. *L. Benzoin*

dp. Petiole 1.5–2.5 cm. long, slender: fr. yellowish or brownish: buds with several lustrous brown scales. . . 2. *L. praecox*

cc. Fls. with the lvs.: pedicels about 5 mm. long: fr. subglobose, black. . . 4. *L. umbellata*

bb. Lvs. persistent, 10–20 cm. long: fr. black, 1.5 cm. long. . . 3. *L. megaphylla*

aa. Lvs. 3-nerved at base, entire or 3-lobed; fr. subglobose, black. . . 5. *L. obtusiloba*

1. **L. Bénzoin** (L.) Bl. SPICE-BUSH. Shrub to 5 m.; glabrous or nearly so; buds with 2–3 outer scales: lvs. oblong-obovate, 7–12 cm. long, acute or short-acuminate, cuneate at base, light green above, pale beneath: fls. greenish yellow, in dense subsessile clusters 5 mm. across: fr. elliptic-oblong, about 1 cm. long, scarlet. Fl.iii–iv; fr.ix. M.Am.2:t.145(c). Em.365,t. B.B.2:135. (*L. aestivalis* Nees, *Benzoin aestivalis* Nees, *B. odoriferum* Nees.) Me. to Ont. and Kans., s. to Fla. and Tex. Intr. 1683. Zone IV. Lvs. changing to clear yellow in fall, when the brs. are studded with scarlet frs.; also attractive in early spring with its yellow fls.—**L. B. xanthocarpa** (G. S. Torrey) Rehd., f. Fr. yellow. Mass.—**L. B. pubescens** (Palmer & Steyerl.) Rehd., var. Brts., petioles and lvs. beneath pubescent, at least on the veins, margin ciliate. S. C. to Miss. and s. Mo. Intr. ?

2. **L. praecox** (Sieb. & Zucc.) Bl. Shrub or small tree to 8 m.; glabrous; buds with lustrous brown scales; brts. brown with conspicuous white lenticels while young: lvs. ovate or elliptic, 4–9 cm. long, acuminate, cuneate at base, glaucescent beneath: fls. greenish yellow in subsessile or short-stalked umbels about 1.5 cm. across: fr. subglobose, 1.5–2 cm. across, yellow or reddish brown, on thickened pedicels about 1 cm. long; peduncle 3–5 mm. long. Fl.iv; fr.ix. S.I.2:t.19(c). (*Benzoin p.* Sieb. & Zucc.) Japan. Intr. 1891. Zone VI. Similar to the preceding; lvs. changing to yellow in fall.

3. **L. megaphylla** Hemsl. Evergreen shrub or tree to 20 m.; brts. glabrous, dark purple-brown, with few pale penticels; terminal buds with many imbricate velutinous scales: lvs. lance-oblong to oblanceolate, 10–20 cm. long, acuminate, cuneate at base, lustrous dark green above, glaucous and glabrous or slightly pubescent beneath; petioles 1–2 cm. long: fls. yellow, in many-fld. dense short-stalked silky umbels about 2.5 cm. across: fr. globose-ovoid,

1.5 cm. long, black, on stout pedicels about 1 cm. long. Fl. III–IV; fr. x. C.C. 162. (*Benzoin grandifolium* Rehd.) C. and W. China. Intr. 1900. Zone VII? Evergreen shrub with large lustrous lvs.

4. *L. umbellata* Thunb. Shrub to 3 m.; buds with 2–3 more or less silky outer scales; brts. yellowish or purplish, smooth, without lenticels: lvs. elliptic-obovate or elliptic to obovate-oblong, 6–12 cm. long; acutish or short-acuminate, cuneate at base, glaucescent beneath and usually slightly pubescent at least on the midrib; petioles 1–1.8 cm. long: fls. yellow, with the lvs. in short-peduncled silky-pubescent umbels 2–2.5 cm. across; pedicels 6–10 mm. long: fr. subglobose, about 8 mm. long, black, on slender pedicels 1.5–2 cm. long. S.I.2:t.18(c). (*Benzoin umbellatum* Ktze., *L. membranacea* Maxim.) Japan, C. and W. China. Intr. 1892. Zone VI?—*L. u. hypoglauca* (Maxim.) Mak., f. Lvs. glabrous beneath except the silky midrib and with a distinct glaucous bloom. (*L. hypoglauca* Maxim.) Japan. Cult. 1880. Zone VI?

5. *L. obtusiloba* Bl. Shrub or thin tree, to 10 m.; buds glabrous, with 3–4 outer scales; brts. yellowish gray, rarely purplish, glabrous, with scattered lenticels: lvs. broad-ovate, 6–12 cm. long, acute or obtusish, cordate to broad-cuneate at the 3-nerved base, entire or 3-lobed at apex with the lateral lobes short and obtuse, grayish green and silky pubescent on the veins beneath; petioles 1–2 cm. long, silky-pubescent: fls. yellow, in subsessile silky-pubescent umbels 1–1.5 cm. across; pedicels 3–4 mm. long: fr. globose, 7–8 mm. across, black, on pubescent pedicels about 1 cm. long. Fl. IV; fr. x. S.I.1:t.44(c). G.F.6:295. S.L.215(h). (*Benzoin obtusilobum* Ktze.) Japan, Korea, China. Intr. 1880. Zone VI. Tall spreading shrub with handsome lobed lvs.

Closely related species: *L. triloba* (Sieb. & Zucc.) Bl. Shrub to 6 m.: lvs. usually broad-cuneate at base or rounded, deeply 3-lobed with nearly equal acuminate lobes; fr. subglobose, 1.2 cm. across, greenish yellow, on glabrous pedicels. S.I.2:t.19(c). (*Benzoin trilobum* Sieb. & Zucc.) Japan. Intr. 1915. Zone VI?—*L. cercidifolia* Hemsl. Shrub to 8 m.: lvs. suborbicular to ovate, 3.5–10 cm. long, short-acuminate, rounded at base, usually entire, rarely with 3 short acute lobes at apex, glabrous or nearly so beneath: fr. globose-ovoid, 6–7 mm. long, dark red. (*Benzoin cercidifolium* Rehd.) China. Intr. 1907. Zone VI?

### 33. CRUCIFERAE Juss. MUSTARD FAMILY

Herbs, rarely subshrubs or shrubs: lvs. usually alternate, entire to pinnatifid: fls. perfect, usually in terminal racemes, regular, rarely symmetrical; sepals 4; petals 4, rarely wanting; stamens 6, 4 longer and 2 shorter, rarely fewer or more; ovary superior, consisting of 2 carpels, 2-celled, rarely 1-celled, with 2 parietal placentae at the edges of the septum: fr. a dehiscent pod (silique or silicle), rarely indehiscent: seed with endosperm; embryo variously curved or folded.—More than 200 genera and 1600 species, chiefly in the temp. and colder regions of both hemispheres; few in the tropics. The family contains few shrubby plants; the genera enumerated below are only suffruticose with the exception of *Pseudocytisus* which is a shrub.

A. Plants without hairs or pilose with simple hairs.

B. Plants suffruticose, usually glabrous, unarmed: pod compressed contrary to the septum.

C. Petals unequal: fls. white or pinkish.....1. *Iberis*

CC. Petals equal, rosy-purple.....2. *Aethionema*

BB. Plant shrubby, pilose, spiny or unarmed: fls. yellow: pod scarcely compressed, 1-2-seeded.....3. *Pseudocytisus*

AA. Plant stellate-pubescent: fls. yellow: pod flattened in the plane of the septum.....4. *Alyssum*

1. *IBERIS* L. CANDYTUFF. Herbs or subshrubs: lvs. glabrous or ciliate, entire to pinnatifid: fls. in usually umbel-like racemes; the outer 2 petals

much longer than the inner ones; stamens without appendages: pod much compressed, roundish or broad-elliptic, usually winged, often notched at apex; seed 1 in each locule. (Ancient Greek name for a kind of cress.) About 30 species in S. Eu., W. Asia and N. Afr.—The following species are all evergreen perennials with woody usually procumbent stems (erect in *I. semperflorens*) and ascending brts. and with thickish fleshy lvs.

- A. Flowering brs. branching above; outer fls. pink, inner white: lvs. obovate-oblong, dentate near apex ..... 1. *I. gibraltaria*  
 AA. Flowering brs. simple: fls. white, rarely pinkish: lvs. usually entire.  
 B. Lvs. linear to oblong or oblanceolate, rarely more than 5 mm. broad: pod winged; seeds wingless.  
 C. Racemose umbel-like in fl.: lvs. ciliate and stems finely pubescent.  
 D. Lvs. obtuse, oblong-linear, the lower obovate-oblong: fls. often pinkish.  
 DD. Lvs. acute, usually linear: fls. white ..... 2. *I. Tenoreana*  
 CC. Racemes elongated; stems and the narrow-oblong obtuse lvs. glabrous ..... 3. *I. saxatilis*  
 4. *I. sempervirens*  
 BB. Lvs. obovate-oblong, to 1 cm. broad, entire: pod wingless; seed winged.  
 5. *I. semperflorens*

1. *I. gibraltaria* L. To 40 cm. high: lvs. obovate to spatulate-oblong, 2–5 cm. long, obtuse, dentate near apex, sometimes entire, slightly ciliate toward the base: infl. to 4 cm. across, umbel-like; the outer fls. lilac-pink: usually lateral infl. in the axils of the upper lvs.: fr. deeply notched at apex. Fl. iv–vi. B.M.124(c). R.H.1870:330,t(c). B.C.3:1635. G.C.46:158(h). Spain, Morocco. Intr. 1732. Zone VII?

2. *I. Tenoreana* DC. To 20 cm. tall: brts. finely hairy: lower lvs. obovate, upper narrow-oblong, 2–4 cm. long, obtuse, entire or dentate, ciliate: infl. umbel-like, 4–5 cm. across, the outer fls. often pinkish: fr. 6–8 mm. long, deeply notched. Fl. v. B.M.2783(c). L.B.18:1721(c). Italy. Intr. 1822. Zone VII?—*I. T. petraea* (Jord.) Nichols. Fls. tinged red in the centre. B.C.3:1636(h). (*I. p. Jord.*) S. Eu.

Closely related species: *I. Pruitii* Tineo. Differs chiefly in the glabrous often subdentate lvs. and white fls. Fiori & Paol. Ic. Fl. Ital. 173. Sicily. By some authors *I. Tenoreana* is referred to this species as *I. Pruitii* var. *hirtula* Ten.

3. *I. saxatilis* L. About 10 cm. tall; brts. and usually the infl. finely hairy: lvs. linear, 1–2 cm. long, acute, mucronate, ciliate: infl. umbel-like, 2–24 cm. across; fls. white: fr. about 7 mm. long, notched at apex. Fl. v. R.I.2: f.4200(c). S. Eu. Intr. 1739. Zone V?

Related species: *I. corifolia* (Sims) Sweet. Lvs. linear-spatulate, obtuse, glabrous. B.M.1642(c). J.H.58:453; III.11:177. (? *I. correaefolia* Nichols.) S. Eu. Cult. 1814. Zone VI?

4. *I. sempervirens* L. To 30 cm. tall; glabrous: lvs. linear-oblong, 1.5–3 cm. long, obtuse, entire: infl. 2–3 cm. across, elongating and finally racemose: fr. orbicular-elliptic, 6–7 mm. long, slightly or deeply emarginate. Fl. v. R.I. 2:f.4198,4199(c). S. Eu., W. Asia. Intr. 1731. Zone V.—*I. s. Garrexiàna* (All.) Nichols. Lvs. linear-oblong, acutish, not mucronate: fls. rather small, umbellate, finally racemose. R.I.2:t.7(c). Gn.62:393(h). (*I. G. All.*) S. Eu. Cult. 1868.

5. *I. semperflorens* L. Upright shrub to 60 cm., glabrous: lvs. obovate-oblong, with the petiole 3–6 cm. long, rounded at apex, gradually narrowed at base, entire: fls. white or sometimes pinkish, fragrant: infl. about 3 cm. across, becoming racemose: fr. broader than long, 8–10 mm. across, slightly emarginate, wingless; seeds winged. Fl. x–iii. R.I.2:4201. S. Italy, Sicily. Intr. 1679. Zone VII?

2. **AETHIONEMA** R. Br. Herbs or subshrubs, sometimes spinescent: lvs. alternate, entire: fls. pinkish-purple or red, rarely whitish or pale yellow,

in terminal racemes; sepals saccate at base; the longer stamens with usually dilated and often toothed filaments: pods compressed, winged, 2-celled, with 1 or several seeds in each cell, rarely 1-seeded and indehiscent. (Greek *aethin*, to scorch and *nema*, filament.) About 50 species chiefly mediterranean.

**A. grandiflorum** Boiss. & Hohenack. Subshrub with slender simple brs. procumbent at base, to 40 cm. long, glabrous: lvs. linear-oblong to obovate-oblong, 2-4 cm. long, obtuse, bluish green: fls. in elongated racemes, to 7 cm. long and 2.5 cm. across, rose-colored, petals 4 times as long as sepals; filaments dilated at base, not toothed: pods suborbicular with the wings much broader than the locules, deeply notched at apex; stigma subsessile: locules 1-seeded. Fl.v-viii. Gn.9:t.108(c). S.H.1:f.231a-h. Persia. Intr. 1879. Zone VI? Handsome subshrub well adapted for rockeries.

Related species: **A. pulchellum** Boiss. & Huet. Stems branched: fls. smaller; petals about  $2\frac{1}{2}$  times as long as the sepals, obovate; pods with erose-dentate wings. Gn.25:320.t(c). G.C.105:147(h). (*A. coridifolium* Hort., not DC.) Asia Minor. Cult. 1887. Zone V?—**A. diastrophis** Bge. Fls. small: pods small with plicate deeply dentate curved wings; style slightly shorter than sinus. Bibl. Bot. No.58:t.1. Asia Minor. Intr. 1841.—**A. coridifolium** DC. It differs chiefly in its shorter crowded linear to linear-oblong lvs. often acutish, in the shorter and denser racemes with smaller fls., and in the obovate-oblong narrowly winged pods. B.M.5952(c). Gt.33:t.1150(c). (*Iberis jucunda* Schott & Kotschy.) Asia Minor. Intr. 1871.—**A. membranaceum** DC. Upright, to 15 cm.: lvs. linear-oblong, upright: racemes subcapitate: fls. 6 mm. long; longer filaments toothed at apex: pods with very broad entire wings, style short. S.B.t.69(c). Persia. Intr. 1828.—**A. gracile** L. Ascending, to 20 cm.: fls. purplish, in dense racemes; longer filaments toothed at apex: pod obcordate with erose-dentate wings; style as long as sinus; locules 2-3-ovuled. R.I.2:t.11(c). Greece to Carniola. Intr. 1820.—**A. iberideum** Boiss. Cespitose, with scabrid brs., crowded narrow lvs. and white fls. in short and dense racemes: pods small, with curved wings; locules 2-ovuled. S.St.4.89(h). (*A. schistosum* Boiss. & Kotschy.) Greece, Asia Minor. Intr. about 1880.

**3. PSEUDOCYTISUS** Ktze. Small shrubs, spiny or unarmed: lvs. alternate, entire, usually hirsute: fls. yellow, in racemes; longer filaments connate below: pod ovoid, slightly compressed, with convex valves; locules 1-2-seeded: seeds globose. (Greek *pseudos*, false, and *kytisos*.) Three species in Spain and Algeria.

**P. spinosus** (Boiss.) Rehd. Upright spiny shrub to 30 cm.: lvs. linear, 1-2 cm. long, fleshy, like the stem furnished with scattered bristly hairs sometimes nearly wanting: fls. few, about 1.5 cm. across; petals yellow, with brown veins; sepals erect, 6 mm. long: pod ovoid, 6 mm. long, beaked. Fl.vi. S.H. 1:358. (*Vella spinosa* Boiss.) Cult. 1890. Zone VII?

**P. integrifolius** (Salisb.) Rehd. is probably still tenderer: unarmed shrub to 60 cm. or more: lvs. obovate, 1.5-2 cm. long, bristly: fls. larger, in elongated many-fl. racemes. B.R.293. (*Vella Pseudocytisus* L., *V. integrifolia* Salisb.) Spain. Intr. 1759.

**4. ALYSSUM** L. Herbs or subshrubs with stellate hairs: lvs. alternate, often forming rosettes, entire or toothed: fls. white or yellow; in terminal usually umbel-like racemes: longer stamens winged and toothed at apex: pods subglobose or ovoid, more or less compressed; valves convex, scarcely veined; each locule with 1 or 2 wingless seeds, rarely more. (Ancient Greek name.) About 100 species in Eu., the Mediterr. Region and Cauc.

**A. saxatile** L. GOLDEN-TUFT. Woody at base, to 30 cm., densely hoary-tomentulose: lvs. obovate-oblong to oblanceolate, obtuse or acutish, sometimes indistinctly toothed, the basal ones tufted, petioled, 6-10 cm. long with the petiole, the upper ones smaller, serrate: flowering stems much

branched above, bearing numerous subumbellate heads about 1.5 cm. across of golden-yellow fls.; petals emarginate: pods suborbicular, compressed, 6-7 mm. long, glabrous. Fl.v. B.M.159(c). R.I.2:f.4280(c). B.C.1:269. C. and S. Eu. Intr. 1710. Zone IV. Low tufted plant covered with golden-yellow fls. in May.—*A. s. variegatum* Nichols. Lvs. margined white. N.I.1:60.

Related species: *A. gemonense* L. Differs chiefly in its broader and shorter lvs., in the incised petals and in the smaller slightly compressed pods about 4 mm. long. R.I.2:f.4281(c). S. Eu. Intr. 1710. Zone V.—*A. argenteum* Vitm. Subshrub to 40 cm., without tufted lvs. at base: lvs. obovate-elliptic to oblanceolate, 6-20 mm. long, acutish, green and pilose above, white-tomentose beneath: fls. golden-yellow, in small heads forming large termina. corymbs: pod suborbicular, 3-4 mm. long, much flattened, stellate-pubescent. Fl.vi-vii. R.I.2:f. 4277,4378(c). B.C.1:269. S. Eu., Asia Minor. Cult. 1830. Zone V.—*A. spinosum* L. Dense spiny shrub to 30 cm.: lvs. oblong-lanceolate, 1-5 cm. long, like the brts. and infl. silvery-scurfy: fls. white to pink, in short racemes: pod glabrous. Gn.88:182(h). J.L.64:f.38(h). S. W. Eu., N. Afr. Intr. 1683. Zone VII?

### 34. CRASSULACEAE DC. ORPINE FAMILY

Herbs or subshrubs, usually fleshy and mostly glabrous: lvs. usually alternate, entire or toothed: fls. mostly in terminal cymes, regular, usually perfect; sepals 5, rarely 3-30; petals as many; stamens as many or twice as many; carpels as many as petals, free, rarely connate, usually each with a scale at base; styles subulate; ovules usually many, rarely few or 1: fr. consisting of dehiscent leathery or membranous follicles.—About 500 species in 14 genera, chiefly in the warmer regions, much developed in S. Afr. and S. Eu.

1. *SÉDUM* L. Herbs or subshrubs: fls. yellow, white, pink or blue, in terminal cymes, usually 5-merous; stamens 10, the epipetalous adnate to the base of the petals; follicles free, many-seeded, rarely 1-seeded, dehiscent on the ventral suture. (Ancient Latin name.) About 140 species in the temp. and colder regions of the n. hemisphere; in Am. s. to Peru.

*S. populifolium* L. Upright subshrub to 30 cm. tall, glabrous; older brs. purple-brown: lvs. slender-petioled, ovate, 1.5-3 cm. long, acute, subcordate at base, coarsely and irregularly dentate: fls. whitish or pinkish, in terminal corymbose cymes, 3-8 cm. across; petals lanceolate, 5-6 mm. long; anthers purple. Fl.vii-viii. B.M.211(c). S.H.1:360. Gn.27:316;82:297(h). Siberia. Intr. 1780. Zone V.

### 35. SAXIFRAGACEAE Dum. SAXIFRAGE FAMILY

Herbs, shrubs or small trees: lvs. alternate or opposite, usually without stipules: fls. perfect, regular, hypogynous or perigynous; sepals 4-5, rarely more; petals as many, valvate or imbricate; stamens as many, or twice as many and the outer opposite to the petals; carpels 2-5, wholly or partly connate, rarely separate; styles or stigmas as many as carpels; ovules many: fr. a capsule or berry; seed small winged, with endosperm; embryo small with flat cotyledons. Including *Hydrangeaceae* Dum. and *Grossulariaceae* Dum.—About 75 genera with 100 species widely distributed in both hemispheres chiefly in temp. regions.

- A. Lvs. opposite: fr. a capsule.....Subfam. I. HYDRANGEOIDEAE Engl.
- B. Fls. all fertile with usually showy petals, in racemes or sometimes corymbose panicles.
- C. Fls. 4-5, rarely 6-merous.
- D. Stamens numerous.
- E. Lvs. evergreen, penninerved: fls. 5-7-merous.....1. *Carpenteria*
- EE. Lvs. deciduous, usually dentate, 3-5-nerved at base: fls. 4-merous.
- 2. *Philadelphus*

- DD. Stamens twice as many as petals.  
 E. Fls. 4-merous; ovary nearly superior: lvs. entire.....4. *Fendlera*  
 EE. Fls. 5-6-merous: lvs. dentate.  
 F. Ovary superior.  
 G. Lvs. penninerved: fls. 5-merous.....3. *Jamesia*  
 GG. Lvs. 3-nerved: fls. 5-6-merous, small.....6. *Whipplea*  
 FF. Ovary inferior.  
 G. Petals free, conspicuous: lvs. serrate, usually with stellate hairs.  
 GG. Petals cohering, falling off as a whole: lvs. entire, glabrous.....10. *Pileostegia*  
 CC. Fls. 7-10-merous; style 1: lvs. entire or nearly so.....11. *Decumaria*  
 BB. Fls. of two kinds, small fertile ones and sterile enlarged marginal ones, rarely the latter wanting: infl. corymbose, rarely paniculate; ovary inferior or semi-superior.  
 C. Sterile fls. with connate sepals, sometimes wanting: stamens many: buds stalked.  
 7. *Platy crater*  
 CC. Sterile fls. with distinct sepals; stamens twice as many as sepals, rarely more: buds sessile.  
 D. Styles 2-5, free: sterile fls. with 3-4 sepals.....8. *Hydrangea*  
 DD. Styles 4-5, connate: sterile fls. with 1 large sepal.....9. *Schizophragma*  
 AA. Lvs. alternate: stamens 4-5.  
 B. Ovary superior: fls. in dense long racemes: fr. a caps.....Subfam. II. ITEOIDEAE Engl.  
 12. *Itea*  
 BB. Ovary inferior.  
 C. Fr. a caps: lvs. usually coriaceous, serrate.....Subfam. III. ESCALLONIOIDEAE Engl.  
 13. *Escallonia*  
 CC. Fr. a berry: lvs. usually palmately lobed: brs. often spiny.  
 Subfam. IV. RIBESIOIDEAE Engl.  
 14. *Ribes*

1. **CARPENTÉRIA** Torr. Evergreen shrub; brts. 4-angled: lvs. petioled, opposite, penninerved: fls. large, in few-fld. terminal cymes; sepals 5-7, valvate; petals as many, convolute, clawless; stamens numerous: ovary superior, 5-7-celled; style short, with 5-7-lobed stigma: caps. leathery, conical, 5-7-valved; seeds numerous. (After William M. Carpenter; 1811-1848.) One species.

**C. californica** Torr. Shrub to 2.5 m.: lvs. elliptic-oblong to oblong-lanceolate, 4-10 cm. long, narrowed at ends, entire or indistinctly denticulate, bright green and glabrous above, glaucous and sparingly pubescent beneath; petioles 5-10 mm. long: fls. in 3-7-fld. cymes, white, 5-7 cm. across, fragrant, sepals ovate-lanceolate; petals orbicular-obovate. Fl.vi-viii. B.M.6911(c). G.C.40:6,7;44:112. Calif. Intr. 1880. Zone VII. Showy shrub when in bloom; demands sunny sheltered position and well-drained soil.

2. **PHILADÉLPHUS** L. MOCK-ORANGE. Deciduous shrubs; brs. with solid white pith and close or flaky bark; buds small, usually hidden by the base of the petiole, sometimes free, with imbricate scales: lvs. opposite, entire or dentate, 3-5-nerved at base: fls. white, rarely purple near base, often fragrant, terminal on lateral brts., usually racemose, but often solitary or in 2-3-fld. cymes, rarely paniculate; sepals and petals 4; stamens numerous, styles 4, more or less connate; ovary 4-celled, inferior or half-superior: fr. a 4-valved capsule with numerous minute seeds. (Ancient name of unknown application.) About 40 species in N. Am., S. Eu. and Cauc., and in E. Asia to the Himal.—Much planted on account of their showy mostly fragrant fls.; numerous hybrids make the distinction of the species difficult.

- A. Fls. in racemes or panicles.  
 B. Fls. in panicles, sometimes partly in racemes, but with the lower pedicels articulate.  
 C. Calyx outside and lvs. glabrous.  
 D. Lvs. subcordate at base.....1. *P. cordifolius*  
 DD. Lvs. broad-cuneate at base.....2. *P. californicus*  
 CC. Calyx outside and lvs. pubescent.....3. *P. insignis*  
 BB. Fls. in racemes.  
 C. Calyx glabrous outside (pubescent in var. of 18).  
 D. Brts. of the previous season yellowish or grayish brown, rarely gray or brown, with not or scarcely exfoliating bark.

- E. Bark yellowish or brown.
- F. Lvs. acute or short-acuminate; racemes dense or only the lower pair remote.
- G. Lvs. glabrous or nearly so, entire or slightly denticulate.....4. *P. Lewisii*
- GG. Lvs. pubescent on both sides, at least those of the shoots dentate.
5. *P. Gordonianus*
- FF. Lvs. long-acuminate; racemes loose; fls. 2-2.5 cm. across; bark brown, usually with longitudinal cracks.....15. *P. satsumanus*
- EE. Brts. light gray, with always close bark; lvs. large.....6. *P. pubescens* var.
- DD. Brts. of the previous season with brown exfoliating bark.
- E. Lvs. glabrous beneath or pubescent only near base or sparingly on the veins.
- F. Lvs. not bearded in the axils, sometimes sparingly pubescent beneath.
- G. Pedicels glabrous; lvs. rather small, petiole usually purplish; fls. yellowish white.....18. *P. pekinensis*
- GG. Pedicels pubescent; fls. pure white.
- H. Style glabrous.
- I. Lvs. 1.5-4 cm. long, entire or with 1-4 small teeth on each side.
11. Lvs. 4-8 (-12) cm. long, denticulate or dentate.....19. *P. tenuifolius*
- HH. Style hairy at base.....20. *P. Schrenkii*
- FF. Lvs. bearded or pubescent near the axils at base, otherwise glabrous.
- G. Bark of brts. freely exfoliating; lvs. dentate.
- H. Style shorter than stamens; lvs. ovate or elliptic; fls. creamy-white, very fragrant.....21. *P. corparius*
- HH. Style longer than stamens or nearly as long; fls. white, inodorous or slightly fragrant.
- I. Lvs. ovate or elliptic, short-acuminate; fls. 4-4.5 cm. broad.
22. *P. Zeyheri*
- II. Lvs. ovate-lanceolate to lanceolate, acuminate; fls. 3-3.5 cm. broad.
- J. Style nearly as long as stamens; petals elliptic, obtuse.
17. *P. nepalensis*
- JJ. Style longer than stamens; petals oblong, acutish.24. *P. Falconeri*
- GG. Bark slightly or scarcely exfoliating; lvs. denticulate or subentire.
4. *P. Lewisii*
- EE. Lvs. more or less pubescent all over beneath.
- F. Calyx green or greenish.
- G. Lvs. with rather small remote teeth, ovate to oblong-ovate; bark slightly or not exfoliating.
- H. Lower pedicels 0.5 cm. long; bark scarcely exfoliating; lvs. short-pubescent beneath.....15. *P. satsumanus* var.
- HH. Lower pedicels 0.5-1 cm. long; bark exfoliating; lvs. densely soft-pubescent beneath.....18. *P. tomentosus*
- GG. Lvs. of shoots coarsely toothed, broad-ovate, loosely hairy beneath; bark freely exfoliating.....23. *P. floribundus*
- FF. Calyx purple or purplish; petioles and veins beneath often violet-purplish.
- G. Young shoots glabrous; lvs. grayish tomentose beneath or nearly glabrous, 3-10 cm. long.....14. *P. Delavayi*
- GG. Young shoots pubescent; lvs. strigose-pubescent beneath, 2-5 cm. long.
13. *P. purpurascens*
- CC. Calyx pubescent outside.
- D. Bark brown or yellowish brown, often exfoliating.
- E. Lvs. usually oblong-ovate, serrulate with the teeth pointing forward.
- F. Lvs. strigose-pubescent above; style hairy near base.....9. *P. Magdalenae*
- FF. Lvs. glabrous or glabrescent above.
- G. Lvs. pubescent beneath, at least on the veins.
- H. Style glabrous at base; lvs. densely pubescent or subtomentose beneath.
10. *P. incanus*
- HH. Style usually pilose at base; lvs. strigose beneath at least on the veins.
11. *P. subcanus*
- GG. Lvs. glabrous or glabrescent beneath.....12. *P. sericanthus*
- EE. Leaves ovate or broad-ovate.
- F. Lvs. dentate or denticulate with spreading teeth, longer than 3 cm.
- G. Style shorter than stamens.
- H. Racemes 7-11-fld.; bark close, light yellowish or grayish brown.
8. *P. monstrosus*
- HH. Racemes 5-7-fld.; bark brown or grayish brown.
- I. Fls. single.....7. *P. verrucosus*
- II. Fls. usually double.....34. *P. virginialis*
- GG. Style as long as stamens; fls. large, usually in 5-fld. racemes, sometimes cymose.....28. *P. magnificus*
- FF. Lvs. usually entire, shorter than 3 cm.; bark brown.....32. *P. polyanthus*
- DD. Bark close, light gray.....6. *P. pubescens*
- AA. Fls. solitary or 3, rarely 5, sometimes more and cymose.
- B. Buds enclosed in the base of the petiole.
- C. Lvs. large, usually over 3 cm., thin; style usually longer than stamens.
- D. Pedicels and calyx glabrous.
- E. Style with broad stigmas divided only at apex.
- F. Lvs. usually entire, ovate, glabrous.....26. *P. inodorus*

ff. Lvs. dentate or denticulate, usually cuneate at base.

g. Fls. 1-3.

h. Lvs. usually oblong-ovate, dentate, usually glabrous. 27. *P. grandiflorus*

hh. Lvs. ovate-lanceolate to lanceolate, strigose beneath, denticulate.

gg. Fls. 5-9, rarely to 15; lvs. ovate, dentate. 22. *P. Zeyheri* var.

ee. Styles with narrow stigmas, divided nearly to base: fls. in 3-9-fld. cymes.

33. *P. cymosus*

dd. Pedicels and calyx pubescent.

e. Styles as long or longer than stamens, with broad stigmas: fls. 1-3.

29. *P. floridus*

ee. Style shorter, with narrow stigmas; fls. 3 or more in cymes, usually double.

34. *P. virginialis*

cc. Lvs. small, 5-20 mm. long: fls. usually solitary; styles slightly shorter than stamens, usually wholly united. 30. *P. microphyllus*

bb. Buds exerted: styles united.

c. Petals with purple blotch at base; stigmas free. 35. *P. purpureo-maculatus*

cc. Petals pure white; stigmas partly united. 36. *P. hirsutus*

Ser. 1. GORDONIANI Koehne. Fls. in racemes or panicles; calyx glabrous, rarely pubescent; stigmas narrower than anthers; bark\* of brts. brown, yellowish or gray, close, or slightly exfoliating.

1. *P. cordifolius* Lange. Shrub to 2 m.; bark red-brown, slightly exfoliating: lvs. broad-ovate, 5-10 cm. long, acute or short-acuminate, rounded to subcordate at base, denticulate or entire, glabrous except in the axils below: fls. 2.5-4 cm. across, in 15-40-fld. glabrous panicles, leafy below; sepals lance-ovate; petals elliptic-oblong; style connate. Bot. Tidsskr. III.2:t.3(c). D.L. 3:344(as *P. Lewisii*). Calif. Intr. 1863. Zone VI. Shrub with large panicles of white fls.

2. *P. californicus* Benth. Shrub to 3 m.; bark pale brown to chestnut-brown, slightly exfoliating; buds slightly exerted: lvs. ovate to elliptic-ovate, rarely lance-ovate, 3-8 cm. long, acute, usually broad-cuneate at base, denticulate or entire, glabrous or sparingly hairy below; fls. fragrant, about 2.5 cm. across in 7-20-fld. panicles, occasionally in racemes, but the lower pedicels articulate; sepals ovate, short-acuminate; petals elliptic; styles connate. Fl.vi-vii. S.H.1:f.234a-a<sup>2</sup>, 263a. (*P. Lewisii* var. *parvifolius* Torr.) Calif. Cult. 1858. Zone VI.

3. *P. insignis* Carr. (*P. pubescens* × *cordifolius* or *californicus*?) Tall shrub: bark light grayish brown, close or slightly exfoliating: lvs. ovate or broad-ovate, 3.5-7 cm. long, short-acuminate, broad-cuneate to slightly subcordate at base, entire or denticulate, glabrous above, grayish pubescent beneath: fls. about 3 cm. across, in 15-30-fld. leafy panicles; pedicels and calyx pubescent; petals obovate; styles connate. Fl.vi-vii. S.H.1:f.236g(l). (*P. Billiardii* Koehne, *P. "Souvenir de Billiard"* Carr.) Origin before 1870. Zone V. Shrub with large panicles of slightly fragrant fls.; one of the latest to bloom.

*P. i.* ? × *Lemoinei* = *P. polyanthus*; see No. 32.

4. *P. Lewisii* Pursh. Shrub to 2 m.; young brts. glabrous; bark red-brown or yellowish brown, with cross-cracks and tardily exfoliating: lvs. ovate to ovate-oblong, 3-7 cm. long, acute, usually cuneate at base, entire or denticulate, 3-5-ribbed, the strongest pair arising some distance from the base, usually villous in the axils of the veins below, otherwise glabrous, those of the shoots larger, denticulate and often rounded at base: fls. 2.5-3.5 cm. across, scentless, in 5-9 fld. dense racemes, only the lowest pair in the axils of lvs.; pedicels glabrous, the lower about 5 mm. long; sepals lance-ovate; petals elliptic to elliptic-oblong; styles divided only at apex or nearly to the middle. Fl.vi-viii. S.H.1:f.236h, 237a-b. Mont. to Wash. and Ore. Intr. 1823 or 1884? Zone IV.

\* The description of the bark refers always to brts. of the previous season.

Closely related species: *P. confusus* Piper. Chiefly distinguished by the yellowish or gray close bark and the ovate acute sepals. Wash. Cult. 1900. Zone V.

5. *P. Gordonianus* Lindl. Shrub to 4 m.; young brts. slightly pubescent; bark yellowish or gray, not exfoliating: lvs. ovate or elliptic-ovate to elliptic-oblong, 4-8 cm. long, acuminate, cuneate at base, usually dentate, rarely nearly entire, coarsely dentate and rounded at base on shoots, usually strongly 5-ribbed, all ribs arising from the base, pubescent beneath: fls. 3-4.5 cm. across, slightly fragrant, in 7-9-, rarely 11-fld. dense racemes; pedicels pubescent; sepals ovate or lance-ovate, sometimes with a few hairs outside; petals elliptic to oblong; styles usually united  $\frac{1}{2}$  or  $\frac{3}{4}$ . Fl.vi-vii. B.R.25:32 (c). D.L.3:342. N.I.3:f.107. M.O.224. (*P. Lewisii* auth., not Pursh.) B. C. to Idaho and N. Calif. Intr. about 1825. Zone IV. Shrub with spreading lateral brs. and profuse large fls., the var. smaller in every part.—*P. G. columbianus* (Koehne) Rehd., var. Lvs. usually elliptic-ovate, 3-5 cm. long, 3-5-ribbed, the stronger ribs some distance from the base, those of the shoots ovate, with usually 2-4 coarse teeth on each side, the hairs of the upper surface often with pustulate bases. S.H.1:f.236k(1). (*P. c.* Koehne, *P. Gordonianus* var. *californicus* Dipp., in part?) B. C. and Idaho and N. Calif. Cult. 1890. Zone V.

*P. G. ?*  $\times$  *pubescens*; see No. 8.—*P. G.*  $\times$  *coronarius*; see No. 23.—*P. G. ?*  $\times$  *grandiflorus*; see under No. 27.

6. *P. pubescens* Lois. Shrub to 3 m.; bark light gray, close: lvs. ovate to elliptic, 4-10 cm. long, acuminate, rounded or broad-cuneate at base, sometimes subcordate on shoots, remotely dentate, rarely nearly entire, dark green and nearly glabrous above, densely grayish pubescent beneath: fls. 3-4 cm. across, scentless, in 5-9-fld. racemes, usually the 2 lower pairs in the axils of rather remote lvs.; pedicels and calyx pubescent; sepals ovate, acuminate; petals obovate or oval; style united about  $\frac{3}{4}$ . Fl.vi-vii. L.D.4:t.268 (c). W.D.1:46(c). B.R.7:570(c) and Gn.40:289 as *P. grandiflorus*. (*P. latifolius* Schrad., *P. grandiflorus* var. *floribundus* Gray.) Tenn. to Ala. and Ark. Intr. 1800. Zone IV. Vigorous shrub with large dark green lvs.; the fls. partly hidden by the foliage.—*P. p. intectus* (Beadle) A. H. Moore, var. Lvs. nearly glabrous beneath and calyx glabrous outside. (*P. i.* Beadle.) Intr. about 1880. Zone V.

*P. p. ?*  $\times$  *coronarius* = *P. nivālis* Jacques. Bark brown, usually exfoliating: lvs. ovate, usually rounded at base, less coarsely serrate and usually only sparingly pubescent beneath: fls. 3-4 cm. across, in 5-9-fld. racemes; pedicels 3-8 mm. long, rarely longer, like the calyx clothed with long villous hairs, rarely glabrescent; petals oval or obovate; style divided only at apex; stigmas longer than anthers, as broad. (*P. verrucosus* var. *n.* Rehd., *P. verrucosus* Hort., not Schrad.) Orig. before 1840.—*P. n. plenus* Rehd., f. Fls. double. (*P. verrucosus* var. *n. f. pl.* Rehd., *P. n. spectabilis pl.* Hort.)—*P. n. pl. ?*  $\times$  *Lemoinei*; see No. 34.—*P. p. ?*  $\times$  *laevis* = *P. pendulifolius* Carr. Low shrub; bark chestnut-brown, tardily exfoliating: lvs. ovate or elliptic, pendent, pubescent beneath: fls. 2.5-3 cm. across, short-stalked, in 5-7-fld. racemes; styles as long as stamens, divided only at apex. Orig. before 1875.—*P. p. ?*  $\times$  *californicus*; see No. 3.—*P. p. ?*  $\times$  *Gordonianus*; see No. 8.—*P. p. ?*  $\times$  *tomentosus*; see under No. 16.—*P. p. ?*  $\times$  *grandiflorus*; see No. 28.—*P. p. ?*  $\times$  *microphyllus*; see under No. 30.

7. *P. verrucosus* Schrad. Shrub to 3 m.; bark brown or grayish brown, close or tardily exfoliating: lvs. ovate or elliptic-ovate, 4-7, on shoots 5-11 cm. long, acuminate, rounded or broad-cuneate at base, denticulate or dentate, glabrous above, pubescent beneath: fls. 2.5-3 cm. across, scentless or slightly fragrant, in 5-7-fld. racemes, the lowest or 2 lower pairs usually in the axils of lvs.; pedicels 3-5 mm. long, strigose-pubescent like the calyx; style usually divided  $\frac{1}{4}$  or  $\frac{1}{3}$ ; stigmas narrower than anthers. Fl.vi. S.H.1:f.

235f-m, 236f-m, 237i-l. (*P. pubescens* Koehne, not Loisel.) Ill. Cult. 1828. Zone IV. The hybrid *P. nivalis* is very similar to this species.

*P. v. ?*  $\times$  *laevis* = *P. congestus* Rehd. Differs chiefly in its smaller and narrower lvs. and in the short and congested usually 5-fld. racemes: fls. 3-4 cm. broad; style shorter than stamens; stigmas as broad or nearly as broad and longer than anthers; calyx slightly pubescent chiefly toward the base. Origin unknown.

8.  $\times$  *P. monströsus* (Spaeth) Rehd. (*P. ? Gordonianus*  $\times$  *pubescens*). Tall shrub; young brts. nearly glabrous, light or sometimes yellowish brown; mature brts. light grayish brown, with cross-cracks, but not exfoliating: lvs. usually ovate, sometimes ovate-oblong, 3-8 cm. long, short-acuminate, usually rounded or broad-cuneate at base, remotely denticulate, on shoots always ovate, with 4-8 pairs of rather shallow teeth, nearly glabrous above, densely grayish pubescent beneath: fls. 3-4 cm. across, scentless, in 5-13-, usually 7-9-fld. racemes, the lower pair usually remote; lower pedicels 3-5 mm. long, pubescent; calyx loosely pubescent; petals elliptic-oblong, rarely elliptic; style shorter than stamens, stigmas shorter and narrower than anthers. W.A. 104,t(h). (*P. Gordonianus* m. Spaeth). Orig. unknown; cult. 1897. Zone V.

Ser. 2. *SERICANTHI* Rehd. Bark of brts. brown with cross-cracks and usually more or less exfoliating: lvs. serrate-denticulate with the teeth pointing forward, never entire, more or less pubescent beneath, rarely glabrous: fls. sub-campanulate, in 5-11-fld. second racemes; calyx usually pubescent, or glabrous and violet purple; style shorter than stamens; stigmas narrower than anthers.

9. *P. Magdalénæ* Koehne. Shrub to 4 m.; young shoots pubescent at first, flowering brts. glabrous, older brts. brown or grayish brown, usually exfoliating: lvs. ovate to lance-ovate, 3-5, on shoots to 8 cm. long, long-acuminate, broad-cuneate or rounded at base, denticulate or dentate, pubescent above, densely strigose-pubescent beneath, chartaceous: fls. about 2.5 cm. across, scentless, in 7-11-fld. racemes; lower pedicels about 5 mm. long; calyx strigose-pubescent; sepals ovate; petals broad-elliptic; style connate to above the middle, pubescent at base. Fl.vi. V.F.129. S.L.256(h). W. China. Intr. 1894. Zone (V). Free-flowering shrub with spreading brs.; the second racemes give this and the following species (Nos. 10-14) somewhat the aspect of a large-fld. *Deutzia*.

10. *P. incanus* Koehne. Shrub to 3, or occasionally 5 m.; young flowering brts. slightly, shoots densely pubescent; bark of older brts. brown, soon exfoliating in small flakes; lvs. ovate to oblong-ovate, 3-6, on shoots to 8 cm. long, acuminate, broad-cuneate or rounded at base, serrate, slightly pubescent or glabrescent above, densely grayish strigose-pubescent beneath: fls. 2.5-3 cm. across, scentless, in 5-7 fld. pubescent racemes; pedicels short; calyx densely grayish pubescent; petals broad-elliptic; style glabrous, rarely with a few hairs at base. Fl.vii. B.S.2:135. W. China. Intr. about 1895. Zone (V). Shrub with upright brs.; one of the last species to bloom.

11. *P. subcânus* Koehne. Shrub to 3 m.; young flowering brts. slightly pubescent, shoots pubescent; older brts. with light or dark brown exfoliating bark: lvs. usually oblong-ovate or ovate, 4-8, on shoots to 12 cm. long, acuminate, rounded or broad-cuneate at base, denticulate or serrulate, glabrous or nearly so above, strongly veined and strigose-pubescent chiefly on the veins and veinlets beneath: fls. 2.5-3 cm. across, in 5-9-fld. racemes; lower pedicels 5-10 mm. long, like the calyx densely pubescent; style usually pubescent at base. Fl.vi. C. and W. China. Intr. 1907 or before. Zone V. Closely related and similar to *P. incanus*, but less pubescent and blooming several weeks earlier.—*P. s. Wilsónii* (Koehne) Rehd., var. Larger in all parts, to 6 m.

tall; lvs. of flowering shoots 10-14 cm. long; racemes 9-15-fld. (*P. W. Koehne.*) Probably not in cult.

12. *P. sericánthus* Koehne. Shrub to 4 m.; young brts. glabrous, soon becoming red-brown; bark chestnut-brown, exfoliating: lvs. elliptic-ovate to lance-ovate, 3-6, on shoots to 10 cm. long, long-acuminate, broad-cuneate, rarely rounded at base, remotely serrulate, or serrate on shoots, with 3-10 pairs of teeth, dark green and sparingly strigose or glabrous above, lighter green below and glabrous or with few scattered hairs on the veins and bearded in the axils; veins beneath and petiole often red or violet: fls. 2.5-3 cm., across, scentless, in 5-11-fld. racemes; calyx and pedicels densely strigose-pubescent; lower pedicels 5-10 mm. long; petals broad-elliptic; style divided about  $\frac{1}{2}$ , glabrous. Fl.vr. B.M.8941(c). S.H.1:f.236f,237m-o. C. and W. China. Intr. 1896. Zone V. Shrub with spreading brs. and numerous secund racemes. Possibly *P. parviflorus* Carr. is this species.—*P. s. Rehderianus* Koehne, var. Lvs. larger, on the flowering brts. to 11 cm. long, sparingly pubescent on the veins beneath. W. China. Intr. 1908. Zone (V).

13. *P. purpurascens* (Koehne) Rehd. Shrub to 4 m.; young flowering brts. glabrous, shoots sparingly strigose-pubescent; bark brown, exfoliating: lvs. elliptic-ovate or ovate to lance-ovate, 2-3, on shoots to 5 cm. long, acuminate, broad-cuneate or rounded at base, remotely serrulate or serrate, more or less appressed-pilose above, sparingly or sometimes densely strigose-pubescent beneath, rarely nearly glabrous: fls. about 2.5 cm. across, pure white, very fragrant, in 5-9-fld. racemes; lower pedicels 4-7 mm. long; calyx glabrous, violet-purple, rarely greenish; petals broad-elliptic; style connate to the stigmas. Fl.vr. B.M.8324(c, as *P. Delavayi*). (*P. brachybotrys* var. *p.* Koehne.) W. China. Intr. 1904. Zone V. Shrub with spreading and arching brs., and with small lvs. and an abundance of sweet-scented fls. whose white color is effectively set off by the purple calyx.

Closely related species: *P. venustus* Koehne. Bark grayish, not exfoliating: lvs. oblong-lanceolate, 3-4 cm. long, densely grayish pubescent beneath: racemes 3-5-fld. Tibet. Intr. about 1900. Zone V?

14. *P. Delavayi* L. Henry. Shrub to 5 m.: young brts. quite glabrous, purplish, bloomy; bark chestnut- or grayish brown, exfoliating, sometimes slightly so; lvs. ovate-oblong or lance-ovate, 3-6, or on shoots to 10 cm. long, acuminate, usually rounded at base, remotely serrulate or serrate, short-pubescent and dark green above, grayish tomentose beneath: fls. 3-4 cm. across, very fragrant, in 5-11-, sometimes 13-fld. racemes; lower pedicels 5-10 mm. long; calyx glabrous, violet-purple, often bloomy; petals oval, sometimes tinged slightly purplish outside; styles glabrous, connate  $\frac{3}{4}$  or nearly to the stigmas. Fl.vr. R.H.1903:13. Yunnan. Intr. 1888. Zone (V). Vigorous upright shrub with large very fragrant fls.—*P. D. melanocalyx* Lemoine is a form with dark purple calyx.—*P. D. calvéscens* Rehd., var. Lvs. pubescent beneath only on the veins, or nearly glabrous, sparingly strigose above. B.M.9022(c). (*P. Delavayi* Stapf, not L. Henry.) Intr. about 1915?

Ser. 3. *CORONARI* Koehne. Bark brown or grayish brown exfoliating (except in No. 15): lvs. dentate or denticulate, not entire: fls. early, in upright racemes; calyx glabrous, not purplish; stigmas narrow.

15. *P. satsumanus* Miq. Shrub to 2.5 cm.; bark brown or grayish brown, usually with longitudinal cracks, not or slightly exfoliating: lvs. ovate to ovate-lanceolate, 4-8 cm. long, rarely more, long-acuminate, broad-cuneate or rounded at base, remotely denticulate-serrulate, glabrous except bearded in the axils beneath and sometimes sparingly hairy on the midrib; petiole

5-10 mm. long: fls. about 2.5 cm. across, slightly fragrant, in 5-9-, usually 7-fld. rather loose racemes; lower pedicels about 5 mm. long, glabrous or pubescent; calyx glabrous or finely pubescent along the ribs ending in the sinuses; petals oval; style divided  $\frac{1}{4}$  or  $\frac{1}{2}$ . Fl.vi. Bot. Tidsskr. III.2:t.2(c). S.H.1:f.237f-h,238a. (*P. Satsumi* Koehne, not Lindl. & Paxt., *P. acuminatus* Lange.) Japan. Intr. before 1860. Zone V. Slender upright shrub with rather small slightly fragrant fls.—*P. s. nikoënsis* Rehd., var. Young brts. and lvs. beneath more or less pubescent, sparingly so above. Intr. 1892.

16. *P. tomentosus* Wall. Shrub to 3 m.; young brts. sparingly hairy or nearly glabrous; bark brown, slightly or rather freely exfoliating: lvs. elliptic-ovate or ovate, 4-8 cm. long, long-acuminate, broad-cuneate or rounded at base, remotely denticulate or dentate, dark green and slightly pubescent or glabrous above, densely grayish soft-pubescent beneath: fls. fragrant, about 3 cm. across, in 5-7-fld. racemes; lower pedicels sparingly pubescent, 7-10 mm. long; calyx glabrous or with a few hairs; petals oval; style divided only at the apex. Fl.vi. Royle, III. Bot. Himal. 1:t.46(c). D.L.3:338. S.H.1:f.237 c-e, 238b. (*P. coronarius* var. *t.* Hook f. & Thoms., *P. nepalensis* Lodd.) Himal. Intr. 1822. Zone V. Similar to *P. coronarius*, but lvs. tomentose beneath.

*P. t. × pubescens* = *P. maximus* Rehd. Tall shrub; bark brown or grayish brown, close or slightly exfoliating: lvs. tomentose beneath: fls. with pubescent calyx. Orig. before 1885.

17. *P. nepalensis* Koehne. Shrub to 2 m.; bark chestnut-brown, exfoliating: lvs. ovate-oblong to lance-ovate, 4-10 cm. long, long-acuminate, rounded or broad-cuneate at base, remotely denticulate-serrulate, glabrous, but conspicuously bearded in the axils of the veins beneath: fls. 3-3.5 cm. broad, scarcely fragrant, usually in 5-fld. racemes; pedicels glabrous, the lower 5-15 mm. long; calyx glabrous; sepals lance-ovate; style divided  $\frac{1}{2}$ - $\frac{3}{4}$ , nearly as long as stamens. Fl.vi. S.H.1:f.238g(l). Himal. Cult. 1888. Zone V. Similar to *P. coronarius*, with larger pure white and scarcely fragrant fls.

18. *P. pekinensis* Rupr. Shrub to 2 m.; young brts. quite glabrous, often purplish; bark chestnut-brown, rarely grayish brown, exfoliating: lvs. oblong-ovate, 2.5-5 cm., on shoots to 8 cm. long, long-acuminate, cuneate at base, remotely serrulate-denticulate, quite glabrous or slightly bearded in the axils beneath and grayish green, usually 3-nerved; petioles slender, 2-10 mm. long, like the nerves beneath purplish: fls. 2.5-3 cm. across, creamy white, slightly fragrant, in 5-7-, rarely 9-fld., dense and glabrous racemes; lower pedicels 2-5 mm. long; calyx pale yellowish green, sometimes tinged purplish; petals oval; style about as long as stamens, usually divided only at apex. Fl.vi. I.S.1:t.29. S.H.1:f.237p-r,238e-f. S.L.257(h). (*P. coronarius* var. *p. Maxim.*, ?*P. rubricaulis* Carr.) N. China to Korea. Intr. 1883. Zone IV. Spreading shrub with small lvs. and small slightly fragrant creamy-white fls.; the following variety more upright.—*P. p. brachybótrys* (Koehne) Koehne, car. Bark more often grayish brown and less readily exfoliating; young brts. sparingly strigose; lvs. sparingly strigose usually on both sides, at least those on the shoot; petioles usually green: racemes usually 5-fld., short and dense. (*P. b.* Koehne.) Intr. 1892. Zone V.—*P. p. kansuënsis* Rehd., var. Lvs. sparingly pilose-setose above, beneath chiefly on the veins: fls. 5-7, fragrant; calyx strigose-villous. N. W. China. Intr. 1926. Zone IV.

19. *P. tenuifolius* Rupr. & Maxim. Shrub to 2 m.; bark chestnut-brown or grayish brown, exfoliating; young flowering brts. sparingly pubescent, shoots glabrous or nearly so: lvs. ovate to oblong-lanceolate, 4-8, on shoots

to 12 cm. long, acuminate, rounded or broad-cuneate at base, remotely denticulate-serrulate or dentate on shoots, glabrous except sparingly hairy on the veins beneath, usually 5-nerved at base, thin, sometimes tinged violet when unfolding: fls. 2.5–3 cm. across, scarcely fragrant, in 5–7-fld. racemes; pedicels pubescent, the lower about 5 mm. long; calyx glabrous, sepals pale greenish white; style glabrous, divided about  $\frac{1}{2}$ . Fl.vi. S.H.1:f.238m-n(l). (*P. coronarius* var. *t.* Maxim.) Manch. to Korea. Cult. 1890. Zone IV. Shrub with spreading slender brs. and rather large thin lvs.

Related species: *P. Viksnei* Zamelin. Upright shrub: pedicels pilose: fls. larger, fragrant. Act. Hort. Bot. Latv. 11–12:230(h). Manch. Cult. 1938. Zone IV?

20. *P. Schrénkii* Rupr. Very near the preceding species, but of more vigorous and upright habit; young brts. more or less hairy, flowering brts. often with minute black warts: young lvs. not violet, at maturity of firm texture: fls. 3–3.5 cm. across in 5–7-fld. racemes; rachis and pedicels more densely pubescent with spreading hairs; calyx often hairy along the nerves ending at the base of the calyx-lobes; style more or less pilose at base, rarely glabrous. Fl.vi. S.H.1:f.238c(l). N.K.15:t.12. (*P. coronarius* var. *mandshuricus* Maxim., *P. m.* Nakai.) Manch. to Korea. Intr. about 1874. Zone V or IV.—*P. S. Jáckii* Koehne, var. Lvs. sparingly hairy below: brts., rachis and pedicels more densely pubescent; calyx pubescent toward the base. N.K.15:t.13. (*P. lasiogynus* Nakai.) Korea, N. China. Intr. 1905. Zone V.

21. *P. coronarius* L. Shrub to 3 m.; young brts. glabrous or slightly pilose; bark chestnut-brown, exfoliating: lvs. ovate to ovate-oblong, 4–8 cm. long, acuminate, broad-cuneate or rounded at base, remotely denticulate or dentate, glabrous except bearded in the axils of the veins beneath and sometimes hairy on the veins: fls. 2.5–3.5 cm. across, creamy-white, very fragrant, in 5–7 fld. racemes; pedicels glabrous or pubescent, the lower 5–10 mm. long; calyx glabrous, rarely sparingly pubescent; style usually divided about  $\frac{1}{2}$ . Fl.vi. R.I.24:t.154(c). B.M.391(c). Gn.58:7(h). (*P. pallidus* Hayek.) S. Eu.: Italy to Cauc. Cult. 1560. Zone IV. Much planted for its fragrant fls.—*P. c. aureus* Rehd., var. Lvs. bright yellow when young, later greenish yellow. Gn.15:476,t(c). (*P. c. fol. aureis* hort.) Orig. before 1878.—*P. c. variegatus* West., var. Lvs. bordered creamy white. Orig. before 1770.—*P. c. duplex* West., var. A semidouble or double form of dwarf habit; fls. often solitary. S.O.1:t.60(s, as *P. nanus*). (*P. c.* var. *fl. pleno* Loud.) Orig. before 1770.—*P. c. deutziaeflorus* (Hartwig) Rehd., var. A double form with narrow acutish petals; racemes 3–5-fld.; pedicels glabrous. (*P. c.* var. *d. plenus* Hartwig.)—*P. c. primulaeflorus* (Carr.) Nichols. A double form with broad petals. R.H.1870:305. Other double-fld. forms are *P. c. dianthiflorus*, *rosaeiflorus*, *multiflorus plenus* (Gn. 15:476,t[c]).—*P. c. salicifolius* (K. Koch) Jaeg., var. Lvs. lanceolate, 5–10 cm. long and 1.5–2 cm. broad, more or less curved. S.H.1:f.238l(l).—*P. c. pumilus* West., var. Dwarf dense shrub; brts. and lvs. on the veins beneath sparingly pubescent: lvs. smaller. (*P. nanus* Mill., *P. c.* var. *nanus* Schrad.)

*P. c. × pubescens*; see under No. 6.—*P. c. × inodorus* or *grandiflorus*; see No. 22.—*P. c. × Gordonianus*; see No. 23.—*P. c. × laxus*; see No. 24.—*P. c. × microphyllus*; see No. 31.

The closely related *P. caucasicus* Koehne with the lvs. pubescent beneath and the calyx slightly pubescent does not seem to be in cult.

22.  $\times$  *P. Zeyheri* Schrad. (*P. coronarius*  $\times$  *inodorus* or *grandiflorus*). Spreading shrub to 2 m., glabrous; bark chestnut-brown, exfoliating: lvs. ovate or elliptic-ovate, 4–7, or on shoots to 10 cm. long, acuminate, remotely

denticulate, rarely nearly entire, on shoots remotely dentate, glabrous except pubescent beneath along the veins near base or only bearded: fls. 3.5–5 cm. across, cup-shaped, in 3–5-fld. racemes; pedicels about 5 mm. long; sepals lance-ovate; petals broad-oval; style about as long as stamens, divided  $\frac{1}{3}$  or sometimes nearly to the base; stigmas about as large as stamens. Fl.vi. Orig. about 1820. Zone IV. Shrub with spreading and arching brs. bearing large cup-shaped pure white and slightly fragrant fls.—See also *P. maculiflorus* under No. 35.—*P. Z. Kochianus* (Koehne) Rehd., var. Lvs. elliptic-ovate to lance-ovate, sparingly pubescent on the veins or bearded beneath: fls. 3.5–4 cm. across; style longer than stamens, divided about  $\frac{1}{2}$ . (*P. K. Koehne.*)—*P. Z. umbellatus* (Koehne) Rehd., var. Fls. 3–5 cm. across, in 7–15-fld. cymes; stigmas as broad and often longer than anthers. (*P. u. Koehne.*)

23.  $\times$  *P. floribundus* Schrad. (*P. coronarius*  $\times$  ? *Gordonianus*). Shrub to 3 m.; bark chestnut-brown, exfoliating: lvs. ovate or elliptic-ovate, 3–7 cm., on shoots to 12 cm. long and often broad-ovate and very coarsely toothed, acuminate, broad-cuneate or rounded at base, rather coarsely and irregularly toothed, pubescent beneath: racemes 5–7-fld.; fls. 3.5–4 cm. across, slightly fragrant; pedicels and calyx glabrous or sparingly hairy; the lower pedicels 1–2 cm. long; style divided about  $\frac{1}{2}$ , as long or shorter than stamens. Fl.vi. Orig. before 1828. Zone V.

24.  $\times$  *P. Falcóneri* Sarg. (*P. coronarius*  $\times$  ? *laxus*). Shrub to 2.5 m.; nearly glabrous; bark chestnut-brown, exfoliating: lvs. ovate-lanceolate, to oblong-lanceolate, 3–5, on shoots to 8 cm. long, long-acuminate, cuneate at base, minutely denticulate or nearly entire, glabrous beneath except bearded in the axils: fls. about 3 cm. across, fragrant, in 3–5-fld. racemes or occasionally in 7-fld. cymes; lower pedicels 1–1.5 cm. long, sometimes articulate and occasionally branched; sepals lance-ovate; petals oblong, acutish; stamens rather few, often sterile; style longer than stamens, deeply divided, with narrow stigmas. Fl.vi. G.F.8:497. B.C.5:2581. Orig. before 1880. Zone IV. Tall shrub of graceful habit with numerous rather small fragrant fls.

Ser. 4. *SPECIOSI* Koehne. Bark brown, exfoliating: lvs. over 3 cm. long: fls. 1–3, rarely 5, usually large and cup-shaped; style longer than stamens, divided above; stigmas longer and broader than anthers.

25. *P. laxus* Schrad. Shrub to 1.5 m.; young brts. glabrous: lvs. elliptic-ovate to oblong-lanceolate, 3–6 cm. long, on shoots to 8 cm., gradually acuminate, cuneate at base, remotely denticulate, sometimes nearly entire, usually glabrous above, with scattered strigose hairs beneath, usually more or less pendulous and curved, subchartaceous: fls. 1–3, scentless, 3–4 cm. across; petals obovate to elliptic; lateral pedicels 5–10 mm. long, glabrous like the calyx. Fl.vi. P.F.2:102 (as *P. satsumi*). (*P. grandiflorus* var. *l.* Torr. & Gray, *P. speciosus* Schrad., *P. undulatus* Kirchn.) Ga. Cult. 1825. Zone IV. Spreading shrub with arching brs., small pendulous lvs. and large fls.—*P. l. strigosus* (Beadle) Rehd., var. Lvs. densely strigose beneath and sometimes sparingly so above. (*P. inodorus* s. Beadle.) S. C. Intr. ?

*P. l. \times verrucosus*; see under No. 7.—*P. l. \times pubescens*; see under No. 6.

26. *P. inodorus* L. Shrub to 3 m.: lvs. ovate, 3–6 on shoots to 10 cm. long, acute or acuminate, rounded at base, rarely broad-cuneate, entire or remotely denticulate, glabrous and lustrous above, glabrous beneath except bearded in the axils or sometimes sparingly strigose on the nerves, subchartaceous; petiole 2–3 mm. long: fls. 1–3, cup-shaped, 4–5 cm. across; pedicels short; calyx glabrous; sepals ovate, short-acuminate; petals orbicular-obovate. Fl.vi. B.M.1478(c). N. C. to Ga. and Miss. Intr. 1738. Zone V. Shrub with

arching brs., lustrous dark green lvs. and large pure white cup-shaped fls.

*P. i.* × *coronarius*; see No. 22.

27. *P. grandiflorus* Willd. Shrub to 3 m.; lvs. elliptic-obovate to oblong-ovate, 4-7, on shoots to 12 cm. long, acuminate, cuneate or rounded at base, remotely denticulate or dentate, rather dull dark green above, glabrous or sparingly strigose beneath, rather thin; petiole 3-5 mm. long; fls. 4.5-5.5 cm. across; sepals lance-ovate; petals orbicular-obovate to oval. Fl.vi. S.B.II.1: 8(c). Gn.89:653(h). (*P. inodorus* var. *g.* Gray, *P. gloriosus* Beadle.) N. C. and Tenn. to Fla. and Ala. Intr. 1811. Zone IV. Similar to the preceding species, but lvs. larger and less lustrous and fls. slightly four-cornered in outline.

*P. g.* × ? *Gordonianus* = *P. splendens* Rehd. Similar to No. 28, but nearly glabrous: fls. usually 5; calyx glabrous; stigmas as broad as anthers, longer. H.B.1923:340(h). Gn.M.33:39(h). Orig. before 1900.—*P. g.* × *coronarius*; see No. 22.—*P. g.* × *pubescens*; see No. 28.—*P. g.* × *Lemoinei*; see No. 33.

28. × *P. magnificus* Koehne (*P. grandiflorus* × *pubescens*). Large spreading shrub: lvs. large, pubescent beneath: fls. about 5 cm. across, in 3-5-fld. racemes, sometimes in cymes; lower pedicels 5-15 mm. long; calyx pubescent; style as long as stamens; stigmas broader than anthers. ?B.R. 2003(c, as *P. grandiflorus*). Orig. unknown. Zone V.

29. *P. floridus* Beadle. Shrub to 3 m.; similar to *P. grandiflorus*, but lvs. sparingly pubescent or glabrous above, rather densely pubescent beneath: fls. 1-3, about 5 cm. across; pedicels and calyx densely villous. Fl.vi. (*P. speciosus* Rydb., not Schrad.) N. C. and Ga. Intr. 1906. Zone V.—*P. f. Faxonii* Rehd., var. Resembling *P. laevis* in habit and shape of lvs.; lvs. and fls. smaller. Cult. 1917.

Ser. 5. *MICROPHYLLI* Koehne. Lvs. small, usually less than 2 cm. long; fls. 1-3; style wholly and stigmas usually partly connate.

30. *P. microphyllus* Gray. Shrub to 1.5 m.; bark chestnut-brown, exfoliating; young brts. appressed-pubescent at first, soon glabrous and lustrous reddish-brown: lvs. very short-petioled, elliptic-ovate to oblong-lanceolate, acute, broad-cuneate at base, entire, lustrous and glabrous or strigose above, glaucescent and strigose beneath: fls. usually solitary, 2-2.5 cm. across, exquisitely fragrant; calyx glabrous or slightly strigose; pedicels 2-5 mm. long, strigose; style slightly shorter than stamens. Fl.vi-vii. Gn.40:288,t(c). G.C.51:225. G.W.19:561(h). Colo. to N. Mex. and Ariz. Intr. 1883. Zone V. Graceful upright shrub with small lvs. and numerous white fls. of pine-apple-like fragrance.

*P.m.* × *pubescens* = *P. latvicius* Zamelin. Act. Hort. Bot. Latv. 11-12:231. Cult. 1938.—*P.m.* × *coronarius*; see No. 31.

Closely related species: *P. argyrocalyx* Wooton. Lvs. elliptic to ovate-oblong, on shoots sometimes to 4 cm. long, densely silky-strigose beneath: fls. 3.5-4 cm. across; calyx white-tomentose. Fl.vii-viii. (*P. ellipticus* Rydb.) N. Mex. Intr. 1916. Zone V.—*P. serpyllifolius* Gray. Straggling shrub to 1 m.; bark pale gray-brown, not exfoliating: lvs. obtuse or obtusish, hirsute-strigose above, densely strigose beneath: fls. solitary, nearly sessile; style much shorter than stamens, nearly wanting. N. Mex., w. Tex. Intr. 1917. Zone V.

31. × *P. Lemoinei* Lemoine (*P. microphyllus* × *coronarius*). Lvs. ovate to ovate-lanceolate, 1.5-4 cm. long, on shoots ovate, to 6 cm., acuminate, entire or with 1-4 small teeth on each side, glabrous above, sparingly strigose chiefly on the veins beneath: fls. 2.5-4 cm. across, very fragrant, in 3-7-fld. racemes; calyx glabrous; lower pedicels 2-5 mm. long; style shorter than stamens, connate to the apex or divided ½. G.F.2:617. Orig. 1884. Zone V.—The following horticultural forms belong here: "Avalanche" (G.C.III.21: 89. M.G.11:293,22:379).—"Boule d'argent," with double fls. (G.C.III.18:18;

23:f.123).—"Candelabre" (M.G.11:294).—"Erectus" (M.G.17:383).—"Man-teau d'hermine," with double fls., sometimes in cymes.—"Mont Blanc" (Gs. 1:64.).—The forms of this hybrid are very handsome shrubs of different habit with rather small lvs. and very fragrant fls. produced in great profusion.—By crossing *P. Lemoinei* with other species and hybrids a bewildering variety of forms has been raised which may be classed under the following names:

32.  $\times$  *P. polyanthus* Rehd. (*P. Lemoinei*  $\times$  ? *insignis*). Bark brown, tardily exfoliating: lvs. ovate, 2-5 cm. long, usually entire, acuminate, on shoots sometimes with a few teeth, strigose-pubescent beneath: fls. about 3.5 cm. across, in cymose infl. or in racemes with articulate pedicels; calyx strigose-pubescent. (*P. Lemoinei multiflorus* Schelle.) Orig. before 1901.—Here belong "Gerbe de neige" (type), "Favorite" and "Pavillon blanc" (Gs.1:64. N.F.6:f.40).

33.  $\times$  *P. cymosus* Rehd. (*P. Lemoinei*  $\times$  ? *grandiflorus* or closely related forms). Bark exfoliating: Lvs. 4-10 cm. long, remotely dentate or denticulate, pubescent beneath particularly near the base of the veins and along the veins or nearly glabrous: fls. 5-6 cm. across, double or single, in 3-9-fld. cymes or in racemes with the lower pedicels branched or articulate; calyx glabrous; sepals lance-ovate; style about as long as stamens, usually divided to the base. Orig. before 1903.—Here belong "Conquête" (G.W.17:102), the type.—"Bannière," with semidouble fls. (N.F.6:f.41).—"Mer de glace" (G.W.17:102. Lemoine, Cat.176,t.).—"Norma," with single or double fls. (N.F.6:f.39).—"Nuée blanche."—"Rosace."—"Voie lactée" (Gn.82:267. J.H.28:f.117. G.M.55:554.).—Also "Perle blanche" may be referred here, but, calyx pubescent.

34.  $\times$  *P. virginialis* Rehd. (*P. Lemoinei*  $\times$  ? *nivalis plenus*). Bark brown exfoliating or gray-brown and little exfoliating; lvs. generally ovate, 4-6, on shoots to 8 cm. long, remotely dentate or denticulate, pubescent beneath: fls. double or semidouble, in 3-7-fld. racemes; calyx densely pubescent, rarely glabrescent; style shorter than stamens, divided  $\frac{1}{2}$ . Orig. before 1910.—Here belong the following forms: "Virginal" (type) with exfoliating bark and semidouble fls. in 5-7-fld. racemes. G.C.64:3(h). Gn.82:267. R.H.1910:408, 409(h).—"Albâtre," with large semidouble fls. in usually 5-fld. racemes. N.F. 6:f.42.—"Argentine," with very double fls. usually in 3's; sepals usually 6.—"Glacier," with rather small double fls. in dense 5-7-fld. racemes. N.H.10:150. —Also "Bouquet blanc" may be referred here, though the calyx is scarcely pubescent. J.H.28:f.116. G.W.17:101.

35.  $\times$  *P. purpureo-maculatus* Lemoine. (*P. Lemoinei*  $\times$  *P. Coulteri*). Young brts. pubescent: lvs. ovate, 8-20 mm. long, acute, entire or with 1-2 teeth (or more in some vars.), strigose-pubescent on both sides; petioles 2 mm. long: fls. 1-3, about 3 cm. across, white, with a purple spot at the base of each petal; calyx sparingly pubescent; style connate, glabrous, shorter than the stamens; stigmas capitate, free. B.M.8193(c). Gn.82:267;87:396. Orig. before 1902. Zone VII?—Here belong: "Amalthée," "Etoile rose," "Fantaisie" (*P. phantasia* A. H. Moore), "Nuage rose," "Oeil de pourpre," "Romeo," "Sirène," "Surprise," "Sybille."

*P. p. \times virginalis* = *P. Burkwoodii* Burkwood & Skipwith. Fls. fragrant, 5-6 cm. across; petals rather narrow, with a lilac-pink blotch at base. Cult 1929.

Another plant with red spots at the base of the petals is *P. maculiflorus* Koehne, but the spots are rather pale and the plant does not show the slightest influence of *P. Coulteri*, but resembles *P. coronarius*, though in the style which is longer than the stamens and in the broad stigmas it approaches *P. grandiflorus*; it may be a form of *P. Zeyheri*.

Ser. 6. GEMMATI Koehne. Buds free, not inclosed in the base of the petiole: fls. 1-3, or in racemes; styles and often the stigmas connate, pubescent or glabrous.

36. *P. hirsutus* Nutt. Shrub to 2.5 m.: bark brown, exfoliating; young brts. pubescent: lvs. ovate to oblong-ovate, 3-8 cm. long, acuminate, cuneate or rounded at base, serrate, short-pubescent or nearly glabrous above, densely grayish pubescent beneath strongly 3-nerved: flowering brts. short, usually only with 1 pair of leaves; fls. usually 3, rarely 1, or 4-5, creamy white, scentless, 2-3 cm. across; pedicels pubescent, the lower ones 5-20 mm. long; calyx pubescent; petals obovate; sepals triangular-ovate; style glabrous; stigmas oblong, partly united. Fl.v-vi. B.R.24:14(c). B.M.5334(c). S.L.254(h). (*P. Godohokeri* Kirchn.) N. C. and Tenn. to Ga. and Ala. Intr. 1820. Zone V. Straggling shrub with rather small scentless fls.; one of the least ornamental species, but the earliest to bloom.

The following two species of this series are in cult., but scarcely hardy within our area: *P. Coulteri* S. Wats. Lvs. ovate to ovate-oblong, 2-4 cm. long, acute or acuminate, remotely denticulate, pubescent above, white-tomentose beneath: fls. solitary, about 3 cm. across, calyx white-tomentose, petals with a red spot at base; style hairy. G.F.1:233. (*P. mexicanus* var. *C.* Bean.) Mex. Intr. about 1840?—*P. mexicanus* Schlecht. Similar, but lvs. larger, sparingly strigose below; calyx short-villous; petals white, not spotted. B.R.28:38(c). G.C.34:218. B.M.7600(c). Mex. Cult. 1842.

3. *JAMÈSIA* Torr. & Gr. Deciduous shrubs: brs. with exfoliating bark and solid pith; terminal bud with 2, lateral with 1 pair of outer scales, densely pubescent: lvs. opposite, short-petioled, serrate, penninerved: fls. perfect, in terminal cymes; sepals 5; petals 5, convolute, obovate-oblong, pubescent inside; stamens 10; ovary incompletely 3-5-celled, nearly superior; ovules numerous; styles 3-5, distinct, about as long as stamens, persistent: fr. a caps., half-inferior, 3-5-valved, little longer, or shorter than the upright sepals; seeds numerous. (After Dr. Edwin James, botanical explorer of the Rocky Mts.; 1797-1861.) Syn.: *Edwinia* Heller. One species in W. N. Am.

*J. americana* Torr. & Gray. Shrub to 1 m., rarely to 2.5 m. tall; brts. pubescent while young: lvs. ovate to elliptic, 1.5-6 cm. long, acute, serrate, rugose and slightly pubescent above, grayish or whitish tomentose beneath; petioles 2-15 mm. long: fls. white, sometimes pinkish outside, slightly fragrant, about 1.5 cm. across, in many-fld. cymes, 2-4 cm. high; sepals ovate-lanceolate, acute, much shorter than the petals; stamens and styles somewhat shorter than petals; caps. about 4 mm. long. Fl.v-vi. B.M.6142(c). Gn.63:105. Gt.53:231,232. L.I.t.6. (*Edwinia a.* Heller.) Wyo. to Utah and N. Mex. Intr. 1862. Zone IV. Attractive upright shrub, though not showy, with rather small dull green lvs. turning orange and scarlet in fall in sunny positions.—*J. a. rosea* Purp., var. Fls. pink. Cult. 1905.

4. *FÉNDLERA* Engelm. & Gray. Deciduous rarely subevergreen shrubs: buds minute, with 1 or 2 pairs of outer pubescent scales; brts. striped, pale, bark of older branches fibrous: lvs. subsessile, opposite, entire, 1-3-ribbed, stipulate: fls. 1-3, on short lateral brts., pedicelled, perfect; sepals 4, valvate, longer than the calyx-tube; petals 4, clawed, with rhombic-ovate, erose-ciliate blades; stamens 8; filaments flattened at the top, with narrow upright appendages slightly exceeding the anthers; ovary half-superior, 4-celled, many-ovuled; styles 4, distinct: capsule 4-valved, longer than the persistent sepals; seeds 5-7 mm. long, oblong-triangular, narrowly winged. (After August Fendler, a German naturalist, botanical explorer of New Mexico; 1813-1883.) Three species from Colo. to Mex.

- A. Lvs. green and strigose or nearly glabrous beneath.....1. *F. rupicola*  
 AA. Lvs. grayish or whitish and strigose and tomentulose beneath.....2. *F. Wrightii*

1. *F. rupicola* Gray. Shrub to 2 m.; brts. minutely pubescent while young: lvs. elliptic to oblong or oblong-lanceolate, 1-3 cm. long, acute or obtusish, usually short-strigose and rough above, rarely nearly glabrous, sparingly or sometimes densely strigose beneath, chartaceous: fls. usually solitary, 3-3.5 cm. across, white or slightly tinged rose outside; sepals pubescent or nearly glabrous; stamens upright, about half as long as the spreading petals: caps. light brown, 1-1.5 cm. long. Fl.v-vi. Gray, Pl. Wrightt.5(excl. f. 2,6,7). Tex. and N. Mex.—*F. r. falcata* (Thornber) Rehd., var. Lvs. larger, 2-4 cm. long, narrow-elliptic to linear-lanceolate, usually nearly glabrous, often falcate: fls. often to 4 cm. across. (*F. f.* Thornber.) N. Mex. to Ariz. and Colo. Intr. 1916. Zone V?

2. *F. Wrightii* (Gray) Hell. Similar to the preceding: lvs. narrow-elliptic to lanceolate or narrow-oblong, 5-20 mm. long, scabrid above, grayish white and densely strigose and tomentulose beneath: fls. usually somewhat smaller; pedicels and calyx densely pubescent: caps. about 1 cm. long. Fl.v-vi. B.M. 7924(c). G.F.2:113 (as *F. rupicola*). G.C.36:410;73:177. G.W.19:562(h). (*F. rupicola* var. *W.* Gray.) N. Mex. and w. Tex. to n. Mex. Intr. 1879. Zone (V). Like the preceding a graceful shrub with slender often arching brs. bearing in late spring numerous white fls. resembling in shape a maltese cross.

5. *DEUTZIA* Thunb. Deciduous or rarely evergreen shrubs; brts. hol- low, with usually brown and exfoliating bark; buds with many imbricate scales, glabrous or nearly so: lvs. opposite, short-petioled, serrate, exstipulate: fls. in panicles or in cymes, rarely solitary, usually terminal on lateral brts., white, sometimes pink or purplish, epigynous; calyx-teeth 5, petals 5; sta- mens 10, rarely more, shorter than petals; filaments usually winged and toothed at apex, the 2 whorls often of different size and shape; styles 3-5, distinct: caps. 3-5-valved, with numerous minute seeds. (After Joh. van der Deutz, patron of Thunberg.) Including *Neodeutzia* Small. About 50 species in E. Asia and the Himal., 2 in Mex.

A. Petals valvate in bud.

B. Fls. in panicles or racemes; calyx-lobes shorter than the tube.

C. Filaments winged and toothed near apex (sometimes subulate in Nos. 2 and 3).

D. Lvs. glabrous or nearly so beneath (sparingly stellate with 4-6-rayed hairs in Nos. 2 and 3).

E. Infl. an elongated panicle or raceme; fls. white.....1. *D. gracilis*

EE. Infl. a broad loose panicle; fls. usually pinkish.

F. Calyx-teeth lanceolate .....2. *D. rosea*

FF. Calyx-teeth triangular-ovate .....3. *D. carnea*

DD. Lvs. stellate-pubescent beneath with 10-15-rayed hairs.

E. Calyx-teeth shorter than the tube; petals nearly upright.

F. Panicle narrow: lvs. crenate-denticulate.....4. *D. scabra*

FF. Panicle broad and loose: lvs. sharply serrulate.....5. *D. Schneideriana*

EE. Calyx-lobes about as long as tube.....7. *D. magnifica*

CC. Filaments, at least the longer ones subulate; panicle loose and broad: lvs. on the floral brts. sessile; hairs with 4-5 rays.....6. *D. Sieboldiana*

BB. Fls. in corymbs or cymes, sometimes solitary.

C. Infl. many-fld. or several-fld.

D. Calyx-teeth shorter than the tube, broad-ovate or triangular: fls. white, rather small .....8. *D. setchuensis*

DD. Calyx-teeth as long or longer than the tube, ovate-lanceolate or lanceolate.

E. Fls. pink or purplish outside (see also Nos. 19 and 20).

F. Anthers of the inner stamens borne on the inner side of the broad filaments.

G. Lvs. green and sparingly stellate beneath, with 4-6-rayed hairs.

9. *D. purpurascens*

GG. Lvs. grayish or whitish beneath, densely stellate with 8-12-rayed hairs.

12. *D. longifolia*

FF. Anthers borne at the end of the filaments: lvs. slightly stellate and green beneath .....10. *D. elegantissima*

- EE. Fls. white.  
 F. Inner filaments linear-oblong, exceeding the anthers; lvs. soft-pubescent beneath ..... 11. *D. glomeruliflora*  
 FF. Inner filaments with 2 teeth near apex; lvs. with close stellate tomentum beneath.  
 G. Infl. rather dense; the pedicels about 5 mm. long ..... 13. *D. discolor*  
 GG. Infl. loose; the pedicels about 1 cm. long; lvs. usually with simple hairs along the midrib ..... 14. *D. villosa*  
 CC. Infl. 1-3-fld.; filaments with long recurved teeth; fls. large, white ..... 15. *D. grandiflora*  
 AA. Petals imbricate in bud (or partly imbricate in Nos. 17-20).  
 B. Lvs. soft-pubescent beneath with spreading hairs.  
 C. Stamens subulate; lvs. densely soft-pubescent ..... 16. *D. mollis*  
 CC. Stamens mostly abruptly contracted below the apex; lvs. with mixed pubescence beneath ..... 17. *D. Wilsonii*  
 BB. Lvs. stellate-pubescent or glabrous beneath.  
 C. Petals partly imbricate, partly valvate in bud; infl. paniculate; filaments dentate.  
 D. Fls. white ..... 18. *D. Lemoinei*  
 DD. Fls. pinkish outside.  
 E. Fls. about 1.5 cm. across; calyx-teeth longer than tube ..... 19. *D. maliflora*  
 EE. Fls. about 2 cm. across; calyx-teeth ovate, as long as tube ..... 20. *D. kalmiaeflora*  
 CC. Petals all imbricate; infl. corymbose.  
 D. Lvs. green beneath, sparingly stellate or glabrous ..... 21. *D. parviflora*  
 EE. Calyx stellate-pubescent ..... 22. *D. glabrata*  
 DD. Lvs. glaucous and glabrous beneath; the inner filaments with the anther attached inside near the middle ..... 23. *D. hypoglauca*

### Sect. I. EUDEUTZIA Engl. Petals valvate in bud.

Ser. 1. LATISEPALAE Schneid. (*Scabrae* Rehd.) Infl. paniculate; calyx-teeth shorter than tube; petals more or less upright; filaments with teeth not exceeding the anthers or subulate; styles as long or slightly shorter than petals.

1. *D. gracilis* Sieb. & Zucc. Shrub to 2 m.; brts. with yellowish gray close bark; lvs. oblong-lanceolate, 3-6 cm. long, rarely to 8 cm., long-acuminate, broad-cuneate or rounded at base, unequally serrate, with scattered stellate hairs above, nearly glabrous and green beneath; fls. white, 1.5-2 cm. long, in upright panicles or racemes, 4-9 cm. long; calyx slightly scaly, with short triangular, greenish white lobes deciduous in fr.; petals elliptic to oblong; filaments with short spreading teeth. Fl.v-vi. S.Z.1:t.8(c). F.S.6:t.611(c). Gn.39:200. Japan. Intr. about 1840. Zone IV. Graceful free-flowering shrub with slender often arching brs.; used for forcing.—*D. g. aurea* Schelle, f. Lvs. yellow. There are also some variegated forms.

*D. g.* × *Sieboldiana* = *D. candelabrum* (Lemoine) Rehd. Brts. grayish brown; lvs. usually ovate-lanceolate, serrulate, scabrid above, thinly covered beneath with 3-5-rayed hairs; petioles of flowering brts. about 1 mm. long; fls. 1.5 cm. across, in many-fld. panicles 6-11 cm. long; filaments toothed. R.H. 1908:174. M.G.22:378(h). R.B.33:372(h). (*D. gracilis* c. Lemoine.) Orig. before 1907. Similar to *D. gracilis* in appearance, but panicles broader and denser.—*D. c. fastuosa* (Lemoine) Rehd., var. (*D. gracilis* f. Lemoine) is scarcely different.—*D. c. erecta* (Lemoine) Rehd., var. (*D. gracilis* e. Lemoine) has shorter panicles and smaller fls.; the longer filaments usually gradually narrowed below the apex.—*D. g.* × *parviflora*; see No. 18.

2. × *D. rosea* (Lemoine) Rehd. (*D. gracilis* × *purpurascens*). Brts. with brown, usually exfoliating bark; lvs. ovate-oblong to ovate-lanceolate, sharply serrulate, with scattered stellate hairs, those below with 4-6 rays; petioles 4-5 mm. long; fls. open-campanulate, about 2 cm. across, pinkish outside, in short panicles; calyx-teeth lanceolate, longer than the tube; filaments usually slightly toothed; styles usually longer than the stamens. F.E.30:423. Gn.M. 25:299. G.27:274. (*D. gracilis* r. Lemoine.) Orig. before 1898. Zone IV.—*D. r. campanulata* (Lemoine) Rehd., var. Fls. white, about 2.5 cm. across; sepals lanceolate, purplish, petals broader; filaments strongly toothed. G.28:485. Gn.M.25:229. (*D. gracilis* c. Lemoine.)—*D. r. venusta* (Lemoine) Rehd., var. Fls. white; filaments toothed; sepals deltoid, green. G.27:275. (*D. gracilis* v. Lemoine.)—*D. r. multiflora* (Lemoine) Rehd., var. Fls. white;

filaments toothed; sepals lanceolate. (*D. gracilis m. Lemoine*).—*D. r. carminea* (Lemoine) Rehd., var. Fls. purplish outside; filaments strongly toothed; sepals deltoid, purplish. (*D. gracilis c. Lemoine*).—*D. r. eximia* (Lemoine) Rehd., var. Fls. slightly pinkish outside; filaments short, strongly toothed; sepals deltoid, purplish. (*D. gracilis e. Lemoine*).—*D. r. floribunda* (Lemoine) Rehd., var. Fls. slightly pink outside, in rather dense upright panicles; stamens strongly toothed; sepals lanceolate. (*D. discolor f. Lemoine*). J.P.1902:312(h).—*D. r. grandiflora* (Lemoine) Rehd., var. Similar, but infl. less dense. Gn.M.25:229. (*D. discolor g. Lemoine*.)

*D. r. × Vilmorinae*; see under No. 14.

3. *× D. cárnea* (Lemoine) Rehd. (*D. rosea grandiflora × Sieboldiana*). Brts. brown: lvs. ovate to oblong-ovate, 3–5 cm. long, acuminate, usually rounded at base, sharply serrulate, with scattered stellate hairs on both sides; petioles 2–3 mm. long; fls. nearly 2 cm. across, pink outside, in loose upright panicles; sepals deltoid, purplish; stamens about as long as style, the filaments with short, sometimes obsolete teeth. (*D. discolor c. Lemoine*.) Orig. 1907.—*D. c. stellata* (Lemoine) Rehd., var. (*D. discolor s. Lemoine*) differs chiefly in its narrower petals.—*D. c. densiflora* (Lemoine) Rehd., var. (*D. discolor d. Lemoine*) has white fls. slightly pinkish in bud and *D. c. láctea* (Lemoine) Rehd., var. (*D. discolor l. Lemoine*) pure white fls.

4. *D. scábra* Thunb. Shrub to 2.5 m.; brts. with red-brown, rarely grayish brown, tardily exfoliating bark, stellate-pubescent while young: lvs. ovate to oblong-lanceolate, 3–8 cm. long, acute or obtusely acuminate, usually rounded at base, crenate-denticulate, dull green, stellate-pubescent on both sides, beneath with 10–15-rayed hairs; petioles on flowering brts. about 2 mm. long; panicles upright, narrow, 6–12 cm. long, stellate-pubescent, often mixed with spreading hairs; fls. white or pinkish outside, 1.5–2 cm. long; calyx-teeth triangular, deciduous in fr.; petals oblong, nearly upright; filaments toothed below apex; the longer stamens nearly as long as petals; styles usually 3; caps. subglobose, about 5 mm. long. Fl.vi–vii. S.Z.1:t.6(c). B.M.3838(c). B.R.1718(c). I.S.5:t.220. Gn.37:315. (*D. crenata* Sieb. & Zucc., *D. dentata* Hort., *D. mitis* Hort.) Japan, China. Intr. 1822. Zone V. Handsome shrub with a profusion of white, often purplish tinted fls. late in June.—*D. s. angustifolia* (Reg.) Voss, f. Lvs. oblong-ovate to ovate-lanceolate: infl. only with stellate hairs. (*D. crenata* var. *a. Reg.*)—*D. s. marmorata* Rehd., var. Lvs. spotted with yellowish white. (*D. s. f. aureo-variegata* Schneid.)—*D. s. punctata* Rehd., var. Lvs. sprinkled with white dots. (*D. s. f. albo-punctata* Schneid.)—*D. s. Wätereri* (Lemoine) Rehd., var. Fls. white, tinted carmine outside. Add.8:t.264(c). G.C.39:340. (*D. s. f. punicea* Schneid., *D. crenata* W. Lemoine.)—*D. s. plena* (Maxim.) Rehd., var. Fls. double, suffused with rosy purple outside. R.H.1867:70,t(c). F.S.17:t.1790;18:t.1850(c). (*D. crenata fl. pleno* Hort., *D. crenata* var. *p. Maxim.*) Here belongs "Pride of Rochester."—*D. s. candidissima* (Froebel) Rehd., var. Fls. pure white, double. G.C.II.18:173. A.F.6:263. (*D. crenata c. plena* Froebel, *D. hybrida Wellsii* Hort.)

*D. s. × Vilmorinae*; see No. 7.

Closely related species: *D. hypoleuca* Maxim. Brs. slenderer: lvs. elliptic to oblong-lanceolate, long-acuminate, serrulate, white-tomentose beneath; panicles smaller; petals 1–1.2 cm. long, white. (*D. Maximowicziana* Mak.) Japan. Intr. 1915. Zone VI?

5. *D. Schneideriana* Rehd. Shrub to 2 m.; brts. with brown, tardily exfoliating bark: lvs. elliptic-ovate to elliptic-oblong, 3–7 cm. long, acuminate, usually rounded at base, sharply serrulate, whitish or grayish tomentose

beneath: fls. white in broad-pyramidal panicles; petals oblong; stamens slightly shorter, with strongly toothed filaments; styles usually 3: caps. about 6 mm. across. I.S.5:t.221. C. China. Similar to *D. scabra*, but with broader and looser panicles.—*D. S. laxiflora* Rehd., var. Lvs. oblong-ovate to oblong-lanceolate, thinly stellate-pubescent and green beneath: panicles 4–8 cm. long and almost as broad at base, loose; petals 1.2–1.4 cm. long. Fl.vi–vii. Gn.M.27:21. C. China. Intr. 1907. Zone (V) VI.

Related species: *D. ningpoensis* Rehd. Lvs. ovate-oblong, remotely denticulate, usually broad-cuneate; petiole 1–3 mm. long: panicle to 12 cm. long; petals oblong, 5–8 mm. long. I.S.5:t.222. E. China. Intr. 1937.—*D. Chunii* Hu. Lvs. oblong-lanceolate, remotely and minutely serrulate: panicle to 8 cm. long; petals ovate-oblong, 6 mm. long. I.S.2:t.71. E. China. Intr. 1935.

6. *D. Sieboldiana* Maxim. Shrub to 2 m.; brts. with brown exfoliating bark: lvs. subsessile on flowering shoots, ovate to oblong-ovate, 3–6, on shoots to 8 cm. long, short-acuminate, rounded or subcordate at base, dentate-serrulate, rugose and scabrid above, green and stellate-pubescent beneath with 3–5-rayed hairs: panicles upright, broad-pyramidal and loose, 3–7 cm. long, stellate-pubescent and usually mixed with spreading hairs; fls. white, about 1.5 cm. across, with spreading elliptic-oblong petals; sepals triangular, acute, persistent; stamens slightly shorter than petals; the outer filaments without teeth, the inner often obscurely toothed; styles usually 3: fr. 3–4 mm. across. Fl.vi. S.Z.1:t.7(c). G.C.36:244. B.S.1:487. S.L.158(h). (*D. scabra* Sieb. & Zucc., not Thunb.) Japan. Cult. 1890. Zone V. Usually a low shrub with upright loose panicles.—*D. S. Dippeliana* Schneid., var. Lvs. of flowering brts. broad-elliptic or broad-ovate: infl. only with stellate pubescence; all filaments without teeth. Japan. Intr. about 1875. Zone V.

*D. S. × rosea*; see No. 3.—*D. S. × purpurascens*; see No. 10.—*D. S. × Lemoinei*; see under No. 18.

7. *× D. magnifica* (Lemoine) Rehd. (*D. scabra* *× Vilmorinae*). Lvs. ovate-oblong, 4–6, on shoots to 8 cm. long, rounded at base, sharply serrulate, scabrid above, grayish green and rather densely stellate-pubescent beneath with 10–15-rayed hairs: fls. white, double, in short, rather dense panicles 4–6 cm. long; calyx-teeth ovate or deltoid, nearly as long as the tube; petals oblong, acutish; styles usually 4. Fl.vi. G.M.53:108. F.E.31:322. (*D. crenata* m. Lemoine.) Orig. before 1910. Zone (V). Similar to *D. scabra*, but the infl. shorter and broader and the filaments with larger ascending teeth.—*D. m. formosa* (Lemoine) Rehd., var. (*D. crenata* f. Lemoine) has also double fls. while the following have single fls. and filaments with large ascending teeth.—*D. m. latiflora* (Lemoine) Rehd., var. (*D. crenata* l. Lemoine.) Fls. nearly 4 cm. across, with spreading petals.—*D. m. supérba* (Lemoine) Rehd., var. (*D. crenata* s. Lemoine.) Fls. campanulate.—*D. m. eburnea* (Lemoine) Rehd., var. (*D. crenata* e. Lemoine.) Fls. campanulate, in rather loose panicles.—*D. m. erecta* (Lemoine) Rehd., var. (*D. crenata* e. Lemoine.) Fls. in dense panicles.

Ser. 2. CYMOSAE Rehd. Fls. in loose corymbose cymes; sepals broad-triangular; filaments with large teeth, those of the inner stamens elongated above the anther.

8. *D. setchuenensis* Franch. Shrub to 2 m.; brts. with brown, tardily exfoliating bark: lvs. ovate-lanceolate to lanceolate, 2–4, on shoots to 8 cm. long, long-acuminate, usually rounded at base, scabrid above and sometimes with simple spreading hairs, grayish green beneath and densely stellate-pubescent with mostly 6-rayed hairs and mixed, particularly on the veins, with simple spreading hairs; petioles on the flowering brts. 2–4 mm. long:

fls. 1-1.2 cm. across, white, in few- to many-fl'd. loose corymbs; petals elliptic, spreading; stamens upright, scarcely half as long as petals, the outer filaments with broad ascending teeth, the inner lanceolate exceeding the anther; styles 3, shorter than stamens. Fl.vi-vii. G.C.76:165(h). (*D. corymbiflora erecta* Lemoine.) C. and W. China. Intr. about 1893. Zone VI. Of rather loose and straggling habit, less showy than most species.—*D. s. corymbiflora* (Lemoine) Rehd., var. Lvs. broader and larger: fls. nearly 1.5 cm. across, in loose corymbs 5-10 cm. broad. B.M.8255(c). G.C.III.24:267(h). R.H.1897:466(h),467. A.F.14:166(h). (*D. c. Lemoine*, *D. corymbosa* André, not R. Br.) Intr. with the type.

*D. s. × parviflora*; see under No. 21.

Related species: *D. Monbeigii* W. W. Sm. Lvs. ovate to ovate-lanceolate, 1.5-2 cm. long, obtusish or acutish, denticulate, densely white-tomentose beneath with 12-14-rayed hairs: fls. white, in 5-12-fl'd. corymbs; sepals triangular; petals about 1 cm. long; inner filaments with teeth shorter than the anther. G.C.100:92. J.L.59:409(h). W. China. Intr. 1921. Zone VI?

Ser. 3. STENOSEPALAE Schneid. Fls. in corymbs; calyx-teeth elongated, as long or longer than the tube; filaments always toothed, the inner ones often elongated beyond the anther.

9. *D. purpurascens* Rehd. Shrub to 2 m.; brts. with brown exfoliating bark: lvs. oblong-ovate to oblong-lanceolate, 2-3.5, on shoots to 6 cm. long, acuminate, usually rounded at base, unequally serrulate, scabrid above, green and loosely stellate-pubescent beneath with 5-7-rayed hairs; petioles about 1-3 mm. long: fls. about 2 cm. across, purplish outside, in 4-10-fl'd. corymbs; sepals lanceolate, purplish, longer than tube; petals spreading, obovate or elliptic; stamens about  $\frac{2}{3}$  as long as petals; outer filaments with large teeth exceeding the anthers, the inner oblong, with the anther attached inside near the middle. Fl.v-vi. B.M.7708(c). G.C.III.2:45;26:45. G.F.7:287. R.H.1895:64,t(c). (*D. discolor* var. *p.* Franch.) W. China. Intr. 1888. Zone VI? Spreading shrub with slender brs. and handsome star-shaped fls. more or less purple outside.

*D. p. × gracilis*; see No. 2.—*D. p. × Lemoinei*; see No. 19.—*D. p. × parviflora*; see No. 20.

10. *× D. elegantissima* (Lemoine) Rehd. (*D. purpurascens*  $\times$  *Sieboldiana*). Lvs. ovate to oblong-ovate, irregularly and sharply serrulate, sparingly stellate-pubescent beneath with 4-6-rayed hairs; petioles 1-2 mm. long: fls. nearly 2 cm. across, open, tinted rose inside and outside, in many-fl'd. loose corymbs; calyx-lobes lanceolate, purple, longer than tube; filaments with large ascending teeth. R.B.36:387. M.G.22:377,f.9. (*D. discolor* e. Lemoine.) Orig. before 1910. Similar to *D. purpurascens* but chiefly distinguished by its broader more abruptly acuminate lvs., shorter petioles, longer stamens with the inner filaments toothed at apex and by the more upright habit.—*D. e. fasciculata* (Lemoine) Rehd., var. (*D. discolor* f. Lemoine) is very similar and *D. e. arcuata* (Lemoine) Rehd., var. (*D. discolor* a. Lemoine) has white fls.

11. *D. glomeruliflora* Franch. Shrub to 2 m.; bark of brts. brown, quickly exfoliating: lvs. ovate-oblong to lanceolate, 2-4, on shoots to 7 cm. long, acuminate, cuneate or sometimes rounded at base, sharply serrulate, pubescent above, grayish white below and soft-pubescent with 5-6-rayed hairs mixed with simple hairs on the veins; petioles 1-2 mm. long: fls. white, about 2 cm. across, in usually dense corymbs 3-5 cm. across; calyx-teeth lanceolate, as long or longer than tube, purple; petals elliptic; stamens about half as long as petals; the outer filaments with large ascending teeth, the inner oblong or lanceolate with the anther attached inside; styles about 4. Fl.v-vi. I.S.5:t.224.

W. China. Intr. 1908. Zone (V). Easily distinguished from the related species by the soft pubescence of the under side of the lvs.

Related species: *D. Rehderiana* Schneid. Brts. slender, densely stellate-pilose; lvs. ovate to ovate-lanceolate, 1.5-2.5 cm. long, acute, pale or grayish green below, densely covered with 5-10-rayed hairs; fls. white, in 3-5-fld. cymes; calyx-teeth triangular-lanceolate, about as long as tube; petals 6-7 mm. long; inner filaments with the anther attached inside, bifid at apex. (*D. dumicola* W. W. Sm.) W. China. Intr. 1913. Zone VI?

12. *D. longifolia* Franch. Shrub to 2 m.; brts. with brown or grayish brown exfoliating bark: lvs. oblong-lanceolate to lanceolate, or sometimes narrow lanceolate, 5-8, on shoots to 12 cm. long, long-acuminate, usually cuneate at base, serrulate, scabrid above, grayish green or whitish beneath and densely covered with stellate, 8-12-rayed hairs, on the veins often with simple spreading hairs; petioles 2-3 mm., on shoots to 8 mm. long: fls. 2-2.5 cm. across, tinted light purple, in many-fld. rather dense corymbs; calyx-teeth lanceolate, longer than tube; petals elliptic-oblong; outer filaments with large ascending teeth, the inner usually lanceolate with the anther attached inside, sometimes similar to the outer ones; styles usually 4, sometimes 5. Fl.vi. B.M.8493(c). G.C.51:409. Gn.76:243;88:589(h). W. China. Intr. 1901. Zone VI. Shrub of vigorous habit with rather large lvs. and large purplish fls. in dense corymbs.—*D. l. Veitchii* (Wils.) Rehd., var. With larger more brightly colored fls. in dense corymbs. R.H.1915:536,t(c). J.H. 40:f.53(h). (*D. V. Wils.*)—*D. l. elegans* Rehd., f. Fls. nearly 2 cm. across, rosy-purple outside, in rather loose corymbs along slender arching brs. Intr. 1908. Zone (V).—*D. l. Farreri* Airy-Shaw, var. Fls. white; styles 4-5, distinct. B.M.9532(c). N. W. China. Intr. 1914. Zone V.

*D. l. × discolor* = *D. hybrida* Lemoine. Here belongs "Mont-Rose" Lemoine. Also "Contraste" (G.C.89:485) and "Magicien" are hybrids of *D. longifolia*.

Related species: *D. albidula* Batal. Shrub to 4 m.: lvs. ovate to oblong-ovate, 2-6 cm. long, obtusish to acute, denticulate, scabrid above, densely white-tomentose and reticulate beneath: fls. white, about 1 cm. across, in several to many-fld. corymbs 3-5 cm. wide; pedicels shorter or partly longer than calyx; petals oval; filaments about half as long as petals, with large teeth exceeding the anthers. N. W. China. Intr. 1914. Zone V?

13. *D. discolor* Hemsl. Upright shrub to 2 m.; bark of brts. red-brown or chestnut-brown, exfoliating: lvs. oblong-lanceolate, 3-7, on shoots to 10 cm. long, acuminate, cuneate at base, denticulate-serrulate, scabrid above, grayish green or whitish beneath and densely covered with 10-15-rayed hairs; petioles 2-3 cm. long: fls. about 2 cm. across, white, rarely slightly pinkish, in usually dense many-fld. corymbs; pedicels 3-6 mm. long; calyx-lobes lanceolate or triangular-lanceolate, about as long as tube; petals elliptic; stamens about half as long as petals, the large teeth of the filaments usually not reaching the base of the anthers, but on the inner filaments sometimes equaling the anthers, rarely the inner filaments prolonged beyond the insertion of the anthers; styles usually 3, longer than the stamens. Fl.vi. I.S.5: t.226. C. China. Intr. 1901. Zone (V) VI. Shrub with rather large lvs. and large white fls. in dense corymbs.—*D. d. major* Veitch, var. Fls. about 2.5 cm. across, slightly rose-tinted outside. B.S.1:482. G.30:307(h). R.B.32: 174(h).

*D. d. × mollis*; see No. 17.—*D. d. × longifolia*; see under No. 12.

Related species: *D. reflexa* Duthie. Lvs. with simple hairs beneath on the midrib and often on the veins: fls. smaller, the petals with reflexed margin and therefore appearing narrow. C. China. Intr. 1901. Zone (V).—*D. globosa* Duthie. Lvs. smaller: fls. smaller, creamy white in smaller dense corymbs; filaments abruptly contracted below apex, without teeth. C. China. Intr. 1901. Zone (V).—*D. staminea* R. Br. Lvs. ovate, 3-6 cm. long, long-acuminate,

usually rounded at base, unequally serrate, densely covered with stellate hairs beneath: fls. about 1.5 cm. across, in corymbs 2-4 cm. across; filaments with large teeth. B.R.33:13(c). Himal. Intr. 1841. Zone VII.—*D. s. Brunoniiana* Hook. f. & Thoms., var. Lvs. less pubescent: fls. larger. B.R.26:5(c). (*D. corymbosa* Lindl., not R. Br., *D. canescens* Hort.)

14. *D. Vilmorinae* Lemoine. Shrub to 2 m.; bark of brts. pale brown, tardily exfoliating: lvs. oblong-lanceolate, 3-6, on shoots to 9 cm. long, acuminate, broad-cuneate or rounded at base, serrulate, scabrid above, grayish green beneath, densely covered with 9-12-rayed hairs, and usually with simple spreading hairs along the nerves; petioles 3-5 mm. long: fls. white, 2-2.5 cm. across, in loose slender corymbs 5-7 cm. across; pedicels 1-1.5 cm. long; calyx-teeth lanceolate, slightly longer than tube; stamens slightly shorter than the petals, the filaments toothed usually much below apex; styles 3-4, almost as long as stamens. Fl.vi. F.V.126. I.S.5:t.225. R.H.1905:266,267. Gn. 81:224(h). M.O.221(h),222. C. and W. China. Intr. 1897. Zone (V). Graceful shrub with large white fls. in loose and large corymbs.

*D. V. × rosea grandiflora* = *D. excéllens* (Lemoine) Rehd. Lvs. ovate-oblong, 3-6, on shoots to 9 cm. long, acuminate, rounded or broad-cuneate at base, serrulate, scabrid above, grayish white beneath with many-rayed hairs and often with simple spreading hairs along the midrib; petioles 3-4 mm. long: fls. 2 cm. across, in loose corymbs 4-6 cm. across; pedicels 5-15 mm. long; calyx-teeth lanceolate, about as long as tube; filaments with large spreading teeth some distance below the apex. (*D. discolor* e. Lemoine.) Orig. before 1911.—*D. V. × scabra*; see No. 7.

Ser. 4. *GRANDIFLORAE* Rehd. Infl. 1-3-fld.; ovary partly superior; calyx-teeth narrow-lanceolate; filaments with long recurved teeth.

15. *D. grandiflora* Bge. Shrub to 2 m.; bark of brts. usually grayish brown: lvs. ovate, 2-5 cm. long, acute or acuminate, rounded at base, closely and irregularly denticulate, scabrid above, white-tomentose beneath and reticulate; petioles 2-3 mm. long: fls. white, 2.5-3 cm. across, 1-3 on short lateral brts. usually only with one pair of lvs.; calyx-lobes linear-lanceolate, about twice as long as tube; petals elliptic-oblong, 1.2-2 cm. long; filaments with large spreading and recurved teeth; style 3, longer than the stamens. Fl.IV-v. I.S.5:t.228. N. China. Intr. 1910. Zone V. The earliest of all species to bloom and having the largest fls.

Another species with solitary flowers is *D. coreana* Lév. which represents a distinct series *COREANAE* Rehd. characterized by solitary fls. originating from axillary leafless buds on the brts. of the previous year. Lvs. elliptic-oblong to lanceolate, 4-6 cm. long, with scattered, 4-6-rayed hairs on both sides. M.K.15:t.16. Korea. Intr. 1917. Zone V?

Sect. II. *MESODEUTZIA* Engl. Petals imbricate in bud: filaments subulate or toothed.

16. *D. mollis* Duthie. Shrub to 2 m.; brts. stellate-pubescent while young, older red-brown: lvs. elliptic or ovate to ovate-oblong, 4-8, on shoots to 12 cm. long, acute or short-acuminate, broad-cuneate to subcordate at base, closely serrulate, with scattered 3-4-rayed hairs above, grayish green and soft-pubescent beneath, the hairs with usually 4 horizontal rays and an upright central one; petioles 3-6 mm. long: fls. white, 1-1.2 cm. across, in rather dense corymbs 6-8 cm. across, with appressed and spreading hairs; calyx-teeth broad-ovate, shorter than tube; petals broad-obovate, rounded; filaments subulate; styles usually 3, shorter than the longer stamens. Fl.vi. B.M.8559 (c). I.S.5:t.230. B.S.1:484. C. China. Intr. 1901. Zone VI? Distinct but not showy, easily distinguished by the soft pubescence of its rather broad lvs.

17. *× D. Wilsōnii* Duthie (*D. ? discolor × mollis*). Brts. with chestnut-brown exfoliating bark: lvs. elliptic to oblong-lanceolate, 6-9 cm., on shoots to 12 cm. long, acute or acuminate, broad-cuneate or rounded at base, irregu-

larly serrulate, scabrid and rugose above, grayish green beneath, densely covered with 5-10-rayed stellate hairs mixed particularly on the veins with numerous simple spreading hairs; petioles 3-5 mm. long: fls. white, about 2 cm. across, in rather loose broad corymbs; calyx-teeth ovate to ovate-oblong, abruptly mucronulate, about as long as tube; petals broad-elliptic, partly valvate in bud; filaments gradually or abruptly narrowed below apex, rarely slightly dentate; styles 3-4, shorter than the longer stamens. Fl.vi. B.M. 8083(c). Gn.89:515(h). M.G.51:230(h). C. China. Intr. probably 1901. Zone VI. Similar to *D. discolor*, but easily distinguished by the broader lvs. hairy-pubescent below and the scarcely toothed filaments.

18.  $\times$  *D. Lemoinei* Lemoine (*D. parviflora*  $\times$  *gracilis*). Shrub to 2.5 m.; young brts. glabrous or nearly so, older with brown exfoliating bark; lvs. elliptic-lanceolate to lanceolate, 3-6, on shoots to 10 cm. long, long-acuminate, cuneate at base, sharply serrulate, green on both sides, with scattered 5-8-rayed hairs beneath; petioles 3-5 mm. long: fls. 1.5-2 cm. across, in panicles or pyramidal corymbs 3-8 cm. high; pedicels slender, glabrous; calyx-teeth triangular, much shorter than tube; petals obovate, partly valvate in bud; filaments toothed below the apex; styles 3, shorter than the longer stamens. Fl.vi. G.F.9:285. Gt.46:383. G.C.III.18:389(h). A.F.11:437(h). Orig. in 1891. Zone IV. Handsome and free-flowering, one of the hardiest Deutzias.—*D. L. compácta* Lemoine. Dwarfier and more compact: fls. smaller in numerous panicles. Gn.M.27:22.—Here belongs also "Boule de neige" with larger fls. in dense corymbs. J.P.IV.3:309. Gng.8:306.

*D. L. \times Sieboldiana* = *D. cándida* (Lemoine) Rehd. Bark of brts. brown, scarcely exfoliating: lvs. ovate to ovate-oblong, 3.5-5 cm. long, acuminate, rounded at base, serrulate, slightly scabrid above, green beneath, with scattered 5-7-rayed hairs; petioles 1-2 mm. long: fls. 1.8 cm. cross, slender-pedicelled, in rather loose panicle-like corymbs 3-4 cm. across; calyx-teeth oblong-ovate, green, almost as long as tube; petals elliptic, chiefly valvate; filaments with short teeth or abruptly contracted, the longer ones often gradually narrowed. M.G. 22:376(h). (*D. discolor* c. Lemoine.) Orig. before 1907.

19.  $\times$  *D. maliflora* Rehd. (*D. Lemoinei*  $\times$  *purpurascens*). Lvs. ovate-oblong, 2.5-4 cm. long, acuminate, usually rounded at base, serrulate, green beneath, with scattered 5-8-rayed hairs; petioles 1.5-3 mm. long: fls. about 2 cm. across, purplish outside, in corymbs 3-6 cm. across; calyx-teeth oblong, acutish, purplish, longer than tube; filaments with large ascending teeth.—Here belongs "Fleur de pommier" (Gn.M.25:228), the typical form of this hybrid, and "Boule rose" which differs in its somewhat smaller lighter colored fls., shorter calyx-teeth and in the less strongly toothed filaments; also "Avalanche" which has large white fls., larger lvs. usually broad-cuneate at base, and is nearer to *D. Lemoinei*. Fl.vi. Orig. about 1903.

20.  $\times$  *D. kalmiaeflora* Lemoine (*D. purpurascens*  $\times$  *parviflora*). Young brts. sparingly stellate-pubescent: lvs. ovate-oblong to ovate-lanceolate, 3-6 cm. long, acuminate, usually broad-cuneate at base, serrulate, light green beneath, with scattered 6-8-rayed hairs; petioles 2-3 mm. long: fls. white, carmine outside, cup-shaped, about 2 cm. across, in rather loose 5-12-fld. corymbs; pedicels stellate-pubescent; calyx-teeth ovate, about as long as tube; petals obovate, partly valvate in bud; filaments with large ascending teeth, the inner often prolonged undivided above the anther. Fl.vi. Gn.W. 17:627. Gn.M.25:229. G.27:199. M.G.51:231. Orig. before 1904. Zone V. Graceful shrub with rather large pinkish fls.

21. *D. parviflora* Bge. Shrub to 2 m.; young brts. with scattered stellate hairs; lvs. ovate or elliptic to ovate-lanceolate, 3-6, on shoots to 10 cm. long, acuminate, usually cuneate at base, unequally serrulate with usually spread-

ing teeth, green on both sides and with scattered 5-6-rayed hairs above, beneath with 6-9-rayed hairs and with simple hairs along the midrib at least near base; petioles 3-5 mm. long: fls. white, about 1.2 cm. across, in many-fld. corymbs 4-7 cm. across; calyx-lobes broad-ovate, shorter than tube; petals roundish-obovate; filaments without teeth or the shorter indistinctly toothed; styles usually 3, shorter than the longer stamens. Fl.vi. (*D. p. musaei* Lemoine.) N. China. Intr. 1883. Zone IV. Free-flowering shrub, one of the hardiest species.—*D. p. amurensis* Reg., var. Lvs. mostly ovate, above with 4-5-rayed hairs, paler beneath, without simple spreading hairs along the midrib and on the rather lax infl. N.K.15:t.20. I.S.5:t.232. Gt.43:65(h);46:382. G.F.1:361. G.C.III.14:153(h). (*D. a. Airy-Shaw.*) Korea, Manch. Intr. 1862.—*D. p. ovatifolia* Rehd., var. Lvs. ovate, rounded at base, with 5-6-rayed hairs above, without simple hairs below. N. China. Intr. 1910.

*D. p. × setchuensis* = *D. myriantha* Lemoine. Lvs. oblong-ovate to oblong-lanceolate, 4-6, on shoots to 9 cm. long, long-acuminate, rounded or broad-cuneate at base, denticulate-serrulate, scabrid on both sides, the hairs beneath 5-6-rayed: fls. white, 2 cm. across, in loose corymbs, 5-8 cm. across; calyx-teeth triangular, short; filaments strongly toothed, the inner filaments often with the anther attached inside. G.C.52:45. A.F.31:100,101. M.G.22:376(h),377. Orig. before 1904. Zone VI.—*D. p. × gracilis*; see No. 18.—*D. p. × purpurascens*; see No. 20.

Related species: *D. corymbosa* R. Br. Brts. glabrous or nearly so: lvs. ovate to oblong-ovate, broad-cuneate or rounded at base, serrulate with usually incurved teeth, below with 8-12-rayed hairs: fls. about 1 cm. across; filaments all toothed. S.H.1:f.244g-i. (*D. parviflora* var. c. Franch.) Himal. Intr. 1830. Zone VII?—*D. compacta* Craib. Lvs. oblong-lanceolate, acuminate, serrulate, pale green beneath with 5-8-rayed hairs: fls. white, 6-9 mm. across, in many-fld. compact corymbs 3-5 cm. across; outer filaments with spreading teeth, inner truncate below apex; anthers reddish. B.M.8795(c). W. China. Intr. 1905. Zone VI?

22. *D. glabrata* Komar. Shrub to 3 m.; young brts. glabrous, later with brown flaky bark: lvs. ovate-oblong or elliptic-ovate to ovate-lanceolate, 3-10 cm. long, acuminate, rounded or broad-cuneate at base, serrulate, bright green above, glabrous or with scattered 3-4-rayed hairs, pale green and quite glabrous beneath; petiole 2-6 mm. long: fls. white, 1-1.5 cm. across in loose many-fld. corymbs 4-8 cm. broad, glabrous; pedicels slender, 6-12 mm. long; calyx glabrous with short broad-ovate obtuse teeth; petals suborbicular; filaments subulate, the longer slightly shorter than petals; styles 3, about as long as stamens. I.S.5:t.231. N.K.15:t.19. Korea. Intr. 1918. Zone V. Vigorous upright shrub with rather large fls. in many-fld. corymbs.

23. *D. hypoglauca* Rehd. Shrub to 2 m.; young brts. glabrous, older with chestnut-brown exfoliating bark: lvs. ovate-oblong to oblong-lanceolate, 3-5, on shoots to 9 cm. long, acuminate, rounded or broad-cuneate at base, serrulate, sparingly stellate above, glabrous and glaucous beneath; petioles 1-2 mm. long; fls. pure white, 1.5-2 cm. across, in many-fld. convex corymbs 4-6 cm. across; calyx loosely stellate, teeth broad-triangular, obtuse; shorter than tube; petals roundish-obovate; outer filaments with large ascending teeth, the inner ones produced undivided beyond the anther. Fl.vi. B.M.9362 (c, as *D. rubens*). C. China. Intr. 1910. Zone V. Easily distinguished from all cult. species by the glaucous and glabrous under side of the lvs.

Closely related species: *D. rubens* Rehd. Young brts. sparingly stellate: lvs. pale green beneath and loosely covered with 4-6-rayed hairs; fls. rosy-pink outside or tinged pink. I.S.5:t.233. W. China. Cult. ? Similar to *D. compacta* Craib (see under No. 21), but differing in the shape of the filaments.

6. **WHIPPLEA** Torr. Low deciduous shrub; buds small, with few outer scales: lvs. opposite, subsessile, 3-nerved, with few shallow teeth, exstipulate:

fls. small, in long-peduncled head-like compact cymes; sepals 5 or 6; petals 5 or 6; stamens 10-12, about as long as petals; ovary 3-5-celled, half-superior; cells 1-ovuled; styles 3-5, distinct; caps. subglobose, separating into 3-5 leathery, 1-seeded carpels. (After Lieut. A. W. Whipple, commander of the surveying expedition to the Pacific Ocean, 1853-54.) One species.

**W. modesta** Torr. Shrub with trailing or arching branches 20-50 cm. long and upright strigillose brts.: lvs. ovate or elliptic, 1-3.5 cm. long, acute or acutish, strigillose on both sides: fls. white, in dense cymes or racemes 1-2 cm. across; sepals ovate; petals rhombic, about 3 mm. long; caps. 2-2.5 cm. across. Fl.v. Rep. Exp. Surv. Pacif. Ocean, 4:t.7. S.H.1:f.241a-g. N. & middle Calif. Intr. before 1892. Zone VII? Low inconspicuous shrub.

**7. PLATYCRATER** Sieb. & Zucc. Deciduous shrub; buds with 2-3 pairs of acuminate outer scales: lvs. opposite, petioled, serrate, exstipulate: fls. white, in terminal loose cymes; the marginal fls. sterile with enlarged 3-4-lobed calyx; sepals 4, acute, petals 4, ovate; stamens numerous, with filiform filaments; styles 2, distinct; ovary inferior, 2-celled: fr. a turbinate caps. dehiscent at apex; seeds numerous, linear, winged at both ends. (Greek *platys*, broad, and *crater*, bowl; alluding to the broad calyx of the sterile flowers.) One species.

**P. arguta** Sieb. & Zucc. Prostrate shrub; brts. glabrous or nearly so, later grayish brown with exfoliating bark: lvs. oblong to lanceolate, 10-18 cm. long, long-acuminate, cuneate at base, coarsely serrate, with scattered hairs above and pilose on the veins beneath or nearly glabrous: fls. about 2 cm. across, slender-pedicelled, in 5-10-fld. cymes; sepals lanceolate, about half as long as petals, the marginal fls. with obtusely 3-4-lobed calyx. Fl.vii. S.Z.1:t.27(c). H.F.1870:206(c). H.S.1:f.245a-l. Japan. The form in cult. is *P. a. hortensis* Maxim., var., with smaller 3-5-fld. cymes usually lacking the sterile fls. Gt.15:t.516. Intr. 1864. Zone VII? It is of little decorative value; likes a shady and humid position.

**8. HYDRANGEA** L. **HYDRANGÆA**. Deciduous upright, rarely climbing shrubs; brs. usually with ample white pith and exfoliating bark; buds with 2 or 3 pairs of outer scales: lvs. opposite, petioled, usually serrate, rarely lobed, exstipulate: fls. perfect, small, in terminal corymbs, rarely in panicles, often with sterile marginal fls.; calyx-lobes 4-5, short; petals 4-5, valvate, small; stamens 8-20, usually 10; ovary inferior or half-superior; styles 2-5, short: fr. a 2-5-celled caps. dehiscent at apex; seeds numerous, minute, winged or wingless. (Greek *hydor*, water, and *ageion*, vessel; alluding to the shape of the caps.) About 35 species in N. and S. Amer., and in E. Asia south to Java.—Ornamental medium-sized shrubs with small white or sometimes blue or pink fls. in usually showy corymbs or panicles; the self-clinging *H. petiolaris* is valuable for covering walls and other objects. They prefer as a rule moist situations and rich soil.

a. Stems upright; stamens 10; petals free, expanding.

b. Infl. paniculate.

c. Lvs. lobed ..... 4. *H. quercifolia*

cc. Lvs. not lobed, serrate ..... 8. *H. paniculata*

bb. Infl. corymbose, flat or hemispherical.

c. Ovary partly superior, hence caps. ovoid, with the calyx-margin about or above the middle; styles usually 3-4.

d. Fertile fls. blue or pink.

e. Infl. sessile, with lvs. at the base: lvs. elliptic-lanceolate, pubescent on the veins beneath ..... 5. *H. Davidi*

ee. Infl. peduncled, leafless or rarely with 1 or 2 leafy bracts.

f. Lvs. obovate to broad-elliptic, glabrous or slightly puberulous beneath, fleshy ..... 6. *H. macrophylla*

- FF. Lvs. ovate or elliptic to lanceolate, sparingly pubescent on both sides, rather thin ..... 7. *H. serrata*
- DD. Fertile fls. white.
- E. Lvs. villous or nearly glabrous beneath.
- F. Mature brts. with close brown or grayish brown bark ..... 9. *H. xanthoneura*
- FF. Mature brts. with exfoliating brown bark ..... 10. *H. Bretschneideri*
- EE. Lvs. white-tomentose beneath ..... 11. *H. heteromalla*
- CC. Ovary inferior, hence caps. truncate, with the calyx-limb at apex.
- D. Corymb without involucre at base.
- E. Brts. glabrous or puberulous when young: seeds wingless.
- F. Lvs. glabrous below: corymbs without or very few marginal fls.
1. *H. arborescens*
- FF. Lvs. pubescent beneath.
- G. Lvs. densely grayish pubescent beneath: corymbs usually with marginal fls. .... 2. *H. cinerea*
- GG. Lvs. white-tomentose beneath, longer, acuminate: corymbs always with marginal fls. .... 3. *H. radiata*
- EE. Brts. densely pubescent: seeds winged.
- F. Brts. densely covered with harsh spreading hairs: lvs. rounded at base.
14. *H. Sargentiana*
- FF. Brts. strigose.
- G. Lvs. cordate or rounded at base ..... 15. *H. longipes*
- GG. Lvs. cuneate at base ..... 13. *H. strigosa*
- DD. Corymbs enclosed before expanding by large bracts: upper pair of lvs. subsessile.
12. *H. involucrata*
- AA. Stems climbing by aerial rootlets: lvs. broad-ovate, nearly glabrous: petals cohering at apex ..... 16. *H. petiolaris*
- Sect. I. EUHYDRANGAEA Maxim. Upright shrubs; petals free and spreading: seeds winged at the ends or wingless.

Ser. 1. AMERICANÆ Maxim. Seeds wingless; capsule inferior, truncate at apex; fertile fls. white; petals spreading or reflexed, persistent during anthesis.

1. *H. arborescens* L. Upright straggling shrub, usually 1, occasionally to 3 m.; young brts. sparingly puberulous: lvs. ovate to elliptic, acute or acuminate, rounded or cordate at base, 6-20 cm. long, serrate, glabrous or sometimes puberulous beneath: petioles 2-6 cm. long: corymbs 5-15 cm. broad, long-stalked; sterile fls. few, 1.5-2 cm. across: capsule 2.5-3 mm. diam. and slightly shorter, prominently 10-ribbed. Fl.vi-vii. W.D.t.42(c). B.B.2:231. G.W.15:612(h). (*H. vulgaris* Michx., *H. a.* var. *cordata* Torr. & Gr.) N. Y. to Iowa, s. to Fla. and La. Intr. 1736. Zone IV. Usually a round bush with conspicuous creamy-white fl.-clusters in early summer.—*H. a. grandiflora* Rehd., f. Fls. all sterile forming subglobose heads 10-18 cm. across; sepals ovate, acutish. M.G.27:472. Gn.75:435. N.F.4:221(h). G.C.78:273(h). Found wild in Ohio before 1900. A striking plant with large heads of white fls.—*H. a. oblōnga* Torr. & Gr., var. Lvs. rounded at base, elliptic-ovate to oblong-ovate. B.M. 437(c). (*H. a. laevigata* Hort.) Intr. before 1800.—*H. a. stérilis* Torr. & Gr., var. A form of the preceding var. with all the fls. sterile; sepals broad-oval, rounded or mucronate at apex. Gs.14:153(h). Found in Pa. before 1840, rare in cult.—*H. a. austrālis* Harbison, var. Lvs. cordate at base, more coarsely serrate; petioles 1-4 cm. long. (*H. a. urticifolia* Hort.) W. Va. Cult. 1888.

*H. a.* × *radiata* = *H. canescens* Kirchn. Resembling the following species: petiole shorter; lvs. smaller; the pubescence beneath usually thinner, the hairs under the microscope nearly smooth (tuberculate in *H. cinerea*); sterile fls. wanting or few. G.W.1931:534(h). (*H. arborescens* var. *c.* Nichols.) Orig. before 1860.

2. *H. cinerea* Small. Spreading shrub, sometimes 2 m. tall; young brts. puberulous: lvs. elliptic or broad-ovate to ovate-oblong, 6-15 cm. long, short-acuminate, rounded or subcordate at base, serrate, bright green above, grayish tomentose beneath; petioles 2-8 cm. long: corymbs 5-20 cm. across; sterile fls. usually present, few. Fl.vi-vii. B.B.2:231. (*H. arborescens* var. *Deamii* St. John.) N. C. and Tenn. to Ala. Intr. 1906. Zone V.—*H. c. stérilis* Rehd., f. A form with all the fls. sterile forming a head 8-15 cm. across; sepals broad-

ovate, obtuse. Gs. 4:27(h). (*H. arborescens* var. *Deamii* f. *acarpa* St. John.) Orig. before 1908. Similar to the sterile form of the preceding species.

3. *H. radiata* Walt. Upright shrub, sometimes to 2.5 m.; young brts. puberulous: lvs. ovate to ovate-lanceolate, rather long-acuminate, subcordate or rounded at base, 6-12 cm. long, serrate, dark green and glabrous above, white-tomentose beneath and reticulately veined; petioles 1.5-6 cm. long: corymbs 5-12 cm. broad, often with numerous ray-flowers 2-3 cm. broad. Fl.vi-vii. W.D.1:43(c). F.E.32:11(h). (*H. nivea* Michx.) N. and S. Car. Intr. 1786. Zone IV.

*H. r.* × *arborescens*; see under No. 1.

4. *H. quercifolia* Bartr. Shrub to 2 m. with upright and spreading brs.; young brts. reddish tomentose: lvs. ovate to suborbicular in outline, sinuately 3-7-lobed, usually truncate at base and decurrent into the petiole, 6-20 cm. long, lobes broad, serrate and often slightly lobed, whitish tomentose beneath: infl. paniculate, 10-30 cm. long with numerous white sterile fls. 2-3 cm. and finally 3-4 cm. across and turning purple, the sepals usually orbicular-ovate: caps. about 3 mm. high. Fl.vi. B.M.975(c). Add.5:t.175(c). G.C. II.22:369. Gn.M.32:260(h). Gs.2:305(h). Ga. and Fla. to Miss. Intr. 1803. Zone (V). Chiefly valued for the distinct shape and the size of its lvs.; also the large panicles are conspicuous.

Ser. 2. PETALANTHAE Maxim. Seeds wingless or with very short wing; caps. half or partly superior, ovoid: fertile fls. pink or blue; petals finally reflexed, usually persisting during anthesis: infl. corymbose.

5. *H. Davidi* Franch. Shrub to 2 m.; young brts. pubescent, older light brown: lvs. elliptic-lanceolate to oblong-lanceolate, long-acuminate, cuneate at base, 8-15 cm. long, dentate-serrate, yellowish green and nearly glabrous above, pubescent on the nerves beneath; petioles 1-2.5 cm. long; infl. a convex loose corymb 12-25 cm. across or sometimes paniculate, with 1 or 2 pairs of lvs. at base; fertile fls. bluish; petals lanceolate; styles 3-4; sterile fls. 2.5-4 cm. across, with orbicular-ovate entire sepals: caps. with the calyx-limb about the middle. Fl.vi-vii. I.S.3:t.132. W. China. Intr. 1908. Zone VII? Shrub with large loose corymbs of blue fertile fls. surrounded by white sterile fls.

Related species: *H. chinensis* Maxim. Brts. glabrous: lvs. thickish, oblong or lance-oblong, 4-8 cm. long, acuminate, remotely denticulate or nearly entire, glabrous; petioles 4-10 mm. long; corymbs 6-10 cm. across with few or no sterile fls. S. E. China, Formosa. Cult. 1934. Zone VII?—*H. scandens* (L.) Ser. Brs. slender: lvs. elliptic to elliptic-lanceolate, 3-6 cm. long, acute or acutish, sparingly setose above: corymbs loose, 4-8 cm. across; sterile fls. white or whitish, 3-5 cm. across with usually 3 entire or slightly dentate sepals. S.Z.1:t.60(c). (*H. virens* Sieb. & Zucc.) Japan. Cult. 1904. Zone VII?

6. *H. macrophylla* (Thunb.) DC. Shrub to 4 m.; brts. stout, glabrous: lvs. thickish, obovate to elliptic or broad-ovate, short-acuminate, broad-cuneate at base, 7-15 cm. long, coarsely serrate with triangular obtusish teeth, bright green and lustrous above, light green beneath, glabrous or slightly puberulous beneath and light green, petioles stout, 1-3 cm. long, leaving large scars, the opposite ones contiguous; corymbs peduncled, sparingly appressed-pubescent, in the sterile form globose and 15-20 cm. or more across; in the fertile form flattened; fls. blue or pink, rarely white; petals ovate-oblong soon deciduous; styles 3-4; sterile ray-fls. large, with entire or dentate sepals; caps.  $\frac{1}{3}$  or  $\frac{1}{4}$  superior, ovoid, with the short styles 6-8 mm. long. Fl.vi-vii. (*H. opuloides* K. Koch, *H. hortensis* Sm., *H. Hortensia* DC., *Hortensia opuloides* Lam.) Japan. Zone (V), VI.—*H. m. Hortensia* (Maxim.) Rehd., f. Fls. all sterile, with broad-ovate, entire sepals; pink to

blue: lvs. usually elliptic. B.M.438(c). G.C.52:251;71:87(h). (*H. opuloides* var. *H. Dipp.*, *H. japonica* var. *plena* Reg.) This is the type. Intr. from China in 1790.—*H. m. Otáksa* (Sieb. & Zucc.) Wils., f. Dwarf, with smaller obovate lvs. and entire obovate sepals. S.Z.1:t.52(c). F.S.17:t.1732-3(c). R.H.1868:450,t(c). A.G.44:415(h). F.E.9:52,401(h). Intr. from Japan before 1861.—*H. m. Veitchii* Wils., f. A form with deep rose-pink sterile fls. Gn. 50:122,t(c). G.W.7:582,t(c). (*H. Hortensia* var. *japonica rosea* Bean.) Intr. from Japan 1880.—*H. m. mandshurica* (Dieck) Wils., f. Stems dark purple or nearly black: lvs. elliptic: fls. rose-colored, nearly all sterile. A.F.5:361. (*H. Hortensia* var. *nigra* Nichols., *H. m. Koehne*, *H. opuloides* var. *cyano-clada* Dipp.) Cult. 1870. Zone (V).—*H. m. normalis* Wils., var. The wild type with a flat corymb of perfect fls. and with a few pink sterile ray-fls. 3-5 cm. across. C. Japan. Intr. 1917.—*H. m. rosea* (Sieb. & Zucc.) Wils., f. Similar to the preceding but with toothed pink ray-fls. S.Z.1:t.53(c). (*H. japonica* Sieb.) Cult. 1841.—*H. m. Mariësii* (Bean) Wils., f. With rosy pink ray-fls., 5-8 cm. across, entire or sparingly toothed. Gn.54:390,t(c);87:341. G.C.III.23:f.122. Intr. 1879 from Japan.—*H. m. macrosépala* (Reg.) Wils., f. With white, toothed ray-fls. Gt.15:t.520(c).—*M. m. coerúlea* (Hook.) Wils., f. Perfect fls. deep blue and the ray-fls. blue or white. S.Z.1:t.55(c). B.M. 4253(c). (*H. Belzoni* Sieb. & Zucc., *H. japonica* var. *c.* Hook.) Cult. 1846. Zone VI. One of the hardier forms.—*H. m. maculàta* (Bl.) Wils., f. Lvs. edged white: infl. with fertile and sterile fls. F.S.7:t.696(c). (*H. hortensis variegata* Nichols.) Cult. 1850.

7. *H. serràta* (Thunb.) DC. Shrub to 1.5, rarely to 2.5 m., with rather slender brs. glabrous or pubescent at first: lvs. elliptic or ovate to lanceolate, 5-10 cm. long, acuminate, cuneate, finely or coarsely serrate, sparsely appressed-pubescent on both sides, midrib with short curled hairs sometimes only above; petiole 1-2.5, rarely to 5 cm. long: fls. blue or white, in flat or slightly convex corymbs 4-8 cm. across, with few rather small, white, pink or bluish ray-fls.: caps. ovoid, 2-4 mm. long, with 3 short diverging styles. Fl. VII-VIII. S.Z.1:t.58(c). G.C.1870:1699. (*H. Thunbergii* Sieb., *H. opuloides* var. *s.* Rehd.) Japan, Korea. Cult. 1870. Zone VI or V?—*H. s. acuminàta* (Sieb. & Zucc.) Wils., f. Lvs. 9-18 cm. long, caudate-acuminate; ray-fls. usually blue. S.Z.1:t.56,57(c). R.H.1874:91,t(c). S.L.193(h). M.G.32:41(h). (*H. a.* Sieb. & Zucc.) Intr. about 1870.—*H. s. pubéscens* (Franch. & Sav.) Wils., f. Lvs. ovate or elliptic-ovate, caudate-acuminate, with appressed and spreading hairs on the veins beneath: ray-fls. pink or white. (*H. hortensis* var. *p.* Franch. & Sav., *H. opuloides* var. *sinensis* Dipp.) Cult. 1888.—*H. s. rosàlba* (Vanh.) Wils., f. Lvs. ovate to obovate, usually rounded at base, slightly pubescent beneath: ray-fls. white and pink, usually toothed. F.S.16:t.1649-50(c). R.H.1866:432,t(c). Gn.46:466,t(c). G.C.106:137. (*H. japonica* r. Vanh., *H. hortensis* var. *Lindleyana* Nichols., *H. opuloides* var. *r.* Rehd.) Cult. 1864.—*H. s. prolifera* (Reg.) Rehd., f. Lvs. ovate or elliptic-ovate, abruptly long-acuminate, pubescent on both sides: ray-fls. with numerous elliptic-ovate to oblong pointed sepals. S.Z.1:t.59(c). (*H. stellata* var. *p.* Reg., *H. st.* Sieb. & Zucc., *H. Hortensia* var. *st.* Maxim., *H. serrata* var. *stellata* Wils.) Cult. 1864.

Ser. 3. *HETEROMALLAE* Rehd. Seeds winged at the ends: fertile fls. white; petals caducous; styles usually 3: caps. half-superior.

8. *H. paniculàta* Sieb. Shrub or small tree to 10 m.; brts. stout, pubescent: lvs. elliptic or ovate, acuminate, rounded or cuneate at base, 5-12 cm. long, serrate, sparingly pubescent or nearly glabrous above, setose-

pubescent beneath, particularly on the veins: fls. in large panicles 15-25 cm. long; styles 2-3; sterile fls. with 4 entire, elliptic sepals, white, changing later to purplish: caps. with the calyx-limb about the middle. Fl.viii-ix. S.Z. 1,t.61(c). M.K.t.46(c). Gt.16,t.530(c). Gn.75:548(h);76:5(h). G.C.78:447, t(h). Japan, China. Intr. before 1864. Zone IV. The hardest species; much planted in its sterile form.—*H. p. praecox* Rehd., var. Sepals of the sterile fls. narrow-elliptic: flowering about 6 weeks earlier than the type. G.F. 10:363. B.C.3:1621. Intr. 1892.—*H. p. grandiflora* Sieb., var. PEEGEE H. Nearly all fls. sterile; panicle to 30 cm. long. F.S.16:t.1665-6(c). R.H.1873: 50,t(c). Gn.72:560(h). Gg.3:357(h);5:3(h). C.L.7:43(h). Intr. 1862.

9. *H. xanthoneura* Diels. Shrub to 5 m.; brts. stout, pubescent, the 2d year with chestnut-brown close bark marked with conspicuous lenticels: lvs. elliptic to elliptic-oblong, abruptly acuminate, cuneate at base, 10-18 cm. long, serrate, bright green and nearly glabrous above and usually with yellowish veins, slightly pubescent on the veins beneath or nearly glabrous; petioles 1-3 cm. long, glabrous: corymbs rather loose, convex, 12-15 cm. across; sterile fls. 3-5 cm. broad, with oval obtuse sepals: capsule with the calyx-limb about the middle. Fl.vii. I.S.3:t.137. S.L.194(h). W. China. Intr. 1904. Zone V. Similar to the following, but with larger lvs. and more vigorous.—*H. x. Wilsónii* Rehd., var. Bark of 2-year-old brts. grayish or pale brown; lvs. usually oblong, lustrous above. M.G.1912:26(h). Intr. 1909.—*H. x. setchuenensis* (Rehd.) Rehd., var. Two-year-old brts. light brown: lvs. to 20 cm. long, villous below. W. China. (*H. Bretschneideri* var. s. Rehd.) Intr. 1908.

Related species: *H. dumicola* W. W. Sm. Stout shrub to 5 m.: brts. and inf. densely and minutely scabrid: lvs. broad-ovate to ovate-lanceolate. 10-20 cm. long, acuminate, usually rounded at base, serrate-denticulate, pale and with long appressed white hairs beneath; petiole 2-4 cm. long: corymbs 25-30 cm. across. W. China. Cult. 1934. Zone VII?

10. *H. Bretschneideri* Dipp. Shrub to 3 m.; brts. pubescent, two-year-old brts. with chestnut-brown bark peeling off in thin flakes: lvs. ovate or elliptic-ovate to oblong-ovate, acute or acuminate, cuneate at base, 7-12 cm. long, serrate, glabrous above, villous beneath; petioles 1-3 cm. long, not margined: corymbs 10-15 cm. across, slightly convex; sepals of sterile fls. broad-ovate, obtuse, changing to purplish. Fl.vii. I.S.1:t.27. G.F.3:17;6:396(h). B.S.1: 624,t(h). (*H. vestita* var. *pubescens* Maxim., *H. pekinensis* Hort.) N. China. Intr. 1882. Zone IV. Shrub with spreading brs. forming a broad round bush very attractive when in bloom.—*H. B. glabrescens* Rehd., var. Lvs. smaller, usually elliptic and more coarsely serrate, sparingly pubescent beneath. (*H. serrata* Koehne, not DC.)

Closely related species: *H. hypoglauca* Rehd. Lvs. glaucous beneath and silky-strigose on the veins. C. China. Intr. about 1901. Zone VI?

11. *H. heteromalla* Don. Shrub to 3 m.; young brts. densely pubescent, 2-year-old brts. with olive-brown close lenticellate bark: lvs. elliptic-ovate, acuminate, cuneate at base, 10-20 cm. long, densely setose-denticulate, nearly glabrous above, whitish tomentose beneath; petioles 2-6 cm. long, margined and deeply grooved, usually red: corymbs 12-20 cm. broad, pubescent, with bracts; sepals of sterile fls. elliptic or obovate: caps. with the calyx-limb above the middle. Fl.vi-vii. F.S.4:t.378-9(c). G.M.50:859. Himal. Intr. 1821. Zone VII? The dark green upper side of the lvs. forms a pleasing contrast with the red petioles and the whitish under side.

Ser. 4. PIPTOPETALAE Maxim. (*Asperae* Rehd.) Seeds winged at the ends: ovary inferior; capsule truncate at apex; styles usually 2: fls. white, blue or pink.

12. *H. involucrata* Sieb. Shrub to 1.5 or 2 m.; young brts. densely strigose: lvs. elliptic-oblong or oblong, acuminate, cuneate at base, 10–20 cm. long, densely and sharply serrate, appressed-pubescent on both sides, denser beneath and more scabrid: corymbs enclosed before expanding by large sub-orbicular bracts; fertile fls. usually pinkish; sterile fls. whitish, 1.5–3 cm. across. Fl.vii–viii. S.Z.1:t.63(c). J.H.III.32:103. Japan. Cult. 1864. Zone VII.—*H. i. hortensis* Maxim., var. The fertile fls. double, often proliferous. S.Z.1:t.64(c). F.S.3:t.187(c). Cult. 1846.

13. *H. strigosa* Rehd. Shrub to 2.5 m.; brts. densely strigose: lvs. oblong-ovate to elliptic-lanceolate or lanceolate, acuminate, cuneate or rounded at base, 7–18 cm. long, serrulate or serrate, sparingly strigose or nearly glabrous above, grayish beneath and densely strigose, particularly on the veins and veinlets; petioles 1–2.5 cm. long, strigose: corymbs 10–15 cm. across; sterile fls. white or purplish, 2–3.5 cm. across, with broad-ovate, entire or serrate sepals. Fl.viii. (*H. aspera* Hemsl., not Don.) C. China. Intr. 1907. Zone VII?—*H. s. macrophylla* (Hemsl.) Rehd., var. Lvs. 20–30 cm. long; cymes to 20 cm. across, with the sterile fls. about 5 cm. broad. G.C.98:282(h).

Closely related species: *H. aspera* Don which differs chiefly in the fimbriate-denticulate lvs. grayish-white beneath and densely scabrid-villous: styles usually 3. Himal., W. China. Intr. ? Zone VII?—*H. villosa* Rehd. Stems, petioles and cymes densely clothed with spreading villous hairs often ferrugineous: lvs. fimbriate-denticulate, strigose above, grayish white and densely villous beneath. W. China. Intr. 1908. Zone VII? Possibly this species and *H. strigosa* are only vars. of *H. aspera*.—*H. v. strigosior* (Diels) Rehd., var., has the petioles and brts. with few or sometimes without spreading hairs. Intr. Cult. 1905.

14. *H. Sargentiana* Rehd. Upright shrub to 3 m., with stout brs.; brts. densely clothed with bristles and harsh hairs; young growth purplish: lvs. ovate to ovate-oblong, short-acuminate, rounded or subcordate at base, 15–25 cm. long, crenate-serrate, dull green and hairy above, densely rough-villous beneath; petioles 3–8 cm. long; corymbs nearly flat, dense, 12–16 cm. across; fertile fls. pale violet; sterile fls. white; styles 2–3. Fl.vii–viii. B.M. 8447(c). I.S.3:t.138. N.F.9:f.32(h). Gn.77:264(h). B.S.1:630. C. China. Intr. 1907. Zone VII? Striking plant with its large lvs., the dense purplish pubescence on the young growth and the large violet cymes with white marginal fls.

15. *H. longipes* Franch. Spreading shrub to 2, or occasionally 3 m., with rather slender lax brs.; brts. sparingly, strigose: lvs. broad-ovate to ovate, rarely oblong-ovate, acuminate, rounded to cordate at base, 8–16 cm. long, sharply and unequally serrate or dentate, sparingly strigose above, strigose beneath on the veins and veinlets, sometimes glabrescent, rather thin; petioles 5–15 cm. long; corymbs 10–15 cm. across, pedicels densely strigose; sterile fls. about 3 cm. across, with orbicular-obovate, usually entire sepals. Fl.vi–vii. I.S.3:t.140. C. and W. China. Intr. 1901. Zone VI. Loosely branched shrub, remarkable for its long petioles.

Closely related species: *H. Rosthornii* Diels. Larger and stouter shrub: lvs. 10–20 cm. long, unequally and densely fimbriate-dentate, grayish and densely strigose and reticulate beneath; petioles stouter, 3–10 cm. long; corymbs larger; sepals of sterile fls. toothed or entire. I.S.3:t.141. W. China. Intr. 1908. Zone VII?—*H. robusta* Hook f. & Thoms. Lvs. coarsely serrate, with brown hairs on the nerves beneath; fertile fls. blue; styles 2–3. B.M. 5038(c). (*H. cyanema* Nutt.) Himal. Cult. 1858. Zone VII?

SECT. II. CALYPTANTHE Maxim. Shrubs climbing by aerial rootlets: petals cohering at apex and falling off as a whole: caps. truncate; seeds winged all around, compressed.

16. *H. petiolaris* Sieb. & Zucc. Climbing to 25 m.; older brs. with flaky brown bark: lvs. broad-ovate to ovate or oval, acute or acuminate, cordate

or rounded at base, 5-10 cm. long, serrate, nearly glabrous, dark green and lustrous above; petioles 2-8 cm. long; corymbs rather loose, 15-25 cm. across; stamens 15-20; styles usually 2; sterile fls. about 3 cm. across, with entire sepals. Fl.vi-vii. B.M.6788(c). N.K.15:t.22. S.Z.1:t.54(c), 59, 92(c). M.G.34: 57(h). Gn.88:144(h). B.S.1:628&t.(h). (*H. scandens* Maxim., not Ser., *H. volubilis* Hort.) Japan, China. Intr. 1865. Zone IV. Clinging firmly to walls and tree trunks, conspicuous in early summer with its large white fl.-clusters.

Closely related species: *H. anómala* Don. Lvs. ovate to elliptic-ovate or ovate-oblong, broad-cuneate, denticulate-serrate: corymbs smaller; stamens 10; sterile fls. wanting or few, about 2.5 cm. across. I.S.3:t.142. (*H. altissima* Wall.) W. China, Himal. Intr. 1839 from Himal., 1908 from W. China. Zone (V.)

9. **SCHIZOPHRÁGMA** Sieb. & Zucc. Deciduous shrubs climbing by aërial rootlets; bark of 2-year-old brts. close, splitting longitudinally on older brs.; buds with 2-4 pairs of chestnut-brown pubescent or ciliate outer scales: lvs. opposite, long-petioled, dentate or entire, stipulate; fls. white, in loose terminal stalked corymbs with sterile marginal flowers consisting of a single large sepal; fertile fls. small, with 4-5 sepals and as many petals; stamens 10; style 1, short, with capitate 4-5-lobed stigma; fr. a 10-ribbed turbinate caps. opening between the ribs; seeds numerous, linear. (Greek *schizein*, to cleave, and *phragma*, wall; referring to the opening of the caps.) Three species in E. Asia.—Climbing shrubs very similar to *Hydrangea petiolaris*, but easily distinguished by the solitary sepal of the sterile fls. and in winter by the close longitudinally splitting bark and the winter-buds.

A. Lvs. coarsely dentate.....1. *S. hydrangeoides*  
 AA. Lvs. entire or sparingly denticulate.....2. *S. integrifolium*

1. *S. hydrangeoides* Sieb. & Zucc. Climbing to 10 m. or more: lvs. sub-orbicular or broad-ovate, short-acuminate, rounded or cordate at base, 5-10 cm. long, remotely coarsely dentate, nearly glabrous; petioles 3-7 cm. long, reddish: corymbs about 20 cm. broad; sepal of the marginal fls. oval to broadly ovate, 3-3.5 cm. long. Fl.vii. S.Z.1:t.26, 100(c). B.M.8520(c). N.K. 15:t.24. Gn.34:281. R.H.1881:313,f.72. Japan. Cult. 1880. Zone V.

2. *S. integrifolium* (Franch.) Oliv. Climbing to 4 m. or more: lvs. ovate or broad-ovate, acuminate, truncate or subcordate at base, 10-15 cm. long, entire or sparingly denticulate, usually pubescent on the veins beneath, of thickish texture: petioles 3-8 cm. long; corymbs to 25 cm. broad; sepals of sterile fls. ovate to ovate-oblong, 3.5-6 cm. long. Fl.vii. B.M.8991(c). I.S.1:t.30. H.I. 20:1934. J.L.28:f.21. M.O.215(h), 217. (*S. hydrangeoides* var. *i.* Franch.) C. and W. China. Intr. 1901. Zone VII. Differs from the preceding in the larger sterile fls. and larger darker lvs.—*S. i. molle* Rehd., var. Petioles and lvs. beneath densely villous; sterile sepals 5-7 cm. long. W. China. Intr. 1908.

10. **PILEOSTÉGIA** Hook. f. & Thoms. Evergreen shrubs climbing by rootlets: lvs. opposite, entire or dentate: fls. whitish, small, fasciated along dichotomous brs. in terminal, broad, stalked corymbose panicles; sepals 4-5, small, imbricate; petals 4-5, caducous, cohering at the apex and falling off as a whole; stamens 8-10, with long filaments and subglobose anthers; ovary inferior, 4-6-celled; style short, clavate, with 4-6-lobed stigma: fr. a top-shaped caps. dehiscent irregularly along the ribs; seeds numerous, oblong, with a terminal extension of the seed-coat. (Greek *pileos*, hat, and *stegē*, roof, tent; alluding to the shape of the stigma.) Three species in S. E. Asia.

*P. viburnoides* Hook. f. & Thoms. Climbing to 15 m., glabrous; young

brts. brown, becoming gray: lvs. lanceolate to elliptic or obovate-oblong, 10–15 cm. long, 2.5–6 cm. broad, acuminate, cuneate, dark green and glossy above, lighter below, with 6–8 pairs of veins, midrib impressed above, prominent below; petiole 1–3 cm. long; panicle 7–10 cm. long and to 15 cm. broad; pedicels 1–3 mm. long; fls. in bud subglobose, about 4 mm. across; sepals triangular; petals ovate; filaments wavy, 4–5 mm. long; style about 1 mm. long; caps. turbinate 2–3 mm. long; seeds about 1 mm. long. B.M.9262(c). G.C.56:225;60:218. J.L.40:f.113. (*Schizophragma* v. Stapf.) S. China, Formosa, Liukiu Isls. Intr. 1908. Zone VII.

11. **DECUMARIA** L. Deciduous or half-evergreen shrubs climbing by aërial rootlets; bark of brs. exfoliating; buds small, pubescent, with indistinct scales: lvs. opposite, estipulate, petioled, entire or sparingly toothed: fls. perfect, white, small, in terminal corymbs; calyx-tube turbinate; sepals 7–10, minute; petals as many, valvate, oblong to narrow-oblong; stamens 20–30, with subulate filaments; ovary inferior, 5–10-celled; styles united, with capitate, 7–10-lobed stigma; caps. urceolate, ribbed, opening between the ribs; seeds numerous, minute, linear-clavate. (Latin *decumus* = *decimus*, ten; referring to the number of parts in the flower.) One species in N. Am. and one in China.

**D. bárbara** L. Climbing to 10 m.: lvs. ovate to elliptic, acute or abruptly short-acuminate, rarely obtuse, 5–10 cm. long and 2.5–5 cm. broad, glabrous and lustrous above, glabrous beneath or slightly pubescent on the nerves: corymbs round-topped, 5–10 cm. across; caps. urn-shaped, surrounded above the middle by the calyx-limb. Fl.v–vi. B.B.2:233. G.C.46:242,t. (*D. sarmen-tosa* Bosc.) Va. to Fla. and La. Intr. 1785. Zone (V), VI. Clinging firmly to walls and tree-trunks, preferring moist and half-shady positions.

Closely related species: *D. sinénsis* Oliv. Less high climbing: lvs. generally oblong and obtuse, 3–7 cm. long and 1–2.5 cm. broad; pedicels appressed-pubescent. H.I.18:1741. C. China. Intr. 1908. Zone VII?

12. **ÍTEA** L. Deciduous or evergreen shrubs or trees; brs. with lamellate pith; buds small, superposed, with 3–4 outer scales: lvs. alternate, serrulate to dentate, estipulate: fls. perfect, white, small, in terminal or axillary racemes or panicles; calyx-tube turbinate; sepals 5, persistent; petals as many, narrow, valvate; stamens 5, inserted under the edge of the disk; anthers oblong; ovary superior, 2-celled; styles united; ovules numerous; caps. elongated, 2-grooved, 2-valved; seeds flattened. (Greek name of the willow.) About 10 species in S. E. Asia and 1 in N. Am.

**I. virgínica** L. Upright shrub to 1 or sometimes to 3 m., with slender, virgate brs. pubescent while young: lvs. elliptic or obovate to oblong, acute or short-acuminate, usually cuneate at base, 4–10 cm. long, serrulate, glabrous above, often sparingly pubescent beneath; petioles 5–10 mm. long: fls. white, fragrant, in upright, dense pubescent racemes 5–15 cm. long; petals 4 mm. long; stamens as long as petals: caps. 6–8 mm. long, narrow, pubescent. Fl.vi–vii. B.M.2409(c). B.C.3:1707. S.L.203(h). N. J. and Pa. to Fla. and La. Intr. 1744. Zone V. Usually a low shrub with virgate brs.; the lvs. turn brilliant red in autumn.

Related species: *I. ilicifolia* Oliv. Evergreen shrub to 3 m.: lvs. elliptic, obtuse, 6–11 cm. long, spiny-toothed: fls. greenish white, in dense drooping racemes 15–35 cm. long. H.I.16:1538. G.C.34:375;43:123;64:151(h). C. China. Intr. 1901. Zone VII?

13. **ESCALLONIA** Mutis. Evergreen, rarely deciduous trees or shrubs, usually glandular: lvs. alternate, usually serrate, estipulate: fls. white, pink

or red, in terminal racemes or panicles or axillary; calyx-tube turbinate to cylindric; sepals 5, short; petals usually narrow and with long claws; stamens 5, inserted under the margin of the disk; style 1, with capitate, 2- or 4-5-lobed stigma; ovary inferior, 2-3-celled; ovules numerous: fr. a 2-3-valved caps. with small oblong often curved seeds. (After Escallon, a Spanish traveler.) Fifty or 60 species in S. Am., chiefly in the Andes.

*E. virgata* (Ruiz & Pav.) Pers. Deciduous, much-branched shrub to 1 m.; brts. brown, glabrous: lvs. obovate to oblanceolate or lanceolate, acute, cuneate at base, 8-15 mm. long, finely serrate, usually entire below the middle: fls. white, about 1 cm. across, axillary, often forming short leafy racemes at the end of the brts.; calyx-lobes triangular; petals roundish-obovate scarcely clawed; stamens shorter than petals; style scarcely as long as sepals: caps. subglobose. Fl.vi-vii. G.C.II.10:108. J.L.37:52,t. Gn.83:518 (h);86:408(h),453. S.L.172(h). (*E. Philippiana* Mast., *E. v.* var. *Ph.* Engl.) Chile. Cult. 1866. Zone VI? Shrub with spreading brs.; the hardiest of all Escallonias.

*E. v. × punctata* DC. = *E. langleyensis* Veitch. Evergreen shrub to 3 m., with arching brs.; brts. glandular: lvs. obovate to narrow-elliptic, 1-2.5 cm. long, serrate, glabrous, resinous beneath: fls. rosy-carmine, 1.2 cm. across. G.C.III. 22:15;24:11(h). Gn.74:351(h);79:315. B.S.1:528. B.C.2:1144. Orig. 1893. Zone VII?

Related species: *E. illinita* Presl. Glabrous and resinous evergreen shrub to 10 m., with obovate or oval lvs. 2-6 cm. long and white fls. in terminal panicles to 10 cm. long. B.R.t.1900(c). Chile. Intr. 1831. Zone VII?

14. **RÍBES** L. Deciduous or rarely evergreen, unarmed, or prickly shrubs; buds with several scarious or herbaceous scales: lvs. alternate, petioled, simple, usually palmately lobed, folded or rarely convolute in bud, estipulate: fls. perfect or dioecious, 5-merous, rarely 4-merous, in few or many-flowered racemes, rarely clustered or solitary; calyx-tube cylindric to rotate, like the sepals usually colored; petals usually smaller than the sepals, often minute, rarely wanting; stamens shorter or longer than the sepals; ovary inferior, 1-celled, many-ovuled; styles 2, more or less connate: fr. a juicy berry, usually many-seeded; seeds albuminous, with minute terete embryo. (Probably derived from *ribas*, the Arabian name for Rheum Ribes.) About 150 species in the colder and temp. regions of the n. hemisphere, in Am. in the Andes s. to Patagonia.—At least half of the species have been introduced to cult. Some are valued for their edible frs., particularly *R. sativum* and *R. Grossularia*, others are ornamental shrubs and planted for their handsome fls. or for their attractive frs. or lvs., while many are without particular merits and are found only in botanical collections. They are almost all early leafing shrubs flowering with or soon after the unfolding of the lvs. and ripening their fruit mostly in mid-summer, rarely later. Many species are carriers of the white-pine blister rust, particularly *R. nigrum* and most American Currants; they should not be planted where White Pine is growing.

A. Brs. unarmed or rarely with a pair of small prickles below the petiole: fls. usually in racemes; pedicels jointed.

B. Fls. dioecious; racemes usually upright.

C. Lvs. deciduous: fls. greenish to purple.

D. Fls. in several- to many-fl. racemes.

E. Brts. quite unarmed: lvs. generally suborbicular to ovate.

F. Young growth viscid-glandular..... 2. *R. orientale*

FF. Young growth glabrous or nearly so.

G. Fls. greenish: lvs. with short obtuse lobes..... 1. *R. alpinum*

GG. Fls. red-brown or purple: lvs. acute or acuminate.

H. Fls. rotate ..... 3. *R. tenue*

HH. Fls. saucer-shaped ..... 4. *R. glaciale*

- EE. Brts. with slender paired prickles below the petiole; lvs. generally obovate, cuneate at base.....5. *R. diacanthum*
- DD. Fls. solitary or in 2-8-fld. fascicles.....7. *R. fasciculatum*
- E. Ovary glabrous.....9. *R. ambiguum*
- EE. Ovary glandular-bristly.....8. *R. Gayanum*
- CC. Lvs. persistent.
- D. Lvs. suborbicular, 3-5-lobed; fls. yellow.....6. *R. laurifolium*
- DD. Lvs. ovate-oblong, crenate-serrate; fls. greenish.....10. *R. aureum*
- BB. Fls. perfect, in usually pendulous or nodding racemes; lvs. deciduous.
- C. Color of fls. yellow; calyx-tube tubular; lvs. convolute in bud; glands crystalline.
- D. Calyx-tube less than twice as long as sepals; sepals spreading, connivent after flowering; young brts. glabrous or puberulous.....11. *R. odoratum*
- DD. Calyx-tube at least twice as long as sepals, 2-2.5 mm. thick; sepals revolute or spreading, not connivent; young brts. and petioles pubescent, rarely glabrous.
- CC. Color of fls. white, pink, red or greenish; lvs. plicate in bud.
- D. Calyx-tube tubular to campanulate.
- E. Ovary glandular; lvs. resin-dotted or viscid-glandular beneath.
- F. Leaves beneath and other parts of plant with viscid glands.
- G. Lvs. white-tomentose beneath; fls. usually red, in many-fld. racemes.....13. *R. sanguineum*
- GG. Lvs. not or slightly pubescent beneath.
- H. Lvs. 4-8 cm. broad.
- I. Calyx-tube cup-shaped; fls. greenish white in long-peduncled racemes.....12. *R. Wolfii*
- II. Calyx-tube cylindric or cylindric-campanulate.
- J. Sepals longer than tube; fls. red, rarely white, in many-fld. racemes.....14. *R. glutinosum*
- JJ. Sepals shorter than tube; fls. greenish or pinkish, in few or several-fld. racemes.....15. *R. viscosissimum*
- HH. Lvs. 1-3.5 cm. broad; calyx-tube tubular; racemes few-fld.: fr. red.
- I. Bracts of racemes cuneate-obovate, toothed; fls. white, rarely pinkish.....16. *R. cereum*
- II. Bracts of racemes rhombic, usually acutish, entire or with a few teeth; fls. pink.....17. *R. inebrians*
- FF. Lvs. resin-dotted beneath; fls. whitish or greenish.
- G. Calyx-tube tubular-campanulate; racemes many-fld....20. *R. americanum*
- GG. Calyx-tube broad campanulate; racemes few-fld.....21. *R. nigrum*
- EE. Ovary and fr. glabrous; lvs. not glandular or only with a few stalked glands beneath.
- F. Racemes dense; sepals ciliate; fls. purple, pink or reddish, broad-campanulate.....27. *R. petraeum*
- FF. Racemes loose; sepals glabrous; fls. pale, narrow-campanulate.
- G. Fls. sessile; racemes to 12 cm. long.....28. *R. moupinense*
- GG. Fls. stalked; racemes to 30 cm. long, very loose....29. *R. longeracemosum*
- DD. Calyx-tube rotate or saucer-shaped.
- E. Ovary and fr. glandular; racemes upright or ascending.
- F. Lvs. resin-dotted beneath; upright shrubs; fr. black.
- G. Bracts of racemes large, broadest in the middle; racemes 10-20 cm. long; fr. bloomy.....18. *R. bracteosum*
- GG. Bracts of racemes narrow, narrowed from the base; racemes 3-6 cm. long; fr. without bloom.....19. *R. hudsonianum*
- FF. Lvs. not resin-dotted beneath, fetid; fr. red: prostrate shrub.....22. *R. glandulosum*
- EE. Ovary and fr. glabrous; racemes drooping or nodding.
- F. Stamens shorter than sepals, sepals spreading.
- G. Habit upright.
- H. Calyx-tube saucer-shaped, with plane disk; anther-cells contiguous; lvs. usually truncate at base.....23. *R. rubrum*
- HH. Calyx-tube rotate, inside with a 5-angled elevated ring; anther-cells separated by a broad connective; lvs. cordate or subcordate.....24. *R. sativum*
- GG. Habit procumbent; anther-cells contiguous.....25. *R. triste*
- FF. Stamens as long as sepals; sepals recurved; racemes very dense and long.....26. *R. multiflorum*
- AA. Brts. more or less prickly, rarely nearly unarmed; fls. 1-4 and pedicels not jointed (except in No. 30).
- B. Fls. in racemes; sepals broader than long; stems bristly.....30. *R. lacustre*
- BB. Fls. 1-4; sepals longer than broad.
- C. Color of flowers white or greenish and often suffused with purple.
- D. Sepals white or sometimes greenish white.
- E. Stamens as long as sepals or longer.
- F. Filaments villous; brts. brown.
- G. Ovary glabrous; calyx-tube about as long as broad.....31. *R. niveum*
- GG. Ovary glandular or pubescent; calyx-tube twice as long as broad.....32. *R. curvatum*

- FF. Filaments glabrous; stamens nearly twice as long as the greenish white sepals: brts. yellowish or gray.....33. *R. missouriense*
- EE. Stamens shorter than sepals; young brts. usually very bristly, grayish.
- F. Peduncle elongated; calyx-tube cylindric-campanulate.....34. *R. setosum*
- FF. Peduncle scarcely exceeding the bud-scales; calyx-tube campanulate. 35. *R. oxyacanthoides*
- DD. Sepals green or greenish, often tinged purplish.
- E. Style and calyx-tube inside pubescent.
- F. Fr. not prickly; stamens about as long as sepals (half as long in No. 40).
- G. Lvs. cuneate or rounded at base.
- H. Sepals about as long as tube; stamens as long or scarcely longer than sepals .....36. *R. hirtellum*
- HH. Sepals about twice as long as tube; stamens slightly longer than sepals. 37. *R. rotundifolium*
- GG. Lvs. subcordate or occasionally rounded at base; sepals recurved during anthesis.
- H. Ovary glabrous.
- I. Sepals longer than tube; stamens slightly longer than sepals. 38. *R. divaricatum*
- II. Sepals shorter than tube; stamens slightly shorter than sepals. 39. *R. inerme*
- HH. Ovary pubescent or glandular; stamens about half as long as sepals. 40. *R. Grossularia*
- FF. Fr. prickly, not glandular, rarely smooth; stamens less than half as long as sepals .....41. *R. cynosbati*
- EE. Style and calyx-tube inside glabrous.
- F. Fr. prickly: petals obtuse; brts. very bristly.....42. *R. burejense*
- FF. Fr. not prickly, glandular-bristly or smooth.
- G. Petals elliptic, acute, connivent; fls. greenish or reddish....43. *R. alpestre*
- GG. Petals obovate, obtuse, upright; fls. white or pink.....44. *R. leptanthum*
- CC. Color of fls. orange, purple or bright red; style glabrous.
- D. Fls. 5-merous.
- E. Anthers oval; calyx-tube cylindric-campanulate.
- F. Fls. orange; sepals longer than stamens: fr. prickly.....45. *R. pinetorum*
- FF. Fls. red or purple; sepals about as long as stamens: fr. densely glandular. 46. *R. Lobbii*
- EE. Anthers sagittate, lanceolate to lance-ovate.
- F. Calyx-tube cylindric; fls. not glandular: fr. prickly.....47. *R. Roesslerii*
- FF. Calyx-tube campanulate: fr. glandular-bristly.....48. *R. Menziesii*
- DD. Fls. 4-merous, bright red; stamens 2-4 times as long as sepals....49. *R. speciosum*

Subgen I. BERISIA Spach. Fls. dioecious, usually in racemes; pedicels jointed: unarmed shrubs, rarely with small paired nodal prickles.

Sect. 1. EUBERISIA Jancz. Racemes upright; staminate fls. without ovary, anthers of pistillate fls. without pollen; petals minute; stamens much shorter than sepals: buds with scarious scales: brs. always unarmed.

1. *R. alpinum* L. ALPINE CURRANT. Shrub to 2.5 m., nearly glabrous; buds acute: lvs. roundish or ovate, truncate or subcordate, 3-5 cm. across, 3-, rarely 5-lobed, with obtuse or acute dentate lobes: fls. greenish yellow, in upright racemes, the staminate 3-6 cm. long, with 20-30 fls.; the pistillate smaller; calyx-tube rotate; sepals ovate: fr. subglobose, scarlet, glabrous. R.I.23:t.135(c). L.B.15:1486(c). S.E.4:t.419(c). (*R. opulifolium* Hort.) Eu. Cult. 1588. Zone II. Early leafing shrub of dense habit with upright stems and spreading brs., usually broader than high, the pistillate form with attractive scarlet berries in summer and autumn. Well adapted for planting in shady places and as undergrowth.—*R. a. aureum* Pynaert. Dwarf form with yellowish lvs. R.B.4:233,t(c). Cult. 1878.—*R. a. laciniatum* Kirchn., f. Lvs. more deeply and incisely toothed. Cult. 1864.—*R. a. pumilum* Lindl., var. A dwarf form with smaller lvs. (*R. a. var. humile* A. Br.) Cult. 1830.—The pistillate form is sometimes distinguished as var. *bacciferum* Wallr. and the staminate as var. *sterile* Wallr.

Related species: *R. tricuspidis* Nakai. Lvs. subcordate, with acute or acuminate lobes: staminate racemes 1-2 cm. long with 8-12 often brownish fls.; sepals elliptic; pistillate with 2-6 fls.: fr. ellipsoid, small. N.K.15:t.5. Korea, Manch., Jap. Intr. before 1907. Zone V.—*R. distans* Jancz. Lvs. broad-cuneate or truncate at base, with acute lobes; staminate and pistillate racemes many-fl.: frs. globose, in 2-6 cm. long racemes. N.K.15:t.3. Manch. Cult. 1905. Zone IV?

—*R. Vilmorinii* Jancz. Shrub to 2 m.; buds obtusish: lvs. 2–3 cm. across, 3–5-lobed: staminate racemes 5–20 mm. long; fls. greenish or brownish: fr. black, glabrous or glandular. Jancz., Monog. Gros. 462. W. China. Intr. 1902. Zone V.

2. *R. orientale* Desf. Upright shrub to 2 m.; young growth with stalked viscid glands: lvs. roundish or reniform, truncate or cordate, about 4.5 cm. long and 5.5 cm. broad, 3–5-lobed with short rounded dentate lobes, bright green and lustrous above, pubescent on the veins beneath; petioles about 2 cm. long: racemes pubescent and glandular, the staminate 2–5 cm. long; fls. rotate, green, usually suffused with red; sepals ovate: fr. scarlet, pubescent and glandular. B.M.1583(c). (*R. resinosum* Pursh.) E. Eu. and W. Asia to Siber. and Himal. Intr. 1805. Zone V. Similar to *R. alpinum*, but easily distinguished by the viscid-glandular pubescence.—*R. o. heterotrichum* (C. A. Mey.) Jancz., var. Young shoots reddish: lvs. lustrous: fls. reddish: fr. not glandular. Ledeb., Icon. Fl. Ross. t.235. Siber. Cult. 1907.

3. *R. tenue* Jancz. Shrub similar to *R. alpinum*; glabrous; buds ovoid, obtusish: lvs. ovate, truncate, to 3.5 cm. long and to 3 cm. broad, 3–5-lobed, lobes acute, incisely toothed, the middle one longer; staminate racemes 3–5 cm. long, pistillate smaller: fls. rotate, brownish-red; sepals elliptic-ligulate: fr. short-stalked, red, globose. Jancz., Monog. Gros. 464. Himal., W. China. Intr. about 1900. Zone V. Flowering and leafing very early.

4. *R. glaciale* Wall. Shrub to 5 m.; nearly glabrous; young brts. red or reddish; buds oblong, obtusish: lvs. roundish or ovate, cordate or truncate, to 6 cm. long, 3–5-lobed; the middle lobe longer, acute or short-acuminate, sparingly glandular-bristly; petioles 1–2 cm. long: staminate racemes 1.5–4.5 cm. long, 7–30-fld.; pistillate with 3–6 smaller fls.; fls. saucer-shaped or sub-turbinate, brownish purple; sepals ovate: fr. subsessile, globose or obovoid, scarlet, glabrous. Jancz., Monog. Gros. 468; suppl. 5:737. Himal., C. and W. China. Intr. from Nepal in 1823, from W. China about 1900. Zone V. Similar in habit to *R. alpinum*, chiefly distinguished by the longer acute middle lobe of the lvs. and the brownish cup-shaped fls.—*R. g. angustisepalum* Jancz., var. Sepals ovate-lanceolate. C. China. Intr. 1907.

*R. g. × luridum* = *R. Wallichii* Jancz. Lvs. similar to *R. luridum*, fls. to *R. glaciale*. Jancz., Monog. Gros. suppl. 4:619(f). Orig. 1907.

Related species: *R. luridum* Hook. f. & Thoms. Lvs. roundish, about 5 cm. long and 6 cm. broad, with short and broad sometimes obtusish lobes; petiole about 4 cm. long: staminate racemes 3–5 cm. long: fls. dark purple, turbinate: fr. black, glabrous. Leafing late; fr. x. Jancz., Monog. Gros. 469, 470. Himal., W. China. Intr. about 1900. Zone V.—*R. Maximowiczii* Batal. Differing from the preceding species in the glandular-bristly fr.: lvs. usually ovate, 4–9 cm. long, slightly 3–5-lobed or nearly simple, coarsely dentate, pubescent on both sides: racemes pubescent, 3–5 cm. long; fls. red: fr. red, yellow or greenish. Jancz., Monog. Gros. 473(f). W. China. Intr. ?—*R. M. floribundum* Jesson, var. Racemes 10–15 cm. long; fr. with thinner and fewer bristles. B.M.8840(c). (*R. Jessoniae* Stapf.) W. China. Intr. 1903. Zone VI?

Sect. 2. *DIACANTHA* Jancz. Buds and fls. as in sect. 1: brts. with 2 small prickles at the nodes and often with smaller scattered prickles.

5. *R. diacanthum* Pall. Upright shrub to 2 m., glabrous: brts. with paired prickles at the nodes, often with scattered additional prickles, rarely nearly unarmed; buds small: lvs. ovate to obovate, cuneate or sometimes rounded, 2–3.5 cm. long, slightly 3-lobed, the lobes obtusish, sparingly dentate, lustrous, with obsolete veins: staminate racemes 2–3 cm. long, pistillate 1–2 cm. long; rachis glabrous, glandular; fls. greenish yellow, rotate; sepals ovate: fr. globose or globose-ovoid, scarlet, glabrous, small. S.O.2:t.97(c). N.K.15:t.2. S.H.1:f.258s-u, 261f-i. (*R. saxatilis* Pall.) N. Asia, Tian-shan to n. Korea.

Intr. 1781. Zone II. Similar to *R. alpinum*, but with prickly brts. and of more upright habit and with lustrous lvs.

Related species: *R. pulchellum* Turcz. Lvs. to 5 cm. long, more deeply 3-lobed, truncate or subcordate: staminate racemes to 6 cm. long; fls. saucer-shaped, reddish: fr. red, glabrous. Jancz., Monog. Gros. 453. N. China. Cult. 1905. Zone V.—*R. Giraldii* Jancz. Brts. pubescent while young, bristly, with larger nodal spines: lvs. truncate or subcordate, about 3.5 cm. broad, 3-5-lobed, pubescent and glandular: fls. cup-shaped, greenish brown: fr. glandular-bristly, red. N. China. Jancz., Monog. Gros. 455. Cult. 1905. Zone V.

Sect. 3. *DAVIDIA* Jancz. Fls. as in sect. 1: lvs. evergreen.

6. *R. laurifolium* Jancz. Evergreen shrub to 1.5 m., glabrous, glandular at first: lvs. ovate to ovate-oblong, acute, rounded at base, 5-10 cm. long, crenate-dentate, coriaceous; petioles bristly, 5-15 mm. long: staminate racemes nodding, 3-6 cm. long; pistillate shorter, upright, 6-12-fld.; fls. greenish yellow, rotate; sepals oval; ovary tomentulose: fr. ellipsoid, puberulous, purplish black, 1.5 cm. long, in pendulous racemes. B.M.8543(c). G.C.55:239;71:213(h). Gn.76:143;79:170,171. W. China. Intr. 1908. Zone VII?

Related species: *R. Hénryi* Franch. Brts. glandular-bristly: lvs. elliptic, to 10 cm. long, crenate; glandular beneath: fls. greenish, the staminate in racemes 2-4 cm. long: fr. obovoid-oblong, green, to 2 cm. long, stipitate-glandular. Jancz., Monog. Gros. suppl.5:738. C. China. Intr. 1908. Zone VII?

Sect. 4. *HEMIBOTRYA* Jancz. Fls. in 2-9-fld. umbels; staminate fls. with ovary containing sterile ovules; anthers of pistillate fls. with sterile pollen: buds with herbaceous scales; brs. always unarmed.

7. *R. fasciculatum* Sieb. & Zucc. Shrub to 1.5 m. with upright or spreading brs.: lvs. roundish, truncate or cordate at base, 4-7 cm. wide, broader than long, 3-5-lobed with obtuse lobes, glabrous or slightly pubescent: fls. yellowish, cup-shaped, fragrant; staminate in 4-9-fld. umbels, pistillate only 2, sometimes 3-4: fr. subglobose, scarlet, crowned by the persistent calyx-tube, glabrous, insipid. Fl. iv-v; fr. ix-x. S.T.1:t.38. D.L.3:302. (*R. japonicum* Carr., *R. alpinum japonicum* Nichols.) Japan, Korea. Cult. 1884. Zone IV. Valued for the late persisting lvs. and the scarlet frs. remaining on the brs. the whole winter.—*R. f. chinense* Maxim., var. Taller and more vigorous: lvs. larger, to 10 cm. across, pubescent beneath like the petioles and young brts., chartaceous, persistent into the winter. S.T.1:t.38,f.3,7-9. N.K.15:t.1. M.G. 14:571. (*R. Billiardii* Carr.) N. China to Korea and Japan. Cult. 1867.

Sect. 5. *PABILLA* Jancz. Fls. in racemes, otherwise like those of the preceding section: lvs. often persistent. S. Amer. species.

8. *R. Gayanum* (Spach) Steud. Evergreen shrub to 1.5 m.: young brts. and petioles villous: lvs. roundish, truncate to subcordate at base, 3-6 cm. long and slightly broader, with 3 or 5 short rounded toothed lobes, pubescent on both sides; petioles 1.5-2.5 cm. long, pubescent and glandular: fls. campanulate, pubescent, yellow, fragrant, in dense cylindric, erect racemes 3-6 cm. long borne on a stalk 2-4 cm. long: fr. globose, purple-black, hairy. B.M. 7611(c). S.L.311(h). (*R. villosum* C. Gay, not Nutt.) Chile. Cult. 1858. Zone VII? One of the hardiest of the S. Amer. species and chiefly grown for its fragrant fls.

Subgen. II. *RIBESIA* Berl. Fls. perfect, usually in racemes; pedicels jointed: unarmed shrubs; bud-scales herbaceous, but scarious in sect. 12.

Sect. 6. *MICROSPERMA* Jancz. Fls. 1 or 2, greenish; receptacle saucer-shaped; pedicels with 2 bractlets; ovary glandular-bristly; style undivided: seeds very small, more than 50.

9. *R. ambiguum* Maxim. Low shrub, often epiphytic: lvs. roundish, cordate, 2-5 cm. wide, 3-5-lobed, with short, often obtuse, dentate lobes, pu-

bescent or nearly glabrous above, viscid-glandular beneath: fls. 1 or 2, greenish, on pedicels about 1 cm. long; sepals elliptic; filaments flattened, broad: fr. green, subglobose, about 1.2 cm. across, glandular-hispid. Jancz., Mon. Gros. 304. C. Japan, W. China. Intr. 1915. Zone V.

Sect. 7. *SYMPHOCALYX* Berl. (§ *Siphocalyx* Endl., *Chrysobotrya* Spach.) Fls. in racemes, yellow; receptacle tubular; ovary glabrous: fr. smooth, black or yellow: lvs. convolute in bud (plicate in all other sections): glands crystalline.

10. *R. aureum* Pursh. GOLDEN CURRANT. Shrub to 2 m.; young brts. glabrous or puberulous: lvs. orbicular-reniform to obovate, cuneate to subcordate, 3-5 cm. wide, 3-lobed, the coarsely crenate-dentate lobes often with only 2 or 3 teeth, glabrous or sometimes puberulous beneath; petioles about as long as blade: fls. yellow, fragrant or slightly so, in 5-15-fld. racemes; bracts oblong to obovate; receptacle slender, 6-10 mm. long, 1.5 mm. thick, sepals more than half as long as the tube, spreading, upright and closed in the faded fl.; petals changing to red: fr. globose, black or purplish brown, 6-8 mm. across. B.R.1274(c). Card, Bush Fr.f.109. Jancz., Mon. Gros. suppl. 3:f.89. (*R. tenuiflorum* Lindl., *R. a.* var. *tenuiflorum* Torr., *Chrysobotrya aurea* Rydb.) East to Assinib., Mont., N. Mex. and Calif. Intr. in ?1806. Zone II. Attractive shrub with golden yellow fragrant fls. appearing in spring with the lvs.—*R. a. chrysococcum* Rydb. Fr. orange-yellow.

11. *R. odoratum* Wendl. BUFFALO CURRANT. Shrub to 2 m.; young brts. pubescent: lvs. ovate to orbicular-reniform, cuneate or truncate, 3-8 cm. wide, deeply 3-5-lobed, with coarsely dentate lobes, glabrate or puberulous beneath: fls. yellow, fragrant, in 5-10-fld., usually nodding racemes; bracts ovate to oval, foliaceous; rachis pubescent; receptacle 12-15 mm. long and 2-2.5 mm. broad; sepals scarcely half as long as tube, revolute or recurved, not upright and closed in the faded fl.; petals reddish; fr. globose to ellipsoid, 8-10 mm. long, black. B.R.2:125(c). L.D.5:301(c). L.B.1533(c). Card, Bush Fr.f.108. B.C.5:2958. (*R. fragrans* Lodd., *R. longiflorum* Nutt., *R. palmatum* Thory, *Chrysobotrya revoluta* Spach, *C. odorata* Rydb.) East of Rocky Mts., S. D. to w. Tex., east to Minn. and Ark. Intr. 1812. Zone IV. Conspicuous in spring with its golden yellow fragrant fls.; with larger fls. and of more spreading habit than the preceding species. Large-fruited forms as the "Crandall" are sometimes grown for their fruit.—*R. o. xanthocarpum* Rehd., f. Fr. orange-yellow.—*R. o. intermedium* (Spach) Berger, var. Racemes spreading; receptacle about 12 mm. long; sepals about 8 mm. long, spreading: fr. orange-brown. Jancz., Monog. Gros. suppl. 3:87. (*R. aureum* i. Jancz., *Chrysobotrya intermedia* Spach.)—*R. o. leiobotrys* (Koehe) Berger, var. Young brts. and rachis glabrous, glandular; sepals recurved, not revolute: fr. black. (*R. l.* Koehe, *R. aureum* l. Zabel.)

*R. o. × sanguineum*; see under No. 13.

Sect. 8. *CALOBOTRYA* Spach. Fls. in racemes, red, white or yellow, proterogynous; receptacle saucer-shaped to tubular: plant viscid-glandular: fr. often glandular, usually black and bloomy.

12. *R. Wölfii* Rothr. Shrub to 3.5 m.; young brts. finely puberulous or glabrous: lvs. suborbicular, cordate, 4-9 cm. wide, 3-5-lobed with obtuse or acutish serrate-dentate lobes, pubescent on the veins beneath and glandular: racemes erect, dense, 2-3.5 cm. long, on a slender pubescent and glandular peduncle: ovary glandular, bristly; receptacle cup-shaped, puberulous; sepals ovate-oblong, 3-4 times the length of the receptacle, greenish white, spreading; petals white, much shorter than sepals; stamens half as long as sepals: fr. black, glandular-bristly, about 1 cm. across. B.M.8121(c). (*R. mogolloni-*

*cum* Greene.) Colo. to N. Mex., Ariz. and Utah. Intr. 1900. Zone V. An upright shrub of little ornamental merit.

13. *R. sanguineum* Pursh. Shrub to 4 m.; young brts. pubescent and often sparingly glandular: lvs. reniform-orbicular, cordate to truncate, 5-10 cm. wide, 3-5-lobed, with obtuse irregularly dentate lobes, the middle one about as long as broad, dark green and puberulous above, whitish tomentose beneath; petioles pubescent and glandular: racemes ascending or pendulous, many-fl., pubescent and glandular; pedicels 8-10 mm. long; fls. red; sepals oblong, 5-7 mm. long, somewhat longer than the tubular receptacle; petals white or reddish, about half as long as sepals: fr. bluish black, bloomy, slightly glandular. Fl.v; fr.viii. B.M.3335(c). B.R.1349(c). B. C. to n. Calif. Cult. 1818. Zone (V). Ornamental free-flowering shrub; very attractive with its numerous racemes of red fls.; the young growth exhales an aromatic odor.

—*R. s. Brocklebankii* Bean, var. With yellow lvs.—*R. s. splendens* Barbier. Fls. dark blood-red. R.H.1913:428,t(c). G.35:363. Orig. before 1900.—*R. s. atrorubens* Loud., var. Fls. dark blood-red, but smaller and in smaller racemes than in the preceding form. (*R. s. f. atrosanguineum* Kirchn.) Orig. before 1838.—*R. s. carneum* Dipp., f. Fls. pink. (*R. c. grandiflorum* Carr.)—*R. s. albescens* Rehd., f. Fls. whitish. (*R. s. albidum* hort., not Kirchn.) Gn. 58:208,t,f.2(c, as *R. album*.) G.M.53:125.—There are also double-fl. forms.

*R. s. × odoratum* = *R. Gordonianum* Lem. Habit of *R. odoratum*: lvs. usually truncate, 3-lobed, glabrate: racemes about 20-fl., fls. yellow, tinged red outside, somewhat glandular, sterile. F.S.2:t.165(c). (*R. Beatonii* hort., *R. Loudonii* hort.) Orig. about 1837. Zone VI?—*R. s. × malvaceum* = *R. Bethmontii* Jancz. Differs chiefly in the style being considerably longer and the sterile anthers shorter than the petals. Jancz., Mon. Gros. 490(f). Orig. before 1904.—*R. s. × Grossularia* = *R. fontenayense* Jancz. Unarmed: lvs. subchartaceous, subcordate, pubescent beneath; racemes horizontal, 3-6-fl.; fls. pubescent, vinous-red; receptacle cup-shaped; ovary pubescent-glandular: fr. rarely developed, purple-black, somewhat bloomy, glandular. Jancz., Mon. Gros. 492. (*R. sanguineum Fontenaysii* hort.) Orig. before 1877. Zone V?

Closely related species: *R. malvaceum* Sm., which differs chiefly in the lvs. being bristly and rough above, in the usually rose-colored slenderer fls., with obtuse sepals shorter than the cylindric receptacle, in the densely white-pubescent ovary and the villous style, and in the viscid-pubescent fr. S.B.2:t.340. S.H.1:f.265m-n,266g-h. Calif. Intr. about 1832. Zone VII?—*R. nevadense* Kellogg. Lvs. thin, sparingly pubescent or nearly glabrous and green beneath: racemes usually spreading; fls. rose-colored, smaller; pedicels 3-5 mm. long; sepals ovate to oblong, about 4 mm. long; receptacle campanulate, about 2 mm. long: fr. blue, glaucous, glandular. Jancz., Mon. Gros. 316,317. Proc. Calif. Acad. III. Bot. 2:t.23,f.4-5,t.24,f.6-7. (*R. sanguineum* var. *variegatum* S. Wats., *R. variegatum* A. Nels.) Ore. to Calif. and Nev. Cult. 1907. Zone VI?

14. *R. glutinosum* Benth. Shrub to 4 m.: young brts., petioles and racemes pubescent and glandular-viscid: lvs. reniform-orbicular, cordate to truncate, 4-8 cm. broad, 3-5-lobed, with obtuse crenate-dentate lobes, at maturity glabrous above, green beneath, glandular, puberulous or nearly glabrous, rarely somewhat tomentose: racemes spreading or nodding; pedicels 8-10 mm. long; bracts reflexed; fls. red; sepals somewhat longer than the cylindric receptacle; style glabrous; ovary bristly-glandular, otherwise glabrous: fr. oblong, black, bloomy. Maund, Bot. Gard. t.597(c). Jancz., Mon. Gros. 318. S.H.1:f.265o,267a. (*R. sanguineum* var. *g.* Loud.) Calif. Intr. 1832. Zone VII?—*R. g. albidum* (Paxt.) Jancz., var. Fls. white, tinged pink. (*R. a.* Paxt.) P.M.10:t.55(c). Cult. 1840.

*R. g. albidum × nigrum* = *R. Carrièrei* Schneid. Intermediate between the parents without the odor of *R. nigrum*: fls. pink, glandular, in 10-15-fl. spreading racemes to 8 cm. long; receptacle campanulate: fr. black, not bloomy. Jancz., Mon. Gros. 489(f). (*R. intermedium* Carr., not Tausch.) Orig. before 1867.

15. *R. viscosissimum* Pursh. Shrub to 1 m.; young brts., petioles and infl. pubescent and viscid-glandular: lvs. reniform-orbicular, cordate, 5-8 cm. wide, usually 5-lobed, with short, rounded, crenate-dentate lobes, glandular-pubescent on both sides; petiole shorter than blade: fls. greenish white or pinkish, fragrant, in 3-8-fld. spreading or ascending racemes; receptacle cylindric-campanulate, 6-7 mm. long, about as long as sepals; ovary glandular: fr. black without bloom, glandular-bristly. Hooker, Fl. Bor. Am. t.76. Card, Bush Fr.f.103. S.H.1.f.265q,267b. B. C. and Mont. to Calif. and Colo. Intr. 1827. Zone V. The hardiest species of this section, but less handsome.

Sect. 9. CEROPHYLLUM Spach. Fls. small, white or pink, glandular, proterogynous, in 2-7-fld. racemes: receptacle cylindric, angled; ovary glandular or smooth: phyllotaxy of leaves  $\frac{1}{2}$  ( $\frac{1}{2}$  in all other sections): plant glandular-viscid.

16. *R. cereum* Dougl. Much-branched upright shrub to 1 m.; young growth glandular-pubescent: lvs. reniform, orbicular, cordate to broad-cuneate, 1-4 cm. wide, 3-5-lobed with obtuse crenulate lobes, glabrous or nearly so above, glandular-pubescent beneath; petioles almost as long as blade: fls. white or greenish, in few-fld. pendulous racemes; bracts cuneate-obovate, toothed at the truncate or rounded apex, glandular-pubescent and longer than the very short pedicels; receptacle cylindric, 6-8 mm. long; sepals ovate, about 2 mm. long, recurved; ovary glandular or smooth; style usually villous: fr. bright red, 6-7 mm. across. B.M.3008(c). Add.8:t.260(c). B.R.1263(c). B.C.5:2958. B. C. to Calif., east to Mont., Idaho and n. Ariz. Intr. 1827. Zone IV. Early leafing shrub with small light grayish green lvs. and attractive with its white or pink fls. and later with its bright red frs.—*R. c. farinòsum* Jancz., var. Brts. violet: lvs. whitish puberulent: fls. pink.

17. *R. inébrians* Lindl. In habit and foliage scarcely different from the preceding species: fls. usually pink; bracts rhombic, usually acutish, entire or slightly toothed; ovary stipitate-glandular; style usually glabrous: fr. usually glandular, bright red. B.R.1471(c). B.B.2:238. (*R. Spaethianum* Koehne.) S. D. and Mont. to Calif. and N. Mex. Intr. 1827. Zone V. Similar to the preceding species.

Closely related species: *R. mescalèrium* Cov. Lvs. usually pubescent on both sides: fls. greenish white; bracts obovate, dentate at the obtuse apex; sepals oblong-ovate, about half as long as the receptacle; style glabrous: fr. sparingly glandular-pubescent, black. N. Mex. to w. Tex. Intr. 1916. Zone V?

Sect. 10. EUCOREOSMA Jancz. Racemes upright or pendulous: fls. proterandrous, greenish or brown, red or white; bracts usually linear; receptacle tubular or campanulate; ovary usually glandular: fr. black or brown: plant resinous-glandular.

18. *R. bracteòsum* Dougl. CALIFORNIAN BLACK CURRANT. Shrub to 3 m., with upright or ascending stems; young growth sparingly pubescent and glandular: lvs. thin, ovate, cordate, 5-20 cm. wide, deeply 5-7-lobed, with ovate to ovate-lanceolate, acute and sharply serrate lobes, resinous-glandular beneath; petioles about as long as blade or longer: fls. greenish or purplish in upright slender racemes to 20 cm. long; bracts spatulate, half as long as pedicels, the lower foliaceous; receptacle cup-shaped; sepals ovate-oblong, 3-4 mm. long: fr. globose, black with whitish bloom, resinous-glandular, edible. B.M.7419(c). Jancz., Mon. Gros. 339. Alaska to n. Calif. Cult. 1895. Zone VI? Remarkable for its large maple-like lvs. and the slender and very long upright racemes.

*R. b. × nigrum* = *R. fuscèscens* Jancz. which differs chiefly in the reddish-brown fls., in the smaller linear bracts of the shorter spreading or arching raceme and in the larger fr. Gt.55:162. Jancz. Mon. Gros. suppl.1:72. (*R. bracteòsum* var. *f.* Jancz.) Orig. before 1905. Zone V.

Closely related species: *R. japonicum* Maxim. Brts. pubescent: lvs. 5-lobed to 17 cm. wide, glandular and pubescent beneath; racemes pubescent; fls. pubescent and glandular: fr. black, not glandular. Jancz., Mon. Gros. 340 (f). Japan. Intr. 1914? Zone V.

19. *R. hudsonianum* Rich. Upright shrub: lvs. broader than long, cordate to subcordate, 3-10 cm. wide, 3-5-lobed, with ovate acute or obtusish, coarsely dentate lobes, pubescent and resinous-glandular beneath; petioles shorter than blade: fls. white, pubescent, in erect, loosely-fld. racemes 3-6 cm. long; pedicels short; bracts setaceous; sepals oval, spreading, longer than the cup-shaped receptacle: ovary resinous-glandular: fr. globose, black, 5-10 mm. thick. B.B.2:237. Hudson Bay to Alaska, s. to Minn. Cult. 1899. Zone II.

*R. h. × nigrum* = *R. Saundersii* Jancz. with pink fls. fading to whitish. Jancz., Mon. Gros. 488 (f). Orig. 1904.

Related species: *R. petiolare* Dougl. Close to No. 19: lvs. glabrous or slightly pubescent, with sharply serrate lobes; petioles often longer than blade: racemes 5-10 cm. long. B. C. to Mont., s. to Ore. and Utah. Intr. 1827. Zone V.—*R. Dikúschá* Fisch. Upright shrub: lvs. 3-5-lobed, to 16 cm. broad, glabrous and glandular beneath; petioles shorter than blade; racemes loose, to 8 cm. long; fls. white, pubescent; bracts 1-1.5 mm. long; receptacle saucer-shaped: fr. bluish black, slightly bloomy. Jancz., Mon. Gros. 344 (f). E. Siber. Intr. before 1911. Zone IV.—*R. fragrans* Pall. Lvs. shallowly 3-5-lobed, 2-6 cm. across, with short and broad obtuse to acute lobes, pubescent or glabrous beneath, rugose: racemes 4-7 cm. long; fls. white, about 1 cm. across; sepals oblong: fr. brownish. Jancz., Mon. Gros. 343 (f). E. Siberia, Manch. Intr. 1917. Zone IV.—*R. procumbens* Pall. Procumbent shrub: lvs. subcoriaceous, reniform, to 8 cm. wide, 3-5-lobed, with short obtuse lobes, glabrous and glandular beneath: racemes upright, 1-4.5 cm. long; fls. glabrous, glandular, reddish or purplish; bracts wanting or minute: fr. brownish, glabrous. Jancz., Mon. Gros. 342. N.K.15:t.7. E. Siber. Cult. 1907. Zone IV.

20. *R. americanum* Mill. AMERICAN BLACK CURRANT. Upright shrub to 1.5 m., with rather slender spreading brs.; young brts. slightly pubescent and glandular: lvs. suborbicular, cordate to nearly truncate, 3-8 cm. wide, 3-5-lobed, with acute or sometimes obtuse dentate lobes, resinous-dotted beneath and pubescent at least on the veins; petioles pubescent, shorter than blade: racemes pendulous, many-fld., glabrous or pubescent; fls. yellowish white; bracts longer than pedicels; ovary glabrous; sepals obtuse, recurved, slightly longer than the cylindric-campanulate receptacle; petals and stamens  $\frac{2}{3}$  the length of the sepals: fr. black; smooth. S.O.2:t.92(c). G.O.t.1(c). B.B.2:238. (*R. floridum* L'Hérit., *R. missouriense* hort., not Nutt.) N. S. to Va., w. to Manit. and Colo. Intr. 1727. Zone II. The pendulous racemes of whitish fls. are rather conspicuous and the lvs. turn yellow and crimson in autumn.

21. *R. nigrum* L. EUROPEAN BLACK CURRANT. Shrub to 2 m. with rather stout brs.; young brts. glandular and puberulous or nearly glabrous: lvs. suborbicular, cordate, 5-10 cm. wide, 3-5-lobed, with broad-ovate, irregularly serrate acutish lobes, sparingly pubescent and resinous-dotted beneath; petioles pubescent: racemes pendulous, 4-10-fld., fls. dull white; bracts usually shorter than pedicels; ovary and receptacle pubescent and glandular; sepals oblong, recurved, longer than the broad-campanulate receptacle; petals almost half as long as sepals: fr. black, subglobose. S.E.4:t.523(c). R.I.23:t.137(c). Card. Bush Fr. f.100. Eu. to C. Asia and Himal. Occasionally escaped in the Middle St. Cult. 1588. Zone IV. Cult. for its fr. which is used for jams, the varieties sometimes planted for ornament. All parts of the plant exhale a peculiar heavy odor when bruised.—*R. n. reticulatum* Nichols. Lvs. densely mottled with yellow.—*R. n. heterophyllum* Pepin. Lvs. deeply divided, sometimes to the base, with irregularly and deeply incised lobes. (*R. n. laciniatum* Ktze., *R. n. f. aconitifolium* Kirchn.) Orig. before 1846.—*R. n. apiifolium* Kirchn., f. Lvs. deeply divided usually to the base, the seg-

ments deeply and partly bipinnately lobed. (*R. n. dissectum* Nichols.) Orig. before 1864.—*R. n. xanthocarpum* Spaeth. Fr. yellow or whitish. Orig. before 1827.—*R. n. chlorocarpum* Spaeth. Fr. green. Gt.16:t.562,f.16(c). Orig. before 1838.

*R. n. × Grossularia* = *R. Culverwellii* Macfarl. Fls. similar to those of *R. nigrum*; the glandless lvs. and infl. resembling those of the gooseberry: fr. dark red, hairy. G.C.III.12:271;44:120. J.L.28:169-73. (*R. Schneideri* Koehne.) Orig. about 1880.—*R. n. × glutinosum*; see under No. 14.—*R. n. × bracteosum*; see under No. 18.—*R. n. × hudsonianum*; see under No. 19.

Closely related species: *R. ussuriense* Jancz. Shrub with suckers: lvs. glabrous, resinous-dotted beneath, with the fragrance of camphor; petioles nearly glabrous: racemes 5-9-fld.; fls. pale; sepals spreading; receptacle campanulate; bracts at least half as long as pedicels: fr. black. N.K.15:t.6. Manch. to Korea. Cult. 1904. Zone V?

Sect. 11. *HERITIERA* Jancz. Racemes upright; pedicels usually slender; fls. whitish or reddish, rotate or saucer-shaped, proterandrous; anthers recurved after anthesis; ovary glandular-bristly: fr. black or red: low or procumbent shrubs with crystalline glands.

22. *R. glandulosum* Weber. FETID CURRANT. Low shrub with prostrate or spreading and reclining stems and ascending brts.; young growth sparingly pubescent and sparingly glandular: lvs. thin, fetid, orbicular, cordate, 3-8 cm. wide, 5-7-lobed, with ovate, acute or acutish doubly serrate lobes, pubescent on the veins beneath; petioles about as long as blade: racemes ascending, 8-12-fld., glandular; pedicels much longer than the narrow bracts; fls. white or pinkish; ovary glandular-hispid; receptacle cup-shaped; sepals short, spreading, glabrous outside; petals much longer than broad: fr. red, glandular-bristly. S.O.2:t.95(c). B.B.2:237. Jancz., Mon. Gros. 308. Am. For. 22:469,471. (*R. prostratum* L'Hérit., *R. rigens* Michx.) Nfdl. to B. C., s. to Mich. and Minn. and in the mts. to N. C. Cult. 1641. Zone II.

Related species: *R. laxiflorum* Pursh. Lvs. deeply 5-lobed, slightly pubescent beneath; sepals longer, pubescent outside, not glandular; petals as broad as long: fr. dark purple, bloomy, glandular. S.H.1:f.268b. Jancz., Mon. Gros. 307;suppl.5:728. Alaska to n. Calif. Intr. 1818. Zone IV.—*R. coloradense* Cov. Young brts. puberulous; lvs. glabrous beneath or sparingly pubescent on the veins; sepals pubescent and glandular outside; petals nearly twice as broad as long: fr. black, not bloomy, sparingly glandular. Jancz., Mon. Gros. 310;suppl. 5:727. (*R. laxiflorum* var. *c.* Jancz.) Colo., N. Mex. Intr. 1905. Zone V?

Sect. 12. *RIBESIA* Berl., emend. Jancz. Racemes pendulous or spreading, usually many-fld.; fls. rotate to turbinate, rarely campanulate, green, reddish or purple: fr. red or purple, rarely black: buds with scarious scales: upright, rarely prostrate shrubs with crystalline glands.

23. *R. rubrum* L. NORTHERN RED CURRANT. Shrub to 2 m.; young growth usually glabrous: lvs. suborbicular, truncate or rarely subcordate, to 12 cm. wide, 3-5-lobed, with serrate-dentate, acutish or obtusish lobes, usually nearly glabrous: racemes usually spreading; pedicels short; bracts very small: fls. greenish brown; receptacle nearly cup-shaped, without prominent ring or projections inside; anthers with contiguous cells: fr. usually red, the dried remnants of the fl. circular at base. S.E.4:t.522. Jancz., Mon. Gros. 287,288. (*R. sylvestre* Syme, not Mert. & Koch, *R. vulgare* Lam., *R. spicatum* Robs., *R. scandicum* Hedl.) C. and N. Eu., N. Asia. Long cult. Zone III. Rare in cult. outside of botanical collections and of the gardens of n. Eu., where forms with red, pinkish or whitish frs. are cult.—*R. r. pubescens* Swartz, var. Young brts. slightly pubescent: lvs. pubescent beneath: fls. brownish or pinkish: fr. small. (*R. Schlechtendalii* Lange.) N. Eu.

*R. r. × sativum* = *R. Houghtonianum* Jancz. (Jancz., Mon. Gros. 479) to which several garden forms belong.—*R. r. × petraeum caucasicum* = *R. holosericeum* Otto & Dietr. Lvs. pubescent beneath: fls. reddish or brownish: fr. blackish purple. Jancz., Mon. Gros. 483(f).—*R. h. pallidum* (Otto & Dietr.)

Rehd., var., a hybrid with *R. petraeum bullatum* has the lvs. slightly pubescent beneath, pale fls. or tinged brownish and usually larger red fr. Jancz., Mon. Gros. 481,482. (*R. p.* Otto & Dietr.)—*R. h.*  $\times$  *sativum*; see under No. 24.

Closely related species: *R. Warscewiczii* Jancz. Lvs. slightly pubescent beneath, chiefly on the veins, cordate at base: fls. pinkish; receptacle with a slightly elevated ring inside: fr. blackish purple, acid. Jancz., Mon. Gros. 285, 286. V.F.133. E. Siber. Intr. about 1860. Zone V.—*R. W.*  $\times$  *sativum*; see under No. 24.

24. *R. sativum* Syme. GARDEN CURRANT. Upright shrub to 1.5 m.; young growth pubescent and slightly glandular: lvs. suborbicular, cordate or subcordate, 3-7 cm. wide, 3-5-lobed, with short acutish serrate lobes, pubescent at least on the veins beneath: racemes drooping, many-fl'd., glabrous or nearly so; pedicels filiform, much longer than the bracts; receptacle saucer-shaped, green or slightly purple, inside with an elevated 5-angled ring; anthers with a broad connective separating the cells: fr. usually red, juicy, the dried remnants of the fl. 5-angled at base. S.E.4:t.520(c). B.B.2:237. Jancz., Mon. Gros. 277,278,280. (*R. sylvestre* Mert. & Koch, *R. hortense* Hedl., *R. domesticum* Jancz., *R. vulgare* Jancz., not Lam., *R. rubrum* auth., not L.) W. Eu. Cult. 1600. Zone IV. Cult in many varieties for its fr. which is eaten fresh or made into preserves.—*R. s. variegatum* (West.) Rehd, f. Lvs. variegated or bordered irregularly with white or yellowish. S.O.2:t.93f.(c). (*R. rubrum* var. *v.* West.)—*R. s. macrocarpum* Bailey, var. Of irregular habit on account of the lateral brts. being partly without buds: leaves large, deeply cordate, 3-lobed, with a large middle lobe: racemes without leaves at the base: fr. large, always red. (*R. vulgare* var. *m.* Jancz.) Jancz., Mon. Gros. 281,282. To this var. belong the large-fruited "Cherry Currants."

Hybrids of this species are *R. Gondouini* Jancz. (*R. s.*  $\times$  *petraeum.*) Jancz., Mon. Gros. 484,485.—*R. Koehneanum* Jancz. (*R. s.*  $\times$  *multiflorum.*) Jancz., Mon. Gros. 486.—*R. futurum* Jancz. (*R. s.*  $\times$  *Warscewiczii.*)—*R. recens* Jancz., (*R. s.*  $\times$  *holosericeum.*) Jancz., Mon. Gros. suppl.1:67.

25. *R. triste* Pall. SWAMP RED CURRANT. Shrub with creeping or ascending often rooting stems: young growth sparingly pubescent and sparingly glandular: lvs. thin, suborbicular, subcordate or cordate with a wide sinus, 5-10 cm. wide, 3-5-lobed, with acute or obtuse coarsely serrate lobes, glabrous above and light green with conspicuous veins, nearly glabrous beneath or pubescent to tomentose; petioles mostly shorter than blade: racemes drooping, 3-5 cm. long, glandular, otherwise nearly glabrous; fls. purplish or purple, rotate; sepals spreading, obtuse; anther-cells contiguous; fr. red, smooth, 6-8 mm. across. Jancz., Mon. Gros. 283. S.H.1:f.267g. (*R. albinervium* Michx.) Nfdl. to Alaska, s. to Mass., Mich. and Ore.; N. Asia. Intr. 1820. Zone II.—*R. t. alaskanum* Berger, var. Stems upright: lvs. cordate, with mostly obtuse lobes and rounded mucronulate teeth, glabrous: racemes 3-6 cm. long; fls. dark brown-red. N. Y. Agr. Exp. Sta. Tech. Bull 109:t.2. Alaska. Intr. 1914.

26. *R. multiflorum* Kit. Upright shrub to 2 m., with stout brs.; young brts. pubescent; buds large: lvs. roundish, subcordate or truncate, to 10 cm. wide, 3-5-lobed, with acute or obtusish crenate-dentate lobes, densely grayish pubescent beneath, pubescent above while young; petioles pubescent, shorter than the blade: racemes pendulous, dense, to 12 cm. long, sometimes to 50-fl'd.; pedicels stout; fls. greenish yellow; receptacle saucer-shaped, inside with an elevated ring bearing 5 warts; sepals reflexed; stamens and style exerted, equaling the sepals: fr. dark red, glabrous. B.M.2368(c). R.I.23:t. 138a(c). L.I.t.31. Jancz., Mon. Gros. 274. E. Eu. Intr. about 1818. Zone V. Easily distinguished by the exerted stamens.

*R. m. × petraeum* = *R. urceolatum* Tausch. Similar to *R. multiflorum*, but fls. reddish and broad-campanulate; stamens slightly shorter than sepals. Jancz., Mon. Gros. 487; suppl.1:70. Cult. 1838.—*R. m. × sativum*; see under No. 24.

Closely related species; *R. manshuricum* Komar. Lvs. large, usually 3-lobed, with often acute or acuminate lobes, glabrous or pubescent beneath: racemes to 20 cm. long; receptacle inside with 5 warts not connected by an elevated ring. Jancz., Mon. Gros. 275; suppl.5:718. N.K.15:t.8. N. E. Asia. Cult. 1906.

27. *R. petraeum* Wulf. Upright shrub to 2 m.; young brts. usually glabrous: lvs. roundish, subcordate or truncate, 7-10 cm. wide, usually 3-lobed with acutish lobes, rugose and pubescent above while young, pubescent beneath at least on the veins; petioles pubescent, mostly shorter than blade: racemes rather dense, to 8 or 10 cm. long; pedicels short; fls. red or pink; receptacle broad-campanulate; sepals short, rounded, ciliate, spreading; petals nearly half as long as sepals, with a callosity below the base; stamens inserted below the petals, slightly longer than petals; ovary conical at apex, half-superior: fr. dark red, acid. R.I.23:t.138(c). S.O.2:t.94(c). Mts. of W. and C. Eu. Cult. 1794. Zone V.—*R. p. bullatum* (Otto & Dietr.) Schneid., var., with the lvs. bullate above is the typical form. (*R. b.* Otto & Dietr.)—*R. p. carpaticum* (Kit.) Schneid., var. Lvs. plane above, glabrescent: racemes looser and smaller. (*R. c.* Kit.) Carpath. Mts. Cult. 1838.—*R. p. Biebersteinii* (Berl.) Schneid., var. Lvs. cordate, usually 5-lobed, with short obtuse lobes, not rugose, usually densely pubescent beneath: racemes long; fls. reddish: fr. dark purple. (*R. B.* Berl., *R. caucasicum* Bieb., not Adams, *R. petraeum* var. *caucasicum* Jancz.) Cauc. Cult. 1840.—*R. p. atropurpureum* (C. A. Mey.) Schneid., var. Lvs. usually 3-lobed, with acutish lobes, to 12 cm. wide, glabrescent or pubescent beneath, not rugose: racemes short; fls. purple, the disk without callosities: fr. blackish purple. Jancz., Mon. Gros. suppl. 5:720. (*R. a.* C. A. Mey.) Siberia. Cult. 1878.—*R. p. altissimum* (Turcz.) Jancz., var. Lvs. 3-5-lobed: racemes 5-7 cm. long; fls. small, paler red. Jancz., l.c.721. Siberia. Cult. 1910.—*R. p. tomentosum* Maxim., var. Lvs. with elongated often subacuminate lobes, pubescent beneath: fls. pale: fr. pale red. Jancz., l.c.722. Manch. Cult. 1913.

*R. p. × rubrum*; see under No. 23.—*R. p. × sativum*; see under No. 24.—*R. p. × multiflorum*; see under No. 26.

Related species: *R. latifolium* Jancz. Young brts. pubescent and stipitate-glandular: lvs. 3-5-lobed, to 18 cm. wide, cordate or subcordate, with often acute or acuminate lobes, pubescent or glabrous beneath: racemes 3-6 cm. long, loose; fls. greenish, often tinged red, subcampanulate, slightly pubescent; stamens inserted at the same height and about as long as petals; ovary inferior: fr. red. Jancz., l.c.723. (*R. petraeum* var. *tomentosum* Maxim., partly.) N. E. Asia. Cult. 1907.—*R. emodense* Rehd. Young brts. glabrous, red while young: lvs. cordate, to 12 cm. wide, 3-5-lobed, with usually acute lobes, glandular, rarely pubescent beneath: racemes to 12 cm. long; fls. greenish, tinged purple, subcampanulate, pubescent or nearly glabrous; sepals broad-obovate, usually spreading; style as long as stamens: fr. red or black. Jacquemont, Voy. Inde.4:t.67. Jancz., Mon. Gros. 296. (*R. himalayense* and *R. himalense* Decne., not Royle.) Himal., C. China. Intr. 1908. Zone VI?—*R. e. urceolatum* (Jancz.) Rehd., var. Fls. urceolate. Jancz., Mon. Gros. 297. W. China, Sikkim. Cult. 1900.—*R. e. verruculosum* Rehd., var. Lvs. smaller, on the veins beneath and petiole with small wart-like excrescences: fr. red, edible. N. China. Intr. 1921.—*R. Meyeri* Maxim. Young brts. glabrous, reddish: lvs. cordate, to 9 cm. wide, usually 5-lobed, with acutish or obtuse lobes, glabrous: racemes horizontal, 3-5 cm. long, loose, glabrous; fls. tubular-campanulate, nearly sessile, reddish; sepals upright; style longer than stamens: fr. black, lustrous. Jancz., Mon. Gros. 298; suppl.5:725. C. Asia to N. W. China. Intr. about 1882. Zone III.

28. *R. moupinense* Franch. Shrub to 5 m.; young brts. glabrous: lvs. cordate to truncate, usually 3-, sometimes 5-lobed, to 16 cm. wide, with acute or acuminate lobes, with gland-tipped hairs above and below, otherwise gla-

brous: racemes pendulous, short or to 12 cm. long; fls. sessile, turbinate-campanulate, red or greenish and tinged red; sepals upright, oval, glabrous; stamens half as long as sepals; style shorter than stamens: fr. black, lustrous. Jancz., Mon. Gros. 299. (*R. tripartitum* Batal.) W. China. Intr. 1908. Zone V. Vigorous shrub with large foliage.

29. *R. longeracemòsum* Franch. Shrub to 3 m.; brts. glabrous: lvs. cordate, to 14 cm. long and wide, 3-5-lobed, with acute or acuminate lobes, glabrous: racemes pendulous, to 30 cm. long, nearly glabrous, very slender, with remote, greenish or reddish fls. tubular-campanulate; pedicels 5-7 mm. long; bracts about half as long, ovate; sepals upright, ovate, much shorter than tube; stamens and style exserted: fr. black. Jancz., Mon. Gros. 301. W. China. Intr. 1908. Zone V. Vigorous shrub with large lvs.; remarkable for its very long and slender racemes.—*R. l. Wilsòni* Jancz., var. Young brts. red: racemes shorter; fls. salmon-red. C. China. Intr. 1907.

Subgen. III. GROSSULARIOIDES Jancz. (*Limnobotrys* Rydb.) Shrubs with spines and prickles: fls. perfect, in pendulous 6-20-fl. racemes; pedicels jointed beneath the ovary; bractlets minute or obsolete; fls. saucer-shaped: fr. black or red, glandular-bristly, disarticulating from the pedicel: buds with scarious scales.

Sect. 13. GROSSULARIOIDES. Characters of subgenus.

30. *R. lacustre* (Pers.) Poir. Shrub to 1 m., with slender weak stems; brs. with slender usually clustered nodal spines and numerous scattered bristles: lvs. nearly orbicular, cordate, 3-6 cm. wide, with acutish incisely dentate lobes, glabrous or nearly so; petioles about as long as blade: racemes pendulous, 5-9 cm. long, 12-20-fl.; pedicels slender, about 5 mm. long; fls. greenish or purplish; receptacle crateriform; sepals spreading, short and broad; petals much broader than long: fr. purple-black, glandular-bristly. B.M.6492(c). L.B.9:884(c). Jancz., Mon. Gros. 353. (*R. grossularioides* Michx., *R. echinatum* Lindl., *Limnobotrys lacustris* Rydb.) Nfdl. to Alaska, s. to Pa., Mich., Minn., Colo. and n. Calif. Intr. 1812. Zone III? Graceful shrub with slender racemes of brownish red flowers.—*R. l. párvulum* Gray, var. Stems usually only slightly bristly: lvs. with obtusish lobes, the terminal one scarcely longer than the lateral ones. (*R. p.* Rydb.) Intr. 1918.

Closely related species: *R. hórridum* Rupr. Brts. yellowish, with more numerous spines and densely bristly: petioles and lvs. on both sides setose-bristly: racemes 6-7-fl. N.K.15:t.10. (*R. lacustre* var. *h.* Jancz.) N. E. Asia. Intr. 1918. Zone V.—*R. montigenum* McClatchie. Lvs. smaller, 1.5-4 cm. wide, pubescent and glandular: racemes 6-10-fl.; pedicels 2-5 mm. long: fr. red, glandular-bristly. Jancz., Mon. Gros. 355. (*R. lacustre* var. *molle* Gray, *R. lentum* Cov. & Rose.) Wash. and Mont. to Calif., Ariz. and N. Mex. Cult. 1905. Zone V.

Subgen. IV. GROSSULARIA Rich. (*Grossularia* Mill.) GOOSEBERRY. Fls. perfect, in small, 1-4-fl. racemes; pedicels not jointed; receptacle turbinate to tubular, never rotate: fr. not disarticulating: buds with scarious scales: brs. with nodal spines, rarely nearly wanting, and often with bristles.

Sect. 14. EUGROSSULARIA Engl. Petals flat or somewhat concave; anthers obtuse, never glandular; style pubescent or glabrous: fls. greenish, whitish or purple, rarely red.

31. *R. níveum* Lindl. Shrub to 3 m., with upright or ascending brs.; brts. reddish brown with stout brown spines 1-2 cm. long, without bristles: lvs. thin, suborbicular, 2-3.5 cm. wide, 3-5-lobed, with short obtusish, few-toothed lobes, sparingly pubescent or glabrous: fls. 1-4, white, on slender peduncles; bracts ovate, much shorter than the filiform pedicels; ovary glabrous; receptacle campanulate; sepals narrowly lanceolate, 6-8 mm. long; filaments pubescent, longer than the sepals: fr. bluish-black, glabrous. B.M.8849(c). B.R.

1962(c). (*Grossularia nivea* Spach.) Idaho and Wash. to Nev. Intr. 1826. Zone V. Slender-branched shrub, attractive in bloom with its numerous small white flowers.

*R. n.* × ? *inermis* = *R. robustum* Jancz. Vigorous shrub with small spines: fls. white or pinkish; sepals broader and shorter and filaments shorter and less pubescent than in *R. niveum*. Jancz., Mon. Gros. 499. Orig. before 1890.—*R. n.* × *divaricatum* = *R. succirubrum* Zabel. Lvs. similar to those of *R. niveum*: fls. pink or pinkish; stamens  $1\frac{1}{2}$  times as long as sepals: fr. black, slightly bloomy. Jancz., Mon. Gros. 500. Orig. in 1888.

32. *R. curvatum* Small. Diffusely branched shrub to 1 m., with slender reddish brown brs.; spines slender, 4–6 mm. long: lvs. suborbicular, cuneate to subcordate, 1–3 cm. wide, 3–5-lobed with obtusish toothed lobes, sparingly pubescent; petioles slender, as long or shorter than blade: fls. 1–5, white, on slender peduncles; bracts often 3-lobed, ciliate; ovary glandular or pubescent; receptacle broad-campanulate; sepals linear-lanceolate, 6–7 mm. long, revolute; stamens as long as sepals; filaments villous: fr. greenish, glabrous. Jancz., Mon. Gros. 395. (*Grossularia curvata* Small, *G. campestris* Small.) Ga. to La. and Tex. Intr. before 1898. Zone V. Graceful shrub.

Closely related species: *R. echinellum* (Cov.) Rehd. Brts. grayish; nodal spines 1–3, to 15 mm. long: lvs. 6–15 mm. long, finely pubescent; receptacle cylindric-campanulate, 4 mm. long; ovary densely glandular-bristly: fr. very spiny, 2–3 cm. across. Jour. Agric. Research, 28:t.1. (*Grossularia echinella* Cov.) Fla. Intr. 1925.

33. *R. missouriense* Nutt. Shrub to 2 m., with grayish or whitish sometimes bristly brs.; spines 2 cm. long or less: lvs. suborbicular, broad-cuneate to subcordate, 2–6 cm. wide, 3–5-lobed, with coarsely dentate obtusish lobes, pubescent beneath: fls. greenish white, 2–3 on a slender peduncle; pedicels much longer than bracts; ovary glabrous; sepals linear, 2–3 times as long as the cylindric-campanulate pubescent receptacle, pubescent or glabrous; filaments glabrous, nearly twice as long as sepals, pubescent below: fr. glabrous, 8–15 mm. across, purplish, subacid. B.B.2:240. Card, Bush Fr. f.86 (as *R. gracile*). Jancz., Mon. Gros. 392 (as *R. rotundifolium*). (*R. gracile* Pursh, not Michx., *Grossularia missouriensis* Cov. & Brit.) Ill. to Minn., S. D., Kans., Mo. and Tenn. Cult. 1907. Zone IV. Similar to *R. niveum*, but fls. smaller and more greenish.

*R. m.* × *hirtellum*; see under No. 36.—*R. m.* × *Grossularia*; see under No. 40.

34. *R. setosum* Lindl. Shrub to 1 m., with reddish brown, usually bristly brs.; spines subulate, to 2 cm. long: lvs. cordate to truncate, rarely cuneate, 1–4 cm. broad, 3–5-lobed, with dentate lobes, finely pubescent and somewhat glandular: fls. 1–3, white; bracts somewhat shorter than pedicels; ovary glabrous or slightly glandular; receptacle cylindric-campanulate, about twice as long as the recurved sepals; petals and stamens  $\frac{1}{2}$  or  $\frac{3}{4}$  as long as sepals: fr. red to black, glabrous or somewhat bristly. B.R.1237(c). B.B.2:240. Card, Bush Fr.f.91. (*Grossularia setosa* Cov. & Brit., *R. saximontanum* E. Nels.) Idaho to Assin., S. Dak. and Wyo. Intr. 1810. Zone II.

Closely related species: *R. cognatum* Greene. Brts. white or buff-colored, usually bristly; receptacle greenish white, sparingly hirsute,  $\frac{1}{2}$  longer or nearly as long as the white or pink sepals: fr. smooth. Card, Bush Fr.f.90 (as *R. irraguum*). (*Grossularia cognata* Cov. & Brit.) Wash. and Ore. Intr. 1909. Zone V.

35. *R. oxyacanthoides* L. Low shrub, with slender often reclining brs. usually bristly, with stout spines 1 cm. or less long: lvs. cordate to broad-cuneate, 2–4 cm. wide, deeply 5-lobed with dentate lobes, slightly pubescent or nearly glabrous, usually rugose at maturity: peduncles very short, scarcely

exceeding the bud-scales, 1-2-fld.; pedicels short; fls. greenish white; sepals narrow-oblong, 2.5-4 mm. long, little longer than the receptacle; stamens and petals  $\frac{2}{3}$  as long as sepals: fr. red, smooth, about 1 cm. across. B.B.2:240. L.A.2:f.715. (*Grossularia* o. Cov. & Brit.) Hudson Bay to B. C., s. to Mich., N. Dak. and Mont. Intr. 1705. Zone II.

Closely related species: *R. irriguum* Dougl. Shrub to 3 m.; brs. often without bristles, usually gray: lvs. usually cordate, 3-7 cm. wide, 3-5-lobed, glabrous or nearly so above, pubescent and minutely glandular beneath: peduncles elongated, nodding, 1-3-fld.; sepals 5-8 mm. long, about twice as long as petals and stamens and nearly twice as long as the greenish receptacle. L.A.2:f.721. Jancz., Mon. Gros. f.110c. (*R. divaricatum* var. *i.* Gray, *R. leucoderme* Heller.) B. C. to Ore., Idaho and Mont. Intr. 1920. Zone IV.—*R. non-scriptum* (Berger) Standl. Small upright shrub; brs. usually without bristles: lvs. 5-lobed, deeply cordate, with crenate lobes, glandular beneath: peduncles shorter than petioles; sepals about as long or little longer than the receptacle; stamens as long as sepals. Colo.? Cult. 1900.

36. *R. hirtellum* Michx. Shrub to 1 m., with slender, sometimes bristly brs., glabrous and gray when young, dark brown when older; spines wanting or small: lvs. ovate-orbicular or reniform-orbicular, usually broad-cuneate, 2-6 cm. broad, incisely 3-5-lobed, with acute dentate lobes, glabrous or sparingly pubescent; petioles slender, often with long hairs: fls. 1-3; bracts much shorter than pedicels; ovary glabrous, rarely pubescent or with stalked glands; receptacle greenish, narrow-campanulate, about as long as the green or purplish, spreading or upright sepals; stamens about as long as sepals; petals half as long: fr. purple or black, 8-10 mm. across, usually glabrous. B.M.6892(c, as *R. oxyacanthoides*). B.B.2:241. Card, Bush Fr. f.92 (as *R. oxyacanthoides*). B.C.3:f.1665-1667;5:2960. (*R. saxosum* Hook., *R. oxyacanthoides* of most auth., *R. gracile* Jancz., not Michx., *Grossularia hirtella* Cov. & Brit.) Nfdl. to Pa. and W. Va., S. Dak. and Man. Intr. 1812. Zone III. This is the most important edible native gooseberry, one of the best known improved forms being "Pale Red" which orig. about 1847.

Varieties as "Downing" (B.C.3:f.1668), "Houghton", "Smith" are referred to *R. rusticum* Jancz., apparently a hybrid with *R. Grossularia* and differing chiefly in its broader sepals and pubescent ovary. Jancz., Mon. Gros. 496. (*Grossularia downingiana* Berger.) Orig. about 1853 (Downing).—*R. h. x missouriense* = *R. arcuatum* Jancz. Fls. whitish or slightly purple; sepals narrow-oblong, longer than the receptacle; stamens sometimes longer than the sepals: fr. red. Jancz., Mon. Gros. 498. Orig. before 1907.

37. *R. rotundifolium* Michx. Shrub to 1 m., usually lower, with slender brown brs.; spines few and small: lvs. broad-cuneate to subcordate, 2-5 cm. wide, usually 3-lobed with coarsely dentate obtusish lobes, minutely pubescent or nearly glabrous; petioles usually shorter than blade: fls. 1-3, greenish purple; peduncles slender; pedicels much longer than bracts; sepals narrow, about twice as long as the campanulate receptacle; stamens somewhat longer than sepals: fr. purplish, smooth, 6-8 mm. across. G.O.t.3(c). L.B.11:1094 (c). B.B.2:241. Card, Bush Fr. f.88. (*R. triflorum* Willd., *Grossularia rotundifolia* Cov. & Brit.) Mass to N. Y. and N. C. Cult. 1809. Zone V. Often confused with the following species.

38. *R. divaricatum* Dougl. Shrub to 3 m., with gray or brown, sometimes bristly brs.; spines usually stout, 1-2 cm. long, sometimes wanting: lvs. cordate to subtruncate, 2-6 cm. wide, usually 5-lobed, with coarsely crenate-dentate obtusish lobes, pubescent beneath along the veins or glabrous: fls. 2-4, greenish purple; peduncles slender, about as long as petioles; ovary glabrous; sepals oblong, slightly longer than the campanulate receptacle; petals white or purplish less than half as long as sepals; stamens somewhat longer than sepals: fr. black or dark purple, about 1 cm. across. B.R.1359(c).

Card, Bush Fr. f.87. Jancz., Mon. Gros. 390. (*Grossularia divaricata* Cov. & Brit.) B. C. to Calif. Intr. 1826. Zone V.—*R. d. pubiflorum* Koehne, var. The more vigorous stems bristly: lvs. pubescent: flowers sparingly villous, smaller.

*R. d.* × *Grossularia* = *R. innominatum* Jancz. Sepals broader; ovary glabrous or pubescent: fr. purple. Cult. 1906.—*R. d.* × *stenocarpum* = *R. gothoburgense* Blom. Petals narrow-spatulate, slightly flushed reddish; style slightly pubescent: fr. subglobose to ellipsoid, purple. Orig. 1917.—*R. d.* × *niveum*; see under No. 31.—*R. d.* × *Lobbii*; see under No. 46.

39. *R. inérme* Rydb. Shrub to 2 m.: brs. with few small spines less than 1 cm. long, sometimes unarmed, rarely with few bristles: lvs. cordate to truncate, 1–6 cm. wide, 3–5-lobed with crenate-dentate, obtusish lobes, glabrous or sometimes pubescent and glandular: fls. 1–4, green or purplish; peduncles mostly shorter than petioles; bracts much shorter than pedicels; ovary glabrous; sepals oblong, reflexed during anthesis, slightly shorter than the narrow-campanulate receptacle; petals pink or white, about  $\frac{1}{2}$  as long as sepals; stamens shorter than sepals: fr. purplish red, smooth, about 8 mm. across, edible. Jancz., Mon. Gros. f.110 (except c). (*R. vallicola* Greene, *R. oxyacanthoides* Jancz., partly, *Grossularia inermis* Cov. & Brit.) Mont. to B. C. s. to N. Mex. and Calif. Cult. 1899. Zone V.

*R. i.* × *niveum*; see under No. 31.

40. *R. Grossularia* L. Shrub to 1 m.; brs. sometimes bristly, with stout spines about 1 cm. long and mostly 3-parted; lvs. cordate to broad-cuneate, 2–6 cm. wide, 3–5-lobed with crenulate-dentate obtusish lobes, glabrous or pubescent, of firm texture: fls. 1–2, greenish; ovary pubescent and often glandular-villous; sepals usually pubescent, about as long as the short-campanulate receptacle; stamens shorter than sepals: fr. globose to ovoid, pubescent and glandular-bristly or smooth, red, yellow or green. S.O.2:t.99(c). S.E.4:t.518(c). R.I.23:t.134(c). B.C.3:f.1663. (*R. reclinatum* L., *Grossularia reclinata* Mill.) Eu., N. Afr., Cauc. Cult. 1500. Zone IV. This species is the parent of the European gooseberries of which a large number of garden forms are in cult., varying greatly in size, color and pubescence of the fr.—*R. G. uva-crispa* (L.) Sm., var. Low shrub with pubescent brs. and lvs.; the tomentose ovary without or with few glands: fr. small, yellow, pubescent. (*R. G. var. pubescens* Koch, *R. uva-crispa* L.) S.O.2:t.100(c).

*R. G.* × *stenocarpum* = *R. vitreum* Jancz. Similar to *R. Grossularia uva-crispa*; ovary with only a few hairs near base: fr. greenish, transparent, tinged red, persisting until Oct. Jancz., Mon. Gros. Suppl. 4:613. Orig. before 1909.—*R. G.* × *cynosbati* = *R. utile* Jancz. Lvs. similar to those of *R. Grossularia*: fls. pale, slightly pubescent; sepals somewhat shorter than receptacle; style as long as stamens: fr. red, sometimes with a few spines. Jancz., Mon. Gros. 495. Orig. before 1896.—*R. G.* × *missouriense* = *R. Van-Fleetianum* (Berger) Standl. Upright shrub with stout spines: lvs. 3-lobed, truncate to broad-cuneate, pubescent at first, later glabrous: ovary glabrous or pubescent; sepals much longer than receptacle; fr. ovoid, smooth, purple. Orig. before 1920.—*R. G.* × *sanguineum*; see under No. 13.—*R. G.* × *nigrum*; see under No. 21.—*R. G.* × *hirtellum*; see under No. 36.—*R. G.* × *divaricatum*; see under No. 38.

41. *R. cynosbati* L. Shrub to 1.5 m. high, usually lower; spines slender, 1 cm. or less long, simple or 3-parted, often wanting; bristles few or none: lvs. truncate to cordate, 3–5 cm. wide, deeply 3–5-lobed with crenately or incisely dentate lobes, usually somewhat pubescent; petioles shorter than blade, usually pubescent: fls. 1–3, green, glabrous; peduncles and pedicels slender; ovary setose; sepals broad, shorter than the broad-campanulate receptacle; stamens little longer than petals, shorter than sepals: fr. globose to ellipsoid, prickly, wine-colored, edible. S.O.2:t.98(c). B.B.2:239. Card,

Bush Fr. f.94. B.C.5:2961. (*R. gracile* Michx., *Grossularia c.* Mill.) N. B. to Manit., s. to N. C., Ala. and Mo. Intr. 1759. Zone II.—*R. c. inérme* Rehd., f. Fr. smooth, without prickles.—*R. c. glabrátum* Fern., var. Lvs. glabrous or only sparingly pilose on the veins.

*R. c.* × *Grossularia*; see under No. 40.

42. *R. burejénse* Fr. Schmidt. Shrub to 1 m. or less; brs. usually very bristly and with small nodal prickles: lvs. cordate to subcordate, 2-6 cm. wide, deeply 3-5-lobed with dentate obtuse lobes, pubescent and glandular: fls. 1-2, pale or reddish brown; peduncle 3-6 mm. long; sepals oblong, longer than the broad-campanulate receptacle; petals rhombic, obtuse; stamens longer than petals; style glabrous, divided only at apex: fr. about 1 cm. across, green, prickly, edible. Jancz., Mon. Gros. 371. (*Grossularia burejensis* Berger.) N. E. Asia. Cult. 1903. Zone III.

Closely related species: *R. aciculáre* Sm. Nodal spines 5-7, small; lvs. glabrous, lustrous above, rarely pubescent and glandular; peduncles to 1 cm. long; fls. pale or pinkish; stamens exceeding the obovate petals only by the anthers; ovary smooth and glabrous, or sometimes glandular-bristly; style divided to the middle: fr. red, green or yellow. Jancz., Mon. Gros. 373. Ledebour, Icon. Fl. Ross. t.230. (*Grossularia acicularis* Spach.) Siber. Cult. 1903. Zone III?

43. *R. alpéstre* Decne. Upright shrub to 3 m.; brs. with stout spines to 2 cm. long and usually 3-parted, often bristly: lvs. cordate to truncate, 2-5 cm. wide, 3-5-lobed with incisely dentate obtusish lobes, slightly pubescent or nearly glabrous: fls. 1-2, greenish or sometimes reddish, on short peduncles; ovary glandular-bristly; sepals oblong, about as long as the campanulate glandular receptacle; petals, white, upright, connivent, elliptic, acutish, half as long as sepals; stamens exceeding the petals by the anthers; anthers with a cup-shaped apical gland; style longer than stamens: fr. subglobose or ellipsoid, to 1.6 cm. long, purple, glandular-bristly. Jacquemont, Voy. Inde, 4:t.75. Jancz., Mon. Gros. 376. (*Grossularia alpestris* Berger.) Himal., W. China. Intr. 1902. Zone V.—*R. a. gigantéum* Jancz., var. Shrub to 5 m., with stout spines to 3 cm. long; fls. glabrous: fr. smooth, green. W. China. Intr. 1908. Zone V. Used in China as a hedge plant forming very dense tall hedges.

Related species: *R. grossularioides* Maxim. Shrub to 2 m.; brs. bristly, glandular-bristly or glabrous: lvs. to 4 cm. broad, glabrous or slightly stipitate-glandular: peduncle about 1.5 cm. long; style as long as stamens; anthers without apical gland; fr. glabrous, red. Jancz., Mon. Gros. 377. Japan. Intr. 1881. Zone V?—*R. stenocárpum* Maxim. Shrub to 2 m.: lvs. somewhat smaller; anthers without apical gland: fr. oblong, 2-2.5 cm. long, greenish and tinged reddish, somewhat transparent, glabrous in the cult. form. Jancz., Mon. Gros. 375. N. W. China. Cult. 1903. Zone V.—*R. s.* × *divaricatum*; see under No. 38.—*R. s.* × *Grossularia*; see under No. 40.

44. *R. leptánthum* Gray. Slender shrub to 2 m.; brs. smooth or bristly, with nodal spines about 1 cm. long: lvs. truncate to open-cordate, 0.5-2 cm. wide, 3- or 5-cleft with crenate-dentate lobes, glabrous or pubescent and somewhat glandular; petioles as long or shorter than blade: fls. greenish white, 1-2 on a slender peduncle; pedicels short or wanting; ovary glabrous or sometimes glandular-pubescent; sepals oblong, greenish white, about as long as the nearly cylindric greenish receptacle; petals white or pinkish, about half as long as the sepals and as long as the stamens; style glabrous, exserted, bifid at the apex: fr. black, lustrous, smooth or glandular-hispid. Gt.53:409. Jancz., Mon. Gros. 379. (*Grossularia leptantha* Cov. & Brit.) Colo. to N. Mex. and Utah. Intr. 1893. Zone V. Graceful shrub.

Closely related species: *R. quercetórum* Greene. Fls. 2-4, yellow; peduncles pubescent; pedicels exceeding the bracts; petals slightly longer than the stamens. Calif. and L. Calif. Cult. 1914. Zone VII?

45. *R. pinetorum* Greene. Shrub to 2 m., with spreading and reclining brs., without bristles; spines 1 or 3, about 1 cm. long or less: lvs. thin, cordate, 2-3 cm. wide, usually 5-cleft with irregularly incised-dentate obtuse lobes, dull green and glabrous above, sparingly pubescent beneath, at least on the veins: fls. orange-red, 1 or rarely 2; peduncles puberulent, shorter than the petioles; ovary bristly; sepals linear-spatulate, pilose, nearly twice as long as the pilose cylindric-campanulate receptacle,  $\frac{1}{2}$  shorter than petals and stamens; style glabrous: fr. purple, 1-1.5 cm. long, prickly. Jancz., Mon. Gros. 370. (*Grossularia* p. Cov. & Brit.) Ariz., N. Mex. Intr. 1898. Zone V. Remarkable for the orange-red color of the fls.

Closely related species: *R. Watsonianum* Koehne. Lvs. deeply 3-5-lobed, 3-5 cm. wide: fls. green; sepals fully twice as long as receptacle; petals white: fr. bristly. Jancz., Mon. Gros. f.97a. Wash. Cult. 1907. Zone VI?

Sect. 15. *ROBSONIA* Bert. Petals convolute, involute or convex; anthers sagittate or obtuse and glandular, rarely glandless; style always glabrous: fls. usually red or scarlet, 5- or 4-merous: fr. bristly or glandular, never glabrous.

46. *R. Lobbii* Gray. Shrub to 2 m.; young brts. pubescent; spines 3, 1-2 cm. long: lvs. thin, cordate or subcordate, 2-3.5 cm. wide, 3-5-lobed with crenate-dentate obtuse lobes, slightly pubescent and glandular, often glabrous above: fls. 1-2, purple-red; peduncles glandular-pubescent; bracts ovate, as long as pedicels or shorter; sepals reflexed, about 1 cm. long, 2-3 times as long as the narrow-campanulate finely pubescent receptacle; petals whitish, half as long as sepals; stamens as long as sepals; anthers ellipsoid, glandular on back: fr. ellipsoid, purple, densely stipitate-glandular. B.M. 4931(c, as *R. subvestitum*). R.H.1908:30. G.C.II:19:11. Jancz., Mon. Gros. 359. (*Grossularia* L. Cov. & Brit.) B. C. to Calif. Intr. 1852. Zone VII?

*R. L. × divaricatum* = *R. Knightii* Rehd. Brts. puberulous: lvs. sparingly villous beneath, more densely on the veins: peduncle and pedicels glabrous or nearly so; receptacle campanulate, sepals about 6 mm. long: fr. sparingly glandular-setose. B. C. Cult. 1920.

47. *R. Roëzii* Reg. Shrub to 1.5 m.; young brts. pubescent, not bristly; spines slender, to 1.5 cm. long: lvs. rather thin, truncate to subcordate, 1.5-2.5 cm. wide, 3-5-lobed with incisely crenate-dentate lobes, finely pubescent on both sides or glabrous above: fls. 1-3, purple; ovary bristly and usually white-hairy; sepals lanceolate, longer than the pilose campanulate receptacle; petals involute, erose, white, about half as long as the sepals and as long as the filaments; anthers sagittate: fr. bristly, purple, 1-1.5 cm. across. Gt.28: t.982,f.1-3(c). R.H.1899:177. (*R. amictum* Greene, *Grossularia* R. Cov. & Brit.) M. and s. Calif. Cult. 1899. Zone VI? Fls. conspicuous on account of the contrast between the purple calyx-tube and the white petals.—*R. R. cruentum* (Greene) Rehd., var. Lvs. and fls. glabrous. B.M.8105(c). R.H. 1908:32. S.L.312(h). (*R. c.* Greene, *R. amictum* var. *c.* Jancz.)

48. *R. Menziesii* Pursh. Shrub to 2 m.; young brts. pubescent and densely bristly; spines 1-2 cm. long: lvs. firm in texture, cordate to subtruncate, 2.5-4 cm. wide, 3-5-lobed with crenate-dentate lobes, glabrous or slightly glandular above, velvety-pubescent and glandular beneath; petioles almost as long as blade: fls. 1-2, purple; peduncle slender, about as long as petiole; bracts shorter than the pedicels; ovary glandular-bristly; sepals oblong, about 3 times as long as the campanulate glandular-pubescent receptacle; petals whitish, erose, shorter than the filaments; stamens as long as sepals; anthers sagittate: fr. globose, bristly. G.C.45:242. R.H.1908:31. Jancz., Mon. Gros. 361,362. (*R. subvestitum* Hook. & Arn., *Grossularia* M. Cov. & Brit.) Ore. to m. Calif. Intr. 1830. Zone VII.

Related species: *R. californicum* Hook. & Arn. Brs. without bristles: lvs. glabrous or nearly so: fls. green or purplish; ovary bristly, only the shorter bristles sometimes glandular; petals obovate, nearly half as long as filaments: fr. prickly. Jancz., Mon. Gros. f.95. Card. Bush Fr.f.83. (*R. occidentale* Hook. & Arn.) Calif. Intr. ? Zone VII?

49. *R. speciosum* Pursh. Evergreen shrub to 4 m.; brs. usually bristly; spines stout: lvs. coriaceous, orbicular to obovate, rounded to broad-cuneate, 1-4 cm. long, 3-5-lobed or crenate-dentate, glabrous or sparingly glandular-hairy: fls. bright red, 2-4 on slender pendulous peduncles, 4-merous; sepals upright, 6-10 mm. long, as long as the convolute petals and much longer than the broad-campanulate glandular-bristly receptacle; stamens 2-4 times as long as sepals; anthers oval: fr. glandular-bristly, red. B.M.3530(c). B.R. 1557(c). B.C.5:2968. G.C.34:71. Gn.34:230. M.G.32:65(h). (*Grossularia speciosa* Cov. & Brit.) Calif. Intr. 1828. Zone VII? One of the most showy gooseberries with its long pendulous bright red fls.

### 36. HAMAMELIDACEAE Lindl. WITCH-HAZEL FAMILY

Deciduous or evergreen shrubs or trees, often with stellate pubescence; buds scaly or naked; lvs. alternate, simple, stipulate, rarely estipulate: fls. usually rather small, in heads or racemes, unisexual or perfect, perigynous or epigynous; sepals 4-5, rarely 6 or 7; petals as many or wanting; stamens 4-5 or sometimes more; ovary 2-celled, with 1 or several pendulous ovules in each cell: fr. a woody 2-valved caps., with a separate inner layer of different texture; seeds often winged, albuminous, with straight embryo.—About 20 genera with 50 species chiefly in subtrop. and warm-temp. regions of both hemispheres.

- A. Lvs. palmately veined, deciduous: ovary-cells with several ovules; fls. in heads: buds with 5-6 outer scales, rather large.
- B. Lvs. entire, broad-ovate: fls. in 2-fld. heads, with linear-lanceolate petals...1. *Disanthus*
- BB. Lvs. palmately lobed: fls. in many-fld. heads, apetalous.....2. *Liquidambar*
- AA. Lvs. penninerved: ovary-cells 1-ovuled.
- B. Petals wanting or minute.
- C. Lvs. deciduous, crenate-dentate.
- D. Fls. in heads or dense upright spikes; stamens usually more than 3; calyx-tube shorter than ovary.
- E. Stamens 5-7, pendulous, with linear-oblong anthers.....4. *Parrotia*
- EE. Stamens 10-24, with upright filaments; anthers oval.
- F. Filaments slender; infl. capitate, with large white bracts at the base.
- 5. *Parrotiopsis*
- FF. Filaments thickened toward the apex; infl. more or less elongated, without bracts .....6. *Fothergilla*
- DD. Fls. in long and slender racemes; stamens 5; calyx-tube urn-shaped, longer than ovary .....10. *Sinowilsonia*
- CC. Lvs. evergreen.
- D. Fls. in slender racemes; stamens 2-8; calyx-tube obsolete.....3. *Distylium*
- DD. Fls. in heads or short racemes; stamens 8-10; pistillate fls. with ureolate calyx.
- 9. *Sycopsis*
- BB. Petals conspicuous, longer than the sepals.
- C. Fls. in racemes, 5-merous.
- D. Petals broad: lvs. sinuate-dentate, with straight veins, each ending in a mucronate tooth .....7. *Corylopsis*
- DD. Petals subulate, minute; filaments very short: lvs. unequally denticulate, with much branched veins.....8. *Fortunearia*
- CC. Fls. in clusters, 4-merous; petals linear: lvs. wavy-toothed.....11. *Hamamelis*

1. **DISANTHUS** Maxim. Deciduous shrub; glabrous except the pubescent calyx; buds ovoid, acute, with 5-6 outer scales: lvs. long-petioled, palmately 5-7-nerved, entire, with small caducous stipules: fls. perfect, in axillary, short-peduncled pairs, connate back to back; calyx 5-parted; petals 5, linear-lanceolate, spreading; stamens 5, shorter than sepals; ovary superior, with 2 short styles; caps. obovoid, 2-lobed at apex, with several black

glossy seeds in each cell. (Greek *dis*, twice, and *anthos*, flower, referring to the two-flowered heads.) One species in Japan.

**D. cercidifolius** Maxim. Shrub to 5 m., with slender lenticellate brs.: lvs. orbicular-ovate, cordate to subcordate, obtuse or acutish, 5-12 cm. broad and usually less long, dull bluish green above, paler beneath, leathery at maturity: fls. dark purple, 1.5 cm. across; calyx pubescent, with short recurved lobes; caps. 1.5 cm. across; seeds about 5 mm. long, angular, very oblique at base. Fl.x; fr. the following Oct. B.M.8716(c). R.H.1910:363, t.(c). G.F.6:215. B.C.2:1021. M.D.1900:1,t(hc). S.L.164(h). Mts. of C. Japan. Intr. 1892. Zone VI or VII. A handsome shrub with cercis-like foliage turning in autumn to crimson-red suffused with orange.

2. **LIQUIDÁMBAR L.** Deciduous trees; buds ovoid, with 5 or 6 outer scales: lvs. slender-petioled, palmately 3-7-lobed, serrate, with small stipules: fls. apetalous, usually monoecious, in globose heads; staminate fls. without perianth, intermixed with small scales, in small heads forming a terminal raceme; pistillate fls. in slender-peduncled globose heads consisting of more or less cohering 2-beaked ovaries subtended by minute scales: fruiting head globose, spiny from the persisting styles, consisting of dehiscent capsules with 1 or 2 winged seeds. (Latin *liquidus*, fluid, and Arabic *ambar*, amber; referring to the fragrant resin exuding from the bark of *L. orientalis*.) Four species in N. and C. Am. and W. and E. Asia.

AA. Lvs. usually 3-lobed: fr.-head with slender-beaked caps. surrounded by subulate bristles.

2. *L. formosana*

1. *L. Styraciflua* L. SWEET-GUM (BILSTED). Tree to 45 m.; bark deeply furrowed; brs. red-brown, often developing corky ridges or thick wings; lvs. cordate or subcordate, 10-18 cm. wide and about as long, 5-7-lobed with usually oblong-triangular acuminate, finely serrate lobes, dark green and lustrous above, paler beneath and glabrous except axillary tufts in the axils of the principal veins; petioles 6-12 cm. long: fr.-heads about 3 cm. across, consisting of lustrous brown capsules surrounded at base by short obtusish scales. Fl.v; fr.x, persisting during the winter. S.S.5:t.199. Am. For. 21:783 (h);22:641(b). F.E.18:90(h). Gn.24:166(h),167. Conn. and s. N. Y. to Fla., Ill., Mo. and Mex. Intr. 1681. Zone IV. Symmetrical tree with stout brs.; its maple-like lvs. turn deep crimson in fall; in winter the tree is conspicuous by its usually corky brs. and the pendulous frs.—*L. S. rotundiloba* Rehd., f. Lvs. with 3-5 short rounded lobes. J.A.12:71. Intr. 1930.—*L. S. pendula* Rehd., f. With deflexed pendulous brs. forming an almost columnar head. Intr. 1938.

Related species: *L. orientalis* Mill. Tree to 20 m.; lvs. truncate, 4-5 cm. broad, usually with 5 ovate-oblong lobulate and obscurely toothed lobes, quite glabrous: fr. heads about 2.5 cm. across, beaks of caps. slender. H.I.11:1019. F.R.3:87. (*L. imberbe* Ait.) W. Asia. Cult. 1750. Zone VI. Of slow growth.

2. *L. formosana* Hance. Tree to 40 m.; young brts. pubescent or glabrous; lvs. cordate to truncate, 8-15 cm. wide, 3-lobed, with broad-ovate acuminate to slender-acuminate serrate lobes, glabrous or pubescent on the veins beneath or sometimes, particularly on young plants, pubescent on the whole under surface: fr.-heads about 3 cm. across, puberulous, of bristly appearance owing to the slender persisting styles and the subulate scales surrounding the capsules. H.I.11:t.1020. C.C.143. (*L. acerifolia* Maxim., *L. Maximowicziana* Miq.) W. to E. China and Formosa. Intr. 1884. Zone VII? Pyramidal tree, similar to the *L. styraciflua*, but the brs. without corky bark.

—*L. f. monticola* Rehd. & Wils., var. Lvs. always glabrous, usually truncate or rounded, cordate only in young seedling plants. Intr. 1907. Zone VI.

3. *DISTYLIIUM* Sieb. & Zucc. Evergreen trees or shrubs; buds ovoid, pubescent, with 2 outer scales: lvs. short-petioled, entire or dentate, penninerved, with deciduous stipules: fls. polygamous or dioecious, apetalous, subtended by small bracts, in axillary racemes; sepals 1-5 or wanting; stamens 2-8, almost spoon-shaped, with short filaments and flat anthers convex outside; pistillate fls. with a superior stellate-tomentose ovary and with several stamens or without; styles 2, slender, stigmatic on the inside: caps. with 1 seed in each cell. (Greek *dis*, two, and *stylos*, style; referring to the two conspicuous styles.) Six species in Japan, China and Himal.

*D. racemösum* Sieb. & Zucc. Tree to 25 m., in cult. usually shrubby; brts. glabrous: lvs. elliptic to elliptic-oblong, sometimes obovate, acute or obtusish, narrowed at the base, 3-7 cm. long, glabrous: racemes stellate-pubescent, 1.5-4, in fr. to 8 cm. long; anthers red: caps. ellipsoid, 2-pointed, about 1 cm. long. Fl.iii-iv; fr.viii-x. S.Z.1:t.94(c). S.I.2:t.25(c). B.M.9501(c). S.L.164 (h). Japan. Cult. 1870. Zone VII?

4. *PARRÓTIA* C. A. Mey. Deciduous small tree with stellate pubescence; buds stalked, with 2 outer scales, brown-tomentulose: lvs. short-petioled, sinuate-dentate, with large lanceolate caducous stipules: fls. perfect, apetalous, in dense heads surrounded by large bracts; sepals 5-7, rather large, oval, inclosing the pubescent ovary about  $\frac{1}{2}$ ; stamens 5-7, opposite the sepals; anthers linear-oblong, opening with a slit, pendulous on slender filaments; styles slender, acute, with linear stigma: caps. ovoid, with the calyx-margin near the base; seeds oblong, shining, one in each cell. (After F. W. Parrot, a German naturalist and traveler, later professor of medicine in Dorpat; 1792-1841.) One species in Persia.

*P. persica* C. A. Mey. Small tree to 5 m. with smooth flaky bark; older brts. red-brown: lvs. oval to obovate-oblong, obtuse, rounded to subcordate at base, 6-10 cm. long, coarsely crenate-dentate above the middle, stellate-pubescent on both sides; petioles 2-6 mm. long: fls. before the lvs.; the heads with the brown-tomentose bracts about 1.5 cm. across: fr. broad-ovoid, about 1 cm. long, 2-lobed at the apex, with recurved beaks. Fl.iii-iv. B.M.5744(c). Gs.3:237,t(c). S.L.246(h). M.O.t.21. Cult. 1840. Zone V. In cult. usually a shrubby tree with spreading brs.; lvs. similar to those of the Witch-Hazel, turning scarlet, orange and yellow in fall; the dull-colored fls. are insignificant.

5. *PARROTIÓPSIS* Schneid. Deciduous tree, with stellate pubescence; buds stalked, with 2 exposed scales, thinly tomentose: lvs. petioled, dentate with acute teeth; stipules oval: fls. perfect, apetalous, in many-fld. heads surrounded by large bracts; sepals 5-7, small; stamens about 15; anthers oval, yellow, opening with 2 valves, on upright slender filaments; styles slender, free, with linear stigmas: capsule ovoid, with spreading beaks, the calyx-margin below the middle. (Parrotia and Greek *opsis*, appearance; referring to its resemblance to that genus.) One species in the Himal.

*P. Jacquemontiana* (Decne.) Rehd. Small tree to 7 m., with smooth gray bark; brts. yellowish gray, tomentulose at first: lvs. suborbicular, 5-8 cm. long, dentate with short acute or acutish teeth, light green beneath, sparingly stellate-pubescent above while young, more densely so on the veins beneath; petioles 6-12 mm. long, densely stellate-tomentose; fl.-heads with the spreading white bracts 3-5 cm. across; bracts dotted with purplish brown scurfy

tomentum on the back; stamens about 5 mm. long. Fl.v. B.M.7501(c). B.S. 2:123 (*P. involucrata* Schneid., *Parrotia* J. Decne.) Intr. 1879. Zone V. Similar to *Parrotia*, but lvs. resembling *Alnus glutinosa* in shape and serration, changing to yellow in fall; fls. appearing with the lvs., conspicuous on account of the large white bracts.

6. **FOTHERGILLA** L. Deciduous shrubs; buds with 2 exposed scales densely stellate-pubescent, caducous: lvs. petioled, coarsely toothed, stipulate: fls. perfect, apetalous, in terminal heads or spikes, not subtended by bracts; calyx 5-7-lobed; stamens about 24, the filaments white, thickened toward the apex; anthers oval, yellow: caps. ovoid, with the calyx-margin about the middle, tomentose and setose, with stout upright or spreading beaks; seeds 1 in each cell, oblong and lustrous brown. (After John Fothergill, eminent English physician who introduced and cultivated many new plants; 1712-1780.) Four species in s. e. N. Am.

- A. Lvs. rarely exceeding 2-5 cm., stellate-pubescent above; low shrub.....1. *F. Gárdeni*  
 AA. Lvs. 5-12 cm. long, glabrous or glabrescent above; upright shrubs.  
 B. Lvs. glaucous beneath and more or less stellate-pubescent.....2. *F. major*  
 BB. Lvs. green and sparingly pubescent beneath.....3. *F. monticola*

1. **F. Gárdeni** Murr. Low shrub to 1 m., with upright and spreading slender brs.: lvs. obovate to oblong, rounded or broad-cuneate, 2-5 cm. long, dentate above the middle, pale or glaucous and tomentose beneath; petioles 5-10 mm. long: fls. before the lvs.; spikes ovoid to oblong, 1.5-3 cm. long. Fl.IV-v; fr.VII-VIII. B.M.1341(c). L.B.16:1507(c). Gn.89:141(h). (*F. alnifolia* L., *F. carolina* Brit.) Va. to Ga. Intr. 1765. Zone V. Conspicuous in early spring with its numerous spikes of white flowers.

2. **F. major** (Sims) Lodd. Upright shrub to 3 m.; brts. stout, stellate-tomentulose: lvs. suborbicular to oval or obovate, cordate or truncate, 5-10 cm. long, coarsely crenate-dentate or sometimes denticulate above the middle, dark green and glabrous above, glaucous and stellate-pubescent beneath at least on the veins, leathery; petioles 5-10 mm. long, tomentose: fls. with the lvs.; spikes 2.5-5 cm. long, with densely brown-tomentose bracts; stamens 8-14 mm. long: fr. including the upright beaks 1 cm. long, light brown inside with red markings on the inner suture; seeds 7-8 mm. long. Fl.v; fr.IX. B.M.1342(c). L.B.16:1520(c). M.G.17:395(h). B.S.1:561(h). Gn.78:229;79:77(h);89:141(h). (*F. alnifolia* var. *m.* Sims.) Ga. Intr. 1780. Zone V. Ornamental shrub of pyramidal habit, conspicuous in spring with its numerous spikes of white fls.; the lvs. turn orange-yellow in fall.

3. **F. monticola** Ashe. Shrub to 2 m., with spreading brs.; lvs. broad-oval to obovate, usually cordate, remotely dentate, often from below the middle, light green and sparingly pubescent beneath, often only on the veins; petioles 8-15 mm. long: spikes 3-6 cm. long: fr. with finally spreading beaks, darker inside without red markings: otherwise much like the preceding species. B.C.3:1271. Gn.89:141(h). N. C. to Ala. Intr. 1899. Zone V. Similar to the preceding species, but of more spreading habit and with rather larger spikes.

7. **CORYLÓPSIS** Sieb. & Zucc. Deciduous shrubs with slender lenticellate brs., rarely small trees; buds with about 3 glabrous exposed scales, conspicuous: lvs. slender-petioled, strongly veined, dentate, stipulate: fls. perfect, yellow, sessile or nearly so, in nodding racemes appearing before the lvs., with large bracts at the base; calyx-lobes short, petals clawed, 5; stamens 5, alternating with short, entire or 2-3-parted staminodes; ovary half-superior, rarely superior; styles distinct, slender: caps. broadly obovoid, truncate at

apex, with two spreading and recurved beaks, 4-valved, with 2 oblong, lustrous black seeds. (*Corylus*, and Greek *opsis*, likeness; alluding to the hazel-like foliage.) About 12 species in E. Asia and Himal.—All species are ornamental shrubs with handsome generally ovate leaves of moderate size and with yellow fragrant flowers appearing in nodding racemes in early spring before the lvs.

- A. Young brts. and petioles pubescent: lvs. pubescent beneath, at least on the veins.
- B. Calyx and fr. glabrous.....1. *C. Wilsonii*
- BB. Calyx and fr. pubescent.
- C. Lvs. obovate to oblong-obovate: racemes 10-18-fld.; its bracts loosely silky outside.
- CC. Lvs. orbicular-ovate or orbicular-obovate: racemes 7-10-fld., its bracts glabrous outside.....2. *C. sinensis*
- AA. Young brts. glabrous or nearly so: lvs. usually glabrous.
- B. Calyx and floral bracts except the basal ones pubescent.....4. *C. Veitchiana*
- BB. Calyx and floral bracts on back glabrous.
- C. Racemes many-fld.
- D. Blade of petals broader than, or as broad as long, petals about 4 mm. long: lvs. generally obovate.
- E. Lvs. pubescent beneath, at least on the veins: nectaries deeply bifid.
- EE. Lvs. with scattered silky hairs when unfolding, soon quite glabrous: nectaries emarginate or truncate.....6. *C. platypetala*
- DD. Blade of petals longer than broad, petals about 8 mm. long: lvs. generally ovate.
- 7. *C. glabrescens*
- CC. Racemes 2-3-fld.; fls. about 1 cm. long.....8. *C. pauciflora*

1. *C. Wilsonii* Hemsl. Shrub or small tree; young brts. stellate-pubescent: lvs. ovate to oblong-ovate or oblong-ovate or elliptic, acuminate, cordate or subcordate, 6-12 cm. long, sinuately dentate with bristle-like teeth, glaucous and sparingly pubescent beneath, more densely on the veins; petioles densely pubescent, 1-2.5 cm. long: racemes 5-7 cm. long; all bracts densely silky-pubescent on both sides, ovate or broad-ovate, acutish or obtuse; petals narrow-spatulate, about 6 mm. long, slightly longer than stamens; staminodes truncate or slightly emarginate: fr. 1-1.2 cm. across, contracted into a stout stipe 3-5 mm. long; seed 1 cm. long. C. China. Intr. 1900. Zone (V).

2. *C. sinensis* Hemsl. Shrub to 5 m.; young brts. pubescent: lvs. obovate to oblong-obovate, short-acuminate, obliquely cordate or subcordate, 5-12 cm. long, sinuate-denticulate, grayish green and pubescent beneath, at least on the veins; petioles densely pubescent, 6-15 mm. long: fls. pale yellow, fragrant, in pendulous 10-18-fld. racemes 3-5 cm. long; petals orbicular-ovate, 7-8 mm. long, longer than style and stamens: fr. 7-8 mm. across, hairy. G.C.39:18. H.I.29:2820, f.17-20. C. and W. China. Intr. 1900. Zone (V).

3. *C. spicata* Sieb. & Zucc. Shrub to 2 m.: young brts. pubescent: lvs. orbicular-ovate or orbicular-obovate, abruptly short-acuminate, obliquely cordate to rounded, 5-10 cm. long, sinuate-denticulate with bristle-like teeth, glaucous and pubescent beneath; petioles densely pubescent, 1-2.5 cm. long: racemes 7-10-fld., 2-4 cm. long; rachis pubescent; fls. bright yellow, fragrant; petals obovate, about as long as stamens; anthers purple; staminodes 2-parted: fr. pubescent, 7-8 mm. across. S.Z.1:t.19(c). B.M.5458(c). F.S.20:t.2135(c). S.I.2:t.26(c). G.C.III.25:210. Japan. Intr. 1863. Zone (V).

Related species: *C. Griffithii* Hemsl. Lvs. larger: racemes to 6 cm. long; bracts small, pubescent on both sides, the basal ones glabrous outside; stamens and style much shorter than petals. B.M.6779(c). Himal. Intr. 1879 Zone VII?

4. *C. Veitchiana* Bean. Shrub to 2 m.; brts. glabrous: lvs. ovate or elliptic to oblong-obovate, short-acuminate, cordate or subcordate, 5-12 cm. long, sinuately dentate, sparingly silky and purplish beneath when young, glaucous and glabrous at maturity; petioles glabrous, 6-15 mm. long: fls. primrose-

yellow, fragrant, in many-fl. racemes 2.5–5 cm. long; basal bracts glabrous, the floral ones silky-pubescent outside; stamens as long or slightly longer than the oval or ovate petals; anthers red-brown; calyx hairy, with rounded lobes; staminodes 2-parted: fr. about 8 mm. across. B.M.8349(c): Gn.76:184. B.S.1:398. M.G.31:405(h). C. China. Intr. 1900. Zone (V).

5. *C. Willmóttiae* Rehd. & Wils. Shrub to 4 m.: brts. glabrous: lvs. oval or obovate, sometimes ovate, short-acuminate, subcordate to truncate, 3–8 cm. long, sinuate-dentate with mucronate teeth, pale green or glaucescent beneath, pubescent at least on the veins with long hairs or rarely villous, sometimes nearly glabrous at maturity; petioles 6–20 mm. long, glabrous or slightly pubescent; fls. soft-yellow, fragrant, in dense many-fl. racemes 5–7 cm. long; rachis villous; petals 3–4 mm. long, with short claw and suborbicular or reniform blade; stamens much shorter than petals, about as long as styles; staminodes 2-parted, shorter than sepals: caps. about 7 mm. across. B.M.8708(c). G.M.55:191. M.G.31:406(h). W. China. Intr. 1908. Zone VI.

6. *C. platypétala* Rehd. & Wils. Shrub to 3.5 m.; brts. glabrous, but stipitate-glandular: lvs. ovate or broad-ovate to elliptic, short-acuminate, cordate or subcordate, 5–10 cm. long, sinuate-dentate with bristle-like teeth, glaucescent beneath; petioles 1–2.5 cm. long, sparingly stipitate-glandular: fls. light yellow, fragrant, in many-fl. racemes with the stalk 3.5–5 cm. long; rachis slightly pubescent or nearly glabrous; petals about 3–4 mm. long, with short claw and reniform or suborbicular blade, staminodes truncate or emarginate, shorter than sepals; stamens shorter than petals, longer than styles: caps. 7–9 mm. long. C. China. Intr. 1907. Zone VI.—*C. p. levis* Rehd. & Wils., var. Young brts. and petioles without stipitate glands. W. China. G.C.95:276. Intr. 1908.

Related species: *C. yunnanensis* Diels. Lvs. slightly pubescent beneath: floral bracts slightly silky on back; petals 6–7 mm. long, with obovate blade; stamens slightly shorter than petals; calyx-lobes ciliate, pubescent outside. S. W. China. Cult. 1910. Zone VII?

7. *C. glabrescens* Franch. & Sav. Shrub to 6 m.; young brts. glabrous: lvs. ovate, acuminate, cordate to subcordate, 3–8 cm. long, sinuate-dentate with bristle-like teeth, glaucescent beneath and sparingly silky on the veins or sometimes slightly pubescent while young, thin; petioles slender, 1.5–3 cm. long: fls. pale yellow, fragrant, in pendulous racemes 2–3.5 cm. long; rachis glabrous; petals 8 mm. long, with obovate blade, slightly longer than style and stamens; staminodes deeply bifid, about as long as sepals: caps. about 7 mm. across. (*C. Gotoana* Mak.) Japan. Intr. 1905. Zone V. The hardiest species.

8. *C. pauciflora* Sieb. & Zucc. Spreading shrub to 2 m.: young brts. glabrous: lvs. ovate or broad-ovate, acute, obliquely cordate to subcordate, 3–7 cm. long, sinuate-dentate with bristle-like teeth, glaucescent beneath and sparingly pubescent on the veins; petioles 5–15 mm. long, glabrous: fls. primrose yellow, about 1 cm. long, 2 or 3 in short spikes; bracts glabrous outside, greenish yellow; petals oblong-obovate, longer than stamens. B.M.7736(c). S.Z.1:t.20(c). S.I.2:t.26(c). B.S.1:397. G.F.5:342(h). G.W.15:101(h). Japan. Intr. 1862 to Am. Zone VI.

8. **FORTUNEARIA** Rehd. & Wils. Deciduous shrub; buds naked, densely stellate-tomentulose: lvs. short-petioled, dentate, with small caducous stipules: fls. andro-monoecious, short-stalked, in terminal racemes appearing with the lvs.; racemes of bisexual fls. usually with 1–3 lvs. at base;

calyx turbinate, 5-lobed; petals 5, subulate, slightly shorter than calyx-lobes; stamens 5, with very short filaments; ovary partly superior; styles 2, filiform, revolute; staminate racemes short, catkin-like, developing in autumn, naked during winter, without lvs. at base; fls. with rudimentary pistil: fr. a 2-valved caps. with 2 glossy dark brown seeds; embryo with large cotyledons, revolute at the margin. (Dedicated to Robert Fortune, who traveled in China during 1843-62 and introduced many new plants; 1812-80.) One species in China.

*F. sinéensis* Rehd. & Wils. Shrub to 7 m.; brts. and petioles densely stellate-tomentulose: lvs. obovate to obovate-oblong, short-acuminate, narrowed toward the rounded or truncate base, 7-15 cm. long, unequally sinuate-denticulate with small mucronulate teeth, glabrous above, pubescent on the veins beneath; petioles 3-8 mm. long; fls. about 4 mm. across, in stellate-pubescent racemes, those of perfect fls. 3-6 cm. long; pedicels 1-3 mm. long; style longer than the stamens, revolute: caps. 1-1.2 cm. across, brown, with pale lenticels; seeds about 1 cm. long. Fl.v; fr.x-xi. I.S.1:t.25. C. China. Intr. 1907. Zone (V). Shrub with rather large lvs. and inconspicuous fls.

9. *SYCOPSIS* Oliv. Evergreen trees or shrubs; buds naked, densely stellate-tomentulose: lvs. short-petioled, entire or sparingly denticulate, penninerved, with narrow caducous stipules: fls. monoecious, apetalous, small, terminal or axillary in heads or short racemes surrounded by pubescent bracts; staminate fls. with minute sepals, 8-10 stamens on slender filaments and with rudimentary ovary; pistillate fls. with urceolate, 5-lobed, stellate-pubescent calyx enclosing the superior ovary; styles distinct, slender, with decurrent linear stigmas: caps. with the irregularly splitting calyx at the base, 2-valved, with 2 brown lustrous seeds. (Greek *sykos*, fig, and *opsis*, likeness; referring to the resemblance of the shrubs to certain species of *Ficus*.) Six species in China, Himal. and in the Philippine Isls.

*S. sinéensis* Oliv. Shrub or small tree to 7 m.: lvs. elliptic-ovate to elliptic-lanceolate, acuminate, broad-cuneate, 5-10 cm. long, remotely denticulate, above the middle or entire, lustrous and glabrous above, pale green and glabrous beneath or with scattered scale-like hairs; petioles 5-10 mm. long; fls. in rather small, short-peduncled heads, surrounded by brown-tomentose bracts; stamens 10, about 1.5 cm. long; anthers oblong, red; caps. ovoid, 3-5 together, with the short beak about 1 cm. long, covered with light brown tomentum mixed with setose hairs. Fl.ii-iii. H.I.20:1931;29:2834,f.1-3. BS.2:562. G.C.72:91. C. and W. China. Intr. 1907. Zone VII.

10. *SINOWILSONIA* Hemsl. Deciduous tree with stellate pubescence; buds naked, stalked, stellate-tomentulose: lvs. short-petioled, denticulate, penninerved; stipules caducous, lanceolate: fls. monoecious, apetalous, in pendulous racemes; staminate racemes catkin-like, from leafless buds; pedicels short; stamens 5, with short filaments adnate to the base of the linear-spatulate sepals disposed in an irregular whorl; ovary wanting; pistillate racemes terminal on short leafy brts.; fls. sessile; calyx-tube urceolate, pubescent, enclosing the ovary; sepals 5, spatulate, spreading; staminodes 5, with rudimentary anthers, opposite the sepals; styles free, exserted: caps. broad-ovoid, setose-strigose, enclosed partly by the calyx-tube; seeds elliptic-oblong, black. (After E. H. Wilson who traveled in China between 1900 and 1910 and introduced many new plants into cult.; 1876-1930.) One species in China.

*S. Hénryi* Hemsl. Tree to 8 m.; brts. stellate-pubescent: lvs. broad-ovate to elliptic, acute or short-acuminate, subcordate to truncate, 10-15 cm. long,

denticulate, with fascicled hairs on both sides while young, later glabrous or nearly so above, pubescent beneath chiefly on the veins; petiole about 1 cm. long, densely pubescent: staminate catkins 4-6 cm. long; pistillate racemes 1.5-3, in fr. to 15 cm. long; calyx-tube yellowish tomentulose, about 1.5 mm. long, little longer than ovary, later much elongated; sepals 2 mm. long: caps. about 1 cm. long, with short weak beak. Fl.v; fr.x. H.I.29:2817. C. and W. China. Intr. 1908. Zone V. Interesting shrub with large linden-like lvs., but fls. inconspicuous.

**11. HAMAMELIS L. WITCH-HAZEL.** Deciduous shrubs or small trees with stellate pubescence; buds naked, stalked: lvs. short-petioled, oblique at base, sinuate-dentate, with caducous, rather large stipules: fls. perfect, in short-peduncled, axillary few-fl. clusters; calyx 4-parted, with spreading ovate obtuse lobes, tomentose outside; petals 4, linear, crumpled in bud, yellow; stamens 4, with short filaments, alternating with scale-like staminodes; styles distinct, short: caps. 2-valved with the calyx-limb about or below the middle; seeds 2, lustrous black, oblong. (Ancient Greek name of a pear-shaped fr., probably the medlar.) Six species in N. Am. and E. Asia.—Ornamental shrubs interesting on account of the unusual time of flowering, from late autumn to early spring.

- A. Lvs. soon glabrous or glabrate, rarely pubescent below, subcordate to truncate.
- B. Fls. in autumn; lvs. bright green beneath.....1. *H. virginiana*
- BB. Fls. during the winter or in early spring.
- C. Lvs. generally obovate with about 5 pairs of veins, often glaucescent beneath and sometimes tomentulose: petals 1-1.5 cm. long.....2. *H. vernalis*
- CC. Lvs. generally broad-ovate, with about 7 pairs of veins: petals about 2 cm. long.....3. *H. japonica*
- AA. Lvs. densely soft-pubescent, cordate at base.....4. *H. mollis*

**1. *H. virginiana* L.** Shrub or small tree to 5 m.; lvs. obovate or elliptic, obtusely short-acuminate or obtusish, narrowed toward the base and subcordate, rarely broad-cuneate, 8-15 cm. long, coarsely crenate-dentate, nearly glabrous or pubescent on the veins beneath, with 5-7 pairs of veins; petioles 5-15 mm. long, pubescent: petals bright yellow, 1.5-2 cm. long; sepals dull brownish yellow inside: fr. broad-obovoid, 1.2-1.4 cm. long, with the calyx-limb slightly below the middle. Fl.ix-x; fr. the following autumn. Em.t.472 (c). B.M.6684(c). S.S.5:t.198. Gn.33:589;39:547;78:45. Can. to Ga., w. to Neb. and Ark. Intr. 1736. Zone IV. Spreading shrub with rather large lvs. turning bright yellow in fall, opening its fls. exhaling a heavy odor when the lvs. are falling.—*H. v. rubescens* Rehd., f. Petals reddish; sepals yellowish or brownish green inside.

Closely related species: *H. macrophylla* Pursh. Lvs. smaller, with fewer, shallower and more rounded lobes, less unsymmetrical at base, more or less pubescent and roughened by persistent tubercles: sepals yellow inside; petals pale yellow. Fl.xii-ii. S.M.370. S. C. to Fla., Ark. and Tex. Intr. 1928. Zone VI.

**2. *H. vernalis* Sarg.** Upright shrub to 2 m. or rarely more, suckering; lvs. obovate to oblong-obovate, obtusely pointed, narrowed toward the broad-cuneate or truncate, rarely subcordate base, 6-12 cm. long, coarsely sinuate-dentate above the middle, green or glaucescent beneath, glabrous or nearly so, with 4-6 pairs of veins; petioles 5-12 mm. long, pubescent: fls. fragrant; petals 1-1.5 cm. long, light yellow, often reddish toward the base; sepals dark red inside: fr. like that of the preceding species. Fl.xii-iii; fr.ix-x. B.M.8573(c). Add.8:t.261(c). S.T.2:t.156. R.H.1913:131. F.E.88,2:23(h). Mo. to La. and Okl. Intr. 1908. Zone V. Fls. less showy than those of the following species, but fragrant. —*H. v. tomentella* Rehd., f. Lvs. glaucescent

and more or less densely pubescent or tomentulose beneath: petals yellow or reddish.—*H. v. carnea* Rehd., f. Petals red.

3. *H. japonica* Sieb. & Zucc. Shrub or small tree to 10 m., with spreading brs.: lvs. suborbicular to broad-ovate or elliptic, rarely obovate, acute or rounded at apex, rounded or subcordate, rarely broad-cuneate at base, 5–10 cm. long, light green and glabrous or slightly pubescent beneath, with usually 6–7 pairs of veins; petioles 5–15 mm. long, slightly pubescent: petals about 2 cm. long, bright yellow, sepals usually purple inside, with revolute lobes: caps. with the calyx-limb much below the middle. Fl.I–III; fr.IX–X. S.I.2:t.25(c). Gt.49:t.1481(c). G.F.4:257. B.C.3:1431. Gn.87:661. Japan. Intr. 1862. Zone V. Conspicuous in winter, the delicate petals withstand zero weather without injury; the lvs. turn bright orange-yellow late in fall.—*H. j. arborea* (Ottolander) Gumbleton, var. Of tree-like habit, more vigorous: lvs. somewhat larger and of firmer texture; calyx deep purple inside, stamens purple; petals golden-yellow. B.M.6659(c). R.H.1891:472,t.(c). G.C. II.1:187; III.9:247. Gn.39:546,t.(c); 87:660. Intr. 1862.—*H. j. Zuccariniæ* (Ottolander) Gumbleton, var. Tree-like, but brs. more upright; petals pale yellow and the calyx greenish yellow inside. Gn.17:251. R.B.28:62,t. Cult. 1882.—*H. j. flavo-purpurascens* (Mak.) Rehd., var. Petals red or reddish, at least toward the base; sepals deep purple inside. (*H. obtusata* var. *f.* Mak., *H. incarnata* Mak.) Japan. Intr. 1919.

4. *H. mollis* Oliv. Shrub or small tree to 10 m.; young brts. densely tomentose: lvs. orbicular-obovate to obovate, short-acuminate, obliquely cordate to subcordate at base, 8–16 cm. long, sinuately denticulate, pubescent above, grayish tomentose beneath; petioles stout, 5–10 mm. long, densely pubescent; calyx ferrugineously tomentose outside, purplish red inside; petals golden yellow, reddish at the base, 1.5–2 cm. long: caps. enclosed  $\frac{1}{2}$  by the calyx. Fl.I–III; fr.X. B.M.7884(c). Add.7:t.229(c). G.C.52:488; 102:171,t.(c). H.I.1742. Gn.90:3(h),94. C. China. Intr. 1879. Zone V. The handsomest of the Witch-Hazels; lvs. turning bright yellow late in fall.

### 37. EUCOMMIACEAE Van Tiegh. EUCOMMIA FAMILY

Deciduous trees: brs. with lamellate pith; buds ovoid, pointed, with about 6 exposed scales: lvs. alternate, petioled, serrate, estipulate: fls. dioecious, without perianth, in the axils of bracts at the base of the young brts., before or with the lvs.; staminate fls. pediceled, with 4–10 linear mucronate anthers on very short filaments; pistillate fls. short-pediceled consisting of a 1-celled ovary composed of 2 carpels with one locule aborted, bifid at apex with the lobes stigmatic on the inner side: fr. a stipitate, oblong, compressed and winged 1-seeded nutlet; seed albuminous with a straight embryo as long as the albumen; cotyledons narrow, flat.—Contains only the following monotypic genus.

**EUCOMMIA** Oliv. Characters of the family. (Greek *eu*, well, and *kommi*, gum; referring to the fact that the plant contains rubber.)

*E. ulmoides* Oliv. Tree to 20 m.; brts. glabrous, light or yellowish brown, lenticellate: lvs. elliptic or ovate to oblong-ovate, acuminate, broad-cuneate or rounded, 7–8 cm. long, serrate, glabrous above and slightly rugose at maturity, pubescent beneath chiefly on the veins while young; petioles 1.5–2.5 cm. long, anthers about 1 cm. long, brownish red: fr. oblong, 3–4 cm. long. Fl.IV; fr.IX–X. H.I.1950,2361. K.B.1904:4,t. I.S.1:t.26. R.H.1909:226,227(h).

M.G.27:11,613(h);32:249(h). C. China. Intr. 1896. Zone V. Tree with ascending brs., resembling an elm-tree; interesting as the only rubber-producing tree hardy so far north, though the rubber is not present in sufficient quantity to make commercial exploitation pay.

### 38. PLATANACEAE Lindl. PLANE-TREE FAMILY

Deciduous trees with stellate pubescence; bark pale, exfoliating in broad thin plates; buds ovoid, acutish, with a single closed scale, at first hidden by the base of the petiole, the terminal one lacking: lvs. alternate, long-petioled, large, palmately veined and lobed; stipules usually sheathing with spreading margin; fls. monoecious, in dense globose heads; staminate and pistillate similar, but on separate peduncles; sepals 3-8, triangular, pubescent, petals as many, spatulate; staminate fls. with 3-8 stamens with very short filaments, connective enlarged at apex into a peltate scale; pistillate with 3-8 distinct carpels with elongated styles stigmatic on the inner side; ovary oblong, with 1 or 2 pendulous ovules: fr. a syncarp consisting of numerous narrowly obconical angled 1-seeded nutlets surrounded by long hairs; seed with scant albumen; embryo slender, with linear often unequal cotyledons.—One genus with 6-7 species in N. Am. s. to Mex. and from S. E. Eu. to India.

**PLÁTANUS** L. PLANE-TREE. Characters of the family. (Ancient Greek name, probably from *platys*, broad.)—The Plane-trees are ornamental trees with handsome large lvs., much planted as shade and street trees, particularly in cities, as they do not suffer much from dust and smoke and stand even severe pruning well.

A. Fr.-heads racemose 3 or more, bristly: lvs. usually deeply lobed.....1. *P. orientalis*  
 AA. Fr.-heads 1 or 2, rarely 3 or more.

B. Fr.-heads 2 or occasionally more: lvs. with the middle lobe about as long as broad.  
 2. *P. acerifolia*  
 BB. Fr.-heads usually solitary: lvs. with the lobes broader than long.....3. *P. occidentalis*

1. *P. orientalis* L. ORIENTAL P. Tree to 30 m., with usually broad round head and comparatively short and thick trunks; bark exfoliating in large flakes, dull grayish or greenish white: lvs. broad-cuneate or truncate at base, 10-20 cm. wide, deeply 5-7-lobed, the sinuses reaching to or below the middle of the leaf, lobes longer than broad, coarsely toothed or entire, glabrous or nearly so at maturity; petioles 3-8 cm. long: fr.-heads 2-6, on long pendulous stalks, 2-2.5 cm. thick, bristly and with exserted hairs between the nutlets, their apex conical, with persistent style. Fl.v; fr.x-x. S.O.3:t.128(c). Gn. 20:369. G.C.III.23:25,27(h). G.F.4:91(h). M.D.1915:3,t(h). H.E.3,t.174-176(h). (*P. vulgaris* Spach.—SYCAMORE.) S. E. Eu. and W. Asia. Zone VI. Tree with broad round head and short trunk often divided near the base into several stems, planted as a shade tree since ancient times in W. Asia and S. E. Eu.—*P. o. digitata* (Gord.) Janko, var. Lvs. cuneate to truncate, deeply 5-lobed, with wide sinuses and narrow elongated coarsely dentate or lobulate lobes. Gn.20:371. G.C.76:250. (*P. digitata* Gord., *P. o. laciniata* Hort., *P. nepalensis* Hort.) Intr. about 1842.—*P. o. cuneata* (Willd.) Loud., var. Smaller tree, sometimes shrubby: lvs. short-petioled, cuneate, or sometimes truncate, 3- or sometimes 5-lobed with ascending toothed lobes. G.C.29:363. Gn.20:371. (*P. c.* Willd.) This and the preceding var. are according to A. Henry possibly of hybrid origin.

Related species: *P. racemosa* Nutt. Tree to 40 m.: lvs. deeply 3-5-lobed with narrow, entire or remotely dentate lobes, tomentose beneath: fr.-heads 2-7, sessile, bristly; achenes with conical or rounded apex. S.S.7:t.328. (*P. cali-*

*fornica* Benth.) S. Calif. and L. Calif. Cult. 1870. Zone VII?—*P. Wrightii* Wats. Tree to 25 m.; lvs. deeply 3-5-lobed, tomentose, finally often nearly glabrous beneath, with lanceolate, entire or remotely dentate lobes; fr.-heads 2-4, usually stalked, mostly smooth, the achenes truncate or rounded with a more or less deciduous style. S.S.7:t.329. Ariz. and N. Mex. to n. Mex. Cult. 1900. Zone VII?

2. *P. acerifolia* (Ait.) Willd. LONDON *P. (P. occidentalis* × *orientalis*). Tree to 35 m., with tall upright stem and widespreading brs., the lower ones drooping; bark exfoliating in large flakes; young growth densely brownish tomentose; lvs. truncate to cordate, 12-25 cm. wide, 3-5-lobed, with triangular-ovate or broad-triangular not or sparingly toothed lobes, with acute or rounded sinuses extending to about  $\frac{1}{2}$  the length of the blade, glabrous or nearly so at maturity; petiole 3-10 cm. long; fr.-heads usually 2, rarely 1 or 3, about 2.5 cm. across, bristly; nutlet ovoid or rounded at apex and crowned by the persistent remnant of the style. G.C.66:48. E.H.3:t.204,f.1. Proc. Irish Acad. 35B:t.6. F.E.24:69(h). (*P. orientalis* var. *a.* Ait., *P. intermedia* Hort., *P. damascena* Dode, *P. densicoma* Dode, partly.) Origin unknown, probably before 1700. Zone V. Much planted as a street tree in Eu. and in this country: tall tree with straight trunk and broad round head. Like the other species it is conspicuous in winter on account of the large fruit-balls hanging from the brs. and of the light colored smooth bark mottled by darker blotches of old bark.—*P. a. Kelseyana* (Jaenicke) Schneid., f. Lvs. variegated with yellow. (*P. a. aureo-variegata* Hort.)—*P. a. Suttneri* (Jaenicke) Schneid., f. Lvs. blotched with creamy white. (*P. occidentalis argenteo-variegata* Hort.)—*P. a. pyramidalis* (Janko) Schneid., f. Habit more upright, lower brs. not drooping; lvs. usually 3-lobed with slightly toothed lobes, often longer than broad, usually rounded at base. G.C.66:51.—*P. a. hispânica* (Muenchh.) Bean, var. Lvs. usually 5-lobed with toothed lobes, often to 30 cm. wide, truncate to subcordate. G.C.66:50.—To *P. acerifolia* also belong: *P. cantabrigiensis* Henry. Lvs. rather small, 5-lobed, truncate with cuneate centre: fr.-heads usually similar to those of *P. orientalis*. G.C.76:251.—*P. parviloba* Henry. Lvs. truncate to cuneate, with 3 triangular to oblong-triangular entire lobes and near base with 1-3 pairs of teeth or small lobes: fr.-heads 3-6.

3. *P. occidentalis* L. BUTTONWOOD (BUTTONBALL, AMERICAN PLANE). Tree to 40 or occasionally to 50 m., with tall trunk and round or ovoid head; bark almost creamy white, exfoliating in rather small plates, dark brown and fissured at the base of older trunks: lvs. truncate or cordate, rarely cuneate, 10-22 cm. wide, often broader than long, 3- or sometimes 5-lobed with shallow sinuses and broad-triangular lobes, broader than long, coarsely toothed or rarely entire, floccose-tomentulose when young, at maturity pubescent only along the veins beneath: fr.-heads solitary, rarely 2, about 3 cm. across, rather smooth at maturity; nutlets with truncate or obtuse apex with a short style, without exerted hairs between the nutlets. Fl.v; fr.ix-x. S.S.7:t.326,327. Em.1:261,263,t. G.F.2:354,355(h);9:55(h). F.L.19:9,t(h). Am. For. 28:145 (h). Maine to Ont. and Minn., s. to Fla. and Tex. Intr. 1640. Zone IV. The most massive and perhaps the tallest deciduous tree of N. Am., often planted as shade and avenue tree, but not thriving well in Eu.—*P. o. glabrata* (Fern.) Sarg., var. Lvs. usually smaller and of firmer texture, mostly truncate at base, more deeply lobed, the sinuses extending to about  $\frac{1}{2}$  of the blade, the lobes long-acuminate and often entire, or coarsely and sparingly dentate. (*P. g. Fern.*, *P. densicoma* Dode, partly.) Iowa to Tex. and n. Mex. Intr. ?

### 39. ROSACEAE Juss. ROSE FAMILY

Herbs, shrubs or trees, deciduous or evergreen, often thorny; buds usually with several exposed scales, sometimes with 2: lvs. alternate, rarely opposite; stipules usually conspicuous, rarely wanting: fls. perfect, rarely unisexual, usually regular, perigynous, the axis enlarged into a flat to urceolate or sometimes conical receptacle bearing the sepals, petals and stamens on its margin, inside usually lined with a glandular disk; sepals 4-5, imbricate; petals as many, imbricate, sometimes wanting; stamens 5-many; carpels 1-many, distinct or more or less united and often connate with the receptacle; carpels with 1-several upright or pendulous ovules; styles as many as carpels, sometimes connate: fr. a follicle, achene, drupe, hip or pome; seeds usually exalbuminous; cotyledons often fleshy with convex back, rarely folded or convolute.—About 100 genera with more than 2000 species widely distributed in all parts of the world, most abundant in the temperate regions.

Several families, as Spiraeaceae, Pomaceae (Malaceae) and Amygdalaceae (Drupaceae), chiefly distinguished by fruit characters, have been segregated, but they are all closely linked together by their floral characters and are perhaps best considered tribes or subfamilies of Rosaceae.

#### KEY TO THE SUB-FAMILIES

- A. Fr. consisting of 1-5, rarely to 12 dehiscent follicles, indehiscent only in No. 12, or fr. a dehiscent caps.: stipules present or wanting.....I. *Spiraeoideae*
- AA. Fr. indehiscent: lvs. stipulate.....
- B. Ovary inferior; the 2-5 carpels more or less connate and adnate to the cup-shaped receptacle: fr. a pome, sometimes berry-like.....II. *Pomoideae*
- BB. Ovary superior (apparently inferior in Rosa).
- C. Carpels usually many (if 1 or 2, not drupaceous); calyx persistent: lvs. often compound.....III. *Rosoideae*
- CC. Carpel usually 1, rarely 2 or 5, drupaceous; calyx usually deciduous: lvs. always simple.....IV. *Prunoideae*

#### I. SPIRAEOIDEAE

- A. Fr. follicular, dehiscent; seeds not winged: fls. not exceeding 2 cm. in width.
- B. Lvs. simple, entire to lobed, or trifold in No. 8: pistils opposite to the petals or less than 5.
- C. Stipules present, caducous; lvs. lobed: staminal disk wanting; seeds shining.
- D. Follicles dehiscent along both sutures, often inflated, 1-5: fls. in umbel-like racemes.....1. *Physocarpus*
- DD. Follicles dehiscent only along the ventral suture, not inflated, 1-2: lvs. with acuminate lobes.
- E. Fls. in terminal elongated racemes or panicles; follicles usually 5-seeded.
- EE. Fr. in small terminal corymbs, minute; style lateral; follicle 1, 1-2 seeded.
- FF. Carpels connate at base: fls. polygamo-dioecious, in panicled racemes: lvs. entire.....6. *Sibiraea*
- EE. Fls. in racemes; carpels dehiscent on both sutures: lvs. entire: prostrate subshrub.....7. *Petrophytum*
- DD. Lvs. trifid with narrow segments: fls. in racemes: prostrate subshrub.....8. *Luetkea*
- BB. Lvs. pinnate or bipinnate, stipulate: fls. in panicles, white; carpels connate at base.
- C. Lvs. pinnate; lfts. serrate.....9. *Sorbaria*
- CC. Lvs. bipinnate; lfts. entire, very small.....10. *Chamaebatiaria*
- AA. Fr. capsular, dehiscent or of 5 indehiscent achenes: lvs. simple; stipules wanting.
- B. Fls. about 4 cm. across, in racemes: fr. capsular.....11. *Eriogonum*
- BB. Fls. small, in panicles: fr. of 5 achenes.....12. *Holodiscus*

#### II. POMOIDEAE

- A. Carpels bony at maturity; fr. with 1-5 nutlets.
- B. Lvs. entire or lobed.
- C. Lvs. entire or rarely serrulate: brs. unarmed.

- d. Fls. usually in several- to many-fld. corymbs, not more than 1 cm. across: fr. about 1 cm. across or less: pistils 2-5.....13. *Cotoneaster*
- db. Fls. solitary, 3-5 cm. across: fr. 3-5 cm. across, brown with foliaceous calyx-lobes: pistils 5.....15. *Mespilus*
- cc. Lvs. crenate, dentate or lobed, rarely entire: brs. usually spiny.
  - b. Lvs. persistent, crenate or entire: pistils 5, with 2 fertile ovules.....14. *Pyraeantha*
  - db. Lvs. deciduous, rarely subsistent: pistils 1-5, with 1 sterile and 1 fertile ovule.....16. *Crataegus*
- bb. Lvs. pinnate; lfts. small, entire.....17. *Osteomeles*
- aa. Carpels with leathery or papery walls at maturity: fr. a 1-5-celled pome, each cell with 1 or more seeds.
  - b. Fls. in compound corymbs or panicles.
    - c. Carpels partly free; styles 2-5, distinct or connate: fls. in corymbs or broad corymbose panicles.
      - d. Ovary in fr. free only at apex or  $\frac{1}{2}$  of its length; endocarp not dehiscent; styles 2-5.
        - e. Pedicels and infl. not verrucose: lvs. deciduous.
          - f. Styles 2-5: lvs. pinnate or simple and often lobed, usually with excurrent veins: calyx-lobes sometimes deciduous.....18. *Sorbus*
          - ff. Styles 5, connate below: lvs. simple, with curving veins, glandular-denticulate, glandular on midrib above: calyx-lobes persistent.....19. *Aronia*
        - ee. Pedicels and infl. verrucose, or smooth and lvs. persistent: lvs. simple, serrulate.....20. *Photinia*
      - dd. Ovary in fr. (core) free to the middle and endocarp at full maturity dehiscent: lvs. persistent, entire or serrulate.....21. *Stranvaesia*
    - cc. Carpels wholly connate; styles 5, distinct: fls. in panicles: fr. pear-shaped, yellow, 3-4 cm. long, with 1 or few large seeds: lvs. evergreen, with excurrent veins.....22. *Eriobotrya*
  - bb. Fls. in umbels, racemes or solitary; sometimes paniculate in No. 23.
    - c. Carpels 4-many-seeded.
      - d. Styles connate at base: lvs. serrate or crenate, rarely entire.
        - e. Ovules 4-10 in each cell; calyx tomentose outside; sepals persistent.....27. *Docynia*
        - ee. Ovules many in each cell; calyx glabrous outside; sepals deciduous.....28. *Chaenomeles*
      - dd. Styles free; sepals persistent: lvs. entire.....29. *Cydonia*
    - cc. Carpels 1-2-seeded.
      - d. Ovary and fr. 2-5-celled; cells 2-ovuled.
        - e. Lvs. evergreen: ovary 2-celled; fls. in upright racemes, sometimes panicled: fr. black; sepals deciduous.....23. *Raphiolepis*
        - ee. Lvs. deciduous: ovary 2-5-celled; fls. in umbel-like racemes.
          - f. Styles connate at base: fr. usually apple-shaped, without or with few grit-cells.....26. *Malus*
          - ff. Styles free: fr. usually pear-shaped, its flesh with numerous grit-cells.....30. *Pyrus*
      - dd. Ovary and fr. incompletely 6-10-celled; cells 1-ovuled.
        - e. Fls. usually in racemes; styles usually 5: lvs. serrate or crenate.....24. *Amelanchier*
        - ee. Fls. in few-fld. umbels; styles 2-3: lvs. entire or denticulate, narrow.....25. *Peraphyllum*

### III. ROSOIDEAE

- aa. Pistils borne on a flat or convex receptacle, usually many.
  - b. Pistils 2-5: lvs. simple.
    - c. Petals wanting; fls. in few-fld. corymbs.....31. *Neviusia*
  - cc. Petals present; fls. solitary.
    - d. Lvs. alternate: fls. 5-merous, yellow.....32. *Kerria*
    - dd. Lvs. opposite: fls. 4-merous, white.....33. *Rhodotypos*
  - bb. Pistils many.
    - c. Carpels becoming drupelets: brs. often prickly.....34. *Rubus*
    - cc. Carpels becoming dry achenes: brs. never prickly.
      - d. Lvs. pinnate or lobed.
        - e. Style deciduous: fls. yellow or white: lvs. pinnate.....35. *Potentilla*
        - ee. Style persistent, plumose: fls. white: lvs. lobed.
          - f. Calyx with bracts at base; pistils many: lvs. glandular.....36. *Fallugia*
          - ff. Calyx without bracts; pistils few: lvs. glandless.....37. *Cowanina*
      - dd. Lvs. undivided, serrate, persistent: fls. 8-9-merous: prostrate shrubs.....38. *Dryas*
  - aa. Pistils enclosed in a tubular or urn-shaped receptacle.
    - b. Pistils 1-4.
      - c. Receptacle tubular or campanulate, enclosing the achene loosely or partly; pistil usually 1.
        - d. Fls. apetalous: lvs. simple, dentate or entire.....39. *Cercocarpus*
      - dd. Fls. with petals.
        - e. Lvs. 3-fld at apex: fls. small, yellow.....40. *Purshia*
        - ee. Lvs. 3-pinnatifid: fls. white.....41. *Chamaebatia*
    - cc. Receptacles urceolate, completely enclosing the 1-4 achenes: lvs. pinnate, small.

- d. Receptacles with prickles, at least 1 under each sepal: fr. white (covered with spines in *Acaena*).....42. *Margyricarpus*  
 dd. Receptacle without prickles: fr. red: fls. unisexual.....43. *Poterium*  
 BB. Pistils many: achenes enclosed in the fleshy receptacle: fls. usually large: lvs. pinnate, rarely simple: brs. usually prickly.....44. *Rosa*

## IV. PRUNOIDEAE

- A. Carpels 1, rarely 2: lvs. usually serrate.  
 B. Sepals 10; petals wanting or small.....45. *Maddenia*  
 BB. Sepals 5, petals present.  
 C. Style terminal: pith of brs. solid.....46. *Prunus*  
 CC. Style lateral: pith of brs. lamellate.....48. *Prinsepia*  
 AA. Carpels 5: lvs. entire.....47. *Osmaronia*  
 Subfam. I. SPIRAEOIDEAE Focke. Unarmed shrubs, rarely trees or herbs: lvs. simple or compound, with or without stipules: fls. usually small, white to pink or purple, in usually large infl.; carpels usually 5, rarely more or less, free or connate, superior, developing into dehiscent follicles usually with several seeds, or rarely into achenes. (*Spiraeaceae* Maxim.)

1. **PHYLOCÁRPUS** Maxim. NINEBARK. Deciduous shrubs; bark peeling off in thin strips; buds rather small, with about 5 exposed brown scales: lvs. alternate, petioled, serrate and usually 3-lobed and 3-nerved at base: fls. perfect, in terminal umbel-like racemes; receptacle cup-shaped; sepals 5, valvate; petals spreading, suborbicular, little longer than sepals, white or rarely pinkish; stamens 20-40; pistils 1-5, united at base: follicles usually inflated, dehiscent along both sutures; seeds 2-5, yellowish, shining. (Greek *physis*, bladder, and *karpos*, fruit; referring to the inflated fruit.) Syn. *Opulaster* Raf. Thirteen species in N. Am. and one in N. E. Asia.—Ornamental shrubs of usually spreading habit with bright green foliage and with conspicuous though not very showy white fls. in dense umbels in June; in some species the inflated pods assume a bright red color in late summer.

- A. Carpels 4-5, rarely 3.  
 B. Pods glabrous.....1. *P. opulifolius*  
 BB. Pods pubescent.  
 C. Lobes of lvs. acute or acuminate.....2. *P. amurensis*  
 CC. Lobes of lvs. obtuse.....3. *P. intermedius*  
 AA. Carpels usually 2, united half their length.  
 B. Mature carpels turgid, styles spreading.....4. *P. monogynus*  
 BB. Mature carpels flattened; styles erect.....5. *P. malvaceus*

1. *P. opulifolius* (L.) Maxim. Shrub to 3 m.; brts. glabrous or nearly so: lvs. roundish-ovate, 2-7 cm. long, usually 5-lobed, with crenate-dentate obtuse or acutish lobes, glabrous or nearly so beneath, those of the shoots to 10 cm. long, more deeply lobed and usually acute to acuminate: fls. white or pinkish, about 1 cm. across, in many-fl. corymbs 3-5 cm. broad; pedicels and calyx glabrous or sparingly pubescent; stamens purplish; pods glabrous, twice as long as sepals, acuminate. Fl.vi-vii; fr.ix-x. N.D.1:t.14(c). R.I.24: t.153(c). B.B.2:244. B.C.5:2610. (*Spiraea opulifolia* L., *Neillia* o. Brew. & Wats., *Opulaster* o. (L.) Ktze.) Que. to Va., Tenn. and Mich.; occasionally escaped from cult. Intr. 1687. Zone II.—*P. o. luteus* (Kirchn.) Zabel, var. Lvs. bright yellow at first, changing to bronzy yellow. (*Spiraea o. lutea* Kirchn.) Orig. before 1864.—*P. o. nanus* (Kirchn.) Zabel, var. Dwarf form with smaller less deeply lobed and dark green lvs. (*Spiraea o. nana* Kirchn.) Orig. before 1864.

Closely related species: *P. capitatus* (Pursh) Ktze. Brs. often sarmentose: lvs. 3-5-lobed, usually stellate-pubescent beneath; pedicels and calyx densely stellate-tomentose; fls. about 1.4 cm. across: pods glabrous at maturity. (*Spiraea capitata* Pursh, *S. o.* var. *mollis* Torr. & Gray.) B. C. to Idaho and n. Calif. Intr. 1827. Zone V.

2. *P. amurensis* (Maxim.) Maxim. Shrub to 3 m.; brts. glabrous or slightly pubescent: lvs. ovate, subcordate to truncate, 5-10 cm. long, 3-5-lobed, with acute or acuminate doubly serrate lobes, slightly pubescent be-

neath: fls. 1.5 cm. across, in rather loose umbels; pedicels and calyx densely stellate-tomentose; stamens purple: pods usually 3-4, stellate-pubescent, about  $\frac{1}{4}$  longer than the calyx-lobes. Gt.14:t.489. N.K.4:t.15. (*Spiraea a. Maxim., Opulaster a. (Maxim.) Ktze.*) Manch., Korea. Intr. between 1854 and 1860. Zone IV. Similar to *P. opulifolius*, but lvs. and fls. larger.

3. *P. intermèdius* (Rydb.) Schneid. Shrub to 1.5 m.; brts. glabrous or nearly so: lvs. suborbicular to ovate, usually rounded to broad-cuneate, 2-6 cm. long, usually shallowly 3-lobed, with obtuse doubly crenate lobes, sparingly stellate or nearly glabrous beneath: fls. about 1.2 cm. across in rather dense umbels; pedicels and calyx stellate-pubescent or nearly glabrous: pods stellate-pubescent, inflated, nearly twice as long as sepals. B.B.2:244. (*P. Ramaleyi* A. Nels., *P. missouriensis* Daniels, *Opulaster i.* Rydb.) S. Ont. and w. N. Y. to Ill., Mo., Ark., Colo. and S. Dak. Intr. 1908. Zone IV.—*P. i. parvifolius* Rehd., var. Dense form, with upright crowded brts.: lvs. ovate, acute, rounded to broad-cuneate at base, 1.5-2 cm. long, glabrous: fls. smaller; pedicels and calyx glabrous; bracts oblong, more or less persistent: pods usually 3, pubescent. Orig. before 1918.

Closely related species: *P. stellatus* (Rydb.) Rehd. Brts. stellate-pubescent: lvs. stellate-pubescent beneath, often acute or acuminate on the shoots: umbels rather small and loose, pedicels and calyx densely stellate-pubescent: pods usually 4, abruptly acute. (*P. ferrugineus* Daniels, *O. alabamensis* Rydb.) S. C. to Ala. and Ga. Intr. 1906. Zone V.

4. *P. monogynus* (Torr.) Coults. Shrub to 1 m.; brts. glabrous or sparingly stellate: lvs. broad-ovate to reniform, rounded or subcordate, 1.5-3.5 cm. long, incisely 3-5-lobed, with rounded, incisely serrate lobes, glabrous or nearly so: fls. 1 cm. across, often pinkish, in rather few-fl. umbels; pedicels and calyx sparingly or rather densely stellate-pubescent; pods 2, rarely 3 or 1, united to about the middle, densely stellate-pubescent, with spreading beaks. G.F.2:5. B.C.5:2611. (*P. Torreyi* S. Wats., *Spiraea monogyna* Torr., *Neillia Torreyi* S. Wats.) S. Dak. and Wyo. to Tex. and N. Mex. Intr. 1879. Zone V. Neat shrub with small lvs. resembling those of *Ribes alpinum*.

Closely related species: *P. glabratus* (Rydb.) Rehd. Differs chiefly in the glabrous or nearly glabrous pedicels and calyx, somewhat larger fls. and less deeply lobed lvs. with doubly crenate lobes. (*Opulaster g.* Rydb.) Colo. Cult. 1908. Zone V. A more showy shrub than the preceding.—*P. bracteatus* (Rydb.) Rehd. It differs chiefly in the many-fl. infl. with obovate or spatulate, often foliaceous and persistent bracts and in the larger lvs. 2-7 cm. long, broad-ovate, usually 3-lobed with doubly crenate lobes: fls. somewhat larger; pedicels and calyx densely stellate-tomentose. (*Opulaster b.* Rydb., *O. Ramaleyi* A. Nels., in part.) Colo. Cult. 1909. Zone V. Showier than *P. monogynus*.

5. *P. malvaceus* (Greene) Ktze. Shrub to 2 m.; brts. stellate-pubescent: lvs. orbicular to broad-ovate, cordate to truncate, 2-6 cm. long and about as broad, 3-5-lobed with broad rounded doubly crenate-dentate lobes, glabrous or stellate-pubescent above, stellate-pubescent beneath, rarely nearly glabrous: fls. white, about 1 cm. across, in rather few-fl. umbels with cuneate or spatulate caducous bracts; pedicels and calyx densely stellate-pubescent: pods usually 2, stellate-pubescent, flattened and somewhat keeled, dehiscent after falling, with erect beaks. B.M.7753(c, as *Neillia Torreyi*). (*P. pauciflorus* Piper, *Neillia malvacea* Greene.) B. C. to Mont., Wyo., Utah and Ore. Intr. 1896. Zone V.

2. **NEILLIA** D. Don. Deciduous shrubs, with slender brs.; buds ovoid, acutish, often superposed, with about 4 exposed scales: lvs. alternate, 2-ranked, doubly serrate and usually lobed, with conspicuous deciduous stipules: fls. perfect, in terminal racemes or panicles, with caducous bracts; calyx-tube

campanulate to tubular; sepals 5, erect, short, about as long as the suborbicular to oval petals; stamens 10-30, in 1-3 series; carpels 1-2, with slender terminal styles; ovules 5-10 in each carpel; pods enclosed by the persistent calyx-tube, dehiscent along the inner suture; seeds several, lustrous. (After Patrick Neill of Edinburgh, Scotch botanist; 1776-1851.) About 10 species in China and in the Himal.—Graceful shrubs with spreading, slender usually zigzag brs., bright green, generally ovate lvs. and white or pink fls. in terminal racemes.

A. Racemes forming terminal panicles: fls. whitish; calyx-tube campanulate. 1. *N. thyrsiflora*  
AA. Racemes solitary: fls. usually pink.

B. Calyx-tube campanulate ..... 2. *N. affinis*

BB. Calyx-tube cylindric, longer than the sepals.

C. Pedicels short; lvs. pubescent ..... 3. *N. thibetica*

CC. Pedicels slender, about 5 mm. long; lvs. glabrous ..... 4. *N. sinensis*

1. *N. thyrsiflora* D. Don. Upright shrub to 1 or rarely 2 m.; young brts. angular, glabrous: lvs. ovate to ovate-oblong, long-acuminate, cordate, 4-10 cm. long, doubly incised-serrate, 3-lobed, particularly on the shoots, pubescent on the veins beneath or nearly glabrous; petioles 5-10 mm. long; fls. white, short-stalked, in racemes 3-7 cm. long, forming terminal panicles; calyx-tube campanulate, with the lanceolate sepals about 8 mm. long, usually sparingly stipitate-glandular; ovary glabrous except a few hairs on the sutures. Fl.viii-rx. R.H.1888:416. L.I., tined. Himal. Intr. about 1850. Zone (VI). Shrub with rather insignificant fls.; tender, but if killed to the ground the young shoots flower and fruit the same season.

2. *N. affinis* Hemsl. Shrub to 2 m.; brts. angled, glabrous: lvs. ovate to ovate-oblong, long-acuminate, cordate or subcordate, 5-9 cm. long, lobulate and often with a pair of acuminate lobes at base, slightly pubescent on the veins beneath or nearly glabrous; petioles 1-2.5 cm. long; fls. pink, in dense racemes 3-8 cm. long; pedicels 2-5 mm. long; calyx-tube campanulate, finely pubescent and usually sparingly stipitate-glandular, about as long as the lanceolate sepals; ovary villous. Fl.v-vi. W. China. Intr. 1908. Zone V?

Related species: *N. Uékii* Nakai. Lvs. ovate, 4-8 cm. long, pubescent on the veins beneath; racemes 3-5 cm. long; fls. white, campanulate, about 6 mm. long; calyx-tube stipitate-glandular, otherwise glabrous, at maturity densely glandular-bristly. N.K.4:t.13. Korea. Intr. 1906. Zone V.

3. *N. thibetica* Franch. Shrub to 2 m.; young brts. nearly terete, pubescent: lvs. ovate, subcordate, long-acuminate, 5-8 cm. long, doubly serrate and lobulate, sparingly pubescent above when young, pubescent beneath, densely so on the veins and veinlets; petioles 8-15 mm. long; stipules ovate, serrate, much shorter than petioles: fls. short-stalked, about 8 mm. long, in rather dense racemes 4-8 cm. long; calyx-tube cylindric, finely pubescent, twice as long as the sepals, at maturity glandular-bristly; ovary silky-pubescent. W. China. Intr. 1910. Zone V?

Closely related species: *N. longiracemosa* Hemsl. Lvs. usually not lobulate, less densely pubescent beneath or glabrescent; stipules lanceolate, entire: racemes sometimes to 15 cm. long; sepals lanceolate; ovary hairy only at apex. W. China. Intr. 1909. Zone VI?—*N. ribesoides* Rehd. Lvs. 3-5 cm. long, incisedly lobulate, pilose chiefly on the veins beneath; stipules oblong, entire, shorter than petioles: calyx-tube glabrous or puberulous; sepals triangular; ovary pilose only at apex. W. China. Cult. 1930. Zone VI?

4. *N. sinensis* Oliv. Shrub to 2 m.; young brts. terete, glabrous: lvs. ovate to ovate-oblong, long-acuminate, rounded or truncate, 4-8 cm. long, incisedly serrate and lobulate, sparingly hairy or nearly glabrous; petioles 5-15 mm. long, glabrous; stipules usually lanceolate, entire: fls. pinkish, 1-1.2 cm. long, nodding, in slender racemes 3-6 cm. long; pedicels 3-7 mm. long; calyx-tube

cylindric, glabrous, at maturity with glandular bristles; sepals triangular-ovate, long-acuminate, much shorter than the tube; ovary hairy at apex. Fl. v-vi; fr.viii-ix. H.I.16:1540. B.C.4:2116. B.S.2:95. M.O.175. C. China. Intr. 1901. Zone V. Graceful shrub with slender spreading brs. bearing numerous racemes of nodding pinkish fls.; lvs. bright green.

**3. STEPHANÁNDRA** Sieb. & Zucc. Deciduous shrubs, with slender brs.; buds superposed, small, with about 4 exposed scales: lvs. alternate, 2-ranked, serrate and usually lobed, stipulate: fls. perfect, white, small, slender-stalked, in terminal corymbs or panicles; calyx-tube cup-shaped; sepals 5; petals as many, of about equal length; stamens 10-20, short; carpel 1, with 2 pendulous ovules; follicles oblique, with lateral style, dehiscent only at base, with 1 or 2 globose-ovoid lustrous seeds. (Greek *stephanos*, crown, and *aner*, *andros*, man; referring to the persistent crown of stamens.) Four species in E. Asia.

A. Stamens 10: lvs. 2-4 cm. long, deeply lobed.....1. *S. incisá*  
 AA. Stamens 15-20; lvs. 3-8 cm. long, lobulate.....2. *S. Tanakae*

1. *S. incisá* (Thunb.) Zabel. Shrub to 2.5 m., usually lower; brts. distinctly zigzag, nearly terete: lvs. ovate, long-acuminate, cordate to truncate, 2-4.5 cm., or on shoots to 6.5 cm. long, incisely lobed and serrate, the lower incisions halfway to the midrib, pubescent on the veins beneath; petioles 3-10 mm. long; stipules ovate-oblong to lanceolate, sparingly toothed; fls. 4-5 mm. across, greenish white, in loose terminal panicles 2-6 cm. long; bracts subulate, shorter than the slender pedicels. Fl.vi. Gt.37:537. Gn.88:55(h). B.C. 6:3237. N.K.4:t.14. M.O.t.14. (*S. flexuosa* Sieb. & Zucc., *Spiraea* i. Thunb.) Japan, Korea. Cult. 1872. Zone IV. Graceful shrub with widespreading slender brs. and finely divided bright green lvs. changing to reddish purple in fall; the small clusters of minute white fls. are rather insignificant.

2. *S. Tanakae* Franch. Shrub to 2 m.; brts. terete or angled: lvs. ovate, long-acuminate, subcordate, 3-8 cm. long, doubly serrate with acuminate teeth and lobulate, the lowest pair of lobes often rather large, spreading and long-acuminate, slightly pubescent on the veins beneath or nearly glabrous; petioles 5-15 mm. long; stipules ovate, serrate: fls. white, about 5 mm. across, in terminal panicles 5-10 cm. long; bracts oblong, often as long as pedicels, partly persistent. Fl.vi-vii. B.M.7593(c). Gt.45:t.1431(c). B.C.6:3237. S.L. 355(h). G.W.4:6. Japan. Intr. 1893. Zone V. More vigorous than the preceding species; lvs. coloring orange and scarlet or bright yellow in fall.

**4. SPIRÆA** L. SPIREA. Deciduous shrubs; buds small, with 2-8 exposed scales: lvs. alternate, simple, dentate or serrate, or sometimes lobed, rarely entire, usually short-petioled, estipulate, penninerved, rarely 3-5-nerved at base: fls. perfect, rarely polygamous, in umbel-like racemes, corymbs or panicles; receptacle cup-shaped or campanulate; sepals 5, usually short; petals 5, usually rounded and longer than the sepals; stamens 15-60, inserted between the disk and the sepals; pistils usually 5, distinct; follicles dehiscent along the inner suture, with several minute, oblong seeds. (Ancient Greek name of a plant used for garlands, derived from *speira*, wreath or band; probably first used for the present genus by Clusius.) More than 80 species in the temperate regions of the n. hemisphere, in Am. s. to Mex., in Asia to the Himal.—Most of the species have been introduced into cult.; many of them, including numerous hybrids originated in cult., are popular garden shrubs and much planted on account of their decorative fls.

## KEY TO THE SECTIONS

- A. Infl. a simple umbel or umbel-like raceme; fls. white.....Sect. I. *Chamaedryon*  
 AA. Infl. compound; fls. white to rose-purple.....Sect. II. *Calospira*  
 B. Fls. in corymbs.....Sect. III. *Spiraria*  
 BB. Fls. in panicles.....Sect. III. *Spiraria*

## Sect. I. CHAMAEDRYON Ser.

- A. Fls. in sessile umbels, without or with very few lvs. at base (in some hybrids the umbels on the lower part of the br. on short leafy stalks).  
 B. Lvs. dentate or serrate; stamens about  $\frac{1}{2}$ – $\frac{3}{4}$  as long as petals.  
 C. Lvs. ovate to oblong-lanceolate.  
 D. Umbels all sessile, 3–6-fld.; fls. often double.....1. *S. prunifolia*  
 DD. Umbels on the lower part of the branch stalked.....3. *S. arguta*  
 CC. Lvs. linear-lanceolate, glabrous.....2. *S. Thunbergii*  
 BB. Lvs. entire or crenate-dentate only near apex, often 3-nerved; stamens as long or nearly as long as petals.....4. *S. hypericifolia*  
 AA. Fls. in umbel-like racemes on leafy brts. (sometimes the upper umbels nearly sessile).  
 B. Lvs. entire or crenate or dentate near apex.  
 C. Lvs. 3-nerved .....5. *S. crenata*  
 CC. Lvs. penninerved.  
 D. Lvs. glabrous or nearly so; infl. glabrous or slightly pubescent.  
 E. Buds long-pointed, with 2 exposed membranous scales.  
 F. Lvs. obovate to suborbicular, usually crenate at apex; buds shorter than petiole .....6. *S. nipponica*  
 FF. Lvs. generally oblong, entire; buds longer than petioles.....7. *S. gemmata*  
 EE. Buds ovoid, small, with several exposed scales.  
 F. Lvs. usually linear-lanceolate, acute, rarely oblong-obovate.....9. *S. alpina*  
 FF. Lvs. oval to obovate-oblong, obtuse.....10. *S. virgata*  
 DD. Lvs. pubescent on both sides; infl. pubescent.  
 E. Buds pointed, with 2 exposed scales, longer than petioles.....8. *S. mollifolia*  
 EE. Buds ovoid, obtuse, with imbricate scales, shorter than petioles.....11. *S. cana*  
 BB. Lvs. serrate or dentate, sometimes slightly lobed (sometimes entire in No. 12).  
 C. Stamens longer than petals; sepals reflexed in fr.; infl. racemose, the lower pedicels distant.  
 D. Shoots terete, often pubescent; lvs. pubescent or nearly glabrous, often nearly entire .....12. *S. media*  
 DD. Shoots angled, glabrous; lvs. glabrous or nearly so.....13. *S. chamaedryfolia*  
 CC. Stamens shorter than or as long as petals; sepals erect, spreading in fr.; infl. umbel-like, the pedicels crowded.  
 D. Lvs., infl. and foliodes glabrous.  
 E. Lvs. acute.  
 F. Lvs. rhombic-lanceolate, penninerved.....14. *S. cantoniensis*  
 FF. Lvs. rhombic-ovate, indistinctly 3-nerved.....15. *S. Vanhouttei*  
 EE. Lvs. obtuse.  
 F. Lvs. suborbicular, distinctly 3–5-nerved at base, usually 3-lobed.  
 FF. Lvs. rhombic-ovate to obovate, cuneate at base, penninerved or indistinctly 3-nerved .....16. *S. trilobata*  
 DD. Lvs. pubescent beneath.....17. *S. Blumei*  
 E. Infl. and foliodes glabrous.....18. *S. pubescens*  
 EE. Infl. and foliodes pubescent.....19. *S. chinensis*

## Sect. II. CALOSPIRA K. Koch

- A. Corymbs on usually short lateral brts. appearing along the mostly arching brs. of the previous year.  
 B. Fls. perfect, white.  
 C. Winter-buds short, ovoid, with several exposed scales or with only 2 in No. 20.  
 D. Stamens about as long as petals.  
 E. Winter-buds with 2 exposed scales, pointed; brts. angled.....20. *S. canescens*  
 EE. Winter-buds obtusish, with several exposed scales.  
 F. Lvs. serrate at least toward the apex; infl. pubescent.  
 G. Lvs. 1–2.5 cm. long.....21. *S. Sargentiana*  
 GG. Lvs. 3–7 cm. long.....22. *S. Henryi*  
 FF. Lvs. entire or with few teeth. (See also *S. trichocarpa* under No. 6.)  
 G. Lvs. pubescent above; infl. glabrous or sparingly pilose; foliodes pilose.  
 23. *S. Wilsonii*  
 GG. Lvs. glabrous above; infl. densely downy; foliodes glabrous.....24. *S. Veitchii*  
 DD. Stamens 2–3 times as long as petals; lvs. doubly serrate.....25. *S. Miyabei*  
 CC. Winter-buds elongated, longer or about as long as petioles; lvs. doubly or incisely serrate.  
 D. Lvs. glabrous, doubly serrate.....26. *S. longigemmis*  
 DD. Lvs. pubescent on the veins beneath, incisely serrate.....27. *S. Rostkornii*  
 BB. Fls. dioecious, pink or white; sepals reflexed in fr.; lvs. sharply serrate.  
 C. Lvs. glabrous above, pubescent only on the veins beneath, ovate to ovate-oblong.  
 28. *S. bella*

- cc. Lvs. pubescent above, rarely nearly glabrous, more densely pubescent beneath, usually ovate-lanceolate ..... 29. *S. amoena*
- AA. Corymbs terminal on upright shoots of the year.
- B. Stamens as long as petals; fls. white; procumbent shrub; lvs. 1-2.5 cm. long. .... 30. *S. decumbens*
- BB. Stamens longer than petals; upright shrubs.
- C. Infl. very compound, flat, besides the terminal corymb, lateral ones blooming later appear beneath, only small brts. with a single corymb; infl. usually pubescent.
- D. Lvs. 4-10 cm. long, usually plane.
- E. Brts. terete; fls. usually rose-colored.
- F. Ripe follicles diverging. .... 31. *S. japonica*
- FF. Ripe follicles upright. .... 32. *S. margaritae*
- EE. Brts. more or less angled, rather stiff, nearly glabrous; fls. white. .... 33. *S. albiflora*
- DD. Lvs. 1-2 cm. long, bullate; plant rarely taller than 0.25 m. .... 34. *S. bullata*
- CC. Infl. consisting of a single corymb, usually convex; follicles not diverging.
- D. Brts. striped; sepals reflexed in fr.
- E. Lvs. generally oblong, acute; fls. pink or white. .... 35. *S. superba*
- EE. Lvs. generally elliptic, obtuse, crenate-serrate; fls. white. .... 36. *S. betulifolia*
- DD. Brts. quite terete; sepals upright or spreading in fr.
- E. Fls. white.
- F. Corymb puberulous ..... 37. *S. corymbosa*
- FF. Corymb glabrous ..... 38. *S. lucida*
- EE. Fls. rose-colored ..... 39. *S. densiflora*

## Sect. III. SPIRARIA Ser.

- A. Infl. a broad panicle, about as broad as high, sometimes consisting of small panicles. (Hybrids between species of Sect. II and III = Sect. *Pachystachya* Zabel.)
- B. Panicles small, on lateral brts. at the end of last year's brs. .... 40. *S. fontenaysii*
- BB. Panicles large, terminal on upright brs.
- C. Lvs. glabrous or nearly so. .... 41. *S. pyramidata*
- CC. Lvs. pubescent or tomentulose beneath. .... 42. *S. sanssouciana*
- AA. Infl. an elongated panicle, much longer than broad. (Sect. *Spiraria* proper.)
- B. Lvs. glabrous or nearly so.
- C. Lvs. sharply serrate, except at the very base, acute.
- D. Fls. light pink; infl. tomentulose, rather narrow, the lower brts. ascending and not exceeding their supporting lvs. .... 43. *S. salicifolia*
- DD. Fls. white or slightly pinkish; infl. broad at base, the lower brts. spreading and exceeding their supporting lvs.
- E. Infl. tomentulose; lvs. oblong to oblanceolate. .... 44. *S. alba*
- EE. Infl. glabrous; lvs. generally elliptic. .... 45. *S. latifolia*
- CC. Lvs. coarsely serrate above the middle, obtuse; fls. pink. .... 46. *S. Menziesii*
- BB. Lvs. pubescent or tomentose beneath; fls. pink.
- C. Follicles glabrous.
- D. Lvs. acute at ends, pubescent or thinly tomentulose beneath. .... 47. *S. Billiardii*
- DD. Lvs. obtuse, tomentose beneath. .... 48. *S. Douglasii*
- CC. Follicles pubescent; lvs. usually light tawny beneath, usually oblong-ovate, acute. .... 49. *S. tomentosa*

Sect. I. CHAMAEDRYON Ser. Shrubs with usually spreading and arching brs.: infl. a sessile fascicle or an umbel-like raceme on short leafy brts. axillary on the brs. of the previous season: fls. white.

1. *S. prunifolia* Sieb. & Zucc. Shrub to 3 m., with slender pubescent or nearly glabrous angled brts.: lvs. elliptic to elliptic-oblong, acute at ends, 2-5 cm. long, denticulate, glabrous or finely pubescent beneath; petioles 2-3 mm. long; fls. pure white, about 8 mm. across, on slender pedicels in 3-6-fld. sessile umbels usually with a few leafy bracts at base; petals broad-obovate, longer than stamens; follicles spreading, glabrous. Fl. iv-v. J.C.22:t.12. N.K. 4:t.10. Korea, China, Formosa. Cult. 1864. Zone IV.—The form described above is *S. p. simpliciflora* Nakai, f. The form commonly cult. is *S. p. plena* Schneid., var., the type of the species. Young brts. pubescent: lvs. elliptic or ovate, lustrous above, pubescent beneath, of firmer texture; petioles to 5 mm. long; fls. double, about 1 cm. across. S.Z.1:t.70(c). F.S.2:t.153(c). A.G.18:425. F.E.9:503;31:602. Gn.53:185(h). (*S. p. fl. pleno* Bosse.) Intr. from Japan 1843.—*S. p. plena* is a handsome early-flowering shrub with dark green lustrous lvs. turning orange in fall; the single-fld. form is less showy.

2. *S. Thunbergii* Sieb. Shrub to 1.5 m., with slender spreading brs.: brts. angled, pubescent while young; lvs. linear-lanceolate, acuminate, 2-4 cm. long, sharply serrate, glabrous, bright green; fls. pure white, about 8 mm.

across, slender-stalked, in 3-5-fld. sessile umbels; petals obovate, much longer than stamens: follicles diverging, with spreading terminal style. Fl. iv-v. S.Z.1:t.69(c). G.F.8:84,85(h). S.L.350(h). Japan, China. Intr. about 1863. Zone IV. Graceful early-flowering shrub, the brs. clothed with feathery bright green lvs. turning late in fall to orange and scarlet.

3.  $\times$  *S. arguta* Zab. (*S. Thunbergii*  $\times$  *S. multiflora*.) Similar in habit to the preceding, but taller and more vigorous: lvs. oblong-obovate to oblong-oblancheolate, acute, 2-4 cm. long, sharply and sometimes doubly serrate, finally glabrous: fls. pure white, 8 mm. across, in many-fld. umbels usually with small lvs. at base; pedicels glabrous; petals nearly twice as long as stamens. Fl. v. G.C.III.22:3;43:398. G.F.10:443. B.S.2:528. Gg.7:291(h). M.G.1900:16(h). Orig. before 1884. Zone IV. The most free-flowering and the most showy of the early spireas.

Closely related hybrid: *S. multiflora* Zab. (*S. crenata*  $\times$  *hypericifolia*). Lvs. obovate, 3-5-nerved at base, serrate above the middle, finely pubescent while young: lower umbels usually on short leafy stalks. Orig. before 1884.

4. *S. hypericifolia* L. Shrub to 1.5 m., with upright and arching brs.: brts. subterete: lvs. nearly sessile, oblong-obovate to obovate-lanceolate, acute, rarely obtuse, 2-3.5 cm. long, with few small teeth near apex or entire, 3-nerved or penninerved, pubescent or nearly glabrous, grayish green: fls. white, about 6 mm. across; in 5-many-fld. sessile umbels; pedicels pubescent; petals suborbicular, slightly longer than stamens: follicles nearly glabrous, divergent. Fl. iv-v. Ledeb., Ic. Fl. Ross. t.438. S. E. Eu. to Siber. and C. Asia. Cult. 1640. Zone IV. One of the earliest Spireas to bloom.—*S. h. acuta* Ser., var. Lvs. oblanceolate: fls. yellowish white, 3-4 mm. across; petals obovate-spatulate, slightly shorter than stamens: follicles ciliate on the ventral suture. S.O.1:t.55(c), as *S. crenata*. G.O.t.9(c). (*S. acutifolia* Willd.) Cult. 1800.—*S. h. obovata* (Waldst. & Kit.) Maxim., var. Lvs. obovate, rounded at the usually crenate apex, 3-5-nerved: fls. about 5 mm. across; petals about as long as stamens. S.O.t.56-57(c). G.O.t.11(c). (*S. obovata* Waldst. & Kit.) Cult. 1800.

*S. h.  $\times$  media* = *S. micropetala* Zab. Lvs. obovate-oblong, entire or serrate at apex, 3-nerved or penninerved: umbels sessile and partly on leafy stalks; petals shorter than stamens. Orig. before 1878.—*S. h.  $\times$  cana* = *S. cinerea* Zab. Lvs. oblong, usually entire: umbels usually sessile on the upper and on leafy stalks on the lower part of the brs.; petals longer than stamens. Orig. before 1884.—*S. h.  $\times$  crenata*; see under No. 3.

Related species: *S. calcicola* W. W. Smith. Low shrub: brts. angled; buds scaly: lvs. obovate to elliptic, obtuse, 4-7 mm. long, entire, glabrous: fls. white, pink outside, in 6-8-fld. umbels; pedicels 2-5 mm. long. Yunnan. Intr. 1915. Zone V.

5. *S. crenata* L. Shrub to 1 m., with slender brs., finely pubescent when young: lvs. obovate-oblong to oblanceolate, acutish or rounded at apex, cuneate, 2-3.5 cm. long, crenulate above the middle or entire, distinctly 3-nerved, puberulous when young, grayish green: fls. white, about 5 mm. across, in dense puberulous umbels on leafy stalks; petals orbicular-obovate, usually shorter than stamens: follicles finely pubescent, with erect styles; sepals upright. Fl. v. G.O.t.10(c). R.I.24:t.147(c). L.B.1252(c). (*S. crenifolia* C. A. Mey.) S. E. Eu. to Cauc. and Altai. Cult. 1800. Zone V.

*S. c.  $\times$  media* = *S. pikoviensis* Bess. Lvs. oblong, 2.5-5 cm. long, with a few teeth at apex or sometimes entire, penninerved to 3-nerved, nearly glabrous: infl. nearly glabrous; petals shorter than stamens: follicles with the upright style somewhat below the apex. (*S. Nicoudieri* Hort.) Found wild in Poland. Intr. 1807. *S. c.  $\times$  cana* = *S. inflexa* K. Koch. Young brts. pubescent: lvs. usually 3-nerved, elliptic-obovate, acute or acutish, pubescent beneath, entire or with a few teeth at apex: infl. pubescent. (*S. conferta* Zab.) Orig. before 1850.—*S. c.  $\times$  hypericifolia* = *S. multiflora*; see under No. 3.

6. *S. nipponica* Maxim. Shrub to 2.5 m., with upright and spreading brs.; brts. angled, glabrous; buds short, with 2 exposed scales: lvs. obovate to oval, broadly cuneate, 1.5–3 cm. long, crenate at the rounded apex, rarely entire, dark green above, bluish green beneath, chartaceous: fls. 8 mm. across in many-fld. umbel-like racemes, on leafy stalks, the lower pedicels often with a leafy bract and sometimes branched; petals orbicular, longer than the stamens: follicles upright, slightly hairy, with spreading style. Fl.vi. B.S. 2:529. (*S. bracteata* Zabel, not Raf.) Japan. Cult 1908. Zone IV. Shrub of rather stiff habit with dark green lvs. remaining green until late in fall and with pure white fls. in showy umbels.—*S. n. rotundifolia* (Nichols.) Mak., var. Lvs. larger, broad-obovate or orbicular-obovate: fls. somewhat larger. B.M. 7429(c). G.F.7:305. G.C.37:149;43:399. J.L.33:f.43(h). Cult. 1882.—*S. n. tosaensis* (Yatabe) Mak., var. Lvs. oblong-obovate to oblanceolate, 1–3 cm. long, entire or crenate at apex: fls. smaller, in dense umbels. Ad.19:613(c). (*S. t.* Yatabe.) Japan. Cult. 1935.

Related species: *S. trichocarpa* Nakai. Shrub to 2 m.: lvs. oblong to oblong-oblanceolate, 2.5–5 cm. long, acutish, entire or with a few teeth at apex: infl. pubescent, 2.5–5 cm. across, compound, its lower brs. with 2–7 fls. and often with a leafy bract: follicles pubescent. N.K.4:t.12. G.C.74:87(h). Korea. Intr. 1920. Zone V. Handsome shrub, similar to *S. nipponica*.

7. *S. gemmata* Zab. Shrub to 3 m.; brts. slender, angled, red-brown, glabrous; buds elongated, pointed, with 2 exposed scales, longer than petiole: lvs. short-petioled, narrow-elliptic to oblong, acutish or obtuse, mucronulate, cuneate, 1–2.5 cm. long, entire, rarely with few teeth at apex, grayish green beneath: fls. white, 6–8 mm. across, in few- to many-fld. umbels, the upper ones sessile with lvs. at base, the lower on leafy stalks; the lower pedicels often with a bract in the middle; petals suborbicular, slightly longer than stamens: follicles diverging at the apex, usually hairy on the ventral suture; style terminal, upright or spreading; sepals spreading. Fl.v. S.H.1:f.289h, 290f-g. (*S. mongolica* Koehne, not Maxim.) N. W. China. Cult. 1886. Zone IV.

Related species: *S. arcuata* Hook. f. Brts. sparingly pubescent, angled: lvs. elliptic to elliptic-oblong, 1–1.5 cm. long, entire, slightly pubescent: fls. about 6 mm. across, in pubescent umbels about 2 cm. broad, on short leafy brts.; stamens 18–25, slightly longer than petals; follicles glabrous. S.H.1:f.292i. Himal. Cult. 1908. Zone VII?—*S. Zabeliana* Schneid. Similar to the preceding: lvs. larger, sometimes crenulate near apex, more pubescent: fls. 1 cm. across, in umbels to 4 cm. across; stamens 30–40, slightly shorter than petals; follicles pubescent. S.H.1:f.292k-m. N. W. Himal. Cult. 1921. Zone VI?

8. *S. mollifolia* Rehd. Shrub to 2 m., with arching, strongly angled brs.; young brts. pubescent, purplish; buds elongated, pointed, with 2 exposed scales, longer than petiole: lvs. short-petioled, elliptic or obovate to oblong, acute at ends, 1–2 cm. long, entire or with a few teeth at apex, silky-pubescent on both sides: fls. white, about 8 mm. across, in rather dense pubescent umbels about 2.5 cm. across, on short leafy stalks: follicles upright, pubescent, with upright or spreading styles; sepals spreading. Fl.vi-vii. W. China. Intr. 1908. Zone V.

9. *S. alpina* Pall. Shrub to 1.5 m., with upright or spreading brs.; brts. puberulous when young, angled, red-brown; buds small, ovoid, with imbricate scales: lvs. partly fascicled, short-petioled, oblong-obovate to oblanceolate, obtuse or obtusish, mucronulate, 1–2.5 cm. long, entire, glabrous: fls. yellowish white, about 5 mm. across, in small and dense glabrous umbels on short leafy stalks; petals suborbicular, slightly shorter than stamens: follicles diverging, with ascending styles; sepals half-spreading. Fl.v-vi. Pallas, Fl.

Ross. t.20. S.H.1:t.289i,290e-e\*. N. E. Asia to W. China. Intr. 1886. Zone V. Much-branched small-leaved shrub of little ornamental merit.

10. *S. virgata* Franch. Shrub to 2.5 m., with slender spreading brs.; brts. sparingly villous while young, angled, brown; buds ovoid, with imbricate scales: lvs. short-petioled, oval to obovate-oblong, obtuse, rarely acutish, 5-15 mm. long, entire, rarely denticulate at apex, glabrous above, paler beneath and sparingly pubescent and ciliolate or nearly glabrous: fls. white, about 6 mm. across, in dense hemispheric umbels sparingly pubescent or glabrous; petals suborbicular, about as long as stamens: follicles upright, glabrous, with spreading styles; sepals upright. Fl.v-vi. (*S. myrtilloides* Rehd.) W. China. Intr. 1908. Zone V? Graceful shrub.

11. *S. càna* Waldst. & Kit. Dense bushy shrub to 1 or rarely 2.5 m.; brts. slender, terete, pubescent; buds small, with imbricate scales: lvs. short-petioled, elliptic to oblong, acute at ends, mucronate, 1-2.5 cm. long, entire or rarely with a few teeth at apex, grayish pubescent on both sides, more densely beneath, very silky while young: fls. white, about 6 mm. broad, in dense pubescent umbels on leafy stalks; petals orbicular, about as long as stamens: follicles pubescent, with spreading styles; sepals reflexed. Fl.v. R.I.24:t.148(c). S. E. Eu. to Italy. Intr. 1825. Zone V.

*S. c. × chamaedryfolia* = *S. Gieseleriana* Zabel. Lvs. ovate, sharply serrate, rarely nearly entire, pubescent: fls. rather large, in umbels on long leafy stalks, petals as long or slightly shorter than stamens: follicles pubescent on the ventral suture. Orig. before 1884.—*S. c. × hypericifolia*; see under No. 4.—*S. c. × crenata*; see under No. 5.

12. *S. mèdia* Schmidt. Upright shrub to 1.5 m.; brts. terete, glabrous or pubescent while young; buds small, pointed, with imbricate scales: lvs. ovate to oblong, acute, cuneate, 3-5.5 cm. long, incised-serrate above the middle or sometimes entire, pubescent or nearly glabrous; petioles 1-2 mm. long: fls. in many-fld. glabrous or nearly glabrous umbel-like racemes on usually rather long leafy stalks; petals orbicular, shorter than stamens; disk conspicuous, yellow: follicles pubescent, with spreading or reflexed styles somewhat below the apex; sepals reflexed. Fl.v. S.O.1:t.54(c). R.I.24:t.149(c). N.K.4:t.9. (*S. confusa* Koern.) S. E. Eu. to N. E. Asia. Intr. 1789. Zone IV. Similar to *S. chamaedryfolia*, but of more upright habit, easily distinguished by the terete brts.—*S. m. glabrèscens* Simonkai, var. Nearly glabrous.—*S. m. mollis* (Koch & Bouché) Schneid., var. Lvs. villous on both sides: infl. pubescent. (*S. mollis* Koch & Bouché.) S. E. Eu. Cult. 1853.—*S. m. sericea* Reg., var. Lvs. more or less silky-pubescent, sometimes nearly glabrous. N. E. Asia.

*S. m. × chamaedryfolia* = *S. oxýodon* Zabel. Nearly glabrous; brts. slightly angled: lvs. serrate above the middle; follicles with terminal spreading style. Orig. before 1884.—*S. m. × hypericifolia*; see under No. 4.—*S. m. × crenata*; see under No. 5.—*S. m. × alba*; see under No. 40.

13. *S. chamaedryfolia* L. Shrub to 1.5 m., with spreading and often arching brs.: brts. glabrous, angled, more or less zigzag; buds acuminate, with few scales: lvs. elliptic-ovate to oblong-lanceolate, acute to acuminate, usually cuneate, 4-6 cm. long, incised-serrate, nearly glabrous, bright green; petioles 5-10 mm. long: infl. several-fld., glabrous, on short-leafy brts., the upper ones sometimes sessile; fls. about 8 mm. across; petals orbicular, shorter than stamens: follicles slightly pubescent, somewhat diverging, with terminal, slightly spreading styles. Fl.v-vi. Ann. Sci. Nat. 1:t.26. (*S. flexuosa* Fisch.) N. E. Asia. Cult. 1789. Zone IV. Stoloniferous shrub with bright green lvs. and rather large fls.—*S. c. stenophýlla* Zab., var. Young brts. purplish; lvs. lanceolate.—*S. c. trásiens* Zab., var. Lvs. ovate to narrow-ovate, incisely or

doubly serrate.—*S. c. ulmifolia* (Scop.) Maxim., var. Taller and less spreading, with stouter brs.: lvs. ovate, usually rounded at base and doubly serrate: infl. many-fld., on longer stalks: follicles with upright styles. S.O.1:t.53(c). G.H.t.83(c). R.I.24:t.150(c). (*S. ulmifolia* Scop.) S. E. Eu. to N. E. Asia and Japan. Cult. 1790.

*S. c. × trilobata* = *S. Schinabéckii* Zabel. Lvs. ovate to oblong-ovate, doubly serrate, the lower ones suborbicular, dark green above; fls. rather large; petals longer than stamens. Orig. before 1884.—*S. c. × cana*; see under No. 11.—*S. c. × media*; see under No. 12.—*S. c. × amoena*; see under No. 29.

14. *S. cantoniensis* Lour. Shrub to 1.5 m., glabrous, with slender arching subterete brs.; buds small, acute: lvs. rhombic-oblong to rhombic-lanceolate, cuneate, 3–5.5 cm. long, incised-serrate, dark green above, pale bluish green beneath; petiole 6–8 mm. long: fls. about 1 cm. across, in rather dense glabrous umbels; petals suborbicular to oval, longer than stamens: follicles parallel, with terminal spreading styles; sepals upright. Fl.vi. B.R.30:10(c). Gn. 34:304. A.G.18:356(h). G.C.II.19:569(h). (*S. Reevesiana* Lindl., *S. lanceolata* Poir.) China, Japan. Intr. 1824. Zone VI. With large pure white fls. and dark lvs. remaining green until late in fall.—*S. c. lanceata* Zab., var. Lvs. lanceolate: fls. double. (*S. Reevesiana* fl. pleno Hort.) H. F. 1855:t.11(c). F.S.11:t.1097(c). Cult. 1855.

*S. c. × chinensis*; see under No. 19.

15. *× S. Vanhouttei* (Briot) Zab. (*S. cantoniensis*  $\times$  *trilobata*). Shrub to 2 m., with arching brs., glabrous: lvs. rhombic-ovate to rhombic-obovate, acute, rounded or cuneate at base, 2–3.5 cm. long, incised-serrate with obtuse mucronate teeth and usually slightly 3–5-lobed, dark green above, pale bluish green beneath: fls. pure white, 8 mm. across, in many-fld. umbels; petals orbiculate, twice as long as the often partly sterile stamens: follicles slightly diverging; styles half-upright; sepals spreading. Fl.v–vi. Gn.53:251;71:334. G.F.2:317. F.E.14:389;31:600. Gng.5:210(h). S.L.351(h). (*S. aquilegifolia* var. *V.* Briot.) Orig. before 1866. Zone IV. One of the handsomest of the spring-flowering spiraeas and much planted.

16. *S. trilobata* L. Shrub to 1.5 m., with slender spreading brs., glabrous; buds ovoid, obtusish: lvs. suborbicular, rounded or sometimes subcordate at base, 1.5–3 cm. long, incisely crenate-dentate, usually 3-lobed and palmi-nerved, pale bluish green beneath; petiole 5–8 mm. long: fls. pure white, in many-fld. umbels; petals longer than stamens: follicles slightly diverging, obtuse, with ascending style; sepals upright. Fl.v–vi. L.B.1271(c). G.F.1:452. F.E.30:45(h, as *S. crataegifolia*.) N. China to Siberia and Turkestan. Intr. 1801. Zone IV. Similar to *S. Vanhouttei*, but smaller in every part.

*S. t. × chamaedryfolia*; see under No. 13.—*S. t. × cantoniensis*; see No. 15.

17. *S. Blumei* Don. Shrub to 1.5 m., with spreading and arching brs., glabrous: lvs. ovate to rhombic-ovate, obtuse, 2–4 cm. long, incisely crenate-serrate and often indistinctly 3–5-lobed, pale bluish green beneath and rather prominently veined; petioles 6–8 mm. long: fls. white, polygamous, in many-fld. rather small umbels; petals roundish obovate, longer or as long as the stamens; follicles parallel, with reflexed or spreading styles. Fl.vi. B.H.8:129,t(c). N.K.4:t.11(as *S. trilobata*). (*S. obtusa* Nakai.) Japan, Korea. Cult. 1858. Zone VI? Rare in cult.; often No. 16 is cult. under this name.

18. *S. pubescens* Turcz. Shrub to 2 m., with slender arching brs., pubescent while young; buds small, subglobose: lvs. rhombic-ovate to elliptic, acute, broad-cuneate, 3–4 cm. long, incisely serrate, sometimes slightly 3-lobed, pubescent above, grayish tomentose beneath; petioles 2–3 mm. long: fls. 6–8 mm. across, in glabrous many-fld. umbels; petals about as long as

stamens: follicles ciliate on the ventral suture, otherwise glabrous, with the spreading styles slightly below the apex; sepals triangular-ovate, upright. Fl.v. G.F.1:331. N. China. Intr. 1883. Zone V.

19. *S. chinensis* Maxim. Shrub to 1.5 m., with arching brs., yellowish tomentose when young: lvs. rhombic-ovate or obovate, acutish or rounded at apex, rounded or broad-cuneate at base, 3-5 cm. long, incisedly serrate and sometimes 3-lobed, finely pubescent and dark green above, yellowish tomentose beneath; petioles 4-10 mm. long; fls. pure white, about 1 cm. across, in densely pubescent many-fl. umbels; sepals ovate-lanceolate, first spreading, later half upright; follicles pubescent with the spreading styles slightly below the apex. Fl.v. B.R.33:t.38(c). (*S. pubescens* Lindl., not Turcz.) E. China. Intr. 1843. Zone VI. Easily recognized by its yellowish tomentum.

*S. c. × cantoniensis* = *S. blanda* Zabel. Lvs. ovate to oblong, acute at ends, incised-serrate, glabrous above, grayish tomentose beneath: fls. pure white, in pubescent umbels: follicles pubescent, with the spreading styles slightly below the apex. (*S. Reevesiana nova* Hort.) Orig. before 1880. Zone VI.

Related species: *S. dasyantha* Bge. Lvs. rhombic-ovate, cuneate at base, incisedly serrate or lobulate, white-tomentose beneath; infl. grayish tomentose; sepals triangular: follicles tomentulose on the ventral suture. N. China. Cult. 1914. Zone V.—*S. yunnanensis* Franch. Lvs. orbicular-ovate or oval to obovate, 1-2 cm. long, doubly dentate to lobulate or sometimes partly entire, rounded at apex, pubescent above, densely whitish or grayish tomentose below: umbels 1-2 cm. broad, densely pubescent; stamens about half as long as petals: follicles pubescent. (*S. sinobrahuica* W. W. Sm.) W. China. Cult. 1923. Zone VI?

SECT. II. CALOSPIRA K. Koch. Infl. a compound, flat or hemispheric corymb, broader than high: fls. often pink to purple, sometimes without glandular disk.

20. *S. canescens* D. Don. Shrub to 2 or sometimes 4 m., with long arching brs.; brts. angled, pubescent; buds short-pointed, with 2 scales: lvs. very short-petioled, broad-oval to obovate, 1-2 cm. long, crenate-dentate above the middle, grayish green, pubescent or sometimes nearly glabrous beneath: fls. white, rather small, in dense hemispheric, pubescent corymbs 3-5 cm. across, on leafy brts. very numerous along the brs.; stamens about as long as or slightly longer than petals: follicles villous, with the styles slightly below the apex and ascending; sepals upright or spreading. Fl.vii. G.C.43:90. Gn. 61:380(h); 62:414(h). (*S. cuneata*, *cuneifolia*, *flagellata*, *flagelliformis* and *rotundifolia* Hort., *S. vacciniifolia* Hort., not D. Don.) Himal. Intr. 1837. Zone VII? The arching brs. covered their whole length with clusters of white fls.—*S. c. myrtifolia* Zab., var. Lvs. oblong, dentate near apex or entire, dark green above, glaucescent and slightly pubescent beneath. M.G.21:385.

*S. c. × amoena* = *S. nivea* Zab. Lvs. coarsely doubly serrate, 2-5 cm. long, pubescent: fls. white or pinkish white in looser corymbs to 10 cm. broad. (*S. expanisa nivea* Billiard.) Orig. before 1867.—*S. c. × salicifolia*; see No. 40.—*S. c. × Douglasii*; see under No. 40.

Closely related species: *S. uratensis* Franch. Brts. slightly angled: lvs. oblong-oblancoate to oblong-obovate, 1-1.5 cm. long, entire, obtuse, glabrous, glaucescent beneath: corymbs glabrous, 1.5-3 cm. across, on leafy brts., leafless below the infl.; fls. 5-6 mm. across; stamens longer than petals: follicles pubescent at first, glabrous at maturity, with spreading styles. S. Mong., N. W. China. Intr. 1926. Zone V.—The two following related species resemble *S. bella* in habit; doubtful if now in cult.: *S. vacciniifolia* D. Don. Brts. terete; lvs. ovate, acute, crenate-dentate, rarely nearly entire, glaucous and nearly glabrous beneath: fls. white, in tomentose corymbs. B.R.26:17(c). P.F.2:98,f.183. (*S. laxiflora* Lindl.) Himal. Intr. 1835. Zone VII?—*S. gracilis* Maxim. Quite glabrous: brts. terete: lvs. slender-petioled, ovate, obtuse, entire or crenate toward the apex, glaucous beneath: fls. white, in lax corymbs. L.B.1403(c). (*S. vacciniifolia* Lodd., not D. Don.) Himal. Intr. 1824. Zone VII?

21. *S. Sargentiana* Rehd. Shrub to 2 m., with slender spreading brs.; brts. terete, puberulous, at first, soon glabrous: buds ovoid, obtusish, with

several scales: lvs. short-petioled, elliptic-oblong to obovate-oblong, cuneate. 1-2.5 cm. long with few acute teeth at apex, puberulous above, villous beneath, chiefly on the veins: fls. creamy-white, about 6 mm. across, in dense villous corymbs 2.5-4 cm. across; petals about as long as stamens: follicles nearly glabrous, with spreading, nearly terminal style; sepals half-upright. Fl.vi. W. China. Intr. 1909. Zone (V). Similar to *S. canescens*; close to the following species, but smaller in every part.

22. *S. Hénryi* Hemsl. Shrub to 2.5 m., with spreading brs.; brts. terete, sparingly pubescent or nearly glabrous; buds ovoid: lvs. obovate to oblong or oblanceolate, acute or rounded, cuneate, 2-7 cm. long, usually coarsely dentate toward the apex, slightly hairy above, villous beneath, particularly on the veins; petiole 4-6 mm. long: fls. white, about 6 mm. across, in rather loose pilose corymbs about 5 cm. across; stamens shorter than petals: follicles hairy, slightly spreading. Fl.vi. B.M.8270(c). G.C.72:67. Gn.65:44. J.L.28:f.20. B.C.6:3211. C. and W. China. Intr. 1900. Zone (V).—*S. H. notabilis* Farquhar. Corymbs larger.

23. *S. Wilsónii* Duthie. Shrub to 2.5 m., with arching brs.; brts. pubescent while young, dull purplish; buds ovoid, obtuse: lvs. very short-petioled, oval to obovate or oblong, obtuse or acutish, cuneate, 2-5.5 cm. long, dentate at apex or entire, dull green and pubescent above, grayish green and villous beneath, particularly on the veins: fls. pure white, about 6 mm. across, in dense glabrous corymbs, 3-5 cm. across; calyx glabrous; petals as long as stamens: follicles spreading, sparingly pilose on the ventral suture. Fl.vi. B.M.8399(c). G.35:851. C. and W. China. Intr. 1900. Zone V.

24. *S. Veitchii* Hemsl. Shrub to 4 m., with long arching brs.; brts. puberulous while young, reddish, striped; buds ovoid, pointed: lvs. oval to oblong, rarely obovate, obtuse, broad-cuneate, 2-4 cm. long, entire, glabrous above, puberulous and glaucescent beneath; petiole about 2 mm. long: fls. 4-5 mm. across, white, in pubescent, rather dense corymbs 3-6 cm. across; calyx puberulous; stamens longer than petals: follicles glabrous, parallel. Fl.vi-vii. B.M.8383(c). J.L.35:f.98. Gn.89:567. S.L.352(h). C. and W. China. Intr. 1900. Zone V. Handsome shrub.

25. *S. Miyabei* Koidz. Upright shrub to 1 m.; brts. slightly angled, puberulous while young; buds small, ovoid, with several scales: lvs. ovate to ovate-oblong, acute or acuminate, rounded to broad-cuneate at base, 3-6 cm. long, doubly incised-serrate, green and glabrous or nearly so beneath; petiole 2-5 mm. long: fls. white, about 8 mm. across, in pubescent corymbs 3-6 cm. across; stamens 2-3 times as long as the suborbicular petals: follicles tomentulose, diverging, with subterminal spreading style; sepals spreading. Fl.vi. N.K.4:t.5. (*S. silvestris* Nakai.) Japan. Similar to *S. chamaedryfolia ulmifolia*, but easily distinguished by the compound corymb.—*S. M. pilosula* Rehd., var. Lvs. larger, to 8 cm. long, pubescent on the veins beneath: infl. sparingly pilose, to 8 cm. across. C. China. Intr. 1907. Zone V.—*S. M. glabrata* Rehd., var. Lvs. glabrous, larger: infl. glabrous, larger. C. China. Intr. 1907. Zone V.

26. *S. longigemmis* Maxim. Shrub to 1.5 m., with spreading slender brs., glabrous when young: buds long-pointed, longer than petioles, with 2 exposed scales: lvs. ovate-lanceolate to oblong-lanceolate, acuminate, cuneate, 3-6 cm. long, simply or doubly serrate, with gland-tipped teeth, bright green, glabrous: fls. white, about 6 mm. across, in rather loose pubescent corymbs 5-7 cm. across; stamens longer than petals; follicles nearly glabrous, with terminal spreading style; sepals spreading. Fl.vi. G.F.7:345. I.T.5:t.192.

B.C.6:3212. G.34:443. N. W. China. Intr. 1887. Zone IV? Graceful shrub with bright green foliage.

27. *S. Rosthörnii* Pritz. Shrub to 2 m., with spreading brs.; brts. sparingly hairy while young; buds elongated, pointed, with 2 exposed scales, often as long as petiole: lvs. ovate to ovate-oblong, acuminate, cuneate or rarely nearly rounded at base, 3-8 cm. long, incisedly doubly serrate or lobulate, pubescent on the veins beneath and often loosely pubescent above; petioles 5-8 mm. long: fls. white, about 6 mm. across, in rather loose pilose corymbs 5-8 cm. across on elongated brts.; stamens longer than petals: follicles pubescent, diverging, with spreading styles. Fl.vi. W. China. Intr. 1908. Zone V. Graceful shrub with bright green foliage.

28. *S. bella* Sims. Shrub to 1 m. with slender spreading brs.; brts. nearly glabrous, slightly ridged: lvs. ovate or elliptic-ovate to oblong-ovate, 3-5 cm. long, rounded to broadly cuneate at base, acute, serrate from below the middle, pubescent on the veins beneath or glabrous; petioles 2-4 mm.: fls. dioecious, pink to white, about 5 mm. across, in pubescent corymbs 2-4 cm. broad; stamens shorter than petals in the pistillate, longer in the staminate fl.: follicles pubescent on the inner suture, with spreading styles; sepals reflexed. Fl.vi. B.M.2426(c). L.B.1268(c). (*S. expansa* Wall.) Himal. Cult. 1823. Zone VI?

29. *S. amoëna* Spae. Upright shrub to 2 m.; brts. terete, tomentulose like the infl.: lvs. ovate-oblong to ovate-lanceolate, rounded to cuneate at base, acute to acuminate, serrate usually only in the upper half, 6-10 cm. long, pubescent or sometimes glabrous above, soft-pubescent beneath: fls. dioecious, white or pinkish, in tomentulose corymbs 3-8 cm. broad on mostly long upright brts.; stamens as in no. 28: follicles pubescent. Fl.vii. Ann. Soc. Agr. Bot. Gand. 2:t.72(c). (*S. fastigiata* Wall., *S. expansa* K. Koch, not Wall.) N. W. Himal. Cult. 1843. Zone VI. Close to the preceding species.

*S. a.* × *?* *bella* = *S. pulchella* Kunze. With large corymbs of pink fls. (*S. expansa rubra* Hort.)—*S. a.* × *chamaedryfolia ulmifolia* = *S. nudiflora* Zab. Lvs. ovate, doubly serrate, nearly glabrous: fls. pinkish white, in compound or sometimes simple pubescent corymbs; longer stamens about twice as long as petals: follicles diverging; sepals reflexed. Orig. before 1890.—*S. a.* × *?* = *S. tristis* Zab. Similar to *S. amoëna*, with small white or pink fls. in smaller corymbs; sepals upright in fr. Orig. before 1878.—*S. a.* × *canescens*; see under No. 20.—*S. a.* × *japonica*; see under No. 31.—*S. a.* × *albiflora*; see under No. 31.—*S. a.* × *alba*; see under No. 40.—*S. a.* × *Douglasii*; see under No. 42.

Related species: *S. micrantha* Hook. f. Lvs. ovate-lanceolate, 8-15 cm. long, acuminate, nearly rounded at base, serrate or doubly serrate, pubescent beneath: fls. pale pink, 4-5 mm. across, in loose leafy corymbs to 15 cm. across, densely fulvous-tomentose: follicles pubescent. E. Himal. Intr. 1924. Zone VII?

30. *S. decumbens* W. Koch. Dwarf procumbent shrub with ascending brs., about 25 cm. high, glabrous; buds small, obtusish, with few scales: lvs. elliptic to elliptic-oblong, acute at ends, 1-3 cm. long, serrate or doubly serrate: fls. white, in small corymbs 3-5 cm. across, terminal on long leafy brts.; fls. imperfectly dioecious; petals about as long as stamens; follicles glabrous, parallel, with terminal upright style; sepals triangular, spreading or recurved. Fl.vi. R.I.24:t.151(c). G.C.II.11:752. M.G.27:186(h). G.M.57:746(h). (*S. lancifolia* var. *d.* Fiori, *S. procumbens* Hort.) S. Eu. Cult. 1830. Zone V. Prostrate shrub adapted for rockeries.

Closely related species: *S. lancifolia* Hoffmanns. Grayish pubescent: lvs. narrower, serrate only toward the apex; sepals in fr. half-spreading. S.H.I:f. 291o.296d-d'. (*S. decumbens* var. *tomentosa* Poech, *S. Haquetii* Fenzl & Koch.) N. E. Italy. Intr. 1835. Zone V.—*S. l.* × *decumbens* = *S. pumilionum* Zabel. Slightly pubescent. S.L.352(h). Orig. before 1900.

31. *S. japonica* L. f. Upright shrub to 1.5 m.; brts. glabrous or puberulous when young, striped or nearly terete: buds ovoid, acute: lvs. ovate-oblong, acute, cuneate, 2-8 cm. long, doubly incised-serrate, pale or glaucescent beneath and usually pubescent on the veins; petioles 1-3 mm. long: fls. pale to deep pink, sometimes white, 4-6 mm. across, in much-compound and rather loose, usually puberulous, corymbs; stamens much longer than petals; disk crenulate; follicles glabrous diverging with ascending styles. Fl.vi-vii. (*S. callosa* Thunb.) Japan. Cult. 1870. Zone V. Handsome shrub with upright brs. terminated by large very compound corymbs of usually pink fls.—*S. j. glabra* (Reg.) Koidz., var. Lvs. ovate, glabrous: fls. pink, in glabrous corymbs. (*S. j. var. glabrata* Nichols., *S. glabrata* Lange.)—*S. j. ovalifolia* Franch., var. Lvs. elliptic, glabrous and glaucescent beneath: fls. white, in corymbs 7-12 cm. across. W. China. Intr. 1908.—*S. j. acuminata* Franch., var. Lvs. ovate-oblong to lanceolate, acuminate, green and pubescent beneath at least on the veins: fls. pink, in corymbs 10-14 cm. across. C. and W. China. Intr. 1908.—*S. j. Fortunei* (Planch.) Rehd., var. Taller; brts. quite terete, puberulous while young: lvs. oblong-lanceolate, acuminate, 5-10 cm. long, sharply and doubly serrate, with incurved callous-tipped teeth, rugose above, glaucous and glabrous beneath: corymbs much compound, puberulous; fls. pink; disk usually little developed, sometimes wanting. B.M.5164 (c). F.S.9:t.871(c). B.H.8:129,t.(c). (*S. Fortunei* Planch., *S. callosa* Lindl., not Thunb.) E. and C. China. Intr. about 1850. Zone V.—Forms of this var. are the two following: *S. j. atrosanguinea* Zab., var. Fls. crimson, in tomentose corymbs.—*S. j. ruberrima* Zab., var. Fls. deep pink, in puberulous corymbs.—*S. j. macrophylla* Zab., var. Lvs. to 14 cm. long, bullate: corymbs small. (*S. Fortunei* m. Simon-Louis.) Orig. before 1866.

*S. j. × albiflora* = *S. Bumalda* Burvenich. Shrub to 0.75 m., with striped glabrous brts.: lvs. ovate-lanceolate, sharply and doubly serrate, glabrous: fls. white to deep pink; follicles diverging. R.B.17:12,t.(c). S.L.353(h). (*S. pumila* Zab.) Orig. before 1890. A very handsome and variable hybrid, often difficult to distinguish from *S. japonica*, but usually of lower, more strictly upright habit and with slightly angled brts.—The best known forms are *S. B. Froebeli* Rehd., var. A taller plant with broader, ovate-oblong lvs. and bright crimson fls. (*S. callosa* F. Hort.) F.E.31:604.—*S. B. "Anthony Waterer."* Compact shrub with rather narrow lvs. and bright crimson fls. Gn.45:49,t.(c). G.C.III.14:365.—Here belongs *S. pruhoniciana* Zeman. (*S. B. "Anthony Waterer" × japonica ovalifolia*.)—*S. j. × amoena* = *S. revirescens* Zab. Brts. slightly angled, pubescent while young: lvs. oblong-ovate, acuminate, 5-9 cm. long, incisely or doubly serrate, glaucescent beneath and densely yellowish pubescent on the veins: fls. rose-colored, in tomentulose corymbs; petals  $\frac{3}{4}$  the length of the stamens: follicles small, parallel, pubescent. Fl.vi-vii and ix-x. Orig. before 1890.—*S. amoena × albiflora* = *S. concinna* Zab. Similar to the preceding: brts. pubescent: lvs. ovate-lanceolate, doubly and sharply serrate, pale green beneath and pubescent on the veins, midrib greenish, white near base: fls. pinkish white, in broad leafy corymbs. Orig. before 1890.—*S. j. × superba*; see No. 32.—*S. j. × corymbosa*; see under No. 32.—*S. j. × salicifolia*; see under No. 41.—*S. j. × Douglassii*; see No. 42.—*S. Bumalda × bullata*; see under No. 34.—*S. Bumalda × splendens*; see under No. 35.

32. *× S. Margaritae* Zabel (*S. japonica × superba* [*albiflora × corymbosa*]). Shrub to 1.5 m.; brts. nearly terete, finely pubescent while young, purple brown: lvs. short-petioled, elliptic-ovate to narrow-elliptic, short-acuminate, cuneate, 5-8 cm. long, coarsely and doubly serrate, pale green beneath and slightly pubescent on the veins or nearly glabrous: fls. 7-8 mm. across, bright rosy-pink, in large leafy puberulous corymbs; calyx pubescent; stamens twice as long as petals: follicles parallel, glabrous, with upright styles; sepals spreading. Fl.vii. Orig. before 1890. Flowering freely in July and sparingly again in August and September.

Similar but less handsome is *S. Fôxii* Zabel (*S. corymbosa* × *japonica*). Brts. striped, nearly glabrous: lvs. elliptic, glabrous: fls. smaller, whitish or pinkish, in large puberulous corymbs: follicles parallel, with spreading styles. Orig. before 1870.

33. *S. albiflora* (Miq.) Zab. Shrub to 0.5 m., with stiff upright brs.; brts. angled, glabrous: lvs. short-petioled, lanceolate, acuminate, cuneate, 6-7 cm. long, coarsely or sometimes doubly serrate, with callous-tipped teeth, glabrous and bluish green beneath: fls. white, in dense puberulous corymbs, the terminal one large with many smaller ones below; disk conspicuous: follicles glabrous, not or slightly diverging, with spreading styles; sepals reflexed. Fl.vii-viii. B.C.6:3212. (*S. leucantha* Lange, *S. japonica* var. *a.* Koidz., *S. jap. alba* Nichols.) Cult. in Japan. Intr. before 1868. Zone IV. Compact shrub with profusely produced white fls.

*S. a.* × *japonica*; see under No. 31.—*S. a.* × *amoena*; see under No. 31.—*S. a.* × *corymbosa*; see No. 35.—*S. a.* × *latifolia*; see under No. 41.—*S. a.* × *salicifolia*; see under No. 41.—*S. a.* × *Douglasii*; see under No. 42.

34. *S. bullata* Maxim. Upright shrub to 0.4 m.; brts. villous while young, brown: lvs. short-petioled, roundish-ovate to ovate, acute, 1-3 cm. long, incisely serrate, nearly glabrous, thickish and bullate, grayish green beneath: fls. deep rosy-pink in small and dense corymbs forming usually a terminal corymb 4-8 cm. across; stamens reddish, slightly longer than petals; carpels sometimes 6-8, with usually aborted styles. Fl.vii-viii. Gt.35:t.1216(c). (*S. crispifolia* Hort.) Japan. Cult. 1880. Zone V.

*S. b.* × *Bumalda* = *S. Lemoinei* Zab. Habit like *S. albiflora*: lvs. ovate, somewhat bullate: fls. rosy-pink. (*S. Bumalda ruberrima* Lemoine.) Orig. before 1892.

35. × *S. supérba* (Froebel) Zab. (*S. albiflora* × *corymbosa*). Low shrub with upright brs., nearly glabrous; brts. striped, dark brown: lvs. elliptic-oblong to oblong, acute at ends, 4-7 cm. long, simply or doubly serrate: fls. light rose, or whitish pink, 7-8 mm. across, in a solitary terminal corymb; stamens about twice as long as the suborbicular petals; disk conspicuous: follicles nearly glabrous, parallel; sepals reflexed. Fl.vi-vii. (*S. callosa* var. *superba* Froebel.) Cult. 1873.

*S. s.* × *japonica*; see No. 32.—*S. assimilis* Zab. (*S. Bumalda* × *splendens*.) Similar to No. 35: low shrub: lvs. ovate or elliptic, 3-6 cm. long, rather finely doubly serrate, light green and puberulous beneath: fls. small rosy-pink in a puberulous corymb. Orig. before 1890.

36. *S. betulifolia* Pall. Low much-branched shrub, sometimes to 1 m. high: brts. striped, red-brown, glabrous; buds ovoid, acutish: lvs. short-petioled, broad-oval to elliptic, rounded, rarely acutish at apex, broad-cuneate, rarely rounded at base, 2-4 cm. long, doubly or sometimes simply crenate-serrate, grayish green and reticulate beneath and glabrous or sometimes puberulous on the veins; petioles 1-3 mm. long: fls. white, in dense, glabrous corymbs 3-6 cm. across: follicles glabrous, parallel, with upright styles; sepals reflexed. Fl.vi. Pallas, Fl. Ross. 1:t.16(c). S.H.1:f.294n,295s-s'. N. E. Asia to C. Japan. Intr. 1812?, again in 1892. Zone IV?

Related species: *S. Fritschiana* Schneid. Upright shrub to 1, rarely 2 m.; brts. sharply angled, glabrous, lustrous purple-brown: lvs. elliptic or elliptic-ovate to elliptic-oblong, 3-8 cm. long, acute to acuminate, usually cuneate, coarsely simply or doubly serrate, pubescent beneath or nearly glabrous; petiole 2-8 mm. long: infl. 3.5-8 cm. across, dense; fls. white or pink in bud: follicles lustrous, glabrous except pilose on the ventral suture. N.K.4:t.6. (*S. koreana* Nakai, *S. angulata* Schneid.) C. China to Korea. Intr. 1919. Zone V.

37. *S. corymbosa* Raf. Low shrub, usually sparingly branched, rarely to 1 m.; brts. glabrous or puberulous, terete, purple-brown: lvs. suborbicular to

elliptic, acute or obtuse, rounded or broad-cuneate at base, 3-8 cm. long, coarsely and often doubly serrate above the middle, pale bluish green beneath and glabrous or nearly so; petioles 3-8 mm. long; fls. white, rather small, in dense, somewhat convex puberulous corymbs 3-10 cm. broad; follicles upright, glabrous and lustrous; sepals upright. Fl.vi-vii. L.B.671(c). W.D. 67(c). G.O.t.82(c). B.B.2:246. (*S. crataegifolia* Lk.) N. Y. to Ga. and Ky. Intr. 1819. Zone V.

*S. c.* × *japonica*; see under No. 32.—*S. c.* × *albiflora*; see No. 35.—*S. c.* × *latifolia*; see under No. 41.—*S. c.* × *Douglasii*; see under No. 42.—*S. c.* × *alba*; see under No. 44.

Related species: *S. virginiana* Brit. Slender shrub to 1.2 m.; brts. pubescent when young; lvs. oblong to oblanceolate, 3-5 cm. long, entire or with few teeth near apex, glabrous or finely pubescent on the veins; corymbs 3-5 cm. across, pubescent. B.B.2:246. Va. to N. C. and Tenn. Cult. 1907. Zone V?

38. *S. lucida* Greene. Upright, sparsely branched shrub to 1 m., glabrous; brts. yellowish brown or brown, terete; lvs. broad-ovate to ovate-oblong, usually acute, sometimes rounded at apex, rounded or broad-cuneate at base, 2-6 cm. long, coarsely serrate or doubly incised-serrate, entire at the lower third or sometimes the lower half, shining above, pale beneath; petioles 3-6 mm. long; fls. white, in rather dense flat glabrous corymbs 3-10 cm. across. Fl.vi-vii. B. C. to Sask., S. Dak., Wyo. and Ore. Cult. 1885. Zone V.

*S. l.* × *Menziesii*; see No. 41.

39. *S. densiflora* Nutt. Low shrub to 0.6 m.; brts. glabrous, terete, dark red-brown; lvs. very short-petioled, oval or elliptic, rounded at ends, rarely acutish, 1.5-4 cm. long, crenate or serrate above the middle, paler beneath; fls. rose-colored, in rather dense glabrous corymbs 1.5-4 cm. across; follicles glabrous, parallel; sepals ovate, obtuse, erect or spreading. Fl.vi. B. C. to Mont., Wyo. and Ore. Intr. 1894. Zone V.

Closely related species: *S. splendens* K. Koch. Taller, to 1.2 m.; young brts. puberulous; lvs. oval to elliptic-oblong, sometimes acute, serrate, or doubly serrate, with acuminate teeth, entire toward the base; corymbs finely puberulous or nearly glabrous; sepals triangular, acute. (*S. arbuscula* Greene, *S. rosea* Koehne, not Raf., *S. betulifolia* var. *rosea* Gray.) Ore. to Calif. Cult. 1875. Zone VI? Possibly only a variety of the preceding species.

*S. s.* × *Bumalda*; see under No. 35.—*S. s.* × *Douglasii*; see under No. 42.

Sect. III. SPIRARIA Ser. Infl. a dense panicle, longer than broad; fls. white to rose.

40. × *S. fontenaysii* Lebas (*S. canescens* × *salicifolia*). Upright shrub to 2 m., with slender brs.; brts. angled, pubescent while young; lvs. short-petioled, oval to elliptic-oblong, obtuse at ends, 2-5 cm. long, crenate-serrate above the middle, pale bluish green and nearly glabrous beneath; fls. white in pubescent pyramidal panicles 3-8 cm. long; its lower brts. 1-3 cm. long, leafless, terminated by a short and small panicle; petals about as long as stamens; follicles nearly glabrous, spreading. Fl.vi-vii. (*S. fontenaysiensis* Dipp.) Orig. before 1866.—*S. f. alba* Zab., f. is the white-fl. typical form; *S. f. rosea* Lebas has rose-colored fls.

Hybrids of similar character are: *S. brachybótrys* Lange. (*S. canescens* × *Douglasii*). Brts. angled, pubescent while young; lvs. narrow-elliptic to oblong, 3-4 cm. long, with a few teeth at apex or serrate above the middle, gray-tomentose beneath; fls. pale rose, in rather dense, usually leafy, less tomentose panicles 3-10 cm. long, with short lateral brts. (*S. pruinosa* Zabel, *S. luxuriosa* Lav.) Orig. before 1867.—*S. microthýrsa* Zab. (*S. alba* × *media*). Glabrous; brts. terete; lvs. obovate to oblong or lanceolate, acute or obtuse, 4-6 cm. long, sharply serrate; fls. white, 6-7 mm. across, slender-pedicel, in rather small glabrous panicles to 4 cm. long or sometimes in few-fl. racemes; petals as long as stamens. Orig. before 1890.—*S. brumális* Lange. (*S. alba* × ? *amoena*). Brts. puberulous; lvs. oblong-elliptic to oblong, acute at ends, 4-7 cm. long, sharply

and often doubly serrate, glaucescent and nearly glabrous below: fls. white, slightly pinkish; infl. a broad terminal panicle with many smaller ones below on leafy brts. Orig. before 1882.

41.  $\times$  *S. pyramidalata* Greene (*S. lucida*  $\times$  *Menziesii*). Upright shrub to 1 m.; brts. glabrous, terete, red-brown: lvs. elliptic to oblong, obtuse or acutish, 3-8 cm. long, coarsely and sometimes doubly serrate above the middle, rarely below, glabrous or nearly so; petioles 2-5 mm. long: fls. white or pinkish in rather dense pyramidal, puberulous or sometimes glabrous panicles. Fl.vii. Occasionally with the parents from B. C. to Ore. and Idaho. Intr. 1911. Zone V.

Hybrids of similar character are: *S. conspicua* Zab. (*S. albiflora*  $\times$  ? *latifolia*). Brts. slightly angled: lvs. elliptic-oblong, acute at ends, sharply serrate, nearly glabrous: fls. pinkish white, in broad-pyramidal puberulous panicles; stamens somewhat longer than petals. Orig. about 1875.—*S. syringaeiflora* Lemoine (*S. albiflora*  $\times$  *salicifolia*). Brts. slightly angled: lvs. oblong-lanceolate to lanceolate, acuminate, serrate above the middle, nearly glabrous beneath: fls. pink in pyramidal tomentulose panicles, usually with smaller panicles below; stamens twice as long as petals. Orig. before 1885.—*S. semperflorens* Zab. (*S. japonica*  $\times$  *salicifolia*). Brts. terete: lvs. oblong-lanceolate, sharply and doubly serrate, glaucescent and nearly glabrous beneath: fls. rose-pink, rather large, in much-branched, broad-pyramidal puberulous panicles; stamens nearly twice as long as petals. (*S. kamaonensis* var. *spicata* Billiard.) Cult. 1870.—*S. notha* Zab. (*S. corymbosa*  $\times$  *latifolia*). Lvs. oval or ovate to elliptic, obtuse or acutish, broad-cuneate or rounded at base, 3-6 cm. long, coarsely or doubly serrate, glabrous or nearly so: fls. white or pinkish, in pyramidal glabrous panicles; stamens almost twice as long as petals. Orig. before 1890.

42.  $\times$  *S. sanssouciàna* K. Koch (*S. Douglasii*  $\times$  *japonica*). Shrub to 1.5 m.; brts. tomentulose while young, striped: lvs. oblong to oblong-lanceolate, usually obtusish, cuneate, 6-9 cm. long, coarsely and often doubly serrate, entire at the lower third or lower half, pale green and tomentulose beneath: fls. rose, in terminal tomentulose corymbs, composed of dense pyramidal obtuse panicles; stamens nearly twice as long as petals: follicles slender, glabrous, parallel, with spreading style; sepals recurved. Fl.vii-viii. B.M.5169(c). I.H.8:286,t(c). Gn.12:189. (*S. Nobleana* Hook., *S. japonica paniculata* Hort.) Orig. before 1857.

Hybrids of similar character are: *S. Watsoniana* Zab. (*S. Douglasii*  $\times$  *splendens*). Lvs. elliptic-oblong to oblong, acute or obtusish, usually rounded at base, serrate usually only above the middle, grayish tomentulose beneath: fls. rose, in dense pyramidal tomentulose panicles: follicles small. (*S. Nobleana* Zab., not Hook., *S. subvillosa* Rydb.) Orig. in cult. before 1890, also found wild in Ore.—*S. pachystachys* Zab. (*S. corymbosa*  $\times$  *Douglasii*). Similar to the preceding, but lvs. broader, elliptic to elliptic-oblong, rounded at base, very short-petioled: fls. light rose: follicles longer than the reflexed sepals. Orig. before 1878.—*S. intermedia* Lemoine (*S. albiflora*  $\times$  *Douglasii*). Similar to *S. syringaeiflora*, but the lvs. tomentulose beneath.—*S. rubra* Zab. (*S. amoena*  $\times$  *Douglasii*). Lvs. oblong-lanceolate, 7-9 cm. long, simply or doubly serrate toward the apex, grayish tomentulose beneath; petioles to 8 mm. long: fls. deep rose, in broad-pyramidal or ovoid tomentose panicles: follicles pubescent. (*S. ruberrima* Dipp., *S. expansa rubra* Hort.) Orig. before 1885.

43. *S. salicifolia* L. Strictly upright shrub with slightly angled yellowish brown brts. puberulous when young: buds small, ovoid, scaly: lvs. short-petioled, oblong-lanceolate to lanceolate, acute at ends, 4-7 cm. long, sharply and closely, sometimes doubly serrate, glabrous and light green beneath: fls. rose, in slender pyramidal pubescent panicles with ascending brs.; calyx puberulous; stamens nearly twice as long as petals: follicles nearly parallel, ciliate on the inner suture, with recurved style; sepals ascending. Fl.vi-vii. S.O.1:t.50(c). R.I.24:t.152(c). S. E. Eu. to N. E. Asia, and Japan. Cult. 1586. Zone IV. Spreading by suckers; attractive in summer with its elon-

gated panicles of rose-colored fls.—*S. s. grandiflora* Loud., var. With larger, light pink fls. L.B.1988(c). Intr. 1826.

*S. s. × alba* = *S. rosálba* Dipp. Lvs. generally lanceolate: fls. light rose, in panicles slender toward the apex, broad at base. Cult. 1892.—*S. s. × latifolia* = *S. rubella* Dipp. Similar to the preceding, but lvs. broader. Cult. 1892.—*S. s. × canescens*; see No. 40.—*S. s. × albiflora*; see under No. 41.—*S. s. × japonica*; see under No. 41.—*S. s. × Douglasii*; see No. 47.

44. *S. alba* Du Roi. Upright shrub to 2 m.; brts. puberulous while young, reddish brown, angled: lvs. short-petioled, oblong to narrow-oblong, acute at ends, 3–6 cm. long, sharply serrate, puberulous on the veins beneath or nearly glabrous: fls. white, in leafy pyramidal tomentulose panicles, broad at base; stamens white, longer than the petals: follicles glabrous; sepals upright. Fl.vi–viii. W.D.133(c). B.B.2:245. (*S. salicifolia* var. *paniculata* Ait., *S. lanceolata* Borkh.) N. Y. to Mo., s. to Ga. and Miss. Intr. 1759. Zone IV.

*S. a. × corymbosa* = *S. difformis* Zab. Lvs. elliptic to lanceolate-oblong, serrate, glabrous or nearly so: fls. white, in a wide-spreading nearly glabrous panicle. Gn.84:348. Orig. about 1875.—*S. a. × media*; see under No. 40.—*S. a. × amoena*; see under No. 40.—*S. a. × salicifolia*; see under No. 43.—*S. a. × Douglasii*; see under No. 47.—*S. a. × tomentosa*; see under No. 49.

45. *S. latifolia* (Ait.) Borkh. Shrub to 1.5 m.; brts. glabrous, bright or dark red-brown, angled; lvs. short-petioled, broad-elliptic or obovate to oblong, acute at ends, rarely obtuse at apex, 3–7 cm. long, coarsely and often doubly serrate, glabrous and slightly bluish beneath: fls. white or slightly pinkish, in glabrous broad-pyramidal panicles; stamens longer than petals; disk usually pinkish: follicles glabrous, with spreading style. Fl.vi–viii. W.D.66(c). Em. 485,t(c). G.C.43:417. (*S. salicifolia* var. *l.* Ait., *S. carpinifolia* Willd., *S. canadensis* Hort., *S. bethlehemensis* Hort., partly.) Nfd. and Can. to N. C. Cult. 1789. Zone II.

*S. l. × albiflora*; see under No. 41.—*S. l. × corymbosa*; see under No. 41.—*S. l. × salicifolia*; see under No. 43.—*S. l. × Douglasii*; see under No. 47.

46. *S. Menziesii* Hook. Upright shrub to 1.5 m.; brts. puberulous when young, striped, brown, older ones dark purple: lvs. oblong-obovate to oblong, obtuse at ends, sometimes acute, 3–7 cm. long, coarsely and unequally serrate above the middle; pale green and glabrous or puberulous on the veins beneath; petioles 3–5 mm. long: fls. small, rose, in rather narrow and dense pubescent panicles 10–20 cm. long; stamens more than twice as long as petals: follicles glabrous, with spreading styles; sepals reflexed. Fl.vi–viii. (*S. Douglasii* var. *M.* (Hook.) Presl.) Alaska to Ore. Intr. 1838. Zone V. Handsome shrub with rose-colored flowers in summer.

*S. M. × lucida*; see No. 41.

47. *× S. Billiardii* Herincq (*S. Douglasii* × *salicifolia*). Shrub to 2 m.; brts. pubescent, brown; lvs. short-petioled, oblong to oblong-lanceolate, acute at ends, 5–8 cm. long, sharply and often doubly serrate except at the lower third, usually grayish tomentulose beneath, at least when young: fls. bright rose, in tomentulose, usually rather narrow and dense panicles 10–20 cm. long; stamens nearly twice as long as petals: follicles glabrous, parallel, with spreading styles. Fl.vi–viii. H.F.1855:t.2(c). F.E.18:613(h). (*S. Menziesii* Zab., in part.) Orig. before 1854. Zone IV. Here belong probably *S. Lenneana*, *S. triumphans*, *S. eximia*, *S. Constantiae* Hort.

Similar hybrids: *S. fulvescens* Dipp. (*S. alba* or *tomentosa* × *Douglasii*). Brts. yellowish tomentose: lvs. grayish or whitish tomentose beneath, sharply serrate above the middle, thinly tomentulose above, with fascicles of small lvs. in the axils of the upper lvs.: fls. bright rose in rather narrow panicles. (*S. Menziesii* f. *erriophylla* Zab.) Orig. before 1885.—*S. macrothyrsa* Dipp. (*S. Douglasii* × *latifolia*). Lvs. elliptic to obovate-elliptic, nearly glabrous above,

tomentulose and light green beneath: fls. bright pink, in dense panicles with almost horizontally spreading brs. (*S. Menziesii* var. *m.* Zab.) Cult. 1870.

48. *S. Douglásii* Hook. Shrub to 2.5 m.; brts. tomentose, reddish brown, striped: lvs. oblong to narrow-oblong, obtuse or acutish at ends, 3-10 cm. long, unequally serrate above the middle, white-tomentose beneath; petioles 2-4 mm. long: fls. deep rose, in rather narrow or sometimes broad tomentose panicles 10-20 cm. long; stamens twice as long as the obovate petals: follicles glabrous, lustrous, with upright-spreading style; sepals recurved. Fl.vii-viii. B.M.5151(c). F.S.2:t.66(c). R.H.1846:101,t(c). B. C. to Calif. Intr. 1827. Zone IV. Spreading by suckers, with large panicles of rosy pink fls.

*S. D.* × *canescens*; see under No. 40.—*S. D.* × *japonica*; see No. 42.—*S. D.* × *splendens*; see under No. 42.—*S. D.* × *corymbosa*; see under No. 42.—*S. D.* × *albiflora*; see under No. 42.—*S. D.* × *amoena*; see under No. 42.—*S. D.* × *salicifolia*; see No. 47.—*S. D.* × *alba* or *tomentosa*; see under No. 47.—*S. D.* × *latifolia*; see under No. 47.

49. *S. tomentosa* L. HARDHACK. Upright shrub to 1.2 m.; brts. brownish tomentose, angled; lvs. ovate to ovate-oblong, acute, 3-7 cm. long, unequally and often doubly serrate, rugulose above, yellowish or grayish tomentose beneath; petioles 1-4 mm. long: fls. deep rose or rose-purple, in narrow and dense, brownish tomentose panicles 8-20 cm. long; stamens somewhat longer than the obovate petals: follicles pubescent, usually diverging; sepals reflexed. Fl.vii-ix. S.O.1:t.51(c). Em.485,t(c). B.B.2:245. G.M.5:344. N. Scotia to Ga., w. to Man. and Kans. Intr. 1736. Zone IV.—*S. t. alba* West., var. Fls. white. F.E.8833. Gng.5:149. (*S. t. f. albiflora* Macbr.) Cult. 1770.

*S. t.* × *Menziesii* = *S. pallidiflora* Zab. Lvs. elliptic-oblong, abruptly acute, serrate only above the middle, light brownish tomentose beneath: fls. light pink: follicles sparingly pubescent, more densely on the ventral suture. Orig. before 1870.—*S. t.* × *Douglasii*; see under No. 47.—The spontaneous hybrid *S. subcanescens* Rydb. (*S. alba* × *tomentosa*) is probably not in cult.

5. **PENTACTINA** Nakai. Deciduous shrub; winter-buds with several outer pubescent scales: lvs. alternate, subsessile, dentate, estipulate: fls. perfect, small, in pendulous panicles; sepals 5; petals 5, linear, involute in bud; stamens 20; pistils 5, free, 2-ovuled: follicles glabrous, dehiscent on both sutures; seed spindle-shaped, brown. (Greek *penta-* five, *actine*, ray; referring to the 5 linear petals.) One species in Korea.

*P. rupicola* Nakai. Decumbent shrub, to 0.7 m.; brts. angled, glabrous; lvs. elliptic to oblanceolate, acute at ends, 2-3 cm. long, with few coarse teeth, glaucescent and sparingly pilose beneath: fls. in elongated panicles 6-8 cm. long; pedicels about 1 mm. long; sepals triangular, reflexed in fr.; petals linear, 5 mm. long; stamens short, white. Fl.vi; fr.ix. Nakai, Rep. Veg. Diamond Mts. t.1. Intr. 1918. Zone V. Suited for rockeries.

6. **SIBIRAEÆ** Maxim. Deciduous shrubs; buds with 2-4 exposed scales, glabrous: lvs. alternate, subsessile, narrow, entire, estipulate, involute in bud: fls. polygamo-dioecious, small, short-pedicelled, in terminal panicle racemes; calyx-tube campanulate; sepals short, erect; petals roundish-obovate, longer than sepals; stamens about 25, longer than petals in the stam. fls., half as long in the pist. fls.; pistils usually 5, connate at base: follicles oblong, upright, dehiscent along the whole ventral suture and on the dorsal one near apex; seeds usually 2, rather large, aluminous. (Name from Siberia, the habitat of the type species.) Two species in Siberia, W. China and S. E. Eu.

*S. laevigata* (L.) Maxim. Shrub to 1.5 m., with stout upright terete and glabrous purple- or red-brown brs.: lvs. cuneate-oblong, obtuse or acutish,

usually mucronulate, 4-10 cm. long, gradually narrowed at base, bluish green, glabrous; fls. white, in glabrous panicles 8-12 cm. long: follicles parallel, about 4 mm. long. Fl.v. G.O.t.89(c). S.O.2:t.49(c). S.B.2:537. S.H.1:f. 297e-f<sup>1</sup>, 298i-p. (*Spiraea* L. L., *Sibiraea altaiensis* Schneid.) Siberia. Intr. 1774. Zone IV.—*S. l. angustata* Rehd., var. Lvs. narrow-lanceolate or oblanceolate, rarely oblong, acute; infl. puberulous. W. China. Intr. 1908. Zone V.—*S. l. croatica* (Degen) Schneid., var. Lvs. obtuse, sessile or subsessile: sepals acute, triangular. S. E. Eu. Cult. 1933.

Closely related species: *S. tomentosa* Diels. Shrub to 0.6 m.: lvs. oblong-obovate to oblanceolate, acute and mucronate, densely silky tomentose beneath, glabrous above: fls. greenish yellow, in dense panicles about 5 cm. long. S. W. China. Intr. 1915.

**7. PETROPHYTUM** Rydb. Low evergreen prostrate subshrub: lvs. crowded, generally spatulate, entire, estipulate: fls. small, white, short-pediceled, in terminal racemes, sometimes branched at base; sepals 5, valvate; petals 5, imbricate; stamens about 20; disk entire; pistils 3-5, hairy; style slender, longer than stamens: follicles leathery, dehiscent on both sutures; seeds few linear. (Greek *petros*, rock, and *phyton*, plant; alluding to the habitat of the plant.) Five species in W. N. Am.

*P. caespitosum* (Nutt.) Rydb. Densely caespitose, forming flat patches on rocks: lvs. oblanceolate, obtuse and mucronulate, 6-15 mm. long, 1-ribbed, silky-pubescent: fls. small, white, in dense upright spikes 1.5-4 cm. long, on upright peduncles 2-8 cm. long; petals spatulate, obtuse, 1.5 mm. long; stamens exserted. Fl.vii-viii. Bot. Gaz. 15:t.14. S.H.1:f.297c-d<sup>1</sup>. S.L.37(h). N.F.11:f.97(h). (*Spiraea caespitosa* Nutt., *Eriogynia* c. S. Wats., *Luetkea* c. Ktze.) Mont., S. Dak. to Calif. and N. Mex. Cult. 1900. Zone V. Adapted for rockeries; likes limestone soil.

Related species: *P. cinerascens* (Piper) Rydb. Lvs. oblanceolate, 3-ribbed, 1-2.5 cm. long, gray, pilose: infl. short and dense. N.F.11:f.98(h). Wash. Cult. 1937. Zone VI?

**8. LUETKEA** Bong. Caespitose undershrub with stoloniferous creeping stems: lvs. alternate, usually twice trifid, estipulate: fls. small, short-pediceled, in upright racemes; sepals 5, acute, valvate; petals 5, oval, contorted in bud; stamens 20, shorter than petals; disk 10-lobed; pistils 5, as long as stamens: follicles dehiscent on both sutures; seeds several, linear-lanceolate. (After Fr. Luetke [Fedor Petrovich Litke], sea captain, in command of the fourth Russian voyage around the world [1826-29]; 1779-1882.) One species.

*L. pectinata* (Pursh) Ktze. Glabrous undershrub with long trailing brs. forming dense carpets: lvs. twice or simply trifid, with linear 3-pointed lobes, with the margined slender petiole 1-2 cm. long, bright green: fls. white, 8 mm. across, in racemes 2-5 cm. long, terminating ascending leafy brts. Fl.vii-viii. (v-vi in cult.) Bot. Gaz. 15:t.14. Hooker, Fl. Bor. Am. t.88. (*Spiraea* p. Torr., *Eriogynia* p. Hook.) Alaska to Calif., high mtns. Cult. 1890. Zone V. Adapted for rockeries; similar to *Saxifraga decipiens*.

**9. SORBARIA** A. Br. Deciduous shrubs; brts. terete: buds ovoid, with several scales: lvs. alternate, large, pinnate, with serrate lfts., stipulate: fls. small, white, in large terminal panicles; calyx-tube cup-shaped; sepals 5, broad and short, reflexed; petals 5, oval to orbicular, imbricate; stamens 20-50, nearly as long or longer than petals; carpels 5, opposite to sepals, connate at base; follicles dehiscent on the ventral suture; seeds several. (From Sorbus; the lvs. resembling those of the Mountain-Ash.) Syn.: *Basi-*

*lima* Raf., *Schizonotus* Lindl. Seven species in E. Asia.—Rather large shrubs with pinnate bright green lvs. and conspicuous panicles of white fls.

- a. Lfts. doubly and sharply serrate, usually more than 1.5 cm. wide.  
 b. Panicle with upright brs., rather dense: frs. upright.  
 c. Stamens 40-50; lfts. with usually 20 pairs of veins.....1. *S. sorbifolia*  
 cc. Stamens about 20; lfts. with 25 or more pairs of veins.....2. *S. assurgens*  
 bb. Panicle with spreading brs., loose: frs. on recurved pedicels.  
 c. Lfts. with mostly simple hairs beneath when young; stamens as long as petals.  
 3. *S. tomentosa*  
 cc. Lfts. with stellate hairs beneath or glabrous; stamens longer than petals.  
 4. *S. arborea*

aa. Lfts. simply or nearly simply serrate, less than 1.5 cm. wide, glabrous....5. *S. Aitchisonii*

1. *S. sorbifolia* (L.) A. Br. Upright shrub, to 2 m., with stout stems; brts. glabrous or puberulous: lfts. 13-23, lanceolate or ovate-lanceolate, long-acuminate, 5-10 cm. long, doubly serrate, usually glabrous or nearly so beneath: fls. about 8 mm. across, in panicles 10-25 cm. long, more or less puberulous; stamens twice as long as petals; calyx glabrous: follicles glabrous, with terminal recurved style. Fl.vi-vii. S.O.1:t.58(c). Gn.23:248. F.E.30:777(h). (*Spiraea* s. L., *Sp. tobolskiana* Hort., *Basilima* s. Raf.) N. Asia from Ural to Japan; sometimes escaped from cult. Cult. 1759. Zone II. One of the first shrubs to burst into leaf in spring; freely spreading by suckers.—*S. s. stellipila* Maxim., var. Lvs. beneath more or less stellate-pubescent: pedicels and calyx puberulous: follicles pubescent. N.K.4:t.1. G.W.15:651(h). (*S. s.* Schneid.) E. Asia. Cult. 1900.

Closely related species: *S. grandiflora* (Sweet) Maxim. Shrub to 1 m.: lfts. fewer, acute or acutish, obtusely doubly serrate, glabrous: fls. larger, in a rather few-fld. corymbose inf.; stamens as long as petals. Gt.9:t.295(c). (*Spiraea sorbifolia* var. *alpina* Pall., *Spiraea* g. Sweet.) E. Siber. Intr. 1852. Zone II?

2. *S. assurgens* Vilm. & Bois. Shrub to 3 m., with upright or ascending stems: lfts. 13-17, oblong-lanceolate to narrow-lanceolate, long-acuminate, often falcate, 5-8 cm. long, sharply doubly serrate, pubescent on the veins beneath or nearly glabrous, with 25 or more pairs of veins: panicle 10-16 cm. long, less dense than in the first species: calyx glabrous; stamens slightly longer than petals: follicles with terminal slightly recurved or spreading style, glabrous. Fl.vii. S.L.343(h). M.G.32:169(h). China? Intr. 1896. Zone V. Similar in habit to No. 3.

3. *S. tomentosa* (Lindl.) Rehd. Shrub to 6 m., with wide-spreading brs.; brts. and petioles glabrous or nearly so: lfts. 15-21, lanceolate to narrow-lanceolate, long-acuminate, 5-10 cm. long, doubly serrate, with simple hairs on the veins beneath while young: fls. about 6 mm. across, in loose puberulous panicles with spreading brs., 20-30 cm. long and 15-20 cm. broad; stamens about as long as petals: follicles glabrous, 2.5 mm. long, with terminal reflexed style, on recurved pedicels. Fl.vii-viii. F.S.2:t.108. B.R.31:33(c). G.C.43:415(h). Gn.86:29(h);87:285(h). (*S. Lindleyana* Maxim., *Spiraea* L. Wall.) Himal. Cult. 1840. Zone VII. Graceful shrub with large often nodding panicles.

4. *S. arborea* Schneid. Spreading shrub to 6 m.; brts. and petioles usually slightly stellate-pubescent: lfts. 13-17, ovate-oblong to lanceolate, long-acuminate, 4-10 cm. long, sharply doubly serrate, stellate-pubescent or nearly glabrous beneath: fls. 6 mm. across, in large panicles similar to those of the preceding species: stamens much longer than petals: follicles with the spreading style below the apex, on recurved pedicels. Fl.vii-viii. Gn.88:126. G.M. 61:603. G.35:697. C. and W. China. Intr. 1908. Zone V. Similar to the preceding species, but much hardier.—*S. a. subtomentosa* Rehd., var. Brts. and petioles pubescent: lfts. elliptic-oblong, to oblong-lanceolate, densely

stellate-pubescent or tomentose beneath, with close-set veins. W. China.—*S. a. glabrata* Rehd., var. Brts. and petioles glabrous, often purplish: lfts. lanceolate to narrow-lanceolate, glabrous; stamens 2-3 times as long as petals.

5. *S. Aitchisoni* Hemsl. Shrub to 3 m. with upright or ascending stems; brs. glabrous, usually bright red when young: lfts. 15-21, lanceolate to linear-lanceolate, acuminate, cuneate at base, 4-8 cm. long and about 1 cm. broad, simply or slightly doubly serrate, quite glabrous: fls. about 1 cm. across, in upright glabrous panicles 20-25 cm. long and 10-15 cm. wide, leafy at base: follicles with recurved terminal style; stamens longer than petals. Fl.vii-viii. G.C.28:255;38:114;43:397. Gn.68:143;77:560. Gn.M.9:75(h). (*S. angustifolia* Zab., *Spiraea* A. Hemsl.) Afghan., Kashmir. Intr. 1895. Zone (V) VI. Handsome shrub, the bright green graceful foliage contrasting well with the bright red stems and petioles.

10. *CHAMAEBATIARIA* Maxim. Deciduous upright shrub, stellate-pubescent and glandular: lvs. alternate, bipinnatisect, with numerous minute segments; stipules lanceolate, entire: fls. white, in terminal panicles; calyx-tube turbinate, with 5 erect sepals; petals 5, suborbicular, upright; stamens about 60, inserted at the margin of the disk; carpels 5, pubescent, connate at base, 6-8-ovuled: follicles dehiscent on the ventral suture and at the apex on the dorsal one: seeds few, terete. (Name in allusion to the similarity of the plant to *Chamaebatia*.) One species.

*C. Millefolium* (Torr.) Maxim. Aromatic shrub to 1.5 m.: lvs. short-petioled, ovate-oblong to oblong-lanceolate in outline, 2-7 cm. long, the primary segments linear, deeply pinnatisect with close-set obtuse segments 1-2 mm. long and occasionally toothed: fls. about 1.5 cm. across, short-pedicel, in tomentose leafy panicles 8-15 cm. long; sepals lanceolate: follicles pubescent or nearly glabrous, about 5 mm. long, with upright style. Fl.vii-viii. B.M.7810(c). G.F.2:509. G.C.40:183. Gn.88:73. M.D.1905:t.11(h). M.G.23:208(h). (*Spiraea* M. Torr., *Sorbaria* M. Focke.) Idaho and Nev. to Ariz. and Calif. Cult. 1878. Zone V. Shrub with aromatic glandular pubescence; retaining a few lvs. at the end of the brts. during the winter and leafing early in spring; prefers sunny and well drained position.

11. *EXOCHORDA* Lindl. Deciduous shrubs; buds ovoid, pointed, glabrous, with imbricate scales: lvs. alternate, petioled, entire or serrate, estipulate or occasionally with small caducous stipules: fls. white, rather large, in terminal racemes; calyx-tube broad-turbinate; sepals 5, very short and broad; petals 5, broadly obovate, clawed, imbricate; stamens 15-30, inserted at the margin of the large disk, with short filaments; carpels 5, connate: fr. a 5-angled deeply furrowed caps. separating into 5 bony, 1-2-seeded carpels dehiscent along both sutures; seeds winged. (Greek *exo*, external, and *chorde*, chord; referring to the fibres on the external part of the placenta.) Four species from C. Asia to Korea.—Handsomeness slender-branched shrubs with large white fls. in terminal racemes; they belong to our most striking and graceful spring-flowering shrubs.

A. Stamens 15-25, 3-5 in front of each petal; pedicels of the lower fls. to 5 mm. long; petals abruptly narrowed into a short claw; petioles 5-15 mm. long. .... 1. *E. racemosa*

AA. Stamens 20-30; fls. short-pedicel or nearly sessile; petals gradually narrowed into the claw. ....

B. Lvs. of shoots without stipule-like appendages, oval to elliptic-oblong, broad-cuneate at base. .... 2. *E. Givaldii*

BB. Lvs. of shoots at least partly with stipule-like appendages, oblong to obovate-oblong, gradually narrowed into the petiole. .... 3. *E. Korolkowii*

1. *E. racemosa* (Lindl.) Rehd. Slender spreading shrub to 3 or rarely 5 m., glabrous; lvs. elliptic to elliptic-oblong or oblong-obovate, acute and mucronate, cuneate, 3-6 cm. long, entire or on vigorous shoots serrate above the middle, whitish beneath: fls. white, 4 cm. across, in 6-10-fld. racemes; the lower pedicels to 5 mm. long, the upper shorter; petals suborbicular with a very short claw: fr. broad-turbinate or nearly subglobose, 8-10 mm. long. Fl. iv-v. B.M.4795(c). L.I.t.11,12. Gt.47:t.1455(c). G.C.III.7:613. Gn.62:161(h). Gng.5:97(h). F.E.31:971(h). M.G.21:561(h). (*E. grandiflora* Hook.) E. China. Intr. 1849. Zone IV.—*E. r. prostrata* (Schwer.) Rehd., var. With prostrate brs. (*E. grandiflora* var. *p.* Schwer.)—*E. r. dentata* (Chenault) Rehd., var. Young brts., lvs. on midrib beneath and rachis of infl. slightly pubescent: lvs. more often serrate. Cult. 1913.

*E. r. × Korolkowii* = *E. macrantha* Schneid. Differs chiefly in its more upright habit and in the somewhat larger short-stalked fls. with about 20 stamens. R.H.1903:18(h), 65. M.G.17:485(h). G.W.16:449. B.S.1:549. Orig. 1900.

2. *E. Giraldii* Hesse. Similar to the preceding: lvs. elliptic to ovate-oblong, acute, broad-cuneate, 4-6 cm. long, entire, rarely crenate-serrate above the middle; petioles 1.2-2.5 cm. long, often red: fls. subsessile or the lower ones short-stalked; petals obovate, gradually narrowed into the claw; calyx often reddish inside; stamens 20-30; caps. turbinate, 1-1.3 cm. long. Fl. v. B.S.1:548. M.D.1909:295. G.W.16:450. (*E. racemosa* var. *G.* Rehd.) N. W. China. Intr. about 1897. Zone IV. Handsomer than No. 1; particularly var. *Wilsonii* which is of more upright habit and more floriferous.—*E. G. Wilsonii* (Rehd.) Rehd., var. Lvs. elliptic to oblong, occasionally serrate; petioles 1-2 cm. long, green: fls. 5 cm. across; stamens 20-25: caps. to 1.5 cm. long. (*E. racemosa* var. *W.* Rehd.) C. China. Intr. 1907. Zone V.

Related species: *E. serratifolia* S. Moore. Shrub to 2 m.: lvs. elliptic, 5-9 cm. long, 3-5 cm. broad, sharply serrate, usually entire below the middle, slightly pubescent beneath at least when young; petiole 1-2 cm. long: fls. about 4 cm. across; petals oblong-obovate, emarginate; stamens 25. N.K.4:t.2: Manch. and Korea. Intr. 1918. Zone IV?

3. *E. Korolkowi* Lav. Upright slender-branched shrub to 4 m., glabrous: lvs. oblong to obovate-oblong, acute or rarely obtusish, mucronulate, 4-7 cm. long, entire or on stronger shoots often serrate above the middle, and at base with 1 or 2 small narrow lobes, gradually narrowed into a petiole 5-15 mm. long: fls. 3-4 cm. across, subsessile, in 5-8-fld. racemes; petals narrow-obovate; stamens 25: caps. about 1.5 cm. long, globose-ovoid, pointed. Fl. iv-v. G.W.16:451. G.31:505. (*E. Alberti* Regel, *E. grandiflora* var. *A.* Aschers. & Graebn.) Turkest. Intr. 1878. Zone V. Of more upright habit and less floriferous; one of the first shrubs to burst into leaf.

12. **HOLODISCUS** Maxim. Deciduous shrubs, more or less pubescent; buds small, ovoid, with several pubescent scales: lvs. alternate, petioled, incisely serrate or lobulate, estipulate: fls. very small, in terminal panicles or rarely racemes; calyx-tube cup-shaped; sepals 5, valvate in bud, upright in fr.; petals oval or elliptic, short-clawed, little longer than sepals; stamens 15-20, usually slightly longer than petals; disk entire; pistils 5, distinct, developing into short-stipitate, hairy 1-seeded achenes indehiscent and strongly convex on the lower suture; seeds broad-oblong. (Greek *holos*, entire, and *diskos*, disk, referring to the entire disk of the fl.) Syn.: *Schizonotus* Raf., not Lindl., *Sericotheca* Raf. About 14 closely related species have been distinguished ranging from B. C. to Idaho, Colo. and N. Mex. and s. through Mex. to Colombia.

**H. discolor** (Pursh) Maxim. Shrub to 4 m., with spreading and arching brs.: lvs. broad-ovate to ovate, acute, truncate or sometimes broad-cuneate at base, 4-10 cm. long, doubly dentate and lobulate, with broad-ovate teeth, sparingly pubescent and finally glabrous or nearly so above, densely pubescent or whitish tomentose beneath; petioles 1-2 cm. long; fls. creamy white, about 4 mm. across, in ample drooping panicles 8-20 cm. long and 5-15 cm. wide; sepals ovate or ovate-oblong, obtusish; follicles semi-ovate, 1.5 mm. long, with a beak of the same length. Fl.vii. B.R.1635(c). G.F.4:617. B.S. 2:533. G.C.60:233;106:93(h). Gn.87:286(h). (*Spiraea d.* Pursh, *Sericotheca d.* Rydb.) B. C. to Calif., Idaho and Mont. Intr. 1827. Zone V. Handsome in bloom with its large panicles of creamy white fls. on slender arching brs.—**H. d. ariaefolius** (Sm.) Aschers & Graebn. (*Spiraea a.* Sm.) is the commonly cult. form and has the lvs. grayish green and pubescent below, while the type has the lvs. whitish tomentose below.

Closely related species: **H. dumosus** (Nutt.) Heller. Upright shrub to 5 m.: lvs. generally obovate, cuneate and decurrent at base, 2-5 cm. long, pubescent above, whitish tomentose below: panicle ovoid, narrow, 5-20 cm. long. Bull. Torr. Bot. Club, 25:338. (*H. australis* Heller, *H. discolor* var. *d.* Dipp., *Spiraea dumosa* Nutt.) Wyo. and Utah to N. Mex. and Mex. Intr. 1879. Zone V.—**H. Boursieri** (Carr.) Rehd. Shrub to 1 m.: lvs. flabellate or suborbicular, abruptly contracted into a short winged petiole, rounded at apex, 1-3 cm. long, grayish beneath: inf. 5-7 cm. long, simple or with few short brs. R.H.1859:519. (*Spiraea B.* Carr.) Calif., Nev. Intr. 1853, but apparently not now in cult.—**H. microphyllus** Rydb. Shrub to 1 m.: lvs. elliptic to obovate, 1-1.5 cm. long, cuneate, serrate, finely pubescent above, white silky-villous beneath: inf. 3-7 cm. long, with few spreading brs. Colo. to Wyo. and Utah. Intr. 1922. Zone V?

Subfam. II. POMOIDEAE Focke. Trees or shrubs: lvs. simple or pinnate, stipulate: fls. solitary or in umbels, racemes, panicles or corymbs; carpels 2-5, usually 2-ovuled, more or less united and adnate to the cup-shaped calyx-tube, forming an inferior ovary: fr. a fleshy pome. (*Pomaceae* Loisel., *Mala-ceae* Small.)

**13. COTONEASTER** B. Ehrh. Deciduous or evergreen shrubs or rarely small trees; buds small, with several imbricate scales: lvs. alternate, short-petioled, entire, with mostly subulate, caducous stipules: fls. white or pinkish, in few to many-fl. corymbs, sometimes solitary, terminal on short lateral brts.; calyx-tube usually turbinate; sepals 5, short; petals upright or spreading, imbricate in bud; stamens about 20; styles 2-5, distinct, carpels more or less connate except on the ventral side; carpels 2-ovuled: fr. a red or black small pome crowned by the persistent calyx-lobes, with 2-5 nutlets. (Latin *cotonea* (*cydonia*), quince, and *aster*, a suffix meaning "kind of"; the lvs. of some species resemble those of the quince.) About 50 species in the temp. regions of Eu., N. Afr. and Asia except Japan.—Ornamental shrubs much planted on account of their attractive frs. and some species also for their white spirea-like fls.

- a. Petals upright, small, obovate, usually pinkish, solitary or in few-fl. or many-fl. and nodding corymbs: frs. red or black.....Sect. I. ORTHOPETALUM Koehne.
- b. Fr. red (or purplish black in No. 6).....
- c. Lvs. glabrous or sparingly pubescent and green beneath, 5-30 mm. long: fls. 1-3, rarely 4: pubescence of brts. strigose.
- d. Habit prostrate.
  - e. Stems appressed to the ground, irregularly branched: lvs. usually wavy at the margin.....1. *C. adpressa*
  - ee. Stems horizontally spreading very regularly distichously branched: lvs. not wavy.....2. *C. horizontalis*
- dd. Habit upright.
  - e. Lvs. dull green above, pubescent when young.
  - f. Fls. usually solitary: calyx glabrous.....3. *C. disticha*
  - ff. Fls. 2-4: calyx pubescent.....4. *C. Simonsii*
  - ee. Lvs. lustrous above.
  - f. Fr. bright red: lvs. usually acute.....5. *C. divaricata*

- FF. Fr. purplish black; lvs. usually obtuse.....8. *C. nitens*  
 CC. Lvs. tomentose or pubescent beneath (or nearly glabrous in Nos. 7, 14, 15); fls. 2-many; pubescence of brts. appressed-villous (see also *C. rubens* under No. 3).  
 D. Calyx glabrous or only slightly pubescent.  
 E. Lvs. oval to oblong, often obtuse, 2-5 cm. long, smooth above.  
 F. Lvs. glabrous or nearly so.....7. *C. rosea*  
 FF. Lvs. tomentose beneath.....8. *C. integerrima*  
 EE. Lvs. ovate to ovate-oblong, acute, 3.5-8 cm. long, rugose above.....15. *C. bullata*  
 DD. Calyx densely pubescent or tomentose; lvs. slightly pubescent above, dull green.  
 E. Lvs. obtuse, rarely acutish.  
 F. Lvs. whitish tomentose beneath; fr. with 3-5 nutlets.....9. *C. tomentosa*  
 FF. Lvs. yellowish tomentose beneath; fr. with 2 nutlets.....10. *C. Zabeli*  
 EE. Lvs. acute or acuminate, rarely acutish.  
 F. Lvs. grayish or yellowish tomentose beneath.  
 G. Fr. scarlet or orange; lvs. 1-3 cm. long.  
 H. Fls. few; lvs. acute or acutish; fr. scarlet.....11. *C. Dielsiana*  
 HH. Fls. in 6-15-fld. cymes; lvs. acute or acuminate; fr. orange-red.  
 12. *C. Francheti*  
 GG. Fr. dull brownish red; lvs. 2.5-4 cm. long.....13. *C. obscura*  
 FF. Lvs. sparingly pubescent beneath, finally often glabrescent.  
 G. Fr. ellipsoid, slightly pubescent, with usually 2 nutlets; calyx pubescent;  
 lvs. pubescent above.....14. *C. acuminata*  
 GG. Fr. subglobose, with 4-5 nutlets; calyx slightly pubescent or glabrous;  
 lvs. glabrous above, usually bullate.....15. *C. bullata*  
 BB. Fr. black.  
 C. Lvs. acute or acuminate.  
 D. Lvs. pubescent above when young, dull green; calyx pubescent.  
 E. Lvs. generally acuminate, 4-10 cm. long; fr. with 3-5 nutlets.  
 F. Infl. many-fld.; lvs. rugose above, reticulate beneath.....16. *C. moupinensis*  
 FF. Infl. 3-7-fld.; lvs. neither rugose nor reticulate.....17. *C. foveolata*  
 EE. Lvs. generally acute, 3-5 cm. long; fr. usually with 2 nutlets.....18. *C. acutifolia*  
 DD. Lvs. glabrous and lustrous above; calyx glabrous or slightly pubescent.  
 19. *C. lucida*  
 CC. Lvs. obtuse or acutish, whitish tomentose beneath; calyx glabrous.  
 20. *C. melanocarpa*  
 AA. Petals spreading, suborbicular, white; fr. red (brown in *C. affinis* under No. 24, black in *C. Lindleyi* under No. 23).....Sect. 2. CHAENOPETALUM Koehne.  
 B. Fls. in many-fld. corymbs; upright shrubs.  
 C. Lvs. deciduous, green or grayish, not papillose beneath; anthers yellow.  
 D. Lvs. suborbicular to elliptic, obtuse or acute, to 3.5 cm. long.  
 E. Lvs. glabrous at maturity.....21. *C. multiflora*  
 EE. Lvs. tomentose beneath.  
 F. Lvs. ovate to elliptic, usually acute, grayish tomentulose beneath; calyx villous.....22. *C. hupehensis*  
 FF. Lvs. suborbicular to elliptic, usually obtuse, white-tomentose beneath; calyx tomentose.....23. *C. racemiflora*  
 DD. Lvs. narrow-elliptic to oblong-lanceolate, acute at ends, usually glabrous at maturity, to 10 cm. long.....24. *C. frigidula*  
 CC. Lvs. evergreen or half-evergreen, subcoriaceous or coriaceous; anthers purple.  
 D. Lvs. with persistent close white tomentum beneath, 1-3 cm. long (to 5 or 8 cm. long in related species).....25. *C. pannosa*  
 DD. Lvs. with floccose or woolly tomentum beneath, finally usually more or less glabrous and glaucous; 3-12 cm. long.  
 E. Lvs. glabrous above, not or slightly papillose beneath, 1-2 cm. broad.  
 26. *C. salicifolia*  
 EE. Lvs. pubescent above while young, papillose beneath, 2-3 cm. broad.  
 27. *C. Henryana*  
 BB. Fls. 1-3; prostrate or trailing evergreen shrubs.  
 C. Lvs. green or glaucescent, not papillose beneath, soon glabrous, 1-3 cm. long.  
 28. *C. Dammeri*  
 CC. Lvs. glaucous and papillose beneath (except in *C. buxifolia* under No. 29), less than 1.5 cm. long.  
 D. Lvs. suborbicular or broad-oval, 8-20 mm. long; fls. 1-3.....29. *C. rotundifolia*  
 DD. Lvs. obovate to cuneate-oblong, 5-10 mm. long; fls. usually solitary.  
 E. Lvs. grayish pubescent beneath, obovate to cuneate-oblong.....30. *C. microphylla*  
 EE. Lvs. glabrous or nearly so beneath at maturity, obovate to oval.....31. *C. congesta*
1. *C. adpressa* Bois. Deciduous prostrate shrub, with irregularly branched creeping stems; lvs. broad-oval or obovate, acutish or obtuse, mucronulate, 5-15 mm. long, usually wavy at the margin, dull green above, ciliolate and sparingly pubescent beneath while young; petioles 1-2 mm. long; fls. 1-2, pinkish, subsessile; calyx slightly pubescent; fr. subglobose, 6-7 mm. long, bright red, usually with 2 nutlets. Fl.vi; fr.viii-ix. V.F.116. S.H.1:f.418k-m, 419e<sup>1</sup>. (*C. horizontalis* var. *a.* (Bois) Schneid.) W. China. Intr. 1896. Zone

IV. Brs. closely appressed to the ground and often rooting, with bright red fr. in late summer and fall; adapted for rockeries.—*C. a. praecox* (Vilm.) Bois & Berthault, var. More vigorous, to 0.5 m. tall: lvs. to 2.5 cm. long: fls. pink: fr. 8–12 mm. thick. R.H.1931:584,t.(c). Gt.81:15. G.W.33:584(h). Gs.16:37(h). (*C. p.* Vilm., *C. "Nan-shan"* Hort.) Cult. 1905.

2. *C. horizontalis* Decne. Half-evergreen low shrub with horizontally spreading distichously branched stems: lvs. suborbicular to broad-elliptic, acute at ends and mucronate at the apex, 5–12 mm. long, dark green, glabrous and lustrous above, sparingly strigose-pubescent beneath; petioles 1–2 mm. long, strigose-pubescent: fls. 1–2, pinkish, subsessile; calyx slightly pubescent: fr. subglobose, about 5 mm. across, bright red, with usually 3 nutlets. Fl.vi; fr.ix–x. R.H.1889:348,t.(c). G.C.32:91. Gn.66:407(h);87:28. (*C. Davidiana* Hort.) W. China. Intr. about 1880. Zone IV. Distinct shrub with closely and regularly 2-ranked brts.; frs. smaller but more numerous than in the preceding species and ripen later; lvs. subpersistent, turning partly red and orange in late autumn.—*C. h. variegata* Osborn. Lvs. variegated with white. R.H.1916:137(h).—*C. h. perpusilla* Schneid., var. More depressed: lvs. about 6 mm. long. W. China. Intr. 1908.—*C. h. Wilsonii* Wils., var. Similar to the preceding var. but more vigorous, lvs. somewhat larger. (*C. Wilsoni* Hort., not Nakai.)

3. *C. disticha* Lange. Deciduous or half-evergreen shrub, to 2.5 m., with more or less distichously arranged brts.: lvs. suborbicular to broad-obovate or broad-oval, usually nearly rounded and abruptly mucronate at apex, broad-cuneate at base, 8–12 mm. long, dark green above, sparingly pubescent on both sides at least while young, but less so and lighter green beneath: fls. usually solitary, white, suffused with pink, short-pediceled; calyx glabrous; sepals broadly triangular: fr. broad-obovoid, 1 cm. long, scarlet. Fl.vi; fr.ix–x. B.M.8010(c). (*C. rotundifolia* Wall. ex Baker.) Himal., S. W. China. Intr. 1825. Zone V. In its mode of branching similar to the preceding species, but upright and with larger fr.

Closely related species: *C. verruculosa* Diels. Differs chiefly in the less pubescent densely verruculose brts. and in the more coriaceous glabrous lvs. often emarginate at apex. Yunnan. Intr. ?—*C. rubens* W. W. Sm. Irregularly branched; brts. whitish pubescent; lvs. suborbicular to broad-elliptic, to 1.5 cm. long, rounded at ends, mucronulate, yellowish tomentose beneath: fls. red; calyx slightly pubescent. W. China. Cult. 1927. Zone VI?—*C. apiculata* Rehd. & Wils. Lvs. suborbicular to orbicular-ovate, apiculate, glabrous at maturity or only slightly ciliate, to 1.5 cm. long: fls. pink; sepals short-acuminate: fr. subglobose, subsessile. W. China. Intr. 1910. Zone IV.

4. *C. Simonsii* Bak. Deciduous or half-evergreen shrub to 3 or rarely 4 m., of upright habit: lvs. orbicular-obovate to broad-elliptic, acute or slightly acuminate, broad-cuneate, 1.5–3 cm. long, dark green above and pubescent while young, paler and pubescent beneath, chiefly on the veins; petioles pubescent, 2–3 mm. long: fls. white, in short, 2–4-fld. cymes; calyx appressed-pubescent; sepals triangular, acutish to acuminate: fr. short-ellipsoid or obovoid, 8 mm. long, scarlet. Fl.vi–vii; fr.x. Ref. Bot. 1:55(c). Gt.55:t.1551, f.5(c). Gn.87:42. (*C. Simmondsii* or *Symonsii* Hort.) Khasia. Cult. 1869. Zone V.

5. *C. divaricata* Rehd. & Wils. Deciduous upright shrub to 2 m., with spreading brs.: lvs. elliptic or broad-elliptic, acute at ends or sometimes rounded at apex, 8–20 mm. long, lustrous dark green above, lighter and slightly pubescent or glabrous beneath: fls. pink, short-pediceled, in usually 3-fld. cymes; calyx slightly pubescent; sepals triangular, acute or acuminate: fr. ellipsoid, 8 mm. long, about 6 mm. thick, red; nutlets 1–3, usually 2. Fl.

vi; fr.ix. C. and W. China. Intr. 1907. Zone V. Handsome shrub with slender spreading brs. and bright red frs. profusely produced.

6. *C. nitens* Rehd. & Wils. Deciduous densely branched shrub, with slender spreading brs.: lvs. oval or sometimes ovate, rounded at ends or sometimes acutish, 8-20 mm. long, lustrous and dark green above, lighter and sparingly pubescent beneath while young, soon glabrous: fls. pink, in usually 3-fld. cymes; calyx slightly pubescent; sepals broad-triangular, obtusish: fr. globose-ellipsoid, 7 mm. long, purplish black; nutlets 1-2. Fl.vi; fr.viii-ix. W. China. Intr. 1910. Zone IV.

7. *C. rosea* Edgew. Deciduous shrub with slender brs., to 2 m. tall or more; brts. pubescent at the tips, soon glabrous: lvs. elliptic or ovate to ovate-oblong, acutish or obtuse, mucronulate, rounded or broad-cuneate at base, 2-6 cm. long, bluish green above, grayish green beneath and slightly pubescent at first, soon glabrous: petioles 2-5 mm. long, glabrous: fls. pinkish in 3-9-fld. glabrous cymes; sepals broad-triangular to ovate, obtuse; petals slightly spreading: fr. globose-obovoid, 7 mm. long, red; nutlets 2. Fl.vi; fr.ix-x. S.H.1:f.423r-s,424n. Jour. N. Y. Bot. Gard. 37:135. N. W. Himal., Afghan. Intr. 1882. Zone V. In fr. similar to *C. racemiflora*, but glabrous.

8. *C. integerrima* Med. Upright bushy shrub to 2 m.; young brts. appressed-woolly, becoming glabrous and lustrous: lvs. suborbicular to broad-ovate or oval, obtuse or acute, usually mucronate, rounded at base, 2-5 cm. long; dark green and glabrous above, whitish or grayish tomentose beneath; petioles 2-4 mm. long, pubescent: fls. pinkish, in nodding glabrous 2-4-fld. cymes; sepals rounded: fr. subglobose, 6 mm. across, red; nutlets usually 2. Fl.v; fr.viii. H.W.3:73. R.I.25:t.96(c). G.H.t.71(c). (*C. Cotoneaster* Karst., *C. vulgaris* Lindl.) Eu., N. Asia to Altai. Intr. 1656. Zone V. A much branched round shrub with rather short and stiff brs. and ornamental red fr.

The closely related *C. uniflora* Bge. with smaller lvs. glabrous at maturity and usually solitary short-stalked fls. from the Altai is possibly only a var. of the preceding species. Cult. 1907. Zone V or IV?—Another related species is *C. Silvestrii* Pampan. Lvs. elliptic-ovate; calyx pubescent: fr. orange. C. China. Intr. 1907. Zone V?

9. *C. tomentosa* (Ait.) Lindl. Shrub to 3 m.; young brts. tomentose: lvs. broad-oval to elliptic or rarely oblong-ovate, obtuse or sometimes acutish, 3-6 cm. long, dull green above and pubescent while young, whitish or grayish tomentose beneath; petioles 3-6 mm. long: fls. pinkish, in nodding 3-12-fld. pubescent cymes; calyx tomentose: fr. subglobose, 7-8 mm. across, brick-red; nutlets 3-5. Fl.v-vi; fr.ix. G.O.t.105(c). R.I.25:t.97(c). H.W.3:73. W.D.55(c). S. E. Eu., W. Asia. Intr. 1759. Zone IV. Similar to *C. integerrima*, but larger in every part and more pubescent.

10. *C. Zabeli* Schneid. Shrub to 2 m., with slender spreading brs.; young brts. densely pubescent: lvs. broad-oval to ovate, obtuse, rarely acutish, 1.5-3 cm. long, dull dark green and loosely pubescent above, grayish or yellowish tomentose below; petioles 1-3 mm. long: fls. pinkish, in 3-9-fld. pubescent nodding cymes; calyx villous, with obtuse lobes, soon glabrous: fr. globose-obovoid, 7-8 mm. long, bright red; nutlets usually 2. Fl.v; fr.ix-x. S.H.1:f. 420f-h,422i-k. C. China. Intr. 1907. Zone IV. Slender-branched shrub with bright red fruit.—*C. Z. miniata* Rehd. & Wils., var. Fr. smaller, light orange-scarlet; lvs. turning yellow in autumn.

11. *C. Dielsiana* Pritz. Shrub to 2 m., with slender spreading and arching brs.; young brts. densely pubescent: lvs. elliptic to ovate, acute or acutish, rarely obtuse, rounded or broad-cuneate at base, 1-2.5 cm. long, slightly pubescent and dark green above, yellowish or grayish tomentose beneath:

fls. pinkish, in short 3-7-fld. pubescent cymes; calyx pubescent; sepals triangular, mucronate: fr. subglobose, about 6 mm. across, scarlet; nutlets 3-5. Fl.vi; fr.ix-x. Gs.1:185. S.L.142(h). (*C. applanata* Duthie.) C. and W. China. Intr. 1900. Zone (V).—Graceful shrub with long arching or pendulous brs. densely studded with scarlet frs. in fall.—*C. D. majör* Rehd., var. Lvs. broader and larger.—*C. D. elegans* Rehd. & Wils., var. Lvs. subpersistent, smaller, finally nearly glabrous and somewhat shining above: fr. coral-red. W. China. Intr. 1908.

12. *C. Franchéti* Bois. Half-evergreen upright shrub with spreading brs.; young brts. densely pubescent: lvs. thickish, elliptic to ovate, acute or acuminate, broad-cuneate, 2-3 cm. long, pubescent above at first, finally glabrous and somewhat lustrous, yellowish or grayish white-tomentose beneath; petioles 1-3 mm. long: fls. pinkish, small, in 5-11-fld. pubescent cymes, on lateral brts. sometimes to 4 cm. long; calyx villous; sepals triangular, acuminate: fr. ovoid, 6-7 mm. long, orange-red, sparingly pubescent or finally glabrous; nutlets usually 3. Fl.vi; fr.ix-x. B.M.8571(c). R.H.1902:379; 1907:256,t(c). V.F.118. W. China. Intr. 1895. Zone VI? Shrub with small lvs. and profusely produced orange-red frs.—*C. F. cinerascens* Rehd., var. More vigorous: lvs. elliptic-ovate, to 4 cm. long, more loosely tomentose and grayish or greenish beneath: infl. many-fld., on brts. to 5 cm. long. W. China. Intr. 1915. Zone VII?

Related species: *C. amoëna* Wils. Differs chiefly in its bushy habit, with short stiff brs., smaller lvs. and denser and smaller cymes with shorter pedicels, and in the aristate sepals. G.C.51:2. Gs.14:25. S. W. China. Intr. 1904. Zone VII?—*C. Wardii* W. W. Sm. Brts. white-tomentose: lvs. ovate, 2.5-3.5 cm. long, acute or acutish, densely silvery white-tomentose beneath: infl. white-tomentose, 10-15-fld., on brts. to 4 cm. long; nutlets usually 2. S. E. Tibet. Cult. 1931. Zone VII?—*C. newryënsis* Lemoine. Lvs. elliptic, 2-4 cm. long, acute or abruptly mucronate, sometimes obtusish, villous and grayish green beneath: fls. in dense corymbs; sepals broad-triangular, with very short or nearly without micro. (*C. Simonsii* var. *n.* Bean.) Origin unknown; possibly hybrid of Nos. 4 and 12. Cult. 1911. Zone VI?

13. *C. obscura* Rehd. & Wils. Deciduous shrub to 3 m., with spreading brs.; young brts. pubescent: lvs. elliptic-ovate or sometimes rhombic-ovate, acuminate, rarely acute, broad-cuneate, 2.5-4, rarely 5 cm. long, dull green above and slightly pubescent, at least while young, yellowish gray-tomentose beneath; petioles 2-3 mm. long, pubescent: fls. pinkish, in short dense, 3-7-fld. pubescent cymes, on very short lateral brts., sepals triangular, acuminate; fr. broad-pyriform, dark red, 7-8 mm. long; nutlets usually 3. Fl.vi; fr.ix-x. W. China. Intr. 1910. Zone V. Bushy shrub with numerous dark red frs. in autumn.—*C. o. cornifolia* Rehd. & Wils., var. Lvs. elliptic-ovate to elliptic-oblong, 4-7 cm. long, less pubescent beneath, veins more deeply impressed: fr. purple-black; nutlets 5. W. China. Intr. 1910.

Closely related species: *C. reticulata* Rehd. & Wils. Lvs. subcoriaceous, elliptic-ovate, 2.5-4 cm. long, wrinkled above, reticulate and yellowish tomentose beneath: fr. subglobose, 3-6 in glabrous cymes, purplish black, 5-7 mm. across; nutlets 5. W. China. Intr. 1910. Zone VI?—*C. glomerulata* W. W. Sm. Lvs. oblong-ovate, 3-5 cm. long, fulvous-tomentose beneath: cymes dense, many-fld.: fr. about 5 mm. long, crimson; nutlets usually 5. W. China. Intr. 1912?

14. *C. acuminata* Lindl. Deciduous shrub to 4 m., of upright habit; young brts. densely pubescent: lvs. elliptic-ovate to ovate-oblong, acuminate or acute, broad-cuneate, 3-6 cm. long, dull green above and pubescent while young, paler green and more densely pubescent beneath, usually glabrescent at maturity; petioles 2-5 mm. long, pubescent: fls. pinkish, in 2-5-fld. short, pubescent cymes; calyx pubescent; sepals broad-triangular, acute or obtuse:

fr. ellipsoid, 8-10 mm. long, bright red, hairy near apex; nutlets 2. Fl.vi; fr.ix-x. L.B.919(c). R.H.1899:348,t.f.5(c, as *C. nepalensis*). S.H.1:f.418-r, 419i. Himal. Intr. 1820. Zone V. Ornamental in fall with its bright red rather large fr.

Related species: *C. nitidifolia* Marquand. Brts. densely pubescent: lvs. elliptic-lanceolate, 4.5-6 cm. long, acuminate, glabrous and lustrous above, loosely pubescent beneath; infl. 3-9-fld., whitish tomentose; calyx-lobes deltoid, acute: fr. 5 mm. across, dark red. H.I.32:3145. W. China. Intr. 1924. Zone VI?

15. *C. bullata* Bois. Deciduous spreading shrub to 2 m.; young brts. pubescent: lvs. elliptic-ovate to ovate-oblong, acuminate, broad-cuneate, rarely rounded at base, 3.5-8 cm. long, slightly pubescent or nearly glabrous above and rugose or more or less bullate, paler or grayish green beneath and reticulate, sparingly pubescent, more densely on the veins or sometimes nearly glabrous; petioles 3-6 mm. long; fls. pinkish, 3-7; calyx glabrous; sepals very short, rounded: fr. subglobose or obovoid, 6-8 mm. long, red; nutlets 4-5. Fl.v-vi; fr.viii-ix. V.F.119. M.O.205. W. China. Intr. 1898. Zone V. With large clusters of bright red frs. in fall.—*C. b. floribunda* (Stapf) Rehd. & Wils., f. Petioles shorter: cymes many-fld., 4-6 cm. across; calyx slightly pubescent. B.M.8284(c). H.B.3:449. (*C. moupinensis* var. f. Stapf.)—*C. b. macrophylla* Rehd. & Wils., var. Similar to the preceding var., but lvs. 6-12 cm. long, often nearly glabrous: calyx nearly glabrous.

16. *C. moupinensis* Franch. Shrub to 5 m., with spreading brs.: lvs. elliptic- or rhombic-ovate to ovate-oblong, acuminate, broad-cuneate or sometimes rounded at base, 4-10 cm. long, dull green, slightly pubescent, rugose and usually bullate above, light green and pubescent beneath, at least on the veins, reticulate; petioles 2-3 mm. long, pubescent: fls. pinkish, in many-fld. corymbs; calyx slightly pubescent; sepals triangular, acutish: fr. subglobose or obovoid, 6-8 mm. long, black; nutlets 4-5. S.H.1:f.421d-e, 423i-k. Fl.vi; fr.ix-x. W. China. Intr. about 1900. Zone VI? Similar to *C. bullata*, but with black fr.

17. *C. foveolata* Rehd. & Wils. Shrub to 3 m. with spreading brs.; brts. densely pubescent, later gray or grayish yellow: lvs. elliptic or rhombic-ovate to ovate-oblong, acute or acuminate, broadly cuneate or rounded at the base, 4-8 cm. long, slightly and loosely pubescent above while young, soon glabrous and smooth, pubescent beneath, chiefly on the veins, finally often nearly glabrous, veins prominent beneath and impressed above; petioles 2-3 mm. long, pubescent or nearly glabrous: fls. pinkish in 3-6-fld. pubescent cymes; calyx densely pubescent; sepals broad-triangular, acute: fr. subglobose, 6-8 mm. long, black; nutlets 3-4, furrowed and shallowly pitted on the back. Fl.vi; fr.ix. C. China. Intr. 1907. Zone IV. Lvs. turning bright scarlet and orange in autumn.

18. *C. acutifolia* Turcz. Shrub to 4 m., with slender spreading brs.; brts. pubescent, later red-brown: lvs. elliptic-ovate to oblong-ovate, acute, rarely acuminate, broad-cuneate, 2-5 cm. long, dull green and slightly pubescent above at first, lighter green beneath, sparingly pubescent, more densely on the veins, finally often nearly glabrous; petioles 2-5 mm. long, pubescent: fls. pinkish, in 2-5-fld. short pubescent cymes; calyx-tube pubescent, lobes triangular, acute: fr. ellipsoidal, about 1 cm. long, black, usually with 2 nutlets. Fl.v-vi; fr.ix-x. S.H.1:f.421a-b, 423d-f. (*C. pekinensis* Zab.) N. China. Intr. 1883. Zone IV.—*C. a. villosula* Rehd. & Wils., var. Lvs. more densely villous beneath, somewhat larger; calyx-tube more densely villous: fr. thinly pubescent. C. & W. China. Intr. 1900. Zone V.

Closely related species: *C. ambigua* Rehd. & Wils. which differs chiefly in its slightly pubescent or nearly glabrous calyx-tube and subglobose or obovoid fr. with 3-4 nutlets. W. China. Intr. about 1902. Zone V.—*C. tenuipes* Rehd. & Wils. Slender shrub to 2 m.: lvs. narrow-elliptic to ovate, 1.5-3.5 cm. long, densely villous beneath; cymes 2-4-fld., densely villous: fr. on slender, though short stalks; nutlets 2. W. China. Intr. 1910. Zone V.

19. *C. lucida* Schlecht. Deciduous shrub to 3 m., of upright habit; young brts. pubescent: lvs. elliptic to ovate, acute, broad-cuneate, rarely rounded at base, 2-5 cm. long, glabrous and lustrous above, pubescent beneath, finally often nearly glabrous; petioles 2-5 mm. long, nearly glabrous: fls. pinkish, in 3-8-fld. slightly pubescent cymes; calyx-tube glabrous or slightly pubescent; fr. subglobose or obovoid, 8-10 mm. long, black, with 3-4 nutlets. Fl.v-vi; fr.ix. D.H.3:413. S.H.1:f.421c,423a-c. G.W.5:247. (*C. acutifolia* Lindl., not Turcz.) Altai Mts. Cult. 1840. Zone IV. Shrub with lustrous lvs. and rather large black frs.

20. *C. melanocarpa* Lodd. Shrub to 2 m., with spreading brs., brts. pubescent when young: lvs. broad-ovate to ovate-oblong, obtuse or acute, often mucronulate, sometimes emarginate, rounded at base, 2-4.5 cm. long, dull dark green above, slightly pubescent at first, whitish tomentose beneath; petioles 3-8 mm. long: fls. pinkish in 3-8-fld. nodding, glabrous or slightly pubescent corymbs; calyx glabrous: fr. subglobose, 6-7 mm. across, black; nutlets usually 2. Fl.v-vi; fr.viii. L.B.1531(c). R.I.25:t.98(c). (*C. nigra* Fries.) Eu. to C. and N. E. Asia. Cult. 1829. Zone IV.—*C. m. laxiflora* (Lindl.) Schneid., var. Lvs. larger, to 6 cm. long; corymbs pendulous, 12-many-fld. B.R.1305(c). R.I.25:t.98,f.4-6(c). (*C. l.* Lindl., ? *C. polyanthema* Wolf.) C. Asia. Intr. 1826.—*C. m. commixta* Schneid., var. Lvs. of shoots ovate, acute and mucronulate; infl. 8-15-fld. B.M.3519(c).

Closely related species: *C. ignava* Wolf. Lvs. 2.5-5 cm. long, those of the shoots ovate, acute and mucronulate: infl. many-fld., pendulous, tomentose; calyx glabrous except at base; fr. dark purple. Yearb. For. Inst. Petersb. 15: 240, t. E. Turkest. Intr. about 1880? Zone V?

21. *C. multiflora* Bge. Shrub to 2 m., with usually slender arching brs.; brts. pubescent at first, soon glabrous, purplish: lvs. broad-ovate to ovate, acute or obtuse, rounded or broad-cuneate at base, 2-5 cm. long, at first tomentose beneath, soon glabrous; petioles 3-10 mm. long: fls. white, 1-1.2 cm. across, in many-fld. usually loose glabrous corymbs; calyx glabrous: fr. subglobose or obovoid, 8 mm. across, red; nutlets 1-2. Fl.v; fr.viii. R.H.1892: 327; 1893: 29. B.S.1:413,t(h). G.W.6:62(h). S.L.2:166(h). (*C. reflexa* Carr.) W. China. Intr. 1837. Zone V. Graceful shrub with arching brs., handsome in bloom and with ornamental fr.—*C. m. calocarpa* Rehd. & Wils., var. Lvs. larger and narrower: fr. larger, about 1 cm. across, very freely produced. W. China. Intr. 1900.—*C. m. granatensis* (Boiss.) Wenz., var. Lvs. more pubescent: infl. laxer and more pubescent. Spain. Cult. 1854. Zone VI?

Related species: *C. submultiflora* Popov. Mature lvs. puberulous beneath: infl. densely pubescent, half as long as lvs.: fr. bright red. Tian-shan, Pamir. Intr. 1935. Zone V.

22. *C. hupehensis* Rehd. & Wils. Shrub to 2 m., with spreading and arching brs., pubescent at first, soon glabrous and purple: lvs. elliptic to ovate, obtuse or acute, mucronulate, usually rounded at base, 1.5-3.5 cm. long, glabrous above, thinly grayish tomentose beneath; petioles 2-5 mm. long, pubescent: fls. about 1 cm. across, in 6-12-fld. pubescent corymbs; calyx villous; anthers yellow: fr. subglobose, about 8 mm. across, bright red; nutlets 2, closely cohering, the hypostyle covering only the apex. Fl.v; fr.viii-

ix. B.C.2:866. Gn.M.29:225(h). S.L.143(h). C. and W. China. Intr. 1907. Zone IV. One of the handsomest species in flower and fruit; the lvs. turning yellow in fall.

23. *C. racemiflora* (Desf.) K. Koch. Shrub to 2.5 m. with slender spreading rarely upright brs.; brts. gray-tomentose while young; lvs. suborbicular to orbicular-obovate or oval, rarely ovate, usually obtuse and mucronate, sometimes emarginate, rarely elliptic and acute at ends, 1.5-3 cm. long, glabrous above, grayish or whitish tomentose beneath; fls. 8 mm. across, in 3-12-fld. short-stalked tomentulose cymes; fr. subglobose, about 8 mm. across, red; nutlets 2. Fl.v-vi; fr.ix-x. R.H.1867:31. S.H.1:f.424e-k,425d-f. (*C. nummularia* Fisch. & Mey., *C. Fontanesii* Spach.) S. Eu., N. Afr., W. Asia to Himal. and Turkest. Cult. 1829. Zone IV.—A very variable species, the typical form var. *Desfontaini* (Reg.) Zab. (var. *typica* Schneid.) has generally elliptic acutish lvs., while var. *nummularia* Dipp. (var. *Meyeri* Zab.) has broader usually obtuse lvs.—*C. r. soongorica* (Reg. & Herd.) Schneid., var. Lvs. oval, usually obtuse and mucronate, less densely pubescent. Gn. M.33:38. W.A.114,t(h), (*C. nummularia* var. s. Reg. & Herd., *C. s. Popov.*) Song., W. China. Intr. 1910. Zone III.—*C. r. microcarpa* Rehd. & Wils., var. Similar to the preceding; lvs. smaller, 1-1.5 cm. long, fr. ellipsoidal, about 6 mm. long. W. China. Intr. 1910.—*C. r. Veitchii* Rehd. & Wils., var. Lvs. generally elliptic, acute at ends, 2-3.5 cm. long; fls. 1.2-1.5 cm. across; fr. dark red, about 1 cm. across; nutlet usually 1. M.G.29:6. C. China. Intr. 1900.—*C. r. Royleana* Dipp., var. Low shrub; lvs. suborbicular or broad-obovate, rounded or emarginate at apex, 8-20 mm. long; infl. 3-6-fld. (*C. r. var. Kotschyi* Schneid., var. *orbicularis* Dipp., not Wenzig, *C. nevadensis* Hort., *C. Royleana* Hort.) Mediterr. Reg. ? Himal.

Related species: *C. hebeophylla* Diels. Lvs. subcoriaceous, suborbicular to broadly oval, 2.5-3.5 cm. long; anthers violet; fr. dark red, ovoid; nutlet usually 1. S. W. China. Intr. about 1910. Zone VII?—*C. Lindleyi* Steud. Brts. pubescent when young; lvs. broad-oval to broad-ovate, usually rounded at apex and mucronulate, sometimes emarginate, 2.5-6 cm. long, grayish tomentose beneath; infl. 5-12-fld.; calyx tomentose; fr. black. S.H.1:f.424a-b,425a. (*C. nummularia* Lindl., not Fisch. & Mey., *C. arborescens* Zabel, *C. compta* Hort.) Himal. Intr. 1924. Zone VI?

24. *C. frigida* Lindl. Tall shrub or small tree to 6 m.; brts. pubescent at first, soon glabrous; lvs. elliptic to elliptic-oblong or oblong-obovate, obtuse or sometimes acute, cuneate, 6-12 cm. long, dull green and glabrous above, paler beneath and tomentose while young, finally usually glabrous; petioles 3-8 mm. long, pubescent; fls. 8 mm. across, in dense tomentose corymbs 4-6 cm. across; sepals triangular, acute; fr. broad-ellipsoidal, about 5 mm. long, bright red; nutlets 2. Fl.vi; fr.viii-ix. B.R.1229(c). L.B.1512(c). Gn.87:28. G.C.72:365. M.A.t.6(c),37(h). Himal. Intr. 1824. Zone VII. Conspicuous in fall and early winter with its large clusters of bright red frs.—*C. f. aldenhamensis* Gibbs, var. Lvs. oblong-lanceolate.—*C. f. Vicàrii* Gibbs, var. Lvs. lanceolate. Gs.14:24.

*C. f. × pannosa* = *C. Crispii* Exell. Lvs. like those of *C. pannosa*, but 3-5 cm. long; frs. like *C. frigida*. Cult. 1928.—*C. f. × Henryana* = *C. Watereri* Exell. Intermediate between the parents: fruiting profusely. G.C.83:44,45. Cult. 1928.

Closely related species: *C. affinis* Lindl. Tall shrub; lvs. elliptic to oblong-obovate, acute or sometimes obtuse, 3-8 cm. long, pubescent or tomentose beneath, finally glabrous; fr. subglobose, purple-brown or nearly black. L.B. 1522(c). S.H.1:f.426b-e,427a-f. Himal. Intr. 1828. Zone VII.—*C. a. bacillaris* (Lindl.) Schneid., var. Lvs. slightly pubescent at first, soon glabrous; young brts. and infl. slightly pubescent. G.C.56:412,t(c). (*C. bacillaris* Wall. ex Lindl.) Himal.—*C. Cooperi* Marquand. Tall shrub; young brts. tomentose:

lvs. elliptic-lanceolate, 5-7 cm. long, short-acuminate, cuneate, glabrous above, white tomentose beneath at first, soon glabrescent; infl. sparingly pubescent at first: fr. turbinate, 1 cm. long, dark purple. H.I.3146. Bhutan. Intr. 1914? Zone VII?—*C. c. microcarpa* Marquand, var. Brts. slender, arching: fr. subglobose, 6.5-7 mm. across, reddish purple. B.M.9478(c). Intr. 1914.

25. *C. pannosa* Franch. Half-evergreen shrub to 2 m., with slender arching brs.; young brts. densely pubescent at first: lvs. elliptic, acute at ends, mucronate, 1-2.5 cm. long, dull green above and glabrous, white-tomentose beneath; petioles 2-7 mm. long; fls. 8 mm. across, in rather dense 6-20-fld. corymbs 1.5-4 cm. across, densely pubescent; sepals triangular, mucronate; anthers purple: fr. globose to ellipsoidal, 6 mm. long, dull red; nutlets 2. Fl.vi; fr.x-xi. B.M.8594(c). Gt.55:t.1551,f.2(c). R.H.1907:256,t(c). Gn.67:118;80:66. N.F.3:f.3(h). S. W. China. Cult. 1888. Zone VII. Similar to *C. Francheti*, but lvs. glabrous above, petioles slenderer and fr. smaller with 2 nutlets.

*C. p. × frigida*: see under No. 24.

Related species: *C. Harroviana* Wils. Lvs. elliptic to elliptic-oblong, 2.5-5 cm. long, leathery, densely villous beneath, finally glabrescent, with 5-10 not very prominent veins: infl. 3-4 cm. across. W. China. Intr. 1900.—*C. oligocarpa* Schneid. Lvs. oval or obovate to elliptic, acute or obtuse, 2.5-5 cm. long, dull and slightly pubescent above, with persistent tomentum beneath: fr. red, obovoid, 4-5 mm. long. W. China. Intr. 1915.—*C. turbinata* Craib. Lvs. oblong-ovate to oblong-lanceolate, acute at ends, 3-4.5 cm. long, mucronulate: infl. white-tomentose: fr. turbinate, 4-5 mm. long, thinly silky, bright red. Fl.vii. B.M.8546(c). W. China. Intr. 1897.—*C. lactea* W. W. Sm. Brts. loosely white-tomentose: lvs. broad-elliptic, 3.5-8 cm. long, usually obtuse and mucronulate, rounded or broad-cuneate at base, dull green above, whitish tomentose beneath: infl. 4-6 cm. across, tomentose: fr. ovoid, 6 mm. long; nutlets 2. B.M.9454(c). N.F.3:f.1(h). W. China. Intr. 1930. Zone (V) VI.

26. *C. salicifolia* Franch. Half-evergreen or evergreen shrub, to 5 m., with spreading brs.; young brts. floccose-tomentose: lvs. elliptic-oblong to ovate-lanceolate, acute or acuminate, cuneate, 3-8 cm. long, rugose and glabrous above, tomentose and glaucous beneath and with 5-12 pairs of prominent veins; petiole 2-5 mm. long, like the midrib often reddish: fls. small, in densely woolly corymbs 3-5 cm. across; anthers red; fr. subglobose, 5 mm. across, bright red, with 2-3 nutlets; hypostyle glabrous. Fl.vi; fr.x. B.M.8999(c). Gn.86:658. W. China. Intr. 1908. Zone VI? Graceful shrub with half-evergreen or in milder climates evergreen lvs. and attractive bright red fr. in late fall.—*C. s. floccosa* Rehd. & Wils., var. Lvs. oblong to oblong-lanceolate, tomentose beneath while young, later partly glabrous, lustrous above, with 7-14 pairs of veins: fr. 6 mm. high, usually with 3 nutlets. G.C.71:114. Gs.14:25. Intr. 1908. Zone (V).—*C. s. rugosa* (Pritz.) Rehd. & Wils., var. Lvs. elliptic-oblong, to 2.5 cm. broad, dull green above, beneath with dense woolly tomentum: fr. 6 mm. long; nutlets 3. B.M.8649(c). G.C.56:412,t(c). Gn.87:42. (*C. r. Pritz.*) C. China. Intr. 1907.

Closely related species: *C. rhytidophylla* Rehd. & Wils. Brts. and lvs. beneath densely whitish or yellowish tomentose: lvs. oblong-ovate to oblong-lanceolate, 3-8 cm. long, strongly wrinkled above, reticulate beneath: corymbs dense, about 3 cm. across: fr. orange-red, pyriform, about 6 mm. long; nutlets 3 or 4. W. China. Intr. 1908. Zone VII?—*C. glabrata* Rehd. & Wils. Young brts. thinly pubescent, soon glabrous and red-brown: lvs. oblong-lanceolate, 4-8 cm. long, bright green and slightly rugose above, glaucous beneath and glabrous or slightly pubescent: corymbs dense, about 3 cm. across, slightly pubescent; styles 2. W. China. Intr. 1908. Zone VII?—*C. glaucophylla* Franch. Lvs. elliptic to elliptic-oblong, 3-6 cm. long, glaucous beneath, glabrous or slightly pubescent at first: infl. slightly pubescent at first; calyx glabrous: fr. obovoid, 5 mm. long. Fl.vi. S.H.1:f.424m,427i. W. China. Cult. 1915. Zone VII?—*C. g. serotina* (Hutchins.) Stapf, f. Infl. 3.5-7 cm. across; fls.vii-viii. B.M.8854, 9171(c). N.F.3:f.2. (*C. s. Hutchins.*) Intr. 1910.—*C. g. vestita* W. W. Sm., var.

Lvs. densely fulvous-tomentose beneath when young; calyx densely white-tomentose. W. China. Cult. 1934.

27. *C. Henryana* (Schneid.) Rehd. & Wils. Half-evergreen shrub, to 4 m., with arching pubescent brts.: lvs. oblong to oblong-lanceolate, acute at ends, 5-12 cm. long, sparingly pubescent above at first, grayish tomentose beneath, finally often glabrescent or pubescent only on the veins and otherwise nearly glabrous and glaucous, with 9-12 pairs of veins; petiole 5-15 mm. long, pubescent; fls. 1 cm. across, in rather loose pubescent corymbs 2.5-4 cm. across; anthers purple: fr. ovoid, 6 mm. long, dark crimson, with 2-3 nutlets; hypostyle pubescent. Fl.vi; fr.x. G.C.46:339. R.H.1919:264,t(c). M.G.29:15. (*C. rugosa* var. *H.* Schneid.) C. China. Intr. 1901. Zone VII? Lvs. larger than any other half-evergreen or evergreen species.

*C. H. × frigida*; see under No. 24.

28. *C. Dámmeri* Schneid. Evergreen shrub with trailing often rooting brs.; brts. slightly pubescent when young, soon glabrous: lvs. elliptic to elliptic-oblong, acutish or obtusish, mucronulate, rarely emarginate, cuneate, 1.5-3 cm. long, glabrous and lustrous dark green above, paler or glaucescent and slightly reticulate beneath, strigose pubescent at first, soon glabrous, petiole 2-3 mm. long; fls. usually solitary, 1 cm. across, short-stalked; calyx sparingly pubescent or nearly glabrous; anthers purple: fr. subglobose 6-7 mm. across, bright red; nutlets usually 5. Fl.v-vi; fr.x-xi. S.H.1:f.428a-b,429h-k. Gs.5:110. Gt.73:135(h). S.L.143(h). (*C. humifusa* Duthie.) C. China. Intr. 1900. Zone V? Very distinct on account of its prostrate habit with long trailing brs.—*C. D. radicans* Schneid., var. Lvs. oval or elliptic to obovate, usually obtuse, often emarginate, more rugulose above, smaller: fls. 1-2, on pedicels 5-15 mm. long. Gn.88:35(h);87:27(h);89:226(h). W. China. Intr. 1904 or 1908.

29. *C. rotundifolia* Lindl. Evergreen shrub to 4 m., with long arching brs.: lvs. broad-oval or broad-obovate, rounded or acute and mucronulate at apex, usually broad-cuneate, 8-20 mm. long, lustrous dark green above, glaucescent and sparingly strigose-hirsute below: fls. 1-3, 1-1.2 cm. across, short-stalked; calyx sparingly pubescent; anthers purple: fr. subglobose, 8 mm. across, red; nutlets 2. Fl.vi; fr.xx. Ref. Bot. 1:t.53(c). B.R.1187(c). (*C. prostrata* Bak., *C. microphylla* var. *uva-ursi* Lindl.) Himal. Intr. 1825. Zone VI? Forming dense masses of interlacing brs.—*C. r. lanata* (Dipp.) Schneid., var. Lvs. elliptic to elliptic-oblong, tomentose beneath: fls. 3-8. Ref. Bot. 1:t.52(c). R.H.1889:348,t.f.4(c). Gn.55:186;87:28. (*C. buxifolia* Baker, not Wall., *C. Wheeleri* Hort., partly, ?*C. lanata* Jacques.)

Related species: *C. buxifolia* Lindl. Low compact shrub; young brts. densely white-tomentose: lvs. elliptic to obovate, 6-15 mm. long, mucronate, dull green and hairy above when young, tomentose beneath, not papillose: cymes few-fl. Wight, Icon. 3:t.992. S.H.1:f.425k,l,429b. Nilghiri Hills. Intr. 1919. Zone VII? —*C. b. vellaëa* Franch., f. Prostrate shrub; brts. thinly pubescent, soon glabrate: lvs. 5-10 mm. long; fls. often solitary. W. China. Intr. about 1915, Zone VI?

30. *C. microphylla* Lindl. Evergreen low shrub to 1 m. with spreading brs.: lvs. obovate to obovate-oblong, obtuse, rarely acutish or emarginate, cuneate, 5-8 mm. long, lustrous dark green above, glaucous and densely grayish pubescent beneath: fls. usually solitary, rarely 2-3, 1 cm. across; calyx pubescent; anthers purple: fr. globose, 6 mm. across, scarlet. Fl.v-vi; fr.xx-x. B.R.1114(c). R.H.1889:348,t.f.3(c). G.C.II.12:333;18:681. Gn.4:165. Jour. Intern. Gard. Club, 2:83(h). Himal. Intr. 1824. Zone (V). Forming dense masses with small lustrous lvs. studded in spring with white fls. fol-

lowed in fall by conspicuous scarlet fr.—*C. m. cochleata* (Franch.) Rehd. & Wils., var. Prostrate: lvs. obovate to nearly oval, rounded or emarginate at apex, margin revolute, beneath with scattered long white hairs. W. China. Intr. 1922.—*C. m. melanotricha* (Franch.) Hand.-Mazz., f. Lvs. obovate or oval, glaucous and with scattered appressed, blackish hairs beneath. W. China. Intr. 1915.—*C. m. thymifolia* (Baker) Koehne, var. Lvs. narrowly oblong-obovate; fls. 2-4, smaller: fr. 5 mm. across. Ref. Bot. 1:t.50(c). R.H. 1889:348,t.f.2(c). G.C.II.12:333;18:681. (*C. thymaeifolia* Baker.) Himal. Intr. 1852.

Related species: *C. conspicua* Marquand. Spreading evergreen shrub to 2 m.: lvs. elliptic-oblong, 6-10 mm. long, on shoots to 2 cm. long, obtuse and usually mucronulate, sparsely pilose above, densely so beneath: fr. subglobose or obovoid, 9 mm. long, scarlet, profusely produced. B.M.9554(c). G.C.103:267. W. China. Intr. 1925. Zone VII?—*C. c. decora* Russell, var. Prostrate shrub with ascending brs. (*C. d. Hort.*) Intr. 1925.

31. *C. congesta* Baker. Low compact shrub to 1 m.; brts. pubescent when young, soon glabrous: lvs. obovate to oval, 6-12 mm. long, obtuse, cuneate, dull green above, whitish beneath, sparingly pubescent at first, becoming glabrous; petiole slender, nearly glabrous, 1-3 mm. long: fls. solitary, 6 mm. across, pinkish white: fr. bright red, about 6 mm. across. Ref. Bot. 1:t.51(c). (*C. microphylla* var. *glacialis* Hook., *C. pyrenaica* Hort.) Himal. Intr. 1868. Zone VI.

14. **PYRACANTHA** Roem. FIRETHORN. Evergreen shrubs with usually thorny brs.; buds small, pubescent: lvs. alternate, short-petioled, crenulate or serrulate or entire, stipules minute, caducous: fls. white, in compound corymbs; sepals short; petals suborbicular, spreading; stamens 20; anthers yellow; carpels 5, free on the ventral side, on the dorsal one adnate about ½ to the calyx-tube: fr. a small pome with persistent calyx, red or orange; nutlets 5. (Greek *pyr*, fire and *acanthos*, thorn; alluding to the spiny brs. and bright red fr.) Six species from S. E. Eu. to Himal. and C. China.

- A. Lvs. beneath and calyx glabrous, or lvs. slightly pubescent.  
 B. Corymbs pubescent: lvs. elliptic to oblanceolate, acute.....1. *P. coccinea*  
 BB. Corymbs glabrous except in var. of No. 2.  
 C. Lvs. oblong to oblong-lanceolate, rarely oblong-obovate, usually acute, bristle-tipped serrate-crenate, 1-2 cm. broad.....2. *P. crenulata*  
 CC. Lvs. generally obovate to obovate-oblong, obtuse, 1.5-2.5 cm. broad.  
 D. Lvs. crenate-serrate, broadest above the middle, obtuse, green beneath.  
 3. *P. crenato-serrata*  
 DD. Lvs. usually entire, sometimes serrulate, widest at or near the middle, usually acutish, glaucescent beneath.....4. *P. atalantioides*  
 AA. Lvs. beneath and calyx tomentose, entire or nearly so.....5. *P. angustifolia*

1. *P. coccinea* Roem. Shrub to 2 m., rarely to 6 m.; spines 1-1.5 cm. long; young brts. grayish pubescent: lvs. narrow-elliptic to lanceolate or oblanceolate, rarely ovate-oblong, acute, rarely obtusish, cuneate, 2-4 cm. long, closely crenulate-serrulate, slightly pubescent beneath at first or glabrous; petioles 2-5 mm. long, pubescent: fls. 8 mm. across, in many-fl. corymbs 2.5-4 cm. broad: fr. subglobose, 5-6 mm. thick, bright red. Fl.v-vi; fr.ix-x. S.O.2:t.90(c). R.I.25:t.99(c). B.S.2:268. M.D.1917:t.32(h). (*Cotoneaster Pyracantha* Spach, *Crataegus P. Borkh.*, *Mespilus P. L.*; FIREY THORN, EVERLASTING THORN.) Italy to W. Asia. Naturalized Pa. and s. Intr. 1629. Zone VI. Ornamental shrub doing particularly well trained against a wall; the var. is more vigorous and hardier.—*P. c. Lalandii* Dipp. Of more vigorous growth with slenderer and longer brs.: lvs. less deeply crenate: fr. bright orange-red. R.H.1925:572,t.f.2(c). Gn.79:570;89:614. M.G.16:136(h). (*P. c. var. latifolia* Zabel.) Orig. about 1874.

2. *P. crenulata* (Roxb.) Roem. Shrub or small tree; young brts. and petioles rusty-pubescent: lvs. oblong to oblanceolate, rarely ovate-lanceolate, acute or obtusish and bristle-tipped at apex, cuneate, 2-5 cm. long, crenate-serrulate, lustrous bright green above, glabrous; petioles glabrous: fls. 8 mm. across, in rather loose corymbs 2-3 cm. broad; styles spreading from the base: fr. subglobose, 6-8 mm. across, orange-red. Fl.v-vi; fr.ix-x. B.R.30:52(c). G.C.57:101,t(c). R.H.1913:205,t(c). S.H.1:f.430c-d,413g-h. (*Crataegus* c. Roxb., *Cotoneaster* c. Wenz.) Himal. Intr. about 1844. Zone VII?—*P. c. Rogersiana* A. B. Jacks., var. Lower: lvs. oblanceolate, 2-4.5 cm. long, unequally serrulate: fr. 7-8 mm. across, reddish orange. R.H.1925:572,t.f.3(c). G.C.60:309(1). Gn.85:567. (*P. R.* Chittenden, *P. R. f. aurantiaca* Bean.) S. W. China. Intr. 1911.—*P. c. flava* Meunissier. A form of the preceding var. with yellow fr. R.H.1925:572,t.f.1(c). G.C.67:55.—*P. c. kansuensis* Rehd., var. Lvs. narrow-oblong to oblanceolate, 1-2.5 cm. long: infl. pubescent: fr. about 5 mm. across. N. W. China. Intr. 1914.

3. *P. crenato-serrata* (Hance) Rehd. Shrub to 3 m.; young brts. rusty-pubescent: lvs. elliptic or obovate to obovate-oblong, rounded or acute at apex, sometimes with a minute mucro, 2.5-6 cm. long, crenate, entire and gradually narrowed toward the base, dark green and lustrous above, light green beneath: fls. 1 cm. across; infl. 3-4 cm. across: fr. subglobose, 7 mm. across, coral-red. Fl.v-vii; fr.x-i. R.H.1913:204,t.B(c). B.M.9099,f.5-10(c). Gn.83:138;87:52. (*P. yunnanensis* Chittenden, *P. crenulata* var. *yunnanensis* Mott., *P. Gibbsii* Rehd., not A. B. Jacks.) C. and W. China. Cult. 1906. Zone VI? More vigorous and more freely fruiting than the preceding species.

*P. c.* × *Osteomeles subrotunda*; see *Pyracomeles*, p. 372.

4. *P. atlantioides* (Hance) Stapf. Shrub to 6 m.: lvs. elliptic to oblong-lanceolate, 3-7 cm. long, acutish or rarely rounded at apex, entire or serrulate to crenulate, glaucescent beneath and fulvous-pubescent when young; petioles 3-8 mm. long: corymbs many-fld., 3-4 cm. across, puberulous toward the base; pedicels glabrous; fls. 8-9 mm. across: fr. 6-7 mm. across, scarlet or bright crimson. Fl.v-vi; fr.x-iii. B.M.9099,f.1-4(c). G.C.60:309;63:47(h); 73:27. J.L.48:59. Gn.82:443. (*P. Gibbsii* A. B. Jacks., *P. discolor* Rehd., ?*P. Loureiri* Merr.) S. E. to W. China. Intr. 1907. Zone VI. Valued for its bright fr. remaining on the brs. through the winter.

5. *P. angustifolia* (Franch.) Schneid. Shrub to 4 m., sometimes prostrate: lvs. narrow-oblong to oblanceolate-oblong, obtuse and mucronulate, sometimes emarginate, cuneate, 1.5-5 cm. long, entire or with few teeth near apex, pubescent above at first, finally glabrous and dark green, grayish tomentose beneath: fls. 8 mm. across, in rather dense corymbs 2-4 cm. across: fr. depressed-globose, 6-8 mm. across, short-stalked, bright orange to brick-red. Fl.v-vi; fr.x-iii. B.M.8345(c). Gn.67:24,105,t(c);87:110. G.C.36:441. (*Cotoneaster* a. Franch.) S. W. China. Intr. 1895. Zone VII. Retaining its bright-colored fr. until March.

15. **MÉSPILUS** L. MEDLAR. Deciduous tree, sometimes thorny; buds with imbricate scales, dark brown: lvs. alternate, short-petioled, serrulate or nearly entire, with deciduous stipules: fls. solitary, large, white, on short, not articulate stalks, terminal on short leafy brts.; sepals large; petals suborbicular or broad-obovate; stamens 30-40, with red anthers; styles 5 distinct, glabrous; carpels 5, completely connate, each with 2 fertile ovules: fr. a large pomaceous drupe, open at the top, with large leafy sepals; stones 5. (Ancient Latin name.) One species.

**M. germànica** L. Shrub or small tree, to 5 m. or more; brts. pubescent: lvs. oblong to oblong-lanceolate, short-acuminate, 6-12 cm. long, slightly pubescent and dull green above, more densely pubescent beneath: fls. 3-4 cm. across: fr. depressed-subglobose or pyriform, 2-3 cm. across. Fl.v; fr.x-xi. S.O.2:t.83(c). G.H.t.69(c). S.E.3:t.478(c). R.I.25:t.100(c). S. E. Eu. to Persia, doubtfully native in C. Eu. and Eng. Long cult. Zone V. Sometimes grown for its fr. which after incipient decay becomes soft and of agreeable acid taste.—**M. g. macrocarpa** (Duham.) K. Koch, with larger, much depressed fr. (**M. g. f. gigantèa** Kirchn.)—**M. g. abortiva** (Dum.-Cours.) K. Koch, var. A seedless form with small fr. (**M. g. var. apyrena** K. Koch.) There are also forms with variegated lvs.

**M. g. × Crataegus Oxyacantha** = **Crataegomespilus grandiflora**; see below.  
—**M. g. × Crataegus monogyna** = **C. Gillotii**; see below.

× **CRATAEGOMÉSPILUS** Jouin. Deciduous trees or shrubs: graft-hybrids or sexual hybrids (**Cratae-mespilus** Camus) between **Crataegus** and **Mespilus**: similar to **Mespilus** but differing in the smaller fls., usually 1-3 at end of brts., with 14-28 stamens and in the smaller fr. with 2-3 sterile nutlets.

1. **C. grandiflora** (Sm.) Bean (**Crataegus Oxyacantha** × **Mespilus germanica**). Shrub or tree: lvs. elliptic, acute at ends, 3-7 cm. long, unequally serrate or serrulate, or sometimes slightly lobed toward the apex, pubescent beneath: fls. 1-3, about 2.5 cm. across; calyx pubescent: fr. globose-ovoid 1-1.5 cm. across, pubescent. Fl.v-vi; fr.x. B.M.3442(c). R.I.25:t.107.f. 4-9(c). G.F.10:35. R.H.1869:80. (**Crataegus g. K. Koch**, **C. Smithii** Ser., **C. lobata** Bosc, **Mespilus g. Sm.**, **Cratae-mespilus g. Camus.**) Orig. before 1800. Zone V.

A similar hybrid is **C. Gillotii** Beck (**Crataegus monogyna** × **M. germanica**), differing chiefly in its lobed, not serrate lvs. and smaller fls. with 2 styles. R.I.25:t.107.f.1-3(c). Orig. in France. Cult. 1890.

2. **C. Dárdari** Jouin (**Crataegus monogyna** + **M. germanica**). Lvs. and fr. similar to those of **Mespilus**, but brs. spiny: fls. 1.5 cm. across, in corymbs, pedicelled; stamens 15-20: fr. 1.5 cm. across, crowned by the upright calyxlobes; stones 1-3. R.I.25:t.108(c). M.G.27:101. K.B.1911:268,t. R.H.1937:446,t(c);1938:187.—**C. D. Asnierèsii** (Schneid.) Rehd., var. Resembling **Crataegus monogyna**, but pubescent: brs. slender: lvs. broad-obovate to ovate, serrulate and usually with 1 to 2 pairs of lobes: fls. in 3-12-fld. corymbs; stamens 20; styles 1-2: fr. subglobose, 1 cm. across. R.I.25:t.109(c). G.C. 50:183,185;77:3(h). Gn.75:310;86:189(h). K.B.1911:268,t(h). (C. "Jules d'Asnières" Jouin, **C. Asnierèsii** Schneid.)—Both forms orig. on the same tree at Bronveaux near Metz, France. Sometimes brs. reverting to one of the parents are produced.

16. **CRATAEGUS** L. HAWTHORN. Deciduous, rarely half-evergreen shrubs or trees, usually spiny: lvs. alternate, serrate or lobed, stipulate: fls. white (red in some vars.), in corymbs, rarely solitary: sepals and petals 5; stamens 5-25; carpels 1-5, connate, but free at the apex and on the ventral side: fr. a pome-like drupe with 1-5 bony 1-seeded nutlets, their free part (hypostyle) differing in texture. (Ancient Greek name.) Temp. regions of the n. hemisphere; more than 1000 species have been described from N. Am., but much reduced by recent authors; about 90 in the Old World. Only some representative species of the different groups are described here; for other American species see Sargent, *Man. Trees N. Am.*, ed. 2, 397-549, Small, *Fl. S. E. St.* 532-569, and *Man. S. E. Flora*, 637-644, Gray's *Man. ed.* 7,460-479, and

Britton & Brown, Ill. Fl. ed. 2, 2:294-321; also Palmer in J.A.6:5-128 for an enumeration of the American species.

- A. Veins of the lvs. extending to the points of the lobes or teeth only: lvs. usually slightly or not lobed (except in Nos. 32-34): fr. not blue or black (except in Nos. 20 and 31).
- B. Nutlets without cavities on the inner surface: fr. usually mealy at maturity.
- C. Petioles elongated, usually slender.
- D. Petioles glandular at apex or sparingly glandular throughout.
- E. Petioles glandular only at apex; corymbs many-fld.: lvs. broad at base.
- F. Lvs. tomentose or pubescent beneath, at least on the veins.
- G. Stamens 20: lvs. leathery.....1. *C. mollis*
- GG. Stamens 10; lvs. membranous.....2. *C. submollis*
- FF. Lvs. glabrous beneath or nearly so.
- G. Fr. not bloomy.
- H. Stamens 20; anthers pink; infl. glabrous: lvs. truncate.
4. *C. coccinioides*
- HH. Stamens 5-10: lvs. broad-cuneate to truncate.
- I. Anthers pink or rose-colored; stamens usually 10.
- J. Calyx-lobes usually glandular-serrate: nutlets usually 4.
- K. Infl. densely villous.....3. *Eluangeriana*
- KK. Infl. slightly villous or glabrous.....5. *C. pedicellata*
- JJ. Calyx-lobes entire or obscurely serrate; nutlets 2-3.6. *C. flabellata*
- II. Anthers yellow; stamens 5-10.....7. *C. chrysocarpa*
- GG. Fr. bloomy until nearly fully ripe.....8. *C. pruinosa*
- EE. Petioles sparingly glandular throughout; corymbs usually few-fld.: lvs. cuneate at base: stamens 10.
- F. Infl. glabrous or nearly so.....9. *C. intricata*
- FF. Infl. pubescent.
- G. Corymbs many-fld. ....10. *C. Harbisonii*
- GG. Corymbs 2-5-fld. ....11. *C. triflora*
- DD. Petioles glandless or with few minute glands: lvs. usually 3-lobed toward the apex, lustrous above.
- E. Fr. bright red.....12. *C. viridis*
- EE. Fr. dull dark red.....13. *C. nitida*
- CC. Petioles usually short (except in No. 21): lvs. cuneate at base, not or very slightly lobed.
- D. Infl. many-fld.
- E. Fr. red.
- F. Stamens 10; corymbs glabrous.....14. *C. crus-galli*
- FF. Stamens 15-20.
- G. Lvs. lustrous above.
- H. Nutlets 1-3: lvs. 6-10 cm. long.
- I. Lvs. glabrous beneath.....15. *C. persistens*
- II. Lvs. villous beneath.....16. *C. Lavalleyi*
- HH. Nutlets 3-5; lvs. 1-6 cm. long.
- I. Fr. 1-1.5 cm. across: anthers red: lvs. pubescent.....17. *C. cuneata*
- II. Fr. 4-6 mm. across: anthers yellow: lvs. glabrous.....25. *C. spathulata*
- GG. Lvs. dull above.
- H. Fr. juicy, edible: lvs. cuneate-oblong to elliptic-lanceolate, tomentose beneath .....18. *C. pubescens*
- HH. Fr. dry, mealy: lvs. obovate or oval.....19. *C. punctata*
- EE. Fr. bluish black.....20. *C. brachyacantha*
- DD. Infl. 1-5-fld.: lvs. not exceeding 5 cm.
- E. Petioles glandless or with few glands.
- F. Fls. before the lvs., 2-5; sepals entire or minutely serrate; petioles 6-20 mm. long .....21. *C. aestivalis*
- FF. Fls. after the lvs., usually solitary: sepals foliaceous, glandular-serrate; petioles short .....22. *C. uniflora*
- EE. Petioles, margin of lf. and infl. densely glandular.....23. *C. aprica*
- BB. Nutlets with furrows or irregular cavities on the inner surface (smooth in *C. discolorica* under No. 32): fr. usually lustrous and pulpy at maturity.
- C. Lvs. not or only slightly lobed.
- D. Fr. scarlet or orange; nutlets 2-3.
- E. Nutlets with shallow cavities: lvs. glabrous or nearly so: stamens 10-15.
27. *C. scabrida*
- EE. Nutlets with deep cavities: lvs. with impressed veins.
- F. Fr. ellipsoid or pear-shaped, upright: lvs. elliptic to oblong, pubescent below: stamens 20 .....28. *C. calpodendron*
- FF. Fr. subglobose, nodding: lvs. broad-elliptic, pubescent only on the veins beneath.
- G. Stamens usually 20; anthers rose-colored.....29. *C. succulenta*
- GG. Stamens usually 10; anthers yellow.....30. *C. macracantha*
- DD. Fr. black; nutlets 3-5: lvs. glabrous.....31. *C. Douglasii*
- CC. Lvs. distinctly lobed and sharply serrate.
- D. Fr. black .....32. *C. chlorosarca*
- DD. Fr. red or yellow.

- E. Lvs. cuneate, often pubescent; petioles stout; anthers pink or purple.  
 EE. Lvs. truncate to broad-cuneate, glabrous; petioles slender; anthers pale yellow: fr. yellow or yellowish red..... 33. *C. sanguinea*  
 AA. Veins of lvs. extending to the points of the lobes and to the sinuses, at least on the larger leaves: fr. red or yellow (black in Nos. 35-36).  
 B. Fr. 4-7 mm. across; sepals often deciduous.  
 C. Lvs. triangular-ovate, 3-5-lobed, with broad-ovate lobes: fr. subglobose; calyx deciduous ..... 26. *C. Phaenopyrum*  
 CC. Lvs. ovate, deeply 5-7-lobed: fr. ellipsoid..... 24. *C. Marshallii*  
 BB. Fr. larger; sepals persistent.  
 C. Fr. black; nutlets with cavities on the inner surface.  
 D. Lvs. with about 5 pairs of lobes; anthers yellow: fr. lustrous, subglobose.  
 DD. Lvs. with 2-3 pairs of lobes: anthers red: fr. dull, ellipsoid..... 35. *C. nigra*  
 CC. Fr. red or yellow.  
 D. Nutlets 1-2, rarely 3, with cavities on the inner surface.  
 E. Styles usually 2: lvs. 3-5-lobed with short and broad serrulate lobes.  
 EE. Style usually 1: lvs. deeply 3-7-lobed, with usually entire or sparingly toothed lobes ..... 37. *C. Oxyacantha*  
 DD. Nutlets 2-5, without cavities.  
 E. Brts. pubescent.  
 F. Lvs. not glandular-serrate; lobes often entire.  
 G. Lvs. lustrous above and glabrescent, finely pubescent below.  
 GG. Lvs. dull and pubescent above, villous beneath: nutlets 4-5.  
 FF. Lvs. with glandular-serrate lobes, pubescent..... 40. *C. orientalis*  
 EE. Brts. glabrous: lvs. deeply lobed, glabrous..... 41. *C. tanacetifolia*  
 42. *C. pinnatifida*

## Ser. 1. MOLLES Sarg.

1. *C. mollis* Scheele. Tree to 10 m., with short stout thorns: lvs. broad-ovate, 6-10 cm. long, sharply and doubly serrate and with 4-5 pairs of short and acute lobes, densely pubescent beneath at first, later chiefly on the veins: infl. tomentulose; fls. 2.5 cm. across, with red disk: fr. usually pear-shaped, 1.2 cm. across, scarlet, pubescent, with sweet mealy flesh; nutlets 4-5. Fl. IV-V; fr. VIII-IX. S.S.13:t.659. (*C. tiliifolia* K. Koch, *C. acerifolia* Hort., *C. coccinea* var. *m.* Torr. & Gray.) S. Ont. to Va., w. to S. D. and Kans. Cult. 1683. Zone IV. This and the following species of this group are handsome small trees with bright green foliage, large white flowers and brightly colored rather large fr. in autumn.

Closely related species: *C. arkansana* Sarg. with generally oblong-ovate lvs. and frs. ripening in Oct. S.S.13:t.660. Ark. Intr. 1883.—A related species or hybrid, probably *C. mollis* × *nigra*, is *C. peregrina* Sarg. Lvs. ovate, broad-cuneate, with 4-6 pairs of narrow lobes, glabrous above, villous beneath: fr. ovoid-globose, dark dull purple, pubescent at base and apex. S.T.2:t.191. Orig. in Eu. before 1873.

2. *C. submollis* Sarg. Tree to 8 m., with broad round head; spines thin, usually straight, 5-7 cm. long: lvs. ovate, acute, broadly cuneate, 5-8 cm. long, doubly serrate and with 3-4 pairs of acute short lobes, scabrous above, soft-pubescent beneath at first, later puberulous on the veins: infl. tomentose: fls. 2.5 cm. across: fr. pear-shaped or broad ellipsoid, 1.8 cm. long, bright orange-red and lustrous, puberulous at base, with yellow mealy flesh; nutlets usually 5. Fl.v; fr. early in Sept., soon falling. S.S.4:t.182(as *C. mollis*). Em.494,t.(as *C. tomentosa*). G.F.5:221(h). Que. to Mass. and e. N. Y. Cult. 1830. Zone IV.

Closely related species: *C. arnoldiana* Sarg. Brs. zigzag; lvs. often truncate at base, smooth and lustrous above; fr. subglobose, villous toward the ends; nutlets 3-4. S.S.13:t.668. B.C.2:882. Mass. to Conn. and N. Y. Cult. 1900.

3. *C. Ellwangeriana* Sarg. Tree, sometimes to 6 m. with ascending brs. forming a broad symmetrical head: lvs. oval or ovate, acute, broad-cuneate or rounded, 6-9 cm. long, coarsely and often doubly serrate, with many short

acute lobes, at first hairy above and villous below, later scabrous above and nearly glabrous below: infl. many-fl., villous; pedicels short; fls. 2.5 cm. across: fr. short-ellipsoid, 2.5 cm. long, bright crimson, lustrous, slightly villous at ends, with thin acid flesh; nutlets 3-5. Fl.v; fr. end of Sept., soon falling. S.S.13:t.671. Gn.86:569. G.C.47:130(h). F.E.33:488(h). (*C. coccinea* var. *E. Eggl.*) Ont. to Mich. and Pa. Cult. 1900. Zone IV.

Closely related species: *C. Robesoniana* Sarg. Shrub: lvs. more deeply lobed: infl. 4-6-fl., nearly glabrous: fr. ellipsoid, about 2 cm. long, scarlet, pale-dotted. (*C. spissiflora* Sarg.) Ont. to Mass. and Pa. Cult. 1890. Zone IV.

#### Ser. 2. DILATATAE Sarg.

4. *C. coccinioides* Ashe. Tree, sometimes to 7 m., with broad round head; thorns stout, 3-5 cm. long: lvs. broad-ovate, acute, rounded or truncate at base, 5-8 cm. long, doubly serrate, with several pairs of broad acute lobes, at first villous on the veins beneath, later nearly glabrous, dull green above: infl. slightly villous, compact, 5-7-fl.; fls. 2 cm. across: fr. subglobose, 1.5-2 cm. across, dark crimson and lustrous, with thick, subacid flesh; calyx enlarged; nutlets 4-5. Fl.v; fr. early in Oct. S.S.13:674. S.T.1:t.33. B.C.2:883. M.G.16:358,359(h). B.S.1:424(as *C. acutiloba*). (*C. speciosa* Sarg.) Mo. to Ind. and Kans. Intr. 1883. Zone V. Small round-headed tree conspicuous in fl. and in fr., the lvs. tinged red when unfolding and turning orange and scarlet in fall.

Related species: *C. durobrivensis* Sarg. Shrub to 6 m.: lvs. broad-cuneate at base, glabrous: infl. glabrous; fls. 2-2.5 cm. across: fr. globose, 1.6 cm. thick. S.T.1:t.2. Gn.M.33:104(h). N. Y. Intr. 1901.—*C. dilatata* Sarg. Tree to 6 m.: lvs. broad-ovate, truncate to subcordate at base, rough above when young, glabrous beneath: infl. 6-12-fl., slightly villous; fls. 2.5 cm. across: fr. subglobose, 8 mm. across, bright red, falling early in Sept. Que. to n. N. Y. and R. I. Intr. 1900.

#### Ser. 3. COCCINEAE Loud.

5. *C. pedicellata* Sarg. Small tree to 7 m., with round symmetrical head; brs. rather slender, with straight or slightly curved thorns 3-5 cm. long: lvs. broad-ovate, truncate or broad-cuneate, 5-10 cm. long, coarsely and often doubly serrate, with 4-5 pairs of short acute lobes above the middle, dark green and scabrous above, paler and nearly glabrous below: infl. slightly villous, loose; fls. 1.5-2 cm. across; sepals coarsely glandular-serrate; anthers rose-colored: fr. pear-shaped or ellipsoidal, bright scarlet and lustrous, with conspicuous calyx; flesh thin, mealy; nutlets 4-5. Fl.v; fr.ix. S.S.13:t.677. Pa. to Conn., N. Y. and Ont. Intr. 1902. Zone IV.—*C. p. gloriösa* (Sarg.) Sarg., var. Fls. larger; anthers pink: fr. larger, more lustrous, usually mamillate at base. Gn.M.33:106(h). (*C. g.* Sarg.) N. Y. Intr. 1906.

#### Ser. 4. TENUIFOLIAE Sarg.

6. *C. flabellata* (Spach) Kirchn. Shrub to 6 m. with many stems; thorns stout, slightly curved, 4-10 cm. long: lvs. ovate to broad-ovate, flabellate, 3-7 cm. long, broad-cuneate to truncate, rarely subcordate, acuminate, with 4-6 pairs of acuminate doubly serrate lobes, their tips often recurved, appressed-pubescent above, later slightly scabrate or glabrate, glabrous or nearly so beneath: infl. slightly villous; fls. 1.5-2 cm. across; calyx glabrous, lobes serrate, slightly villous inside; stamens 5-10; fr. ellipsoidal, 8-12 mm. thick, crimson; nutlets 3-5. Fl.v; fr.ix. Lange, Rev. Crat. 29. (*C. crudelis* Sarg., *C. blanda* Sarg.) E. Can. Cult. 1830. Zone III.

Closely related species: *C. Grayana* Eggl. Lvs. flabellate, broad-cuneate to truncate; pairs of lobes 4-6, their tips recurved; infl. slightly villous: fls.

about 1.5 cm. across; calyx villous at base, lobes slightly glandular-margined; stamens 20; fr. subglobose, dark red. (*C. flabellata* of Sarg., not Kirchn.) E. Can. to n. N. Y. and N. Eng. Intr. 1901. Zone III.—*C. macrospérma* Ashe. Shrub or small tree: lvs. elliptic-ovate to broad-ovate, rounded to truncate, rarely cordate at base, with 4-5 pairs of short acute lobes, glabrous: infl. glabrous or slightly villous; sepals entire; stamens 5-10; fr. short-ellipsoid, 1-1.8 mm. thick. Add.4:t.138(c). Gray Man. 471. N. S. to Minn., s. to N. C. and Ill. Intr. 1903. Zone III.—*C. m. acutifolia* (Sarg.) Eggl., var. Lvs. with narrower acuminate recurved lobes, lvs. of shoots often cordate. (*C. a.* Sarg.) N. S. and N. Eng. Cult. 1880.

#### Ser. 5. ROTUNDIFOLIAE Eggl.

7. *C. chrysocárpa* Ashe. Shrub or small tree; spines 2-7 cm. long; brts. villous-pubescent when young: lvs. suborbicular to broad-ovate or broad-obovate, 3-5 cm. long, acute at apex, broad-cuneate, with 3-4 pairs of short triangular acute lobes, doubly serrate, loosely pubescent on both sides: infl. loosely villous; fls. 1.5-2 cm. across; sepals lanceolate, glandular-serrulate; stamens 5-10; fr. subglobose, about 1 cm. thick, red to orange. Fl.v-vi; fr.x. (*C. Sheridaniana* A. Nels., *C. rotundifolia* var. c. Eggl.) Man. and N. D. to Colo. and Neb. Intr. 1906. Zone III.—*C. c. phoenicea* E. J. Palmer, var. Brts. and infl. glabrous: lvs. glabrous or pubescent on the veins beneath: fr. 1-1.2 cm. thick, dark red. B.R.1957(c). G.C.II.14:557. Gn.33:464. Gray Man. 468. (*C. rotundifolia* Moench, not Lam., *C. coccinea* var. r. Sarg.) N. S. to Sask., s. to Pa. and Mich. Cult. 1737.

#### Ser. 6. PRUINOSAE Sarg. (including *Silvicolae* Beadle)

8. *C. pruinosa* (Wendl.) K. Koch. Shrub or tree to 6 m.; brs. spreading, with numerous stout straight thorns: lvs. elliptic or ovate, acute, usually broad-cuneate, 3-5 cm. long, irregularly and often doubly serrate and with 3-4 pairs of short acute lobes, red when unfolding, later dark bluish green above, paler beneath, glabrous: infl. several-fld.; fls. slender-pedicelled, 2-2.5 cm. across; stamens 20; anthers pinkish: fr. subglobose, 1-1.2 cm. thick, apple-green and glaucous until nearly fully ripe, finally dark purple with yellow sweet flesh; the calyx with well-developed tube: nutlets 5. Fl.v; fr.x. S.S.13:t.648. Ont. to Va. and Ill. Cult. 1823. Zone IV.

#### Ser. 7. INTRICATAE Sarg.

9. *C. intricata* Lange. Shrub to 3 m.; brs. upright or spreading, with long curved thorn: lvs. elliptic-ovate, acute, cuneate, 2-7 cm. long, doubly serrate and with 3-4 pairs of short acute lobes, glabrous above, bright green, slightly paler beneath and nearly glabrous: infl. slightly villous, 3-7-fld., with very glandular deciduous bracts; sepals glandular-serrate; anthers yellow: fr. subglobose to ellipsoid, reddish brown; nutlets 3-4. Fl.v; fr.x. Lange, Rev. Cratt.1. (*C. coccinea* L., in part.) Mass. to N. Y. and N. C. Intr. 1730. Zone V.

#### Ser. 8. BRACTEATAE Sarg.

10. *C. Harbisonii* Beadle. Tree to 8 m., with wide-spreading brs.; thorns usually stout, 3-5 cm. long: lvs. broad-ovate to obovate, acute, rounded or broad-cuneate, 3-10 cm. long, coarsely or incisely serrate; lustrous and scabrate above, pubescent beneath: infl. many-fld., pubescent, with conspicuous glandular bracts; fls. about 2 cm. across; sepals glandular-serrate; stamens 20; anthers yellow: fr. globose, 1.2 cm. across, red; nutlets 3-5. Fl.v; fr.x. S.S.13:t.691. Tenn. Intr. 1900. Zone V.

## Ser. 9. TRIFLORAE Beadle.

11. *C. triflora* Chapm. Large shrub or tree to 7 m.: lvs. ovate to elliptic, acute, rounded or broad-cuneate, 2-7 cm. long, serrate and with short acute lobes, pubescent: infl. usually 3-fld., pubescent: fls. 2.5-3 cm. across; sepals glandular-serrate, pubescent; stamens 20; anthers yellow: fr. globose, 1.2-1.5 cm. across, pubescent, red; nutlets 3-5. Fl.v-vi; fr.ix-x. Ga., Ala. Intr. 1912. Zone V.

## Ser. 10. VIRIDES Beadle.

12. *C. viridis* L. Tree to 12 m., with spreading brs.; thorns slender: lvs. oblong-ovate to elliptic, acute or acuminate, cuneate, 2-6 cm. long, serrate, dark green and lustrous above, paler beneath, finally glabrous: infl. glabrous; pedicels slender; sepals lanceolate, entire: fr. globose, 4-6 mm. across, bright red; stones usually 5. Fl.v; fr.x(-iii). S.S.4:t.187. (*C. arborescens* Ell.) Md. and Va. to Ill., Iowa, Tex. and Fla. Cult. 1827. Zone IV.

13. *C. nitida* Sarg. Tree to 10 m. with spreading brs., unarmed or with straight thorns: lvs. elliptic to oblong-obovate, acuminate, cuneate, 2-8 cm. long, coarsely serrate and often slightly lobed, dark green and lustrous above, paler below, glabrous: infl. glabrous; sepals lanceolate, entire or sparingly glandular-serrate: fr. subglobose or short-ellipsoid, about 1 cm. long, dull red, with yellow mealy flesh; nutlets 2-5. Fl.v; fr.x(-iii). S.S.13:t.703. Gray Man. 465. Ill. to Mo. and Ark. Intr. 1883. Zone IV. Like the preceding a handsome round-headed tree with lustrous lvs. changing to orange and scarlet in fall and with red fr. persisting through the winter.

## Ser. 11. CRUS-GALLI Loud.

14. *C. crus-galli* L. COCKSPUR THORN. Large shrub or tree to 12 m., with wide-spreading rigid brs.; thorns slender, numerous: lvs. obovate to oblong-obovate, usually rounded at apex, cuneate, 2-8 cm. long, sharply serrate above the entire base, quite glabrous, subcoriaceous: infl. glabrous; fls. 1.5 cm. across; sepals entire or minutely glandular-serrate: fr. subglobose about 1 cm. across, red, with thin and dry flesh; nutlets usually 2. Fl.v-vi; fr. late in Oct. R.B.116(c). S.S.4:t.178. Em.492,t. G.F.7:295. G.C.28:244, suppl. Que to N. C. and Kans. Intr. 1656. Zone IV. Attractive in bloom and with decorative bright red fr. remaining during the winter; the lvs. changing to orange and scarlet in fall.—*C. c. salicifolia* (Med.) Ait., var. Lvs. lanceolate to oblanceolate, thinner. (*C. c. var. linearis* Ser.)—*C. c. pyracanthifolia* Ait., var. Lvs. elliptic to obovate, usually acute: fr. smaller, bright red. S.S.13:t. 637. W. N. Y. and Pa. to Fla. and Tenn.—*C. c. splendens* Ait., var. Lvs. elliptic-oblanceolate, very shining.

*C. c. × pubescens*; see No. 16.—*C. c. × ? macracantha*; see under No. 30. *C. c. × pentagyna*; see under No. 36.

Related species: *C. Fontanesiana* (Spach) Steud. Lvs. thinner, elliptic to elliptic-lanceolate, or obovate-oblong; pedicels hairy; stamens 16-18, with yellow anthers: fr. ellipsoid or pyriform, 1.2 cm. long, brick-red. G.O.t.144. (*C. olivacea* Sarg.) Pa. Cult. 1830. Zone V.—*C. fecunda* Sarg. Tree to 8 m.: lvs. thinner, ovate or elliptic to oblong-ovate, 5-8 cm. long, acute, rarely rounded at apex, coarsely doubly serrate, slightly pubescent on the veins beneath or nearly glabrous: infl. glabrous or slightly pubescent: fr. subglobose to short-ellipsoid, about 1.5 cm. long. W.A.62,t(h). Mo., Ill. Intr. 1883. Zone V.

15. *C. persistens* Sarg. Low tree to 4 m. or more, with wide-spreading brs.; thorns stout, to 5 cm. long; young brts. glabrous: lvs. narrow-elliptic to oblong-obovate or oblong, acute or acuminate, cuneate, 5-7 cm. long, serrate from below the middle, dark green and lustrous above, paler beneath, gla-

brous, subcoriaceous; infl. slightly villous; calyx glabrous; fls. 2 cm. across; sepals glandular-serrate above the middle or entire; stamens 20, with whitish anthers; fr. ellipsoid or slightly pear-shaped, 1.5 cm. long, crimson, not lustrous; nutlets 2-3. Fl.v; fr.x. S.T.2:t.190. Orig. 1876? (Possibly hybrid of *C. crus-galli*.) Zone V. Similar to the Cockspur Thorn, but remaining green into the early winter and conspicuous with its persistent red fr.

16.  $\times$  *C. Lavállei* Herincq (? *C. crus-galli*  $\times$  *pubescens*). Small tree to 7 m., with spreading brs.; spines stout, to 5 cm. long; young brts. pubescent: lvs. elliptic to oblong-obovate, acute, cuneate, 5-10 cm. long, unequally serrate from below the middle, slightly pubescent above when young, finally glabrous and lustrous, pubescent beneath: infl. many-fld., villous: fls. 2 cm. across, with red disk; sepals linear, slightly serrulate; stamens 15-20, with yellow or red anthers: fr. ellipsoid, about 1.5 cm. long, brick-red or orange-red; nutlets 2-3. Fl.v; fr.x(-m). R.H.1883:108,t(c);1924:59(h). L.I.t.7. G.C. III.4:737;21:118,119. M.A.t.31(h). (*C. Carrierei* Vauvel.) Orig. before 1880. Zone IV. Tree with the lvs. turning bronzy red late in fall and with conspicuous fls. and showy fr. remaining through the winter.

#### Ser. 12. CUNEATAE Rehd.

17. *C. cuneata* Sieb. Much-branched shrub to 1.5 m.; spines slender, 5-8 mm. long; young brts. pubescent: lvs. broad-obovate to obovate-oblong, gradually narrowed into a short petiole, 2-6 cm. long, incisely and irregularly serrate and often 3-lobed at apex, soon glabrous above, loosely villous beneath, at least on the veins; stipules semi-ovate, toothed: fls. 1.5 cm. across, in few-fld. pubescent corymbs; sepals entire or toothed; stamens 20; anthers red: fr. globose or pear-shaped with persistent large reflexed sepals and usually an adnate bract; nutlets 5. Fl.v-vi; fr.x. L.I.t.5. S.H.1:f.453s-v, 454a-c. (*C. alnifolia* Hort., not Sieb. & Zucc.) Japan, China. Cult. 1880. Zone (V). Small twiggy shrub, of no particular ornamental value.

#### Ser. 13. MEXICANAE Loud.

18. *C. pubescens* (H.B.K.) Steud. f. *stipulacea* (Loud.) Stapf. Small tree to 10 m., unarmed or with straight spines to 4 cm. long; young brts. tomentose: lvs. elliptic-oblong or elliptic-obovate to oblanceolate, acute, cuneate, 4-8 cm. long, simply or nearly doubly serrate-crenate, sometimes lobed toward the apex, dark green above, pubescent at first, finally glabrous, slightly villous beneath, more densely on the veins; petiole 5-15 mm. long; stipules usually foliaceous, linear to lanceolate, infl. 6-12-fld., rather dense, villous: fls. 2 cm. across; sepals linear-lanceolate, entire or sparingly dentate near apex; stamens 15-20; anthers pink: fr. subglobose or pyriform, to 2.5 cm. thick, greenish yellow or orange; nutlets usually 2-3. Fl.iii; fr.x-xi. B.M.8589(c). B.R.t.1910(c). S.B.II.t.300(c). Gn.87:462. (*C. s.* Loud., *C. Loddigesiana* Desf., *C. hypolasia* K. Koch.) Mex. Intr. 1824. Zone VII? Tree with the lvs. turning orange and red late in fall and with edible fr.—The typical *C. pubescens* Steud. (*C. mexicana* DC., *Mespilus p.* H.B.K.) is probably not in cult.

*C. p.*  $\times$  *crus-galli*; see No. 16.—*C. p.*  $\times$  ? = *C. grignonensis* Mouillef. Lvs. with 2-4 pairs of acutish slightly crenate-serrate lobes: fr. subglobose, about 1.5 cm. thick, bright red. R.H.1936:16,t(c). M.A.t.30(h). Orig. before 1870. Zone V.

#### Ser. 14. PUNCTATAE Loud.

19. *C. punctata* Jacq. Tree to 10 m., with horizontally spreading brs.; spines stout, short or wanting; young brts. pubescent at first: lvs. obovate,

5-10 cm. long, obtuse or acute, narrowed at base into a margined petiole to 1.5 cm. long, irregularly serrate, those of the shoots often slightly lobed above the middle, with impressed veins above, villous beneath: infl. villous, many-fld.; fls. 1.5-2 cm. across; sepals nearly entire; stamens 20: fr. subglobose or pyriform, 1.5-2 cm. long, dull red, dotted; nutlets 5. Fl.v-vi; fr. Oct., falling soon. S.S.4:t.184. W.D.57(c). A.F.28:805(h). W.A.60,t(h). Que. to Ont., Ill. and Ga. Intr. 1746. Zone IV.—*C. p. aurea* Ait., var. Fr. yellow. (*C. p.* var. *xanthocarpa* Lav., *C. crocata* Roem.) L.I.t.16.

*C. p.* × *tanacetifolia*; see under No. 41.

Related species: *C. collina* Chapm. Lvs. 3-5 cm. long, nearly glabrous: fr. dark red, about 1 cm. across. S.S.13:t.654. Va. to Ala. and Kans. Cult. 1899. Zone V.

Ser. 15. BREVISPINAE Beadle (*Brachyacanthae* Sarg.)

20. *C. brachyacantha* Sarg. & Engelm. Tree to 15 m.; spines curved, 8-15 mm. long: lvs. obovate-oblong to elliptic, acute or sometimes obtuse, cuneate, 2-5 cm. long, crenulate-serrate, rarely slightly lobed, pubescent above when young, glabrous and lustrous at maturity: infl. many-fld., glabrous; fls. 8 mm. across, fading to orange; stamens 15-20: fr. subglobose, about 1 cm. across, blue and bloomy; nutlets 3-5. Fl.v-v; fr.viii. S.S.4:t.177. Tex. to La. Intr. 1900. Zone VII?

Related species: *C. saligna* Greene. Spines about 2 cm. long: fr. globose, 6 mm. across, red, finally blue-black; lustrous. S.S.13:t.636. Colo. Intr. 1902. Zone V?

Ser. 16. AESTIVALES Sarg.

21. *C. aestivalis* (Walt.) Torr. & Gray. MAY HAW. Tree to 10 m. with a round compact head, unarmed or with stout spines 2-3.5 cm. long: lvs. elliptic to oblong-obovate, 2.5-3 cm. long, acute or rounded at apex, gradually narrowed into a petiole 6-20 mm. long, crenate-serrate or remotely dentate above the middle, on shoots sometimes 3-lobed, lustrous above, glabrous except axillary tufts of hairs beneath: fls. with the lvs., about 2 cm. across, in 2-3-fld. glabrous infl.: fr. ovoid, about 8 mm. across, bright red, fragrant, juicy; nutlets usually 3. Fl.iii-iv; fr.v-vi. S.S.4:t.192. N. C. to Fla. Intr. ? Zone VII?

Closely related species: *C. opaca* Hook. MAY HAW (APPLE HAW). Lvs. rusty-pubescent beneath, chiefly on the veins: fls. 2.5 cm. across in 3-5-fld. infl.: fr. subglobose, about 1.5 cm. across, ripening in May. S.M.436. Ala. to w. Tex. Probably not hardy. Fr. used for preserves and jellies.

Ser. 17. PARVIFOLIAE Loud. (*Uniflorae* Beadle)

22. *C. uniflora* Moench. Dense low shrub, to 2.5 m., with numerous slender spines, rarely unarmed: lvs. short-petioled, obovate to oblong-obovate, obtuse, cuneate, 1.5-3.5 cm. long, coarsely or doubly crenate-serrate, pubescent on both sides, finally glabrous above: fls. 1-3, about 1.5 cm. across; calyx pubescent, with large serrate lobes: fr. globose or pyriform, about 1 cm. long, yellow or greenish yellow with conspicuous calyx; nutlets 3-5. Fl.v-vi; fr.x. W.D.65(c). S.S.4:t.191. (*C. parvifolia* Ait., *C. florida* Lodd., *C. tomentosa* L., in part, Eggl.) Va. to Fla. and e. Tex. Intr. 1704. Zone VI?

Closely related species: *C. trianthophora* Sarg. differing chiefly in the usually 3-fld. infl. and obovoid orange-red fr.; scarcely different from the preceding. S.T.2:t.106. Mo. to Tex. Intr. 1906. Zone V.—*C. Brittonii* Eggl. differing in its elliptic or ovate acute lvs., in the 2-6-fld. corymbs and in the dull red fr. (*C. Vailiae* Beadle, not Brit.) Va. to Ga. and Ala. Intr. 1906. Zone V.

Ser. 18. FLAVAE Loud.

23. *C. áprica* Beadle. Shrub or small tree to 6 m., with spreading brs. and slender zigzag brts.; spines thin, straight, 2-3.5 cm. long: lvs. broad-

obovate or oval, acute or rounded, cuneate, 2-3.5 cm. long, serrate usually only above the middle, and often slightly lobed, with gland-tipped teeth, pubescent while young, finally glabrous, thickish: fls. 1.8 cm. across, in 3-6-fld. pubescent compact corymbs; sepals glandular-serrate; stamens 10; anthers yellow: fr. globose, 1.2 cm. across, dull orange red; nutlets 3-5. Fl.v; fr.x. S.S.13:t.698. Va. to Ga. and Tenn. Intr. 1876. Zone V. A very distinct and handsome species with small lvs.

Related species: *C. elliptica* Ait. Lvs. larger, 2-5 cm. long, crenately serrate and often slightly lobed: fls. few: fr. pyriform, green or reddish. B.R.1932, 1939. G.C.27:404. (*C. flava* var. *lobata* Lindl., *C. l.* Loud.) Orig. unknown; cult. 1789. Zone VI?—*C. flava* Ait. Differs chiefly in the less pubescent lvs., 20 stamens with purple anthers and in the ellipsoid orange-brown fr. S.S.13:t.693. Ga., Fla. Cult. 1723.

#### Ser. 19. APIIFOLIAE Loud.

24. *C. Marshallii* Eggl. Shrub or small tree to 6 m.; brts. pubescent while young; spines 2-3 cm. long; lvs. broad-ovate to reniform, 2-4 cm. long, pinately 5-7-cleft, serrate, glabrous or slightly pubescent when young; petioles slender, 1.5-2.5 cm. long: infl. 3-12-fld., villous; fls. 1.8 cm. across: fr. ellipsoid, 6-8 mm. high, scarlet; sepals reflexed, lanceolate, serrate, sometimes partly deciduous. Fl.iv-v; fr.x. S.S.4:t.188. (*C. apiifolia* Michx., not Med.) Va. to Fla., Ark. and Tex. Intr. 1812. Zone (V). With widespreading slender brs., abundant white fls. in spring and attractive fr. in fall.

#### Ser. 20. MICROCARPAE Loud.

25. *C. spathulata* Michx. Shrub or small tree, to 8 m.: lvs. unarmed or with straight stout spines about 3 cm. long: lvs. rhombic-obovate to oblanceolate, acute or rounded and sometimes 3-5-lobed at apex, cuneate, 1-3.5 cm. long, crenate-serrate, glabrate at maturity: fls. about 1 cm. across in many-fld. glabrous corymbs: fr. subglobose, 4-6 mm. thick, with reflexed, deltoid, entire sepals, scarlet. Fl.v-vi; fr.x. B.R.1846(c). S.S.4:t.185. (*C. microcarpa* Lindl.) Va. to Fla., Okl. and Tex. Intr. 1806. Zone (V).

#### Ser. 21. CORDATAE Beadle.

26. *C. Phaenopyrum* (L. f.) Med. WASHINGTON THORN. Tree to 10 m., glabrous; spines slender, to 7 cm. long; lvs. broad- or triangular-ovate, acute, truncate or subcordate, 3-7 cm. long, sharply serrate and 3-5-lobed, bright green and lustrous above, paler below; petioles slender, 1.5-3.5 cm. long: fls. 1.2 cm. across, in many-fld. corymbs; sepals entire, deltoid; stamens 20; anthers yellow: fr. depressed-globose, 8 mm. across, scarlet, lustrous; sepals deciduous, leaving a circular scar; nutlets 3-5. Fl.v-vi; fr.ix-x. B.R.1151(c). S.S.4:t.186. Gn.87:461. F.E.28:103(h). B.S.1:424(h). (*C. cordata* Ait., *C. acerifolia* Moench, *C. populifolia* Walt., ? *C. cordifolia* Mill.) Va. to Ala. and Mo. Intr. 1738. Zone IV. Tree with round head, beautiful in fall with its bright scarlet fr. in large clusters and the lvs. turning scarlet and orange.—*C. P. fastigiata* Slavin, f. Small tree of columnar habit: fls. and frs. smaller. Cult. 1929.

#### Ser. 22. ANOMALAE Sarg.

27. *C. scabrida* Sarg. Shrub or small tree to 6 m.; brts. glabrous; spines 3-5 cm. long: lvs. elliptic to obovate, 5-7 cm. long, short-acuminate, broad-cuneate, with many short spreading sharply and irregularly glandular-dentate lobes, at first finely pubescent above, soon glabrous, thick at maturity, dark green; petioles 1-2.5 cm. long: fls. 1.8 cm. across, in many-fld. loose glabrous

corymbs; sepals linear-lanceolate, glandular-serrate; stamens 5-15; anthers pink: fr. subglobose, scarlet, 1 cm. across; nutlets 2-4. Fl.v-vi; fr.ix. (*C. Brainerdi* var. s. Eggl.) S. e. Can. to Pa. Intr. 1899. Zone IV.

Closely related species: *C. asperifolia* Sarg. Shrub to 2 m.: lvs. with persistent hairs above; cymes sometimes slightly villous; fr. short-ellipsoid. (*C. Brainerdi* var. a. Eggl.) S. e. Can. to N. Y. and N. H. Intr. 1902. Zone IV.

Ser. 23. MACRACANTHAE Loud. (*Tomentosae* Sarg.)

28. *C. Calpodéndron* Med. Shrub or small tree to 6 m., with spreading brs., unarmed or with short spines; young brts. pubescent: lvs. elliptic to obovate-oblong, acute, cuneate, 5-12 cm. long, serrate and often slightly lobed, dull green and finally glabrous above, pubescent beneath: fls. 1.2 cm. across in many-fld. pubescent corymbs 6-12 cm. across; sepals serrate; stamens 15-20; anthers pink: fr. ellipsoid or pear-shaped, about 1 cm. long, dull yellow or yellowish red, pulpy; nutlets 2-3. Fl.vi; fr.x. B.R.1877(c). Ad.4: t.154(c). S.S.4:t.183. G.F.2:425. Gn.22:145. (*C. tomentosa* auth., not L., *C. pyrifolia* Ait., *C. leucophloeos* Moench, *C. Chapmanii* Ashe.) Ont. to Ga., w. to Minn. and Kan. Intr. 1747. Zone IV.

Related species: *C. Wilsonii* Sarg. Shrub to 6 m.: lvs. ovate to obovate, acute or obtuse, at maturity lustrous above, sparingly villous beneath: fr. ellipsoid, about 1 cm. long, red. C. China. Intr. 1907. Zone V.

29. *C. succulénta* Lk. Tree to 5 m., with stout ascending brs.; spines stout, 3-5 cm. long: lvs. broad-elliptic to obovate, acute or short-acuminate, cuneate, 5-8 cm. long, coarsely and doubly serrate, lustrous above, pubescent beneath on the veins, finally glabrous: fls. 1.8 cm. across, in many-fld. villous corymbs; sepals glandular-serrate, stamens 15-20; anthers pink: fr. globose, 1.5 cm. across, bright red, pulpy. Fl.v; fr.ix-x. Lange, Rev. Crat. t.8b. Ad.4:t.123(c). S.S.4:t.181(as *C. cocc.* var. *macracantha*). (*C. macracantha* var. s. Rehd.) Que. and Ont. to Mass. and Ill. Cult. 1830. Zone III.

30. *C. macracántha* Lodd. Shrub or small tree to 5 m.; spines slender, sometimes 10 to 12 cm. long: lvs. broad-elliptic to obovate, usually acute, cuneate, 5-8 cm. long, doubly serrate, lustrous and dark green above, nearly glabrous beneath; petioles about 1 cm. long: fl. 1.8 cm. across; infl. slightly villous; stamens 10; anthers yellow; sepals glandular-serrate: fr. subglobose, 8 mm. across, dark cherry-red, lustrous, pulpy. Fl.v-vi; fr.ix-x. B.R.1912(c). L.B.1012(c, as *C. glandulosa*). S.S.13:t.689. M.G.21:561(h). (*C. coccinea* var. m. Dudley, *C. succulenta* var. m. Eggl.) W. N. Y. and Vt. to Pa. Intr. about 1820. Zone IV. Shrub of dense habit with dark green shiny lvs. and conspicuous lustrous red fr. in fall.

A related species or possibly hybrid with *C. crus-galli* is *C. prunifolia* (Poir.) Pers. Lvs. obovate or broad-obovate, pubescent on the veins beneath when young: infl. pubescent; anthers pink: nutlets only slightly grooved on the inner surface. B.R.1868(c). G.C.78:146,t. (*Mespilus* p. Poir., not Marsh.) Orig. unknown; cult. 1797. Zone V.

Ser. 24. DOUGLASSIANAE Eggl. (*Douglasii* Loud.)

31. *C. Douglassii* Lindl. Tree to 12 m. with slender, often pendulous brs., unarmed or with few short spines: brs. glabrous: lvs. broad-ovate to ovate-oblong, acute or sometimes rounded, cuneate, 3-8 cm. long, serrate and slightly lobed, pubescent on the veins at first, finally lustrous dark green above, pubescent on the midrib, glabrous beneath; petiole about 1 cm. long: fls. 1 cm. across, in glabrous corymbs; stamens 20; sepals triangular-ovate, usually glandular-serrate above the middle: fr. short-ellipsoidal, 1.2 cm. long, black and lustrous; stones 3-5. Fl.v; fr.viii-ix, soon falling. B.R.1810(c). S.S.4:t.175. B. C. and N. Cal. to Mich. and Wyo. Intr. 1828. Zone IV.

Closely related species: *C. rivularis* Nutt. Smaller tree, with ascending brs.: lvs. shorter-stalked, narrower, serrate; sepals shorter, entire. S.S.4:t.176. (*C. Douglasii* var. *r.* Sarg.) Idaho to Nev. and N. Mex. Intr. 1881. Zone V.

#### Ser. 25. SANGUINEAE Zabel

32. *C. chlorosárca* Maxim. Small tree of pyramidal habit; young brs. slightly pubescent, later purple-brown, lustrous: lvs. triangular-ovate to broad-ovate, acute or short-acuminate, broad-cuneate or rounded at base, 5-9 cm. long, with 3-5 pairs of short and broad, unequally serrate lobes, loosely pubescent on both sides, finally glabrous above and dark green; petioles slender, 8-20 mm. long: infl. 4-7 cm. across, nearly glabrous: fls. 1.2 cm. across, stamens 20; sepals serrulate; top of ovary pubescent; style inserted much below apex; fr. subglobose, about 1 cm. across, black; nutlets 5. Fl.v; fr.ix-x. S.H.1:f.437p-q,f.438n-o. Manch. Cult. 1880. Zone II.—*C. c. pubescens* Wolf, var. Lvs. pubescent beneath. Cult. 1908.

Related species: *C. jozàna* Schneid. Brts. villous: lvs. with 5-7 pairs of lobes, pubescent beneath: infl. villous. M.K.t.51(c). Japan. Intr. 1888. Here belongs apparently *C. atrocarpa* Wolf. Yearb. For. Inst. Petersb. 15:250,t.—*C. dsungárica* Zabel. Lvs. rhombic-ovate to broad-ovate, cuneate, 3-8 cm. long, more deeply lobed, lobes fewer, sparingly toothed, glabrous: infl. glabrous, loose; fls. 1.5 cm. across; style inserted slightly below apex; nutlet smooth on ventral surface. S.H.1:f.437k-m,438p-q. S.E. Siber., N. China. Cult. 1885. Zone V.

33. *C. sanguinea* Pall. Shrub or small tree to 7 m., with spreading brs., usually unarmed, or with short spines; brts. slightly hairy at first, soon glabrous: lvs. rhombic-ovate to broad-ovate, acute or short-acuminate, cuneate, 5-8 cm. long, with 2-3 pairs of short, sharply and sometimes doubly serrate lobes, slightly pubescent on both sides; petiole 8-15 mm. long: fls. 1.5 cm. across, in rather dense glabrous corymbs; stamens 20; anthers pink or purple; style inserted near apex: fr. globose, 1 cm. across, bright red. Fl.v; fr.viii-ix. W.D.60(c). S.H.1:f.437c-h,438d-f. (*Mespilus purpurea* Poir.) E. Siber. Intr. 1822. Zone III.—*C. s. chlorocárpa* (K. Koch) Schneid., var. Fr. yellow, smaller.

*C. s.* × *?* *nigra* = *C. Lambertiana* Lge. Young brts. pubescent: lvs. pubescent beneath: infl. few-fl., pubescent: fr. blackish purple. Lange, Rev. Crat. 58. Orig. unknown. Cult. 1871.

Closely related species: *C. Maximowiczii* Schneid. Lvs. less deeply lobed, villous below: infl. densely villous; fr. villous when young. N.K.6:t.28. S.H.1:f.437a-b', 438a-c. (*C. sanguinea* var. *villosa* Maxim.) N. E. Asia. Cult. 1904. Zone IV.—*C. dahúrica* Koehne. Lvs. rhombic-ovate, or elliptic-ovate, 2-5 cm. long, those of the flowering brts. often slightly or scarcely lobed; infl. glabrous: fr. subglobose, 7-8 mm. across, orange-red. S.H.1:f.437n-o,438g-i. S. E. Siber. Cult. 1895. Zone V. Graceful species, one of the earliest to burst into leaf.

34. *C. Wattiana* Hemsl. & Lace. Small tree; brts. lustrous, red-brown, unarmed or with short spines: lvs. ovate, acute or short-acuminate, truncate or broad-cuneate, 5-9 cm. long, glabrous, with 3-5 pairs of usually ovate, acute or acuminate sharply and unequally serrate lobes, the teeth acuminate to aristate, the sinuses reaching rarely halfway to the middle; petioles 1-2 cm. long: infl. 5-8 cm. across; stamens 15-20; anthers whitish; top of ovary glabrous: fr. subglobose, 1-1.2 cm. across, orange- or reddish-yellow, pulpy. Fl.v; fr.viii-ix. R.H.1901:308,t(c). Jour. Linn. Soc. 28:t.40. (*C. Korolkowii* L. Henry.) Altai Mts. to Beluchistan. Cult. 1888. Zone V. With bright green lvs., large corymbs of white fls. and bright orange fr. in late summer.

Closely related species: *C. kansuensis* Wils. Shrub or tree to 8 m.: lvs. broad-ovate, pinnately lobed, coarsely dentate or doubly dentate with triangular mucronate teeth, beneath with axillary tufts of hair; petioles 1-4 cm. long: infl. many-fl.; top of ovary villous: fr. 8-10 mm. across, red. N. China. Intr.

1926. Zone V.—*C. altaica* Lange. Lvs. usually smaller, with 2-4 pairs of lobes, the sinuses reaching usually more than halfway to the middle, and the lower ones often almost or quite to the midrib; petiole 1.5-3 cm. long; fr. 8-10 mm. across. Lange, Rev. Crat. t.5(excl.f.g.). (*C. sanguinea* var. *incisa* and var. *xanthocarpa* Reg., *C. songarica* Reg.) Songaria to Turkest. Intr. 1876. Zone III.

Ser. 26. NIGRAE Loud. (*Pentagynae* Schneid.)

35. *C. nigra* Waldst. & Kit. Small tree to 7 m., with a round head of rather short brs.; brts. tomentose while young, unarmed or with short stout spines: lvs. ovate or triangular-ovate, acute, broad-cuneate or truncate, 4-9 cm. long, with 7-11 sharply and irregularly serrate lobes, the lower sinuses not more than halfway to the middle, pubescent on both sides, more densely beneath; petioles 1-2 cm. long; infl. dense, many-fld., villous; fls. 1.5 cm. across, white, fading to pink; anthers yellow; top of ovary glabrous; fr. subglobose, 1.2 cm. across, black, lustrous, pulpy. Fl.v; fr.viii. R.I.25:t.102(c). L.B. 1021(c). L.I.t.30. (*C. carpathica* Lodd.) S. E. Eu. Cult. 1810. Zone IV.

*C. n.* × *mollis*; see under No. 1.—*C. n.* × *sanguinea*; see under No. 33.

36. *C. pentágyna* Waldst. & Kit. Shrub or small tree to 5 m.; young brts. pubescent; spines short: lvs. broadly rhombic-ovate or broad-ovate to obovate, truncate or broad-cuneate, 2-6 cm. long and usually nearly as broad, with 3-7 irregularly serrate lobes, on sterile shoots often elongated and with the lobes more than halfway to the middle, pubescent while young, finally nearly glabrous; fls. 1.2-1.5 cm. across, in pubescent corymbs 4-7 cm. broad; anthers pink; top of ovary pubescent; fr. ellipsoid, 1.2 cm. long, black-purple, dull; nutlets 4-5. Fl.v-vi; fr.ix. R.I.25:t.101(c). B.R.1874(c). R.H.1901:310,t(c). (*C. melanocarpa* Bieb.) S. E. Eu., Cauc., Persia. Cult. 1836. Zone V.—*C. p.* *Oliveriana* (Dum.-Cours.) Rehd. More pubescent, mature lvs. slightly pubescent above, more densely beneath; fr. smaller. B.R.1933(c). (*C. oxyacantha* var. *O.* (Dum.-Cours.) Loud., *C. Oliveriana* DC.) W. Asia. Cult. 1810.

*C. p.* × *crus-galli* = *C. hiemalis* Lange. Lvs. densely serrate and often slightly lobed, pubescent on the veins beneath; infl. villous; stamens 15; anthers purple; fr. purple-black. Bot. Tidsskr. 13:t.2(c). Lange, Rev. Crat., t.9(c). Orig. before 1880.—*C. p.* × *?* = *C. celsiana* Bosc. Lvs. elliptic-ovate, cuneate, 4-8 cm. long, with 3-5 pairs of serrate lobes pointing forward; fr. ellipsoid, bright red; nutlets 2-3. Lange, Rev. Crat. t.3a. S.H.1:f.441q-r,442g-i. Orig. before 1830.

Ser. 27. OXYACANTHAE Loud.

37. *C. Oxyacantha* L. HAWTHORN (MAY of English literature). Shrub or small tree, to 5 m. with spreading brs.; spines stout, to 2.5 cm. long; lvs. broad-ovate or obovate, cuneate, 1.5-5 cm. long, with 3-5 broad serrulate, obtuse or acutish lobes, glabrous; petioles 6-15 mm. long; infl. glabrous, 5-12-fld., fls. 1.5 cm. across; stamens 20; anthers red; styles 2-3; fr. subglobose or broad-ellipsoid, 8-15 mm. long, scarlet, with 2 nutlets. Fl.v; fr.ix-x. B.R.1128(c). R.I.25:t.103(c). (*C. oxyacanthoides* Thuill.) Eu., N. Afr. Long cult. Zone IV.—*C. O. rosea* Willd., var. Fls. rose. Orig. before 1770.—*C. O. punicea* Loud., var. Fls. dark red. L.C.1363(c). F.S.15:t.1509,f.1(c).—*C. O. Pauli* Rehd., var. Fls. double, bright scarlet. I.H.14:t.536(c). (*C. O. coccinea plena* Hort., *C. O. f. splendens* Schneid., *C. O.* "Paul's New Double Scarlet.") One of the most showy garden forms. Orig. 1858.—*C. O. plena* West., var. Fls. double, white. F.S.15:t.1509,f.2(c). (*C. O.* var. *multiplies* Loud., *C. monogyna albo-plena* Rehd.) Orig. before 1770.—*C. O. aurea* West., var. Fr. yellow. Orig. before 1770.

*C. O.* × *monogyna* = *C. média* Bechst. R.I.25:t.105,f.2(c). Here may belong some of the garden forms.—*C. O.* × ? = *C. sorbifolia* Lange. Lvs. long-petioled, elliptic to ovate, with short obtuse crenate lobes, dark green and lustrous above, puberulous on the veins beneath, chartaceous; infl. several-fld.; stamens 12-18: fr. ellipsoid; nutlets 2-3. Lange, Rev. Crat. t.2(c). (*C. Oxyacantha* var. *s.* Dipp.) Orig. unknown. Cult. 1877. Zone V.—*C. O.* × *Mespilus germanica* = *Crataegomespilus grandiflora*; see p. 359.—*C. O.* × *Pyrus communis* = *Pyrocrataegus Willei*; see under No. 42.

38. *C. monogyna* Jacq. Shrub or tree to 10 m., similar to the preceding: lvs. more deeply 3-7-lobed, with narrower acute lobes usually only with a few teeth at apex; pedicels and calyx sometimes hairy; style 1, rarely 2: fr. ellipsoid, with 1 stone. Fl.v; fr.ix-x. R.I.25:t.104(c). R.H.1900:72. Gn.40:500(h);52:266(h). (*C. Oxyacantha* var. *m.* (Jacq.) Loud.) Eu., N. Afr., W. Asia. Long cult. Zone IV.—*C. m. pteridifolia* (Loud.) Rehd., var. Lvs. deeply lobed with broad closely incised-serrate lobes. F.S.20:t.2076(c). (*C. Oxyacantha filicifolia* Van Houtte.)—*C. m. stricta* (Loud.) Rehd., var. Of fastigate habit with erect brs. (*C. Oxyacantha* var. *s.* Loud., var. *pyramidalis* Hort., var. *fastigiata* Hort., *C. m. f. fastigiata* Dipp.) M.G.21:390(h). M.A. t.36(h).—*C. m. pendula* (Loud.) Dipp., f. With pendulous brs. Gn.68:288(h). G.M.44:827. M.G.17:25,26(h). (*C. Oxyacantha* var. *p.* Loud.)—*C. m. semperflora* (André) Dipp., f. A low shrubby form flowering continuously or at intervals until August. R.H.1883:140. Gn.29:431;33:465. (*C. Oxyacantha Bruantii* Carr.)—*C. m. biflora* (West.) Rehd., f. GLASTONBURY THORN. Blooming in mild seasons in midwinter, producing a second crop of fls. in spring. Gn.84:40. (*C. m.* var. *praecox* Henry, not Dipp.) Cult. 1562.—*C. m. Azarëlla* (Griseb.) Koehne, var. Young brts., lvs. and the loose infl. villous. (*C. A.* Griseb.) S. E. Eu. Intr. before 1880. Zone V.

*C. m.* × *Oxyacantha*; see under No. 37.—*C. m.* × *Mespilus germanica* = *Crataegomespilus Gillotii*; see p. 359.

Closely related species: *C. heterophylla* Fluegge. Lvs. usually deeply 3-fld., the lower ones oblong, serrate only at apex, those of the shoots pinnatifid: infl. loose, glabrous; top of ovary glabrous: fr. larger, 1.5-1.8 cm. long. B.R.1161(c), 1847(c). ?W. Asia. Intr. about 1816. Zone V.—*C. ambigua* C. A. Mey. Lvs. deeply 4-7-lobed, slightly pubescent on both sides: infl. slightly hairy: fr. ellipsoid, usually with 2 nutlets. R.I.25:t.105,f.4-7(c). S. Russia. Intr. 1858. Zone V.—*C. microphylla* K. Koch. Slender shrub: lvs. thin, 3-7-lobed, usually halfway to the middle or the lowest pair deeper, slightly pilose on the veins beneath or glabrous, lobes ovate, acute, serrate: infl. 2-5-fld., glabrous; pedicels slender, 1-2 cm. long; fls. 1 cm. across: fr. short-ovoid, 1 cm. across, red. S.H.1:f.4451-l, 447g-i. Cauc. to N. Persia. Cult. 1926. Zone V.

#### Ser. 28. AZAROLI Loud. (*Orientalis* Zabel)

39. *C. Azarolus* L. Shrub or small tree to 10 m.; spiny or unarmed; young brts. tomentulose: lvs. rhombic-obovate or rhombic-ovate, cuneate, 3-7 cm. long, deeply 3-5-lobed, with narrow lobes nearly entire or incised at apex, pubescent on both sides, finally nearly glabrous above; petioles 1-2.5 cm. long: fls. 1.2 cm. across, in dense tomentose corymbs 5-7 cm. across; stamens 20; anthers purple: fr. subglobose, about 2 cm. across, orange-red or yellow, of apple-like flavor; nutlets 1-2. Fl.v; fr.ix. R.I.25:t.106(c). B.R. 1897(c). R.H.1856:441,t(c). M.A.t.35(h). (*C. Aronia* Ser., *C. maura* L. f.) S. Eu., N. Afr., W. Asia. Cult. 1700. Zone VI?—*C. A. sinica* (Boiss.) Lange, var. Lvs. glabrous: fr. usually reddish yellow. B.R.1855(c, as *C. maroccana*). Gn.22:146;28:634. (*C. s.* Boiss.) W. Asia. Intr. 1822. Zone VI?

Related species: *C. Fischeri* Schneid. Brts. glabrous or nearly so: lvs. deeply 5-7-lobed, the lowest pair often nearly to midrib; lobes incisely serrate with acuminate teeth, villous beneath on veins at least when young: infl. several-fld., loosely villous; fls. to 1.5 cm. across; styles 2: fr. short-ovoid, 1 cm. high, black or purple. S.H.1:f.4501-n,451y-z. C. Asia. Cult. 1926. Zone IV.

40. *C. orientalis* Pall. Small tree to 7 m., with spreading brs. and pendent brts. tomentose while young: lvs. short-petioled, obovate or oblong-obovate, cuneate, 3-5 cm. long, pinnatifid with 5-9 narrow lobes incisedly toothed at apex, pubescent above, tomentose beneath: fls. nearly 2 cm. across, in dense tomentose corymbs; sepals entire; fr. depressed-globose, 1.5-2 cm. across, brick- or orange-red, pubescent; nutlets 4-5. Fl.vi; fr.x. B.M.2314(c). B.R. 1885(c). G.C.72:310. Gn.28:632,t(c, as *C. tanacetifolia*). (*C. odoratissima* Lindl.) S. E. Eu., W. Asia. Intr. 1810. Zone V.—*C. o. sanguinea* Loud., var. Lvs. less pubescent, with broader lobes: fr. dark red, with 2-4 nutlets. B.R.1852(c). (*C. Tournefortii* Griseb., *C. orientalis* var. T. Schneid., *C. sanguinea* Schrad., not Pall.) S. E. Eu. Intr. 1910. Zone V.

Related species: *C. Heldreichii* Boiss. Lvs. 1.5-3 cm. long, with rounded entire or nearly entire lobes: fr. red. S.H.1:f.448t-v', 451p-r. Greece. Cult. 1890. Zone V.

41. *C. tanacetifolia* (Lam.) Pers. Shrub or small tree to 10 m., with upright brs.; unarmed or spiny: young brts. tomentose: lvs. short-stalked, obovate or rhombic-ovate, cuneate, 2-5 cm. long, pinnatifid, with 5-7 narrowly oblong glandular-serrate lobes, villous-pubescent on both sides; stipules large, curved, serrate: fls. 2-2.5 cm. across, in dense 5-8-fld. tomentose corymbs; sepals large, glandular-serrate: fr. yellow or reddish, 2-2.5 cm. across, with laciniate bracts at base; nutlets 5. Fl.v-vi; fr.ix. B.R.1884(c). Gt.43:15. J.L.41:f.10(h). G.C.71:285(h). W. Asia. Intr. 1789. Zone V.

*C. t.* × ? *punctata* = *C. Dippeliana* Lange. Lvs. lobed less than halfway to the middle, lobes acute, serrate, pubescent above, more densely beneath: corymbs dense; anthers red: fr. yellow, red or dull red. Lange, Rev. Crat. t.10(c). D.H.3: 452. (*C. Celsiana* Dippel, not Bosc, *C. tanacetifolia* var. *Leeana* Loud., *C. Leeana* Bean.) Orig. probably about 1830. Zone V.

#### Ser. 29. PINNATIFIDAE Zabel

42. *C. pinnatifida* Bge. Tree to 6 m.; brts. glabrous; spines wanting or short: lvs. broad- or triangular-ovate to rhombic-ovate, truncate or broad-cuneate, 5-10 cm. long, pinnately 5-9-lobed, the lower pair of lobes often divided nearly to the midrib, the lobes sharply and irregularly serrate, lustrous and dark green above, light green beneath, pubescent on the midrib and veins on both sides; petiole 2-6 cm. long; stipules large, serrate: fls. 1.8 cm. across, in villous corymbs 5-8 cm. across; stamens 20; anthers pink; fr. subglobose or pyriform, 1.5 cm. across, red, punctulate; stones 3-4. Fl.v-vi; fr.ix. Gt.11:t.366. R.H.1901:308,t(c). N.K.6:t.26. N. E. Asia. Cult. 1860. Zone V. Tree with lustrous lvs. and showy fr., particularly large in var. *major* cult. in N. China for its edible fr.—*C. p. psilosa* Schneid., var. Lvs. and infl. quite glabrous. N.K.6:t.26c.—*C. p. major* N. E. Br., var. Larger, more vigorous tree: lvs. larger, less deeply lobed, thicker: fr. about 2.5 cm. across, deep lustrous red. R.H.1901:308,t(c). G.C.II.26:620. N.K.6:t.27. U. S. Inv. 35:t.8(fr); 40:t.2(h). (*C. Korolkowii* Schneid., not Henry, *C. Bretschneideri* Schneid., *C. tatarica* Hort.) N. China. Cult. 1880.

A supposed graft-hybrid between *Crataegus* and *Pyrus* is *Pyrocrataegus* Daniel of which only the following incompletely described form is known: *P. Willei* Daniel (*Crataegus Oxyacantha* × *Pyrus communis*). Lvs. similar to *Pyrus*; infl. corymbose: fr. pear-shaped, 1.5-3 cm. long. Norsk Havetid. 12:85, f.8. Orig. before 1896.

× **PYRACOMÈLES** Rehd. ex Guillaum (*Pyracantha* × *Osteomeles*). From the first differing chiefly in its unarmed brts. and pinnatisect lvs., from the latter in its pinnatisect lvs., the upper lfts. or lobes decurrent and usually crenate-serrulate at the apex.

**P. Vilmorinii** Rehd. ex Guillaum (*P. crenato-serrata* × *O. subrotunda*). Half-evergreen low shrub with slender brts.; brts. and lvs. grayish pubescent at first, soon glabrous: lvs. with the petiole 2.5–3.5 cm. long, pinnate below and pinnatisect toward the apex, lfts. or lobes 5–9, the upper decurrent, oval, obtuse or slightly mucronulate, usually crenate-serrulate at apex: fls. about 1 cm. across, in many-fld. glabrous or nearly glabrous corymbs: fr. 4 mm. across, coral-red, with 4–5 nutlets. G.C.103:125. Orig. 1922. Zone VII?

**17. OSTEOMÈLES** Lindl. Deciduous or evergreen shrubs; winter-buds small, with several narrow scales: lvs. pinnate, alternate; stipules linear to lanceolate; lfts. small, entire: fls. white, in terminal corymbs; calyx-teeth acute or acuminate; petals 5, ovate-oblong; stamens 15–20; styles 5, distinct; ovary 5-celled, each cell with 1 ovule: fr. a small pome with persistent calyx and 5 nutlets. (Greek *osteon*, bone, and *meles*, apple.) Three species in E. Asia and Polyn.

**O. Schwerinae** Schneid. Deciduous or half-evergreen, slender-branched shrub, to 3 m.; brts., petioles and lvs. beneath grayish pubescent; lvs. 3–7 cm. long, with narrowly winged rachis; lfts. 15–31, elliptic to elliptic- or obovate-oblong, acute and mucronulate, 4–12 mm. long: fls. 1.5 cm. across, in loose terminal corymbs 3–6 cm. across; sepals lance-ovate, glabrous inside, pubescent outside; calyx-tube glabrescent; styles pubescent: fr. globose-ovoid or subglobose, 6–8 mm. long, bluish black, glabrous. Fl.v-vi; fr.ix. B.M.7354(c). G.C.50:533, both as *O. anthyllidifolia*. B.S.2:114. W. China. Intr. 1888. Zone VII? Graceful shrub with small pinnate lvs.—**O. S. microphylla** Rehd. & Wils., var. Lfts. fewer, elliptic to obovate, 3–5 mm. long, glabrescent: infl. smaller and denser. Intr. 1908. Supposed to be hardier.

Related species: *O. subrotunda* K. Koch. Brts. appressed-pubescent: lfts. 11–17, 4–8 mm. long, rounded and mucronate at apex, ciliate, thinly appressed-pubescent beneath; rachis appressed-pubescent: fls. 1 cm. across in loose corymbs 2–3.5 cm. across, thinly appressed-pubescent; styles glabrous. H.I.27:t. 2644. S. E. China. Cult. 1900. Zone VII?—*O. s.* × *Pyracantha crenato-serrata* = *Pyracomeles Vilmorinii*, see above.—*O. anthyllidifolia* Lindl. from Polynesia and Bonin Isls. is not hardy.

**18. SORBUS** L. Deciduous trees or shrubs; buds with imbricate scales, usually rather large; lvs. alternate, stipulate, simple and serrate, or odd-pinnate, folded or rarely convolute in bud: fls. white, rarely pink, in compound terminal corymbs; sepals and petals 5; stamens 15–20; carpels 2–5, 2-ovuled, either partly free and half-superior or wholly connate and inferior; styles free or connate at base: fr. a 2–5-loculed pome, usually rather small; the cells with cartilaginous walls, each with 1 or 2 seeds. (Ancient Latin name.) Including *Hahnia* Med. (*Aria* Host), *Cormus* Spach, *Torminaria* Roem. and *Micromeles* Dene. More than 80 species distributed through the n. hemisphere, in N. Am. to N. C. and N. Mex., in Asia to the Himal.—The *Sorbus* are attractive in bloom with their large clusters of white fls. and most of them bear showy red fr. in fall.

Lvs. pinnate or at least partly so.

A. Lvs. all regularly pinnate.

B. Fr. small, 4–10 mm. thick, red, rarely yellow or white.

C. Lfts. 7–17, 1.5–10 cm. long.

D. Fr. red or yellow.

E. Stipules small, caducous.

F. Winter-buds glabrous or slightly pubescent, viscid.

G. Winter-buds glabrous or slightly whitish pubescent: lfts. serrate to near base, generally oblong-lanceolate.

H. Lfts. acuminate, with acute or acuminate teeth, slightly pubescent beneath when young.....1. *S. americana*

- HH. Lfts. long-acuminate, with aristate or mucronate teeth, quite glabrous beneath ..... 2. *S. commixta*  
 GG. Winter-buds and infl. slightly rufous-pubescent.  
 I. Lfts. short-acuminate or rounded at apex, generally oblong, dull above. 3. *S. decora*  
 HH. Lfts. acuminate, generally oblong-lanceolate, lustrous above. 4. *S. sambucifolia*  
 FF. Winter-buds densely white-villous.  
 G. Lfts. acuminate, lustrous: brts. glabrous ..... 5. *S. tianshanica*  
 GG. Lfts. acute, dull above: young brts. and lvs. pubescent ..... 6. *S. aucuparia*  
 EE. Stipules large, persistent, at least below infl. .... 7. *S. pohuashanensis*  
 DD. Fr. white: lvs. glaucous and glabrous beneath; rachis usually purple. 8. *S. discolor*  
 CC. Lfts. 19-29, 8-25 mm. long.  
 D. Lfts. serrate usually only above the middle: infl. rufous-pubescent: fr. pale rosy-red ..... 9. *S. Vilmorini*  
 DD. Lfts. serrate from near the base: infl. nearly glabrous: fr. whitish. 10. *S. Koehneana*  
 BB. Fr. 1.5-3 cm. across, apple- or pear-shaped, yellowish, with red cheek and with grit-cells; styles 5 ..... 11. *S. domestica*  
 AA. Lvs. pinnate only toward the base, the upper part lobed and serrate, occasionally only lobed. (See also *Sorbaronia*, p. 381.) ..... 12. *S. hybrida*

## Lvs. simple, lobed or serrate

- A. Fr. with persistent calyx.  
 B. Lvs. glabrous beneath at length, broad-ovate, lobed: ovary inferior: fr. brown, with grit-cells ..... 13. *S. torminalis*  
 BB. Lvs. tomentose beneath or glabrescent and not lobed: ovary half-inferior: fr. usually red, without grit-cells.  
 C. Lvs. lobed.  
 D. Lvs. broad-ovate, usually rounded at base ..... 14. *S. latifolia*  
 DD. Lvs. ovate to ovate-oblong, broad-cuneate at base ..... 15. *S. intermedia*  
 CC. Lvs. sharply and doubly serrate.  
 D. Fls. white: lvs. white-tomentose beneath ..... 16. *S. Aria*  
 DD. Fls. pink, with upright petals: lvs. usually glabrous beneath. 17. *S. Chamaemespilus*  
 AA. Fr. with deciduous calyx.  
 B. Lvs. glabrous beneath or nearly so.  
 C. Styles usually 2 ..... 18. *S. alnifolia*  
 CC. Styles 5 ..... 19. *S. caloneura*  
 BB. Lvs. white-tomentose beneath.  
 C. Lvs. serrulate ..... 20. *S. Folgeri*  
 CC. Lvs. lobulate ..... 21. *S. japonica*  
 Sect. I. SORBUS (L.) Pers. (Sect. *Aucuparia* K. Koch.) Lvs. pinnate: carpels 2-4, rarely 5, more or less free above, partly superior: fr. red, yellow or white, 5-15 mm. across.

1. *S. americana* Marsh. AMERICAN MOUNTAIN-ASH. Small tree, to 10 m., sometimes shrubby: lfts. 11-17, lance-oblong to lanceolate, acuminate, 4-10 cm. long, sharply serrate, light green above, pale beneath and slightly pubescent beneath when young, soon glabrous: infl. glabrous, dense, 7-14 cm. across; fls. 5-6 mm. across: fr. globose, 4-6 mm. across, bright red, with connivent, very small calyx-lobes. Fl.v-vi; fr.x. S.S.4:t.171,172. F.E.23:209(h); 32:721(h). (*Pyrus a.* DC., *S. micrantha* Dum.-Cours.) Nfd. to Man., s. to N. C. and Mich. Cult. 1811. Zone II. Particularly showy in fall with its bright red fr.

*S. a.* × *aucuparia* = *S. splendida* Hedl. Winter-buds loosely pubescent and viscid: fls. and fr. larger. Gs.5:181,t. Cult. 1850.—*S. a.* × *Aronia melanocarpa* = *Sorbaronia sorbifolia*; see p. 382.—*S. a.* × *Aria*; see under No. 12.—*S. a.* × *Aronia prunifolia* = *Sorbaronia Jackii*; see p. 382.

Related species: *S. scopulina* Greene. Shrub to 4 m.: lfts. 11-14, oblong-lanceolate, 3-6 cm. long, acute to short-acuminate, dark green and lustrous above, glabrous beneath: infl. sparingly pilose: fr. 7-8 mm. across. (*S. sambucifolia* auth., not Roem., *S. angustifolia* Rydb., *Pyrus sitchensis* Piper in part.) B. C. and Alb. to n. Calif. and S. Dak., s. to Ariz. and N. Mex. Intr. 1917. Zone V.—*S. s.* × *Amelanchier florida* = *Amelasorbus Jackii*, see p. 382.—*S. dumosa* Greene. Shrub to 3 m.; winter-buds white-villous: lfts. 9-11, oblong-lanceolate, 2-4 cm. long, dull dark green above: infl. less than 10 cm. broad, white-villous; fr. to 8-10 mm. across. Ariz., N. Mex. Intr. ?

2. *S. commixta* Hedl. Shrub or small tree to 8 m.; buds glabrous, viscid; stipules deciduous; lfts. 11–15, elliptic-lanceolate to lanceolate, long-acuminate, 2.5–8 cm. long, sharply and sometimes doubly serrate, with acuminate or aristate teeth, glaucescent beneath: infl. 8–12 cm. across, rather loose, glabrous; fls. 8 mm. across; styles usually 3: fr. globose 6–8 mm. across, bright red. Fl.vi; fr.x. S.I.2:t.31(c). M.K.t.48(c). N.K.6:t.3. (*S. aucuparia* var. *japonica* Maxim., *S. japonica* Koehne, not Sieb.) Korea, Saghal., Japan. Cult. 1880. Zone V. Small tree, similar to No. 1, but lvs. smaller and corymbs looser.

Closely related species: *S. reflexipétala* Koehne. Lfts. usually 15, to 5 cm. long: infl. nearly glabrous; petals reflexed; styles 3–4. Japan? Cult. 1890.—*S. serotina* Koehne. Lfts. usually 13, to 5 cm. long: infl. villous; petals reflexed: fr. smaller. Gs.1:183. Japan? Cult. 1900.

3. *S. decora* (Sarg.) Schneid. Shrub or tree to 10 m.: lfts. 11–17, usually 15, elliptic to oblong, obtusish to abruptly short-acuminate, 3–7 cm. long, serrate with more or less spreading teeth, glabrous and dark green above, pale and usually pubescent beneath while young: infl. 5–10 cm. across, rather loose, slightly pubescent; fls. 8–10 mm. across; fr. globose-ovoid while young, with upright calyx-lobes, 7–10 mm. across, bright red. Fl.v; fr.x. N.S.2:t.50(c). S.S.4:t.173,174. (*S. americana* var. *d.* Sarg., *S. scopulina* Britt., not Greene, *P. sitchensis* Rob. & Fern., not Piper.) Lab. to Minn., S. N. Y. and Vt. Cult. 1636. Zone II. Owing to its larger fr. this species is showier than *S. americana* and often planted.

*S. d.* × *Aronia prunifolia* = *Sorbaronia Arsenii*; see p. 382.

Related species: *S. cascadiensis* G. N. Jones. Shrub to 5 m; lfts. 9–11, ovate to oblong, acute, lustrous above, glabrous beneath: infl. 7–12 cm. across, sparingly pilose: fr. globose, 8–10 mm. across, scarlet. (*Pyrus sitchensis* Piper, not *S. s.* Roemer.) B. C. to n. Calif. Intr. ?

4. *S. sambucifolia* (Cham. & Schlecht.) Roem. Shrub to 2.5 m.; young brts. slightly pubescent; buds slightly rufous-pubescent and viscid: lfts. 9–11, ovate-lanceolate to oblong-lanceolate, acuminate, very unequal at base, 3–7 cm. long, dark lustrous green above, lighter green beneath, soon quite glabrous: infl. 4–5 cm. across, sparingly rufous-pubescent; fls. 1–1.5 cm. across; calyx glabrous with ciliate lobes: fr. subglobose, 1–1.2 cm. across, with upright rather large sepals, red, slightly bloomy. Fl.vi; fr.x. S.H.1:f.366a-b,367a-b. (*Pyrus s.* Cham. & Schlecht.) N. E. Asia, Japan. Cult. 1905. Zone II. Confused with *S. decora* and *S. sitchensis*; rare and apparently short-lived in cult.

Related species: *S. rufo-ferruginea* (Schneid.) Schneid. Similar to No. 2, but winter-buds slightly rufous-villous: lfts. beneath, rachis and infl. rufous-villous when young; styles usually 5. (*S. commixta* var. *r.* Schneid.) Japan. Intr. 1915. Zone V.—*S. sitchensis* Roem. Shrub to 4 ft.: lfts. 7–11, elliptic-oblong, obtuse or acutish, dull above, serrate to the middle or below: infl. 5–9 cm. across, rufous-pubescent to nearly glabrous; styles usually 3: fr. red, bloomy, about 8 mm. across. Hedl. *Sorbus* 40.f.4. Alaska and Yukon to Mont. and Idaho. Intr. 1918. Zone IV.—*S. occidentalis* (S. Wats.) Greene. Shrub to 3 m.: lfts. 7–11, oval to oblong, 2–6 cm. long, obtuse, serrate only near apex, dull bluish green above: infl. 3–6 cm. broad, rufous-pubescent to nearly glabrous: fr. red, bloomy, 6–8 mm. across. Hedl. *Sorbus* 40.f.3. (*Pyrus o.* S. Wats., *S. sambucifolia* var. *Grayi* Wenz., ? *S. pumila* Raf.) B. C. to Ore. Cult. 1913. Zone V?

5. *S. tianshanica* Rupr. Shrub or small tree to 5 m.; buds pubescent; young brts. glabrous or nearly so, later red-brown and lustrous: lfts. 9–15, lanceolate, acuminate, 3–5 cm. long, serrate, entire near base, lustrous and dark green above, green beneath, glabrous: infl. glabrous, rather loose, 8–12 cm. across; fls. 1.8 cm. broad; stamens half as long as petals: fr. globose, 8 mm. across, bright red. Fl.vi. B.M.7755(c). Gt.40:8. (*Pyrus t.* Franch.) Turkest. Intr. 1895. Zone V. Handsome shrub with dark green lustrous lvs.

Related species: *S. Matsumurana* (Mak.) Koehne. Small tree; buds glabrous: lfts. 9-13, oblong, 2.5-6 cm. long, acute, rarely rounded, serrate above the middle, pale beneath and pubescent only at base: styles 5: fr. 8-10 mm. across. S.H.1:f.366e-f,367c. Japan. Doubtful if in cult.—*S. Harrowiana* (Balf. & W. W. Sm.) Rehd. Tree to 13 m., glabrous or nearly so; brts. 5-7 mm. thick: lfts. 5-9, narrow-oblong, 6-20 cm. long, obtuse, oblique at base, finely serrulate and slightly revolute at margin, glaucous beneath: infl. 15 cm. across, sparingly villous; styles usually 3: fr. ovoid, 6 mm. across. W. China. Intr. 1912. Zone VII? Distinct and handsome species.

6. *S. aucuparia* L. ROWAN TREE (EUROPEAN MOUNTAIN-ASH.) Tree to 15, occasionally to 20 m.; young brts. pubescent, grayish brown when older; buds tomentose: lfts. 9-15, oblong to oblong-lanceolate, acute or obtusish, 2-5 cm. long, serrate, usually entire in the lower third, dull green above, glaucescent beneath and pubescent, at least when young: infl. 10-15 cm. across, villous or sometimes nearly glabrous; fls. 8-10 mm. across; stamens about as long as petals: fr. globose, about 8 mm. across, bright red. Fl.v; fr.viii-ix. H.W.3: 78,79(h),t.54(c). R.I.25:t.114(c). (*Pyrus* A. Gaertn.) Eu. to W. Asia and Siber. Long cult. and naturalized in N. Am. Zone II. Handsome in fall with its showy bright red frs.—*S. a. Dirkeni* Schneid., f. Lvs. yellow (*S. a. Dirkeni aurea* Hort.)—*S. a. asplenifolia* K. Koch. Lfts. incisely serrate, at base sometimes with 1 or 2 distinct small lobes, densely pubescent beneath. (*S. a. laciniata* Hort., not Hartm.)—*S. a. integririma* Koehne, var. Lfts. entire or with few teeth at apex.—*S. a. xanthocarpa* Hartw. & Ruempl., var. With orange-yellow fr. (*S. a. var. Fifeana* Hartw.)—*S. a. fastigiata* (Loud.) Hartw. & Ruempl., var. With upright brs. forming a tree of narrow-pyramidal habit.—*S. a. pendula* Kirchn., f. A form with long pendulous brs. M.D.1911:247 (h).—*S. a. edulis* Dieck, var. Nearly glabrous; petioles purplish; lfts. 4-7 cm. long, serrate usually only above the middle: fr. larger, of slightly acid agreeable flavor and used for preserves. R.I.25:t.114,f.11(c). (*S. a. var. moravica* Zengerl., var. *dulcis* Kraetzel.) Intr. about 1886.—*S. a. rossica* Späth. Similar to the preceding, but lfts. larger and more serrate.—*S. a. Beissneri* Rehd., f. A graceful form of var. *edulis* with pinnately lobed lfts. and the petioles and brts. bright red. G.W.3:267,t(c). (*S. a. dulcis laciniata* Beiss.)

*S. a. × americana*; see under No. 1.—*S. a. × discolor*; see under No. 8.—*S. a. × intermedia*; see No. 12.—*S. a. × Aria*; see under No. 12.—*S. a. × Aronia arbutifolia* = *Sorbaronia hybrida*; see p. 381.—*S. a. × Aronia melanocarpa* = *Sorbaronia fallax*; see p. 382.—*S. a. × Aronia prunifolia* = *Sorbaronia heterophylla*; see p. 382.

Closely related species: *S. amurensis* Koehne. Lfts. acuminate, incisely serrate above the middle, slightly pubescent beneath when young: fr. 6-9 cm. across, orange-red. N.K.6:13(h),t.2. N. E. Asia. Intr. 1907. Zone IV.

7. *S. pohuashanensis* (Hance) Hedl. Small tree; brts. villous; buds white-villous; stipules large, semi-ovate, toothed, persistent at least under the infl.: lfts. 11-15, elliptic-oblong to oblong-lanceolate, acute to acuminate, 2.5-6 cm. long, serrate usually from below the middle, glaucescent and pubescent beneath: infl. 10-12 cm. across, floccose-tomentose: fr. subglobose, 6-8 mm. across. Fl.v; fr.x. N. China. Intr. 1883. Zone V or IV?

Related species: *S. Wilsoniana* Schneid. Tree to 10 m.; brts. 5-7 mm. thick; buds silky at apex: lfts. 11-15, oblong to oblong-lanceolate, 6-8 cm. long, acute to acuminate, pubescent on midrib beneath: infl. 15-17 cm. across, slightly pubescent; styles 3-4: fr. orange-red. S.H.1:f.367k,368p. C. China. Doubtful if in cult.; confused with *S. hupehensis*.—*S. Esserteauiana* Koehne. Shrub or tree to 8 m.; brts. 5-7 mm. thick; buds silky: lfts. 11-13, oblong to broad-lanceolate, 4-10 cm. long, sharply serrate, tomentose beneath, veins impressed above: fr. 4-6 mm. thick. B.M.9403(c). (*S. Conradinae* Koehne.) W. China. Intr. 1909. Zone VI?—*S. Sargentiana* Koehne. Tree to 10 m.; buds slightly

villous and viscid: lfts. 7-11, oblong-lanceolate, 8-13 cm. long, serrulate, tomentose beneath: infl. about 15 cm. across, densely villous: fr. scarlet, about 6 mm. across. W. China. Intr. 1908. Zone VI?—*S. S. warleyensis* Marquand, var. Lfts. smaller; rachis dark purple: infl. larger and looser: fr. smaller. G.C.94:177. Cult. 1931.—*S. gracilis* (Sieb. & Zucc.) K. Koch. Shrub to 2 m.; brts. slender; buds finally glabrescent: lfts. 7-9, elliptic-oblong to oblong, 2-6 cm. long, the upper ones 4-8 cm. long, the lowest pair usually broad-oval, 1-1.5 cm. long, acute or obtusish, serrate above the middle, slightly pubescent or glabrescent beneath: infl. 2-4 cm. across, with large bracts; styles 2: fr. red. S.H.1:f.373a,374c. Japan. Cult. 1934. Zone VI?

8. *S. discolor* (Maxim.) Hedl. Tree to 10 m.; buds slightly pubescent; young brts. glabrous or nearly so, like the petioles usually purplish; stipules leafy, digitately toothed, persistent; lfts. 11-15, oblong to lanceolate, acute or acuminate, 3-8 cm. long, sharply serrate except at base, glaucous beneath, glabrous: infl. loose, 10-14 cm. across, glabrous or nearly so; fls. about 1 cm. across; styles usually 3: fr. 6-7 mm. across, globose-ovoid, white or yellowish. Fl.v; fr.ix. Gt.55:t.1551.f.7(c). S.H.1:f.366l-m,367g. (*S. pekinensis* Koehne, *Pyrus d. Maxim.*) N. China. Intr. about 1883. Zone V. Remarkable for its white fr.

*S. d. × aucuparia* = *S. arnoldiana* Rehd. Lfts. pubescent beneath when young: fr. pink. Orig. 1907.

Related species, but with deciduous stipules: *S. hupehensis* Schneid. Buds glabrous: lfts. 13-17, elliptic to oblong, 2-3.5 cm. long, acute or obtusish, usually entire at the lower third: styles 4-5. (*Pyrus mesogaea* Cardot.) C. and W. China.—*S. h. aperta* (Koehne) Schneid., var. Lfts. 9-11, 3-6 cm. long, usually acute. Intr. 1910. Zone V.—*S. h. obtusa* Schneid., var. Lfts. 9-11, obtuse, 3-5 cm. long, serrate only near apex. W. China. Cult. 1912.—*S. Rehderiana* Koehne. Shrub or small tree; brts. 5-8 mm. thick: lfts. 15-19, oblong-lanceolate or lanceolate, 2.5-5 cm. long, acuminate, serrulate, glabrous: infl. 2.5-6.5 cm. broad, sparingly rufous-villous; styles 5: fr. whitish to reddish, 6-7 mm. across. W. China.—*S. R. cupreo-nitens* Hand.-Mazz., var. Rachis and midrib of lfts. beneath and infl. rufous-villous. Intr. 1932.—*S. Hélénae* Koehne. Tree to 7 m.; brts. 5-8 mm. thick; buds glabrous: lfts. 7-9, oblong, 5-10 cm. long, acute, crenate-serrate, slightly rufous-villous on veins beneath; rachis narrowly winged; infl. about 10 cm. across, slightly rufous-pubescent. W. China.—*S. H. rufidula* Koehne, f. Infl., rachis of lf. and veins beneath densely rufous-villous. Intr. 1932. Zone VI?

9. *S. Vilmorini* Schneid. Shrub or small tree to 6 m., with spreading brs.; young brts. and buds slightly rusty-pubescent; stipules narrow, deciduous: lfts. 19-25, elliptic-oblong to oblong, acute, 1.5-2.5 cm. long, serrate from below the middle or sometimes only near apex, glabrous, grayish green beneath; rachis slightly winged and often slightly pubescent: infl. loose and slender-stalked, 5-10 cm. across; fls. 6 mm. across; styles 5: fr. globose, about 8 mm. across, pale rose-red. Fl.vi; fr.ix. B.M.8241(c). Gn.85:501;87:576. S.L.345(h). (*Pyrus V. Aschers. & Graebn.*) W. China. Intr. 1889. Zone V. With conspicuous white fls. in spring and rosy-red fr. in fall.

Related species: *S. microphylla* Dene. Shrub; brts. glabrous, later dark brown: lfts. about 25, oblong, 9-12 mm. long, obtusish, loosely villous and grayish beneath; infl. few-fl., loosely villous. S.H.1:f.374m-n. Sikkim. Cult. 1934.—*S. filipes* Hand.-Mazz. Shrub to 4 m.; brts. glabrous or nearly so: lfts. 19-27, elliptic, 8-14 mm. long, with 3-4 teeth on each side: cymes 3-12-fl., glabrous, on slender peduncles 3-5 cm. long: fls. red: fr. red, 7 mm. across. W. China. Intr. 1932.—*S. rufopilosa* Schneid. Tree to 5 m.: young brts., infl., lf.-rachis and lfts. beneath at least on midrib rufous-pubescent; lfts. 17-29, oblong, 1.5-2.5 cm. long, acute, serrate: infl. long-peduncled, 3-5 cm. across: fls. pink: fr. subglobose, 8-10 mm. across, red. S.H.1:f.374p-q,375o-p. W. China. Intr. 1932. Zone VI?

10. *S. Koehneana* Schneid. Shrub to 3 m.; young brts. glabrous or nearly so; buds slightly fulvous-pubescent; stipules small, semi-ovate, with few teeth, partly persistent: lfts. 17-25, oblong to oblong-lanceolate, acute, 1.5-

3.5 cm. long, sharply serrate from near base, grayish green beneath, not papillose, slightly pubescent when young; rachis slightly winged: infl. 4-8 cm. across, slightly pubescent; fls. about 1 cm. across; anthers brown; styles 5; fr. subglobose, 6-7 mm. across, white. Fl.v-vi; fr.viii. S.H.1:f.374o(l). C. China. Intr. 1910. Zone V. Attractive in fall with its white fr. on red stalks.

Related species: *S. Práttii* Koehne. Lfts. 21-27, 1.5-2.5 cm. long, entire on lower third or half, glaucous beneath and papillose, usually villous, chiefly on midrib; fr. white. B.M.9460(c). W. China.—*S. P. tatsienensis* (Koehne) Schneid., var. Lfts. smaller, 1-2 cm. long, often entire only at base. G.C.68: 153;72:226. Gn.87:556. Intr. about 1904. Zone V?—*S. P. subarachnoidea* (Koehne) Rehd., f. Lfts. with a rufous cobwebby tomentum beneath. B.S.3: 326(t). (*S. munda* f. *subarachnoidea* Koehne.) Intr. 1910.—*S. glomerulata* Koehne. Buds glabrous: lfts. 23-29, 1.5-2.5 cm. long, serrulate above the middle or near apex, glaucous beneath and glabrous or nearly so: infl. glabrous, consisting of 12-20 small dense clusters; styles 5; fr. white. C. China. Cult. 1910.—*S. scalaris* Koehne. Shrub to 6 m.; stipules large, persistent: lfts. 23-29, oblong, 2-3 cm. long, serrate above the middle or nearly entire: infl. 12-14 cm. wide, rather dense, villous; styles 3-4; fr. 5-6 mm. across, bright red. W. China. Intr. about 1904. Zone V?—*S. pluripinnata* (Schneid.) Koehne. Shrub: lfts. 21-25, oblong, 1.5-2.5 cm. long, grayish villous beneath: infl. about 9 cm. across: styles 4-5. S.H.1:f.374e'. (*S. foliolosa* var. *pl.* Schneid.) W. China. Cult. 1934. Zone VI?

Sect. II. *CORMUS* (Spach) Schneid. Lvs. pinnate: carpels 5, connate, inferior: fr. green or brown, 1.5-3 cm. long.

11. *S. doméstica* L. Tree to 20 m.: bark scaly, rough; buds viscid, lustrous, pubescent at apex; brts. soon glabrous: lfts. 11-21, narrow-oblong, acute, sometimes rounded, 3-8 cm. long, sharply serrate with acuminate teeth, entire near base, glabrous above, floccose-tomentose beneath, at least while young: infl. broad-pyramidal, 6-10 cm. across, tomentose; fls. 1.5 cm. across: fr. apple- (var. *pomifera* Hayne) or pear-shaped (var. *pyrifera* Hayne), yellowish green or brownish, tinged with red. Fl.v; fr.ix-x. R.I. 25:t.113(c). G.C.II.1:283;6:649. H.W.3:80,81(h). B.S.2:296,t(h). M.G.12: 376-8(h). (*Pyrus d.* Smith, *Cormus d.* Spach, *Pyrus Sorbus* Gaertn.) S. Eu., N. Afr., W. Asia. Long cult. Zone V. Sometimes grown for its fr., used in France and Germany in cider making.

SECT. I × III (*AUCUPARIA* × *ARIA*.)

12. × *S. híbrida* L. (*S. Aucuparia* × *intermedia*). Tree to 12 m., with ascending brs.; young brts. and petioles floccose-tomentose: lvs. ovate to oblong-ovate or oblong, 7-12 cm. long, with 7-10 pairs of veins, below with 1-4 pairs of oblong decurrent lfts. acute or acutish and serrate toward the apex, the upper part lobed, tomentose beneath; petioles 1.5-3 cm. long: infl. 6-10 cm. across, tomentose; fls. 1 cm. across: fr. subglobose, 1.2 cm. thick, red. Fl.v; fr.ix-x. H.W.3:86. M.A.t.40(h). G.C.76:235. Gn.88:685. (*S. fennica* K. Koch, *Pyrus pinnatifida* Ehrh., *P. semipinnata* Bechst.) Scandinavia with the parents. Cult. 1779. Zone IV.—*S. h. Gibbsii* (Osborn) Bean, var. With 1 or 2 pairs of distinct lfts.: fr. coral-red. G.C.77:234,t. (*Pyrus firma* Hort.) Cult. 1925.—*S. h. fastigiata* Rehd., var. Form of fastigate habit. G.C.41:185(h). (*P. pinnatifida* var. *fastigiata* Bean.)—*S. h. Meiniichii* (Lindb.) Rehd., var. A transition to *S. aucuparia* with 4-6 pairs of distinct lfts. S.H.1:f.370g. (*S. h. neuillensis* Cockerell.) Cult. 1907.

Closely related hybrid: *S. thuringiaca* (Ilse) Fritsch (*S. aucuparia* × *Aria*). Lvs. oblong-ovate, with 9-12 pairs of veins, with 1-3 pairs of distinct lfts., obtusish or rounded at apex with shorter and broader, less pointed teeth, the upper part lobed at base, very slightly so toward the apex. R.I.25:t.115(c). (*S. hybrida* var. *t.* Rehd., *S. decurrens* Hedl., *P. semipinnata* Roth partly, *S. quercifolia* Hedl.) This hybrid is less often cult. than the preceding.—An im-

perfectly known hybrid is *S. plantierensis* Schneid., supposed to be *S. americana* × *Aria*.

Sect. III. *ARIA* Pers. (*Aria* Host, *Hahnia* Med., *Torminaria* Roem.) Lvs. simple, lobed or only serrate: fr. with persistent calyx-lobes.

13. *S. torminalis* (L.) Crantz. SERVICE-TREE. Round-headed tree, to 25 m., with spreading brs.; buds glabrous, green; young brts. loosely tomentose: lvs. broad-ovate, slightly cordate to broad-cuneate at base, 5-10 cm. long, with 3-5 pairs of triangular-ovate lobes, the lower sinus reaching about halfway to the middle, bright green, thinly floccose-tomentose beneath when young, usually soon glabrous; petiole 2-5 cm. long: infl. 10-12 cm. across, rather loose, tomentose; fls. 1.2 cm. across; styles usually 2: fr. ellipsoid, about 1.5 cm. long, brown, dotted. Fl.v-vi; fr.ix-x. H.W.3:82(h), t.53(c). S.L.347(h). (*Pyrus* t. Ehrh., *Torminaria* t. Dipp.) Eu., Asia Minor, N. Afr. Long cult. Zone V. With light green lvs. turning bright red in fall.

*S. t.* × *Aria*; see No. 14.

A species with large brown fr. is *S. megalocarpa* Rehd. Shrub to 7 m.: lvs. elliptic-obovate to obovate-oblong, 12-24 cm. long, acuminate, crenate-serrate, glabrous: infl. 10-15 cm. across; styles 3-4, connate, glabrous: fr. ovoid, 1.5-3.5 cm. long, russet-brown. W. China. Intr. 1908. Zone VI?

14. × *S. latifolia* (Lam.) Pers. (*S. Aria* × *torminalis*). Tree to 16 m., similar to the preceding; buds olive-brown, glabrous: lvs. broad-ovate to ovate, usually rounded at base, 6-10 cm. long, pinnately lobed with short broad-triangular, sharply serrate lobes and with 5-8 pairs of veins, grayish or whitish tomentose beneath, rarely glabrescent: infl. 7-10 cm. across, tomentose; fls. 1.5 cm. across; styles 2-3: fr. globose to short-ellipsoid, 1.2 cm. long, orange or brownish red, dotted. Fl.v; fr.ix. Ad.7:t.225(c). H.W.3:85. N.D. 4,t.35(c). (*S. decipiens* Hedl., *Torminaria* l. Dipp.) Occasionally with the parents in C. Eu. Intr. before 1750. Zone IV.

15. *S. intermedia* (Ehrh.) Pers. Shrub or tree to 10 m.: buds greenish or brownish, viscid, the scales with tomentulose margin; young brts. tomentose: lvs. elliptic to obovate-oblong, broad-cuneate, 6-10 cm. long, pinnately lobed, with short and broad irregularly serrate lobes and 6-9 pairs of veins, grayish white or grayish tomentose beneath; petioles 1.5-2 cm. long: infl. 8-10 cm. across, tomentose; fls. 1.2 cm. across; styles usually 2; fr. subglobose, about 1.2 cm. across, orange-red. Fl.v; fr.ix-x. S.E.3:485. S.H.1:f.377s-t(l). B.S.2:285,t(h). (*S. scandica* Fr., *Aria suecica* Koehe, *Pyrus* i. Ehrh.) N. Eu. Long cult. Zone V. Sometimes confused with *S. hybrida*, but its lvs. never have distinct lfts. and the sinuses do not reach farther than ¼ toward the middle.—*S. i. minima* (Ley) Bean, var. Slender shrub: lvs. oblong, shallowly lobed; fls. and frs. smaller. Jour. Bot. 35:t.372. England.—*S. i. arranensis* (Hedl.) Rehd., var. Lvs. more deeply lobed, the lowest lobes more than halfway to midrib. Hedl. *Sorbus*. 60. Scotland.

Closely related species: *S. Mougeotii* Soy.-Willem. & Godr. Tree to 20 m.: lvs. short-acuminate, with 8-12 pairs of veins, less deeply lobed, whitish tomentose beneath: fr. 8 mm. across, red, edible. H.W.3:83. S.H.1:f.377u-v(l). (*Pyrus* M. Aschers. & Graeb.) Mts. of C. Eu. Cult. 1880. Zone V.—*S. M.* × *Chamaemespilus*; see under No. 17.

16. *S. Aria* (L.) Crantz. WHITE BEAM-TREE. Tree with broad-pyramidal or ovoid head, to 15 m.: young brts. tomentose; buds greenish, viscid: lvs. elliptic to elliptic-oblong, acute or obtuse, usually cuneate, 5-12 cm. long, sharply and doubly serrate, glabrous except on the nerves and bright green above, white-tomentose beneath, with 8-12 pairs of veins, leathery; petioles 1-2 cm. long, tomentose: infl. 5-8 cm. across, tomentose; fls. 1.5 cm. across; styles 2, rarely 3, connate at base; fr. subglobose, 1.2 cm. thick, orange-red or

scarlet, with mealy flesh. Fl.v; fr.ix-x. H.W.3:t.52(c). G.M.44:291. (*Pyrus* A. Ehrh., *Aria nivea* Host.) Eu. Long cult. Zone V. Tree with handsome lvs. and attractive fr.—*S. A. aurea* Hesse. Lvs. yellow. A form with deeper yellow lvs. is *S. A. chrysophylla* Hesse; a form with yellowish lvs. is *S. A. lutescens* Hartwig, var.—*S. A. edulis* Wenzig, var. Lvs. elliptic-oblong to oblong, 7–14 cm. long; fr. ovoid, larger. S.H.1:f.377h-i(l).—*S. A. Decaisneana* (Lav.) Rehd., var. Lvs. elliptic-ovate, 10–15 cm. long, irregularly and doubly serrate; petiole 2–2.5 cm. long; fls. 1.8 cm. across; stamens longer than style; fr. larger, ovoid. B.M.8184(c). Gn.90:554. L.It.18. (*Aria* D. Lav., *S. Aria majestica* Zab., *Pyrus Aria* var. *majestica* Prain.) Cult. 1880.

*S. A. × aucuparia*; see under No. 12.—*S. A. × torminalis*; see No. 14.—*S. A. × Aronia arbutifolia* = *Sorbaronia alpina*; see p. 382.—*S. A. × Aronia melanocarpa* = *Sorbaronia Dippelii*; see p. 382.—*S. A. × Pyrus communis* = *Sorobopyrus auricularis*; see p. 382.

Closely related species: *S. umbellata* (Desf.) Fritsch. Tree to 7 m.: lvs. orbicular to broad-elliptic, obtuse, cuneate, 3.5–6 cm. long, incisedly lobed above the middle with short rounded coarsely toothed lobes and with 5–6 pairs of veins; petioles usually 1 cm. or less long; fr. depressed-globose. S.H.1:f.379a-d, 378f-g. (*S. flabellifolia* F. Schau., *S. meridionalis* Guss., *S. Aria* var. *flabellifolia* Wenz.) S. E. Eu., W. Asia. Intr. before 1930. Zone V or VI?—*S. u. cratica* (Lindl.) Schneid., var. Lvs. broad-elliptic or elliptic, 5–9 cm. long, with 6–11 pairs of veins, scarcely lobulate. Gs.3:270. S.H.1:f.379e-i. (*S. graeca* (Spach) Hedl., *S. Aria* var. *graeca* K. Koch.) S. E. Eu. Cult. 1830.—*S. pallascens* Rehd. Lvs. elliptic, doubly denticulate-serrate, grayish-tomentose beneath; infl. small, sessile; fr. subglobose, pale, 8 mm. across. (*S. ochrocarpa* Rehd.) W. China. Intr. 1908. Zone V.—Also related to *S. Aria* are: *S. lanata* (Don) K. Koch. Tree: lvs. elliptic, 10–16 cm. long, sharply and doubly serrate and slightly lobed, grayish villous-tomentose beneath, later often glabrescent; styles 2–3, woolly; sepals nearly glabrous outside; petals narrowed into a claw; fr. globose, 1.5–3 cm. across. S.H.1:f.383a-b, 380o-p. M.D.47:146. (*Pyrus kumaonensis* Wall.) Cult. 1870. Zone VII?—*S. cuspidata* (Spach) Hedl. Tree: lvs. elliptic to elliptic-oblong, acuminate, 7–16 cm. long, doubly serrate, densely white-tomentose beneath; infl. 8–10 cm. across; styles usually 5, distinct; fr. subglobose, about 2 cm. across, reddish. B.M.8259(c). B.R.1655(c). G.C.II.1:17. (*Pyrus vestita* Wall., *Cormus lanata* Koehne, *S. nepalensis* Hort.) Himal. Intr. 1820. Zone VII. One of the handsomest species of the *Aria* group.

17. *S. Chamaemespilus* (L.) Crantz. Shrub to 3 m.; young brts. loosely pubescent; buds glabrous, with ciliate scales; lvs. elliptic to oblong, acute, cuneate, 3–7 cm. long, serrate, glabrous beneath or slightly floccose-tomentose, with 6–9 pairs of veins; petioles 4–10 mm. long; infl. dense, about 3 cm. across, tomentose; petals pink, upright, gradually narrowed into the claw; styles 2: fr. ovoid, red. Fl.vi; fr.ix-x. H.W. 3:84. S.O.2:t.87(c). G.H. t.70. (*Pyrus* C. Ehrh., *Aria* C. Host.) C. & S. Eu. Intr. 1683. Zone V.—*S. Ch. sudetica* (Tausch) Wenz., var. Lvs. to 10 cm. long, grayish tomentose beneath, (*S. s.* Nym., *Pyrus s.* Tausch, *S. chamaemespilus* var. *discolor* Neill., not Hegetschw.) C. Eu. Cult. 1908. Possibly *S. Aria × Chamaemespilus*.

*S. C. × Mougeotii* = *S. Hostii* (Jacq.) Hedl. Shrub to 4 m.: lvs. elliptic to elliptic-obovate, sharply serrate, loosely tomentose beneath; fls. whitish pink, in corymbs to 6 cm. across; fr. globose-ovoid. S.O.4:t.193(c). S.H.1:f.381a-b. (*Aria Hostii* Jacq.) C. Eu. with the parents. Cult. 1820. Zone V.

Sect. IV. MICROMELES (Decne.) Rehd. Lvs. simple: fr. small, with deciduous calyx.

18. *S. alnifolia* (Sieb. & Zucc.) K. Koch. Tree to 20 m.; brts. glabrous or slightly pubescent; lvs. ovate to elliptic-ovate, short-acuminate, rounded at base, 5–10 cm. long, unequally serrate, glabrous above, glabrous or slightly pubescent beneath, on vigorous shoots sometimes pubescent, with 6–10 pairs of veins; infl. loose, 6–10-fl., nearly glabrous; fls. 1 cm. across; styles usually 2: fr. subglobose, 8 mm. across, red and yellow. Fl.v; fr.ix-x. B.M.7773(c).

S.I.1:t.49(c). G.F.7:84. Gt.41:283,284. (*Micromeles a.* Koehne, *Pyrus Miyabei* Sarg.) C. China to Korea and Jap. Intr. 1892. Zone V. Tree with dense round head and bright green lvs. turning orange and scarlet in fall.

19. *S. caloneura* (Stapf) Rehd. Shrub or tree to 6 m.; brts. glabrous: lvs. elliptic- to obovate-oblong, 7-12 cm. long, usually acute or sometimes obtusish, doubly crenate-serrate, pale beneath and sparingly hairy on the veins, at least at their base, with 10-12 pairs of veins impressed above; petiole about 1 cm. long: infl. dense, many-fld., loosely pubescent; fls. about 6 mm. across; styles 5: fr. pyriform, about 1 cm. high, brown, dotted. B.M. 8335(c). (*Micromeles c.* Stapf.) C. China. Intr. 1904. Zone V.

Related species: *S. meliosmifolia* Rehd. Tree to 10 m.: lvs. short-petioled, ovate to elliptic-oblong, 10-18 cm. long, doubly serrate, with 18-24 pairs of veins: infl. 5-10 cm. across: fr. subglobose, brownish red. W. China. Intr. 1910? Zone VI?—*S. Keissleri* (Schneid.) Rehd. Tree to 12 m.: lvs. elliptic-obovate, 5-8 cm. long, crenate-serrulate, with 8-10 pairs of veins: infl. tomentose; styles usually 3, connate below: fr. ovoid, red. (*S. Decaisneana* Rehd., not Zabel, *Micromeles K.* Schneid.) C. & W. China. Intr. 1900? Zone VI?

20. *S. Fölgneri* (Schneid.) Rehd. Tree with spreading and arching brs., to 8 m.; young brts. tomentose: lvs. ovate to elliptic-ovate, acute or short-acuminate, broad-cuneate or rounded at base, 5-8 cm. long, finely serrate or on shoots doubly serrate and often slightly lobed, dark green and glabrous above, white-tomentose beneath, with 8-9 pairs of veins; infl. many-fld., about 10 cm. across; styles 3: fr. ellipsoid, about 1.3 cm. long, red. Fl.v; fr.x. M.G.27:136(h). (*Micromeles F.* Schneid., *Pyrus F.* Bean.) C. China. Intr. 1901. Zone V. Graceful species.—*S. F. pendula* Rehd., f. Brts. pendulous.

Related species: *S. epidendron* Hand-Mazz. Shrub or tree to 15 m.: lvs. obovate to narrow-elliptic, 8-15 cm. long, acuminate, cuneate, serrulate, fulvous-tomentose beneath, with 10-12 pairs of veins; petiole 5-1.5 cm. long: infl. 5-10 cm. across, fulvous-pubescent. W. China. Cult. 1934. Zone VI?

21. *S. japonica* (Dcne.) Hedl. Tree to 20 m.; young brts. tomentose: lvs. ovate to oblong-ovate, short-acuminate, cuneate, 7-10 cm. long, doubly serrate and lobulate, pubescent above or sometimes glabrescent, grayish white or white-tomentose beneath, with 10-12 pairs of veins; petioles 1-2 cm. long: infl. tomentose, rather dense: fr. ellipsoid, 1.2 cm. long, scarlet, punctulate. Fl.v; fr.x. S.I.1:t.48(c). (*Micromeles j.* Koehne, *S. Koehnei* Zabel, *S. Aria* var. *kamaonensis* Maxim.) Japan, Korea. Intr. ? Zone V. Ornamental tree, particularly the var. with its lvs. white beneath changing to yellow in fall and with its bright orange fr.—*S. j. calocarpa* Rehd., var. Lvs. with purer white denser tomentum beneath, to 8 cm. broad: fr. orange, 1.5 cm. long, not punctulate. C. Japan. Intr. 1915. Zone V.

× **SORBARONIA** Schneid. Hybrids between *Sorbus* and *Aronia* and intermediate between the two genera. Deciduous shrubs with partly pinnate or simple, serrulate lvs., rather small and dense infl., 3-4 styles and red or nearly black fr.

A. Lvs. partly pinnate or lobed.....1. *S. hybrida*  
 A. Lvs. serrulate .....2. *S. alpina*

1. × *S. hybrida* (Moench) Schneid. (*Sorbus aucuparia* × *Aronia arbutifolia*.) Shrub or small tree, with slender, sometimes pendulous brs.; young brts. tomentose: lvs. ovate to oblong-ovate, obtuse, 3-8 cm. long, with 2-3 pairs of lobes or lfts. near base, crenate-serrate toward the apex, pubescent beneath: infl. about 3 cm. across, pubescent or nearly glabrous; fls. white or pinkish white: fr. subglobose or pear-shaped, 8-10 mm. long, dark purple. G.H.t.81(c). B.R.1196(c). (*Pyrus h.* Moench, *Aronia h.* Zab., *P. hetero-*

*phylla* Pott, *Sorbus spuria* Pers., *Sorbaronia heterophylla* Schneid.) Orig. before 1785. Zone V.

Similar hybrids: *S. fallax* Schneid. (*Sorbus aucuparia* × *A. melanocarpa*.) Similar, but nearly glabrous and fr. blackish. (*Sorbus heterophylla* Dipp., not Reichenb.) Cult. 1878.—*S. Jackii* Rehd. (*Sorbus americana* × *A. prunifolia*.) Brts., infl. and lvs. beneath thinly villous; shoot-lvs. oblong-ovate to oblong-lanceolate, acute to acuminate, lvs. of fl. brts. acute to obtusish; fr. dark purple. N. Scotia. Intr. 1924.—*S. Arsénii* (Britt.) G. N. Jones (*Sorbus decora* × *A. prunifolia*.) Lvs. abruptly acute or short-acuminate, slightly villous beneath; lateral lfts. obtuse; infl. small, nearly glabrous. Jour. N. Y. Bot. Gard. 27:228. Nfd. Cult. ?—*S. sorbifolia* (Poir.) Schneid. (*S. americana* × *A. melanocarpa*.) Similar to *S. fallax*, but lvs. more pointed and like the infl. glabrous; fr. nearly black. W.D.1:53(c). (*Sorbus s.* Hedl., *Sorbus Sargentii* Dipp.) Cult. 1893.

2. × *S. alpina* (Willd.) Schneid. (*Sorbus Aria* × *A. arbutifolia*.) Shrub similar to *S. Aria*, but lvs. smaller, glandular-serrulate, with fewer and less straight veins; infl. and fls. smaller; styles 3-4; fr. red or brownish red, 8 mm. across. S.H.1:f:385f-h(1). (*Pyrus a.* Willd., *Sorbus a.* Heynh., *Aronia densiflora* Spach, *A. Willdenowii* Zab.) Orig. before 1809. Zone V.

A similar hybrid is *S. Dippelii* (Zab.) Schneid. (*S. Aria* × *A. melanocarpa*.) Similar, but lvs. and infl. finally glabrous; fr. blackish purple. (*Sorbus D.* Zab.) Cult. 1870.

× **SORBOPYRUS** Schneid. Hybrids between *Pyrus* and *Sorbus* known so far only between *P. communis* and *S. Aria*. (*Bollwilleria* Zab., *Pyraria* Cheval.)

× *S. auriculàris* (Knoop) Schneid. (*Pyrus communis* × *Sorbus Aria*.) Tree to 15 cm.; brts. and buds tomentose; lvs. broad-elliptic to elliptic, short-acuminate, usually rounded at base, 6-10 cm. long, irregularly and coarsely serrate or doubly serrate, pubescent beneath; fls. in 5-many-fl. corymbs; pedicels slender; calyx tomentose; styles 2-5; fr. pyriform, about 2.5 cm. across, greenish or reddish yellow. Fl.v; fr.x. B.R.1437(c). L.B.1009(c). B.S.2:278. S.L.344(h). (*Pyrus a.* Knoop, *P. Pollveria* L., *P. Bollwilleriana* DC., *Sorbus Bollwilleriana* Zab., *Bollwilleria a.* Zab.) Orig. before 1620. Zone V.—*S. a. bulbifórmis* (Tatar) Schneid., var. Nearer to *Pyrus*: fr. larger, to 4 cm. across. Wien. Obst-Gart.-Zeit. 1878:26. To this var. may belong *Pyraria malifolia* (Spach) Cheval. (*Bollwilleria m.* Zab., partly.) Dene. Jard. Fruit. 1:t:32.

× **AMELASÓRBUS** Rehd. Hybrid between *Amelanchier* and *Sorbus*; from the former it differs chiefly in the partly incompletely pinnate lvs. and in the paniculate infl., from the latter in the partly simple, partly incompletely pinnate or lobed lvs., the paniculate infl., the oblong petals, the usually 5 styles and the incompletely 8- or 10-celled fr.; the false partitions extending about halfway to the middle.

× *A. Jackii* Rehd. (*Amelanchier florida* × *Sorbus scopulina*.) Vigorous shrub: lvs. oval to elliptic, 3.5-6 cm. long, or on shoots to 10 cm. long and elliptic-oblong, rounded or acutish at apex, subcordate or rounded at base, coarsely dentate and partly pinnate or lobed below the middle, loosely pubescent at first, soon glabrous; infl. to 5 cm. long, with racemose brs.; petals oblong, 1 cm. long; styles 4-5; fr. subglobose, 6-8 mm. across, dark red, with blue bloom. Jour. N. Y. Bot. Gard. 27:228. Idaho, Ore. Intr. 1918. Zone V.

19. **ARÒNIA** Med. **CHOKEBERRY**. Deciduous shrubs; buds appressed, with about 3 outer scales; lvs. crenate-serrulate, with blackish glands on the midrib above, convolute in bud; stipules small, deciduous; fls. white or pinkish, in small corymbs; petals spreading; stamens numerous; anthers purple;

ovary 5-celled, woolly at the top; styles 5, connate at base; carpels connate, but partly free on their ventral suture: fr. a small pome without grit-cells, with persistent connivent calyx-lobes. (Derived from the generic name *Aria*.) Syn.: *Adenorhachis* Nieuwl. Three closely related species in N. Am.—Ornamental shrubs with handsome lvs. and attractive white fls. and decorative fr.

- A. Lvs. beneath and infl. pubescent.  
 B. Fr. red ..... 1. *A. arbutifolia*  
 BB. Fr. purple-black or dark purple ..... 2. *A. prunifolia*  
 AA. Lvs. and infl. glabrous or nearly so: fr. black ..... 3. *A. melanocarpa*

1. *A. arbutifolia* (L.) Elliott. RED CHOKEBERRY. Shrub to 3 m.; brts. tomentose: lvs. elliptic to oblong or obovate, acute or abruptly acuminate, glabrous above except the midrib, grayish tomentose beneath: infl. tomentose, 3-4 cm. broad, rather dense, 9-20-fld.; fls. about 1 cm. across, white or reddish: calyx-lobes glandular: fr. subglobose or pear-shaped, 5-7 mm. across, bright or dull red. Fl. iv-v; fr. ix-x, long persistent. B.M.3668(c). G.F.3:417. G.W.5:245. (*Pyrus a.* (L.) L. f., *Sorbus a.* (L.) Heynh., *Mespilus a.* var. *erythrocarpa* Mich.) Mass. to Fla., w. to Minn., Ohio, Ark. and Tex. Intr. about 1700. Zone V. Ornamental shrub with bright red fr. persisting through the winter; the foliage turns red in autumn.—*A. a. macrophylla* (Hook.) Rehd., f. Large shrub or tree to 6 m.: lvs. 5-9 cm. long. Ark. to La. and Tex. Intr. 1918. Zone (V).—*A. a. leiocalyx* Rehd., f. Calyx and pedicels glabrous or nearly so.—*A. a. macrocarpa* Zab., f. Fr. larger, 8-10 mm. across.—*A. a. pumila* (Schmidt) Rehd., var. Dwarf shrub with smaller lvs. and darker red fr. S.O.2:t.89(c). (*Mespilus p.* Schmidt, *Pyrus depressa* Lindl.)

*A. a.* × *Sorbus aucuparia* = *Sorbaronia hybrida*; see p. 381.—*A. a.* × *Sorbus Aria* = *Sorbaronia alpina*; see p. 382.

2. *A. prunifolia* (Marsh.) Rehd. PURPLE-FRUITED C. Shrub to 4 m., similar to the preceding; corymbs looser, calyx often less densely tomentose and calyx-lobes glandless or nearly so: fr. subglobose, 8-10 mm. across, purplish black, lustrous. Fl. iv-v; fr. viii-ix. Ad.3:t.81(c). B.R.1006(c). B.B.2:291. (*A. atropurpurea* Britt., *Sorbus arbutifolia* var. *atropurpurea* Schneid., *A. floribunda* Spach.) N. S. to Fla., w. to Ind. Cult. 1800? Zone IV. Intermediate between the preceding and the following, but not a hybrid.

3. *A. melanocarpa* (Michx.) Elliott. BLACK C. Usually low shrub, 0.5-1 m. tall; brts. nearly glabrous: lvs. elliptic or obovate to oblong-oblancoate, abruptly acuminate or obtusish, 2-6 cm. long, bright green and glabrous or nearly so beneath: infl. glabrous or nearly so: fr. globose, 6-8 mm. across, lustrous black or black-purple. Fl. iv-v; fr. viii-ix. B.M.9052(c). B.B.2:291. D.H.3:385. (*A. nigra* Dipp., *Sorbus m.* Heynh., *Pyrus m.* Willd.) N. S. to Fla., w. to Mich. Intr. about 1700. Zone IV.—*A. m. subpubescens* (Lindl.) Schneid., var. Lvs. pubescent beneath when young.—*A. m. elata* Rehd., var. More vigorous shrub, to 3 m.: lvs. larger, generally oblong-obovate and acute: fls. and fr. larger.—*A. m. grandifolia* (Lindl.) Schneid., var. Shrub to 3 m.: lvs. obovate to broad-obovate and abruptly acuminate, 4-8 cm. long and 2-6 cm. broad: infl. fls. and fr. larger. B.R.1154(c).—Particularly the two last vars. are handsome shrubs with lustrous dark green lvs., attractive white fls. in spring and shining black fr. in fall.

*A. m.* × *Sorbus americana* = *Sorbaronia sorbifolia*; see p. 382.—*A. m.* × *Sorbus aucuparia* = *Sorbaronia fallax*; see p. 382.—*A. m.* × *Sorbus Aria* = *Sorbaronia Dippelii*; see p. 382.

20. *PHOTINIA* Lindl. Deciduous or evergreen shrubs or trees; buds ovoid, with several outer scales: lvs. short-petioled, usually finely serrate, stipulate: fls. white, in corymbs or short panicles; petals 5, orbicular; sta-

mens about 20; styles 2, rarely 3-5, connate at least at base; ovary often nearly half-superior, in fr. free only at apex or  $\frac{1}{3}$  of its length: fr. a small, 1-4-seeded pome, red, rounded at top and with persistent connivent calyx-lobes. (Greek *photeinos*, shining, alluding to the lustrous lvs.) Including *Pourthiaea* Dcne. About 40 species, in S. and E. Asia.

- A. Lvs. deciduous: fls. in corymbs or cymes, with conspicuously warty axes.  
 Sect. I. *POURTHIAEA* Schneid.  
 B. Infl. compound, many-fld. .... 1. *P. villosa*  
 BB. Infl. subumbellate, 2-8-fld., glabrous ..... 2. *P. parvifolia*  
 AA. Lvs. persistent: infl. corymbose-paniculate, not warty ..... Sect. II. *EUPHOTINIA* Focke.  
 3. *P. serrulata*

1. *P. villosa* (Thunb.) DC. Shrub or small tree, to 5 m.; brts. slender, pubescent when young: lvs. short-stalked, obovate to oblong-obovate, 3-8 cm. long, acuminate, cuneate, finely and sharply serrate, dark green and glabrous above, villous beneath, with 5-7 pairs of veins, firm at maturity; petioles 1-5 mm. long: infl. 3-5 cm. across, villous; fls. 1.2 cm. across: fr. ellipsoid, 8 mm. long, bright red. Fl.vi; fr.x. S.I.1:t.49(c). M.K.t.50(c). G.F. 1:67. (*P. variabilis* Hemsl., *Pourthiaea* v. Dcne., *Sorbus* v. Zab.) Japan, Korea, China. Intr. about 1865. Zone IV. Ornamental shrubby tree, with bright red fr. persisting into the winter; the lvs. turn red in autumn.—*P. v. Maximowicziana* (Lévl.) Rehd., f. Lvs. obovate, rounded and abruptly short-acuminate or truncate at apex, gradually cuneate, strongly veined with impressed veins above; petiole 1-2 mm. long. Korea. Cult. 1876.—*P. v. laëvis* (Thunb.) Dipp., var. Lvs. narrower and smaller, soon glabrous: infl. glabrous: fr. 1.2 cm. long. G.F.4:377. B.C.2596. (*P. l.* DC., *Pourthiaea arguta* Lav., not Dcne.) Cult. 1875.—*P. v. sinica* Rehd. & Wils., var. Shrub or tree to 10 m.: lvs. thinner, elliptic or elliptic-oblong, soon glabrous: infl. 5-8, rarely to 15-fld., loosely villous. C. China. Intr. 1908.

Closely related species: *P. Beauverdiæ* Schneid. Lvs. obovate-oblong to oblong, 6-10 cm. long, glabrous, with 8-14 pairs of veins; petioles 5-10 mm. long: infl. 5 cm. across: fr. subglobose, 6 mm. across, scarlet. S.H.1:f.393p-q(1). C. and W. China. Intr. 1900? Zone VI?—*P. B. notabilis* Rehd. & Wils., var. Lvs. elliptic-oblong, 7-12 cm. long: infl. 8-10 cm. across: fr. ellipsoid, 7-8 mm. long. Intr. 1908.

2. *P. parvifolia* (Pritz.) Schneid. Slender shrub to 3 m.; brts. glabrous: lvs. elliptic to elliptic-ovate or rhombic-ovate, 3-6 cm. long, acuminate, broad-cuneate or rounded at base, sharply serrulate, glabrous, pale beneath: fls. 1-6, subumbellate, about 1.5 cm. across; pedicels 1-2.5 cm. long, glabrous: fr. ellipsoid, 8-10 mm. long, scarlet. Fl.v-vi; fr.x. S.H.1:f.392o,393g. (*P. subumbellata* Rehd. & Wils.) E. and C. China. Intr. 1908. Zone VI. Graceful shrub with scarlet fr.

Markedly different in its 5 styles and larger fr. is *P. amphidoxa* (Schneid.) Rehd. & Wils. Shrub to 3 m.; young brts. tomentose: lvs. elliptic to oblong or oblong-oblong, acuminate, 5-9 cm. long, finally nearly glabrous: infl. 3-6-fld., tomentose; pedicels short; styles 5: fr. subglobose, 1-1.4 cm. across, scarlet. S.H.1:f.394k-l(f). (*Stranvaesia a.* Schneid.) C. China. Intr. 1908. Zone VII?

3. *P. serrulata* Lindl. Evergreen shrub or tree to 12 m., quite glabrous; buds ovoid, 4 mm. thick: lvs. oblong, acuminate, usually rounded at base, 10-18 cm. long, serrulate, dark green and lustrous above, yellowish green beneath, reddish when young; petioles 2-3 cm. long, pubescent: fls. 6-8 mm. across, in broad panicles 10-16 cm. across, with thick slightly angular brts.; petals glabrous: fr. globose, 5-6 mm. across, red. Fl.v-vi; fr.x. B.M.2105(c). L.B.248(c). G.W.15:247(h). China. Intr. 1804. Zone VII. Shrub with large lustrous lvs. and attractive white fls. followed late in fall by bright red fr.—*P. s. rotundifolia* Bean, var. Lvs. shorter and broader.

Closely related species: *P. Davidsoniae* Rehd. & Wils. Buds about 1 mm. thick, acutish; young brts. appressed-pubescent; lvs. cuneate, 8–14 cm. long, pubescent on the veins beneath at first; petioles 1–1.5 cm. long; fls. 1 cm. across; infl. slightly pubescent; fr. 7–10 mm. long. C. China. Intr. 1900. Zone VII?—*P. glabra* (Thunb.) Maxim. Shrub to 3 m.; lvs. elliptic or obovate to oblong-obovate, cuneate, 5–8 cm. long; petiole about 1 cm. long; infl. 5–10 cm. across; petals bearded; fr. about 5 mm. across. S.I.L.t.47(c). (*Sorbus g.* Zab.) Japan. Cult. 1903? Zone VII?

21. **STRANVAËSIA** Lindl. Evergreen trees or shrubs; buds small, with few acuminate scales; lvs. entire or serrate, with subulate stipules; fls. white, in terminal many-fl. corymbs; calyx turbinate, 5-toothed; petals 5, generally obovate, clawed; stamens about 20; styles 5, connate at least to the middle; ovary half-superior; cells 2-ovuled; fr. a small orange or scarlet pome; calyx-teeth persistent, connivent; upper part of ovary free to the middle or beyond, the whole ovary at full maturity easily separable from the fleshy receptacle and the valves splitting loculicidally. (After William Fox-Strangways, English botanist; 1795–1865.) Four or 5 species in China and the Himal.)

*S. Davidiana* Dcne. Shrub to 8 m.; young brts. silky-villous, soon glabrous; lvs. oblong to oblong-lanceolate or oblanceolate, acuminate, cuneate; 6–11 cm. long, entire, green and glabrous on both sides except the sparingly pubescent midrib; petiole pubescent, 1–2 cm. long, often red; infl. loose, 5–8 cm. broad, villous; fls. 8 mm. across; anthers red; fr. subglobose, 7–8 mm. across, scarlet. Fl.vi; fr.x–xi. B.M.9008(c). M.O.t.19. G.C.71:199(h);84:403. (*Photinia* D. Cardot.) W. China. Intr. 1917. Zone VII?—*S. D. undulata* (Dcne.) Rehd. & Wils., var. Usually lower: lvs. elliptic-oblong to oblong-lanceolate, 3–8 cm. long, usually wavy at the margin; infl. 5–7 cm. across, sometimes nearly glabrous; fr. about 6 mm. across, coral-red to orange. B.M.8418(c). Gn.86:644. (*S. u.* Dcne.) W. and C. China. Intr. 1901. Zone (V).—*S. D. salicifolia* (Hutchins.) Rehd., var. Lvs. narrow-lanceolate, with more numerous veins; stipules and bracts quickly deciduous; infl. densely pubescent; fr. red, about 8 mm. across. B.M.8862(c). Gn.87:no.2717;88:57(h). (*S. s.* Hutchins.) W. China. Intr. 1907. Zone VII?

22. **ERIOBÓTRYA** Lindl. Evergreen trees or shrubs; lvs. short-petioled or nearly sessile, dentate, with straight veins ending in the teeth; fls. white, in terminal broad usually woolly panicles; calyx-lobes acute; petals 5, oval or suborbicular, clawed; stamens 20; styles 2–5, connate below; ovary inferior; cells 2-ovuled; fr. a pome with incurved persistent calyx-teeth, thin endocarp and one or few large seeds. (Greek, *erion*, wool, and *botrys*, cluster.) About 10 species in E. Asia.

*E. japonica* (Thunb.) Lindl. LOQUAT. Small tree to 6 m.; lvs. nearly sessile, obovate to elliptic-oblong, cuneate, 12–25 cm. long, remotely dentate, lustrous above, rusty-tomentose below; fls. fragrant, about 1 cm. across, nearly hidden in the rusty woolly pubescence of the panicle 10–16 cm. long; fr. pear-shaped, 3–4 cm. long, yellow; seeds 1–1.5 cm. long. Fl.ix–x; fr.iv–vi. S.Z.1:t.97(c). B.R.365(c). G.C.52:319. R.H.1913:107(fr). Gn.80:615(h). G.W.8:314(h). C. China. Intr. 1784. Zone VII. With large lvs., fragrant fls. and edible fr. of agreeable acid flavor, for which the plant is cult. in E. Asia, S. Eu. and in the S. States.—*E. j. variegata* Sander. Lvs. variegated with white. G.C.53:293.

23. **RAPHIÓLEPIS** Lindl. Evergreen shrubs; lvs. short-petioled, serrate or entire, with curving and anastomosing veins, leathery; fls. white or

pink, in terminal racemes or panicles; sepals triangular; petals 5, oblong to obovate, obtuse; stamens 15-20; styles 2-3, connate at base; ovary inferior: fr. subglobose, purple-black or bluish black, with deciduous calyx and with 1 or 2 large seeds. (Greek, *rhaphe*, needle, and *lepis*, scale; in reference to the subulate bracts.) Three or four species in S. Japan and S. China.

**R. umbellata** (Thunb.) Mak. Shrub to 4 m.: lvs. elliptic to obovate, rarely elliptic-oblong, obtuse or acute, cuneate, 3-8 cm. long, remotely dentate, dark green above, pale beneath and floccose-tomentose when young: fls. white, 1.5-2 cm. across, fragrant, in dense upright tomentose panicles or racemes: fr. about 1 cm. across, bluish black. Fl.v-vi; fr.ix(-iii). S.Z.1:t. 85(c). (*R. japonica* Sieb. & Zucc.) S. Japan. Intr. before 1859. Zone VII? Handsome evergreen shrub with fragrant white fls.—**R. u. ovata** (Briot) Schneid., f. Lvs. broad-obovate, rounded at apex, entire or sparingly toothed. B.M. 5510(c). R.H.1870:348. G.W.4:129(h);14:323(h). (*R. japonica* var. *integerrima* Hook. f., not Maxim.) Japan, Korea. Intr. before 1864.

Doubtfully hardy is *R. indica* Lindl. Lvs. thinner and narrower, acute or acuminate, more sharply serrate: fls. white or pinkish in loose glabrous or somewhat tomentose racemes with narrow lanceolate bracts; sepals lanceolate, acute and usually red; petals narrow, acute. B.M.1726(c). B.R.1400,1468(c). S. China. Intr. 1806.—*R. i.* × *umbellata* = *R. Delacourii* André. R.H.1900:698, t(c).

**24. AMELANCHIER** Med. SHADBUSH (SHADBLow, SARVIS). Deciduous shrubs or trees: buds conspicuous, pointed, with several scales: lvs. petioled, serrate, with nearly straight veins; stipules small, deciduous: fls. white, in terminal racemes, rarely solitary; calyx-tube campanulate, with 5 short lobes; petals 5, obovate to lanceolate; stamens 10-20; styles 2-5, partly connate or distinct; ovary inferior, each cell with 2 ovules separated by a false partition growing from the back of the cell; fr. a small berry-like pome, incompletely 4-10-celled, with one seed in each cell, crowned by the usually reflexed calyx-lobes, bluish black or dark purple, usually juicy and sweet. (Provençal name of *A. ovalis*.) About 25 species chiefly in N. Am. s. to Mex., few in Eu. and in W. and E. Asia.—Ornamental trees or shrubs, handsome in bloom, particularly *A. laevis*; some as Nos. 3-7 and 10 have edible fr. sometimes used for jellies and are occasionally cult. for their fr.

Styles free, 5, not exceeding the calyx-tube .....1. *A. ovalis*  
 Styles connate at least at base, longer than calyx-tube.

A. Styles 5, often connate to the middle.

B. Fls. in racemes: lvs. folded in bud; petioles slender.

C. Lvs. rather coarsely serrate, 3-5 teeth per cm. on average lvs.; veins usually straight and close together; young unfolding lvs. soon flat: top of ovary woolly.

D. Lvs. rounded or truncate at apex, usually serrate above the middle, glabrous or soon glabrous .....2. *A. florida*

DD. Lvs. acute or acutish, densely woolly beneath when young.

E. Shrub to 3 m.: lvs. serrate nearly to the base .....3. *A. sanguinea*

EE. Shrub to 1.25 m.: lvs. serrate to below the middle .....4. *A. humilis*

CC. Lvs. closely and finely serrate, about 6-12 teeth per cm.; young lvs. remaining folded for some time.

D. Lvs. tomentose when young; pedicels usually rather short.

E. Lvs. rounded or acutish at apex.

F. Top of ovary woolly: lvs. generally elliptic.

G. Sepals on fr. recurved: stoloniferous shrub to 1.25 m. ....5. *A. stolonifera*

GG. Sepals on fr. slightly spreading: shrub to 4 m. ....6. *A. spicata*

FF. Top of ovary glabrous or nearly so: lvs. generally oblong; sepals upright.

7. *A. oblongifolia*

EE. Lvs. short-acuminate or acute.

F. Top of ovary woolly: lvs. glabrous above when young, rounded or subcordate at base .....8. *A. asiatica*

FF. Top of ovary glabrous or nearly so: lvs. tomentose on both sides when young, usually cordate at base .....9. *A. canadensis*

DD. Lvs. glabrous from the beginning: pedicels slender, to 2.5 or in fr. to 5 cm. long.

10. *A. laevis*

- BB. Fls. 1-3: lvs. imbricate in bud, flat when unfolding, cuneate at base; petioles short.  
 11. *A. Bartramiana*  
 AA. Styles 2-3, usually connate only at base..... 12. *A. prunifolia*

1. *A. ovális* Med. SERVICE-BERRY. Upright or spreading shrub, 0.5-2.5 m., with rather stiff brs.; young brts. tomentose: lvs. oval to obovate, 2.5-5 cm. long, usually rounded at apex, subcordate at base, serrate from near the base, woolly beneath when young; racemes many-fld., tomentose; calyx glabrescent; petals linear-oblongate; fr. bluish black, bloomy. Fl.v; fr.viii. B.M. 2430(c). H.W.3:87. G.C.II.9:793. M.G.1900:497(h). (*A. rotundifolia* Dum.-Cours., *A. vulgaris* Moench.) C. and S. Eu. Intr. 1596. Zone IV.

2. *A. florida* Lindl. Shrub with rather stout upright brs., sometimes small tree to 10 m.: lvs. broad-oval to oval, truncate or subcordate at base, 2-4 cm. long, coarsely and sharply toothed above the middle, rarely below, quite glabrous or slightly floccose-tomentose at first; racemes many-fld., upright, glabrous or slightly tomentose at first; sepals short; petals oblong to narrow-oblong, about 1 cm. long; summit of ovary woolly: fr. nearly black, bloomy. Fl.v; fr.vii. B.R.1589(c). S.S.4:t.196. G.F.185:5:515. G.M.52:143(h). (*A. alnifolia* var. *f.* Schneid., *A. alnifolia* auth., not Nutt., *A. oxyodon* Koehne.) Mich. to Ore. and Wash. Intr. 1826. Zone II.—*A. f. tomentosa* Sealy, f. Lvs. glaucous and sparsely villous or glabrous beneath: infl. densely villous. B.M.9496(c). Cult. 1937.

*A. f.* × *Sorbus scopulina* = *Amelasorbus Jackii*; see p. 382.

Closely related species: *A. alnifolia* Nutt. Usually low and shrubby; brts. pubescent: lvs. broad-oval to suborbicular, densely pubescent beneath, finally glabrate; racemes rather short and dense, silky-villous. Sask. to Colo. and Idaho. Intr. 1918. Zone V.—*A. Cusickii* Fern. Lvs. elliptic to obovate-oblong, acutish to obtuse, 2-4 cm. long, serrate from near base or only above the middle: racemes 5-7-fld., glabrous; petals 1.5-2 cm. long; top of ovary glabrous: fr. scarlet, tardily turning black. S.H.1:f.410d. Wash. and Ore. to Mont. and Utah. Cult. 1934. Zone V?

3. *A. sanguinea* (Pursh) DC. Slender shrub with 1 or few stems, to 2.5 m.: lvs. orbicular-oval to oval-oblong, 3-6 cm. long, subacute, rounded or subcordate at base, serrate nearly to base: raceme usually loose and nodding; lower pedicels 7-10, in fr. to 25 mm. long; petals 1-1.4 cm. long; calyx-tube 3.5-6 mm. broad; top of ovary densely woolly; fr. rather large, nearly black, bloomy, sweet. Fl.v; fr.viii. B.B.2:233. Rh.14:t.95. (*A. rotundifolia* Roem., *A. spicata* Robins. & Fern., not K. Koch.) Can. to N. Y., Neb. and Ind. Intr. 1824. Zone IV.

Closely related species: *A. amabilis* Wieg. Lvs. elliptic-ovate, with veins more irregular, glabrescent: infl. loose; lower pedicels 2.5-4 cm. long; calyx-tube more shallow, 7-9 mm. broad; petals 1.6-2.2 cm. long. (*A. sanguinea* var. *grandiflora* Wieg., *A. grandiflora* Wieg., not Rehd.) N. Y. Intr. 1913.

4. *A. humilis* Wieg. Upright shrub, to 1.25 m., stoloniferous and forming patches: lvs. elliptic to elliptic-oblong, subcordate or rarely rounded at base, 2-5 cm. long, serrate to below the middle; racemes upright, rather dense, many-fld.; petals oblong-obovate, about 8 mm. long; fr. nearly black, bloomy, sweet. Fl.v; fr.viii. Rh.14:t.95. Vt. to Alb., s. to N. Y. and Iowa. Intr. 1904. Zone IV.

5. *A. stolonifera* Wieg. Upright stoloniferous shrub to 1.25 m., forming patches: lvs. elliptic, rarely elliptic-oblong or suborbicular, rounded at base or rarely subcordate, 2-5 cm. long, finely serrate, usually quite or nearly entire at the lower third, densely white-tomentose beneath when young: racemes upright, short and densely tomentose or nearly glabrous; petals obovate-oblong, about 8 mm. long; fr. purplish black, bloomy, sweet. Fl.v, a

few days later than *A. laevis*; fr.viii. Rh.14:t.95. (*A. spicata* Britt. & Br., not K. Koch.) Nfd. and Me. to Va. Intr. 1883. Zone IV.

6.  $\times$  *A. spicata* (Lam.) K. Koch (*A. oblongifolia*  $\times$  *stolonifera*?). Bushy shrub with numerous stems, to 4 m.: lvs. elliptic to obovate, sometimes elliptic-oblong, rounded at base, 3-6 cm. long, serrate to the base, white tomentose beneath when young; racemes upright, dense, woolly; petals oblong-obovate, 8 mm. long; fr. bluish black, bloomy, with slightly spreading sepals; pedicels rather stout, 3-12 mm. long. G.O.t.79(c). M.G.15:496(h,fl). (*Crataegus* s. Lam., *A. ovalis* Borkh., not Med.) Orig. before 1800.

7. *A. oblongifolia* Roem. Shrub with rather slender upright stems growing in rather dense clumps, to 6 m.: lvs. oblong to obovate-oblong, rounded or acute at apex, rounded or subcordate at base, 3-6 cm. long, finely serrulate nearly or quite to the base, white-tomentose beneath when young; racemes upright, short and dense, silky-tomentose; petals obovate-oblong to linear-oblong, about 8 mm. long; top of ovary glabrous or sometimes slightly woolly; fr. nearly black, bloomy, sweet. Fl.v, with *A. laevis*; fr.vi. B.M. 7619(c). Em.2:503,t(c, lower fig.) S.S.4:t.195. G.C.III.21:333. S.L.84(h). M.G.15:497(h). (*A. canadensis* var. *o.* Torr. & Gr., *A. obovalis* Ashe, *A. Botryapium* Britt. & Brown in part.) Me. to S. C. Cult. 1641. Zone IV. This differs from all other species except Nos. 6 and 11 in the upright sepals of the fr.—*A. o. micropétala* Robins., var. Shrub to 1 m.: fls. inconspicuous, with linear petals 3-4 mm. long. (*A. m.* Ashe; possibly *A. o. \times stolonifera*.) Mass. to Va. Intr. 1918.

Closely related species: *A. intermedia* Spach. Usually low shrub: lvs. acute, often reddish when young, soon glabrous, those of shoots similar to lvs. of *A. laevis*; sepals irregularly spreading; pedicels slender, 8-20 mm. long. (*A. canadensis* i. Ashe.) Vt. to N. C. Cult. 1834. Zone V.

8. *A. asiatica* (Sieb. & Zucc.) Endl. Shrub or tree to 12 m., with slender spreading brs.; lvs. ovate to elliptic-oblong, acute, rounded at base or subcordate, 4-8 cm. long, finely serrate to the base, densely white or yellowish tomentose beneath when young; racemes nodding, rather dense, woolly; top of ovary woolly; fr. bluish black. Fl.v; fr.ix. S.Z.1:t.42(c). S.I.1:t.47(c). (*A. canadensis* var. *a.* (Sieb. & Zucc.) Miq., *A. japonica* Hort.) Japan, Korea. Intr. 1865. Zone V.—*A. a. sinica* Schneid., var. Lvs. less tomentose, often finally glabrous, smaller, usually serrate only above the middle: infl. usually glabrous. I.S.1:31. C.C.169. (*A. s.* Chun.) China. Intr. 1920.

9. *A. canadensis* (L.) Med. Tree to 20 m., with ascending brs., sometimes shrubby: lvs. generally obovate, less often ovate, elliptic or oblong, acute to acuminate, usually cordate at base, 3-8 cm. long, sharply serrate nearly or quite to the base, when young densely tomentose beneath, less so above, tomentum usually partly persistent; racemes nodding, rather dense, silky-tomentose; petals linear to linear-oblong, 1-1.4 cm. long; top of ovary glabrous or slightly hairy; fr. maroon-purple. Fl.v, before the lvs.; fr.vi. B.R.1174(c). S.S.4:t.194. Rh.14:t.96. B.S.1:188&t(h). Me. to Ga. and La., w. to Iowa, Mo. Intr. 1623. Zone IV. This is the only species with the young lvs. tomentose on both side.—*A. c. nuda* Palmer & Steyerl., f. Lvs. and petioles glabrous at maturity. Intr. ?

*A. c. \times laevis* = *A. grandiflora* Rehd. Tree or shrub: lvs. purplish when unfolding and floccose-tomentose, soon glabrous; racemes slightly villous; lower pedicels to 2.2 cm. long; petals obtuse; fls. rather large. Spontaneous with the parents. Cult. 1870. Very handsome, particularly the pink-fl. form.—*A. g. rubescens* Rehd., f. Fls. purple-pink in bud, tinged pink when open. Cult. 1920.

Closely related species: *A. sera* Ashe. Shrub to 4 m.: lvs. glabrous at maturity; racemes slender, glabrous or glabrescent; petals narrow, 2.5-3 mm. wide, acute; lower pedicels about 1.5 cm. long. Va. and Md. Intr. 1920. Zone V.

10. *A. laevis* Wieg. Tree with spreading brs., to 12 m., sometimes shrubby: lvs. elliptic-ovate to ovate-oblong, short-acuminate, subcordate or rounded at base, rarely broad-cuneate, 3-7 cm. long, sharply serrate nearly to the base, quite glabrous and purplish when young: racemes slender, many-fld., nodding, glabrous or nearly so; pedicels to 3 cm. long, in fr. to 5 cm.; petals linear-oblong, 1-1.8 cm. long; top of ovary glabrous: fr. purple or nearly black, bloomy, sweet. Fl.v; fr.vi. Em.2:503,t.(c, upper fig.) H.T.242. M.G. 15:494,495(h). G.34:343(h). G.M.44:306(h). (*A. canadensis* Gray, not Med.) Nfd. to Ga. and Ala., w. to Mich. and Kans. Cult. 1870. Zone IV. One of the most graceful species in bloom, differing in the purplish young foliage and the drooping racemes.

11. *A. Bartramiana* (Tausch) Roem. Shrub to 2.5 m.: lvs. elliptic to elliptic-oblong, acute or rounded at apex, cuneate, 3-5 cm. long, sharply serrate to below the middle or nearly to the base, glabrous when young: fls. 1-3, pedicels 1-2.5 cm. long, glabrous; petals obovate, about 8 mm. long; top of ovary woolly: fr. purplish black, bloomy. Fl.iv-v; fr.vii-viii. B.M.8499(c). G.F.1:247. B.C.1:273. (*A. oligocarpa* Roem.) Lab. to Mich. and Minn., s. to Pa. in the mts. Intr. about 1800. Zone II.

12. *A. prunifolia* Greene. Much-branched shrub, to 4 m.; brts. pubescent: lvs. ovate to elliptic, rarely obovate, 1-2.5 cm. long, acute to obtuse, rather finely serrate, pubescent on both side, finally glabrate above, finely appressed-pubescent beneath; petiole 3-5 mm. long: racemes 3-6-fld., pubescent; pedicels 4-10 mm. long; ovary finely villous or sometimes nearly glabrous; sepals lanceolate, pubescent; petals oblong, 7-8 mm. long; stamens 10; styles usually 3, slightly pubescent at base; top of ovary villous. S.H.1:f.413a-c, 414a-f. (*A. rubescens* Greene.) Colo. to N. Mex. and Utah. Cult. 1900. Zone VI?

Related species: *A. Purpusii* Koehne. Lvs. broadly oval or suborbicular, truncate or emarginate at apex, rather coarsely serrate: sepals pubescent inside; top of ovary glabrous. Colo. Intr. about 1900. Zone V?—*A. plurinervis* Koehne. Lvs. oval, 1-1.5 cm. long, with few small teeth at the rounded apex, minutely puberulous, with 8-12 pairs of veins; stamens 10-15; ovary sparingly pubescent, top glabrous. Rocky Mts. Intr. about 1900. Zone V?

25. *PERAPHYLLUM* Nutt. Deciduous shrub; buds small, acute, pubescent: lvs. partly fascicled, nearly sessile or short-stalked, entire or sparingly serrate, with minute caducous stipules; fls. white or tinged pink, in terminal 2-5-fld. umbel-like racemes; calyx-lobes lanceolate, entire; petals 5, obovate, spreading; stamens 20; styles 2-3, free, slightly longer than stamens: ovary wholly inferior, 2-3-celled, each cell with 2 ovules separated by a false partition: fr. a small pome 4-6-celled, each cell with one seed; calyx-lobes persistent. (Greek *pera*, excessively, and *phyllon*, leaf; alluding to the crowded leaves.) One species.

*P. ramosissimum* Nutt. Upright shrub to 2 m.; young brts. tomentose: lvs. oblong to oblanceolate, narrowed at ends, 1.5-5 cm. long, silky-pubescent when young, later glabrous above; fls. 1.8 cm. across; disk rose-colored: fr. pendulous, globose, 8-10 mm. across, yellow with brownish or reddish cheek. Fl.v; fr.ix. B.M.7420(c). B.S.2:126. S.H.1:714. Ore. to Calif. and Colo. Intr. 1870. Zone V. Small shrub of little ornamental value.

26. *MALUS* Mill. APPLE. Deciduous, rarely half-evergreen trees or shrubs, rarely with spinescent brs.; buds ovoid, with several imbricate scales: lvs. serrate or lobed, folded or convolute in bud, stipulate: fls. white to pink or carmine, in umbel-like racemes; petals usually suborbicular or obovate;

stamens 15-50, with usually yellow anthers; ovary inferior, 3-5-celled; styles 2-5, connate at base: fr. a pome without or with some grit-cells, with persistent or deciduous calyx. (Ancient Latin name.) About 25 species in the temperate regions of N. Am., Eu. and Asia; in N. Am. s. to Fla. and Tex., in Asia to the Himal.—Some species are important fruit-trees, others belong to our most valuable ornamental trees and shrubs with showy fls. in spring and attractive fr. in autumn.

- Lvs. convolute in bud, always undivided.....Sect. I. EUMALUS Zabel.
- A. Calyx persistent .....
- B. Calyx-lobes longer than tube, acuminate.
- C. Fr. depressed and usually ribbed at apex, with impressed calyx, short-stalked: lvs. crenate-serrate .....1. *M. pumila*
- CC. Fr. usually ovoid, attenuate at apex and without ribs, the raised calyx with tubular fleshy base, usually slender-stalked: lvs. sharply serrate.....2. *M. prunifolia*
- BB. Calyx-lobes shorter or as long as tube, acute: fr. slender-stalked: lvs. chartaceous, lustrous above.
- C. Lvs. broad-cuneate or nearly rounded at base; petiole 1.5-2.5 cm. long: fr. usually contracted into the pedicel.....3. *M. spectabilis*
- CC. Lvs. gradually attenuate at base; petiole 2-3.5 cm. long: fr. impressed at base. 4. *M. micromalus*
- AA. Calyx deciduous (partly so in some hybrids).....Ser. 2. BACCATAE Rehd.
- B. Calyx-lobes longer than tube, narrow-lanceolate: fls. white; styles 5, rarely 4. 5. *M. baccata*
- BB. Calyx-lobes shorter than tube or as long, triangular-ovate: fls. white or pink.
- C. Styles 3, rarely 4; calyx-lobes acute or acuminate: fr. ellipsoid.....6. *M. hupehensis*
- CC. Styles 4 or 5, calyx-lobes obtusish: fr. pyriform, small.....7. *M. Halliana*
- Lvs. folded in Nos. 8, 13 and 16).
- Lvs. folded in Nos. 8, 13 and 16).
- A. Calyx deciduous .....
- B. Styles villous at base.
- C. Calyx and pedicels glabrous or slightly pubescent.....Ser. 3. SIEBOLDIANAE Rehd.
- D. Lvs. never lobed, cuneate: fls. intense carmine in bud; styles usually 4, connate to the middle .....8. *M. floribunda*
- DD. Lvs. at least those at end of shoots lobed, usually rounded at base: fl.-buds white or pink; styles connate at base.
- E. Petals cuneate at base, often pink.
- F. Lvs. of flowering brts. entire or nearly so, only upper lvs. of shoots slightly lobed; sepals longer than tube.....9. *M. Zumi*
- FF. Lvs. all serrate: lvs. of shoots lobed; sepals as long as tube.....10. *M. Sieboldii*
- EE. Petals suborbicular, rounded at base: low shrub with spreading brs. 11. *M. Sargentii*
- DD. Calyx and pedicels tomentose: lvs. always lobed; styles 5. Ser. 4. FLORENTINAE Rehd. 12. *M. florentina*
- BB. Styles glabrous .....
- C. Fr. without grit-cells, not dotted: styles 3-4. Ser. 5. KANSUENSES Rehd.
- D. Lvs. undivided or partly 3-lobed.....13. *M. fusca*
- DD. Lvs. deeply lobed, sometimes undivided.....14. *M. toringoides*
- CC. Fr. with grit-cells, dotted; styles 3: lvs. 3-5-lobed.....15. *M. kansuensis*
- AA. Calyx persistent; styles 5.
- B. Fr. with a cup-shaped cavity at apex and apex of core not free, 1-1.5 cm. across, dotted, with grit-cells: lvs. not or slightly lobed: styles glabrous or nearly so. Ser. 6. YUNNANENSES Rehd.
- C. Lvs. glabrous or slightly pubescent beneath, not lobed.....16. *M. Prattii*
- CC. Lvs. tomentose beneath, often slightly lobed.....17. *M. yunnanensis*
- BB. Fr. with apex of core free and pointed; styles villous at base.
- C. Fr. without grit-cells, usually depressed, with impressed calyx; pedicels slender; fls. white, flushed pink.....Sect. III. CHLOROMELES (Dene.) Rehd.
- D. Lvs. ovate to elliptic, not or only slightly lobed on vigorous shoots: fr. about 5 cm. across .....18. *M. platycarpa*
- DD. Lvs. at least those of shoots lobed: fr. smaller.
- E. Calyx glabrous or sometimes villous: lvs. usually glabrous and rather thin.
- F. Lvs. acute or acuminate, serrate or doubly serrate.
- G. Lvs. glaucous beneath, even those of flowering brts. slightly lobed, ovate to triangular-ovate: calyx thinly villous.....19. *M. glaucescens*
- GG. Lvs. green beneath; those of flowering brts. usually undivided, ovate to oblong-ovate.
- H. Lvs. of flowering brts. ovate to oblong-ovate.....20. *M. coronaria*
- HH. Lvs. of flowering brts. ovate-lanceolate to oblong-lanceolate. 21. *M. lancifolia*
- FF. Lvs. of flowering brts. obtuse or acutish, crenate-serrate, cuneate at base, usually oblong. ....22. *M. angustifolia*

- EE. Calyx tomentose; lvs. tomentose beneath, those of shoots thickish and strongly veined ..... 23. *M. ioensis*  
 CC. Fr. with grit-cells, the calyx not impressed; fls. pure white; calyx tomentose.  
 D. Lvs. deeply lobed; fls. 6-8, slender-stalked; fr. 1.5 cm. across.

## Sect. IV. ERILOBUS (DC.) Schneid.

24. *M. trilobata*

- DD. Lvs. not or slightly lobed; fls. 2-5; styles villous below: fr. about 3 cm. across.

## Sect. V. DOCYNIOPSIS Schneid.

25. *M. Tschonoskii*

1. *M. pumila* Mill. COMMON A. Tree to 15 m., with short trunk and round head; buds pubescent; young brts. tomentose; lvs. broad-elliptic to elliptic or ovate, 4.5-10 cm. long and 3-5.5 cm. broad, usually broad-cuneate, acute or acutish, crenate-serrate, pubescent on both sides at first, later glabrate above; petioles pubescent, rather stout, 1.5-3 cm. long; fls. white, suffused with pink; pedicels 1-2.5 cm. long, like the calyx tomentose; styles usually pubescent to the middle; fr. usually subglobose, 2 cm. across or larger, impressed at apex and at base. H.W.2:76,f.295(b),t.51(c). R.I.25:t.112(c). S.E.t.390(c). (*M. communis* DC., *M. Malus* Britt., *M. dasyphylla* Borkh., *Pyrus Malus* L., partly.) Eu., W. Asia. Cult. since ancient times. Zone III. —This species is the parent of most of our cult. Apples, though some probably are the offspring of hybrids with *M. sylvestris*, *M. prunifolia* and also *M. baccata*.—*M. p. apétala* (Muenchh.) Schneid., f. Fls. small, with deformed greenish petals, without stamens and with 10-15 styles; fr. open at the top. B.C.5:2870,2871. R.H.1935:369. (*M. dasyphylla dioica* Zabel, *Pyrus apétala* Muenchh., *P. dioica* Moench.) Cult. 1770.—*M. p. translúcens* (Hartwig) Schneid., f. Fls. double, pink in bud, changing to white. (*M. p. var. plena* Bean.) Cult. 1811.—*M. p. péndula* (Zab.) Schneid., f. With pendulous brs. ("Elise Rathke.")—*M. p. paradisiaca* Schneid., var. Shrubby form. (*M. p. Med.*)—*M. p. Niedzwetzkyana* (Dieck) Schneid., var. Young lvs., fls., fr. including the flesh, and bark and wood of the brs. red. B.M.7975(c). R.H.1906:232,t(c). F.R.2:344,t(c). S.L.231(h). (*M. N.* Dieck, *Pyrus N.* Hemsl.) S. W. Siber., Turkest. Intr. about 1891.

*M. p. × prunifolia* = *M. astracánica* Dum.Cours. Differing chiefly in the more sharply and coarsely serrate lvs. and in the longer-stalked usually bright red and bloomy fr. (*Pyrus Malus* var. *a.* Loud., *P. a.* DC.) Orig. before 1800.—*M. p. × spectabilis*; see under No. 3.—*M. p. × baccata*; see under No. 5.—*M. p. × fusca*; see under No. 13.—*M. p. × coronaria*; see under No. 20.—*M. p. × ioensis*; see under No. 23.—*M. p. Niedzwetzkyana × atrosanguinea* = *M. purpurea* (Barbier) Rehd. Young lvs. and brts. purple; lvs. smaller, lustrous, on shoots occasionally slightly lobed; pedicels longer; petals oblong; styles often 4; fr. smaller, with sometimes deciduous calyx. G.C.62:221. (*M. floribunda p.* Barbier.) Orig. before 1900.—*M. p. Eleyi* (Bean) Rehd., var. Lvs. elliptic or ovate, reddish when unfolding, pubescent beneath, with purple midrib; fls. vinous-red, about 3 cm. across; petals ovate; fr. conic-ovoid, about 2.5 cm. long, deep purple-red, on slender stalks about 3 cm. long. G.C.72:214;104:243,t(c). Gn.88:81;91:760. B.S.3:321,t. (*M. E.* Hesse, *Pyrus E.* Bean.) Orig. before 1920.—*M. p. aldenhamensis* (Gibbs) Rehd., var. Lvs. ovate to elliptic or ovate-oblong, pubescent beneath on veins or nearly glabrous and reticulate-veined, with purple midrib; fls. vinous-red, semidouble, 2.5-3 cm. across; calyx glabrous or slightly tomentose outside; sepals ovate to lance-ovate; fr. subglobose, deep purple-red, with persistent calyx. R.H.1926:279,t(c). (*Pyrus Malus a.* Gibbs.) Cult. 1922.—*M. p. Lemoinei* (Lemoine) Rehd., f. Lvs. purple; fls. dark crimson. G.C.83:349. (*M. floribunda* L. Lemoine.) Cult. 1922.—For other hybrids of *M. p. Niedzwetzkyana* see *M. adstringens* under No. 5, *M. Scheideckeri* under No. 8, and *M. Soulardii* under No. 23.

Closely related species: *M. sylvestris* Mill. differing chiefly in the nearly glabrous or slightly pubescent lvs., the glabrous pedicels and glabrous or slightly villous calyx; styles usually glabrous. R.I.25:t.111(c). S.E.3:t.389(c). (*M. acerba* Mérat, *Pyrus Malus* var. *s. L.*) Eu. Rarely cult.

2. *M. prunifolia* (Willd.) Borkh. Small tree; young brts. pubescent; lvs. ovate or elliptic, 5-10 cm. long, acute or short-acuminate, rounded or cuneate

at base, sharply serrate, pubescent on the veins beneath, finally glabrous; petioles slender, 1.5-5 cm. long; fls. white, about 3 cm. across; pedicels 2-3.5 cm. long, like the calyx glabrous or sometimes villous; fr. subglobose or ovoid, about 2 cm. across, yellow or red, with a cavity at base, calyx not impressed, the sepals connate at base into a short tube. B.M.6158(c). (*Pyrus p.* Willd.) N. E. Asia. Intr. about 1750. Zone III. Cult. in E. Asia for its fr., particularly the var. As an ornamental tree chiefly valued for its bright red or yellow fr. produced in great abundance and persisting a long time on the tree.—*M. p. Rinki* (Koidz.) Rehd., var. Lvs. pubescent beneath: fls. pinkish; calyx villous; pedicels usually shorter. B.M.8265(c). N.K.6:t.14. B.S.2:291. B.C.5:2873. (*M. Ringo* Carr., *M. yezoensis* Koidz., *M. Matsumurana* Koidz., *M. asiatica* Nakai, *Pyrus p.* var. *R.* Bailey.) E. Asia. Intr. about 1850.—*M. p. fastigiata* Rehd., f. A form of the preceding var. with ascending brs. forming a columnar head; pedicels 8-16 mm. long. Orig. 1908.—*M. p. pendula* (Bean) Rehd., f. Brs. pendulous. Zone IV.

*M. p.* × *pumila*; see under No. 1.—*M. p.* × *baccata*; see under No. 5.—*M. p.* × *floribunda*; see under No. 8.—*M. p.* × *Sieboldii*; see under No. 10.

3. *M. spectabilis* (Ait.) Borkh. Tree to 8 m., of upright habit; young brts. sparingly pubescent, later red-brown: lvs. elliptic to elliptic-oblong, 5-8 cm. long, short-acuminate, cuneate, appressed-serrate, lustrous and glabrous above, pubescent beneath when young, finally nearly glabrous, subchartaceous; petioles 1-3 cm. long, pubescent: fls. deep rose-red in bud, fading to blush, 4-5 cm. across, semidouble or sometimes single; pedicels 2-3 cm. long, like the calyx glabrous or slightly villous; sepals triangular-ovate, shorter than tube: fr. subglobose, about 2 cm. across, yellowish, without cavity at base and stalk usually thickened at apex, sour. W.D.1:50(c). B.C.5:2873 (fr.). W.D.50(c, form with single fls.). B.M.267(c). L.B.1729(c). G.F.1:272. Gn.59:209(h). M.G.14:455(h). (*Pyrus s.* Ait.) Intr. before 1780 from China; not known wild. Zone IV.—*M. s. Rivérsii* (Booth) Nash. With larger and broader lvs. and larger double pink fls. F.P.1872:25,t.(c). Gn.84:387. (*Pyrus s. R.* Booth, *P. s. roseo-plena* T. Moore.)—*M. s. albi-plena* Schelle, f. Fls. double, white.

*M. s.* × *pumila* = *M. magdeburgensis* Schoch. Lvs. broader, pubescent beneath; pedicels shorter, like the calyx tomentose: fls. semidouble: fr. subglobose, larger. M.G.20:254(h). (*M. herrenkrugensis* Hort., ? *M. Kaido* Dipp.) Orig. before 1900.—*M. s.* × ? *baccata*; see No. 4.

4. × *M. micromalus* Mak. (*M. spectabilis* × ? *baccata*). Small tree of upright habit; young brts. pubescent, soon glabrous: lvs. elliptic-oblong, acuminate, cuneate, 5-10 cm. long and 2-4 cm. broad, serrulate, pubescent beneath when young, finally glabrous, lustrous above, of firm texture; petioles slender, 2-3 cm. long: fls. pink, about 4 cm. across; calyx-tube villous, its lobes glabrescent, ovate to oblong-ovate, as long as tube, acute; pedicels slightly pubescent, 2-3 cm. long: fr. subglobose, 1-1.5 cm. across, red, with cavity at base; calyx persistent or deciduous. Ad.12:t.413(c). N.K.6:t.13. Gn.88:77(h). (*Pyrus m.* Bailey, *M. Kaido* Pardé, not Dipp.) Japan cult. Intr. about 1856. Zone IV. Of upright habit with showy pink fls.

5. *M. baccata* (L.) Borkh. SIBERIAN CRAB. Tree to 14 m., with round head; young brts. glabrous, slender: lvs. elliptic or ovate to ovate-oblong, acuminate, cuneate or rounded at base, 3-8 cm. long, finely serrate, slightly pubescent beneath when young or glabrous; petioles 2-5 cm. long: fls. 3-3.5 cm. across, white; calyx glabrous, its lobes long-acuminate; pedicels slender, 1.5-4 cm. long; styles usually longer than stamens, slightly villous at base: fr.

subglobose, 8–10 mm. across, red or yellow; calyx deciduous. Gt.11,t.364(c). B.S.2:278,t(h). M.G.14:454(h). (*Pyrus baccata* L., *M. b.* var. *sibirica* (Maxim.) Schneid.) N. E. Asia to N. China. Intr. 1784. Zone II. Pyramidal when young, later with round head, with showy white fls. in spring and berry-like red or yellow fr. in fall.—*M. b. gracilis* Rehd., var. Small tree with pendent brs.; lvs. smaller, on longer stalks; fls. smaller. Intr. 1910.—*B. b. mandshurica* (Maxim.) Schneid., var. Lvs. usually broad-elliptic, remotely serrulate, pubescent beneath when young; petioles pubescent: fls. fragrant; pedicels and calyx pubescent; styles scarcely as long as stamens: fr. larger to 1.2 cm. across, often broad-ellipsoid. B.M.6112(c). M.K.t.47(c). Gn.89:61(h, as *M. theifera*). (*M. cerasifera* Spach, *Pyrus cerasifera* Tausch, *Pyrus b.* var. *m.* Maxim.) C. Jap. to Amur Reg. and C. China. Intr. before 1825.—*M. b. Jäckii* Rehd., var. Similar to var. *mandshurica*, but glabrous: fr. red, about 1 cm. across. Korea. Intr. 1905.—*M. b. himalaica* (Maxim.) Schneid., var., with broad-elliptic coarsely serrate lvs. pubescent beneath on the veins. W. Himal., S. W. China. Intr. 1919?—*M. b. columnaris* Rehd., f. Columnar tree with large glabrous lvs. Cult. 1927.

Hybrids of *M. baccata* with *M. prunifolia* and *M. pumila* are cult. under the name "Siberian Crabs."—*M. b.* × *prunifolia* = *M. robusta* (Carr.) Rehd. Lvs. glabrescent or pubescent beneath: fls. slender-stalked, white or pinkish; calyx usually glabrous: fr. subglobose or ellipsoid, red or yellow, slender-stalked, up to 2 cm. across, usually partly with and partly without calyx. Beach, Apples N. Y. 2:264,t(c, as "Red Siberian"). (*M. cerasifera* Schneid., not Spach, *Pyrus cerasifera* Wenzig, not Tausch.) Intr. about 1815. Cult. in numerous forms.—*M. r. erecta* Rehd., f. Brs. ascending, forming a narrow nearly columnar head. Orig. 1905.—Another distinct form is *M. r. persicifolia* Rehd., var. Lvs. oblong-lanceolate, peach-like. Intr. 1910 from N. China.—*M. b.* × *pumila* = *M. adstringens* Zabel. Lvs. pubescent beneath: fls. usually pinkish with rather short villous stalk and villous calyx: fr. usually subglobose, up to 4 or 5 cm. across, rather short-stalked, red, yellow or green, calyx less often deciduous. Beach, Apples N. Y. 2:260,t(c, "Martha"), 266,t(c, "Transcendent"), 256,t(c, "Hyslop"). Gs.4:181,t(c). A great variety of forms is in cult, many of them probably the product of *M. robusta* × *pumila*. A handsome form with large purple-red fls. is "Hopa Crab" (*M. b.* × *pumila* *Niedzwetzkyana*). Orig. 1920.—*M. b.* × *Halliana*; see under No. 7.—*M. b.* × *floribunda*; see under No. 8.—*M. b.* × *Sieboldii*; see No. 9.

Related species: *M. sikkimensis* (Hook. f.) Koehne. Brts. and lvs. beneath tomentose: lvs. ovate to ovate-oblong, 5–7 cm. long, long-acuminate, sharply serrate: fls. pink outside; calyx pubescent: fr. obovoid, 1.5 cm. long, red, dotted. B.M.7430(c). B.S.2:294. (*Pyrus s.* Hook. f.) Himal. Intr. 1849. Zone (V).—*M. Rockii* Rehd. Young brts. villous: lvs. elliptic to elliptic-ovate, to 12 cm. long, mostly rounded at base, pubescent and reticulate beneath: pedicels and calyx villous: fr. ovoid or subglobose, often attenuate at apex, 1–1.5 cm. long; calyx tardily dehiscent. W. China. Intr. 1923?

6. *M. hupehensis* (Pamp.) Rehd. Tree to 8 m., with stiff, spreading brs.; young brts. pubescent, soon glabrous: lvs. ovate to ovate-oblong, 5–10 cm. long, acuminate, sharply serrulate, pubescent on the veins beneath and finally glabrous, of firm texture; petioles 1–3 cm. long: fls. 3–7, white or pinkish, fragrant, 3.5–4 cm. across, on slender pedicels 3–4 cm. long, glabrous or slightly villous; sepals triangular-ovate, acute or acuminate, purplish, glabrous; styles 3 or rarely 4: fr. globose, about 1 cm. across, usually greenish yellow with red cheek. C.C.174. I.S.1:t.32. Gn.89:221(h). (*Pyrus h.* Pamp., *M. theifera* Rehd., *Pyrus th.* Bailey.) China, Assam. Intr. 1900. Zone IV. Floriferous species of distinct habit.—*M. h. rosea* (Rehd.) Rehd., f. Fls. pink.

7. *M. Halliana* Koehne. Tree to 5 m., with rather loose open head; young brts. soon glabrous, purple: lvs. ovate or elliptic to oblong-ovate, 3.5–8 cm. long, acuminate, crenate-serrulate, quite glabrous except the midrib above, dark green and lustrous above and often purple-tinted; petioles 5–20 mm.

long: fls. 4-7, bright rose, 3-3.5 cm. across; pedicels slender, nodding, like the calyx purplish and glabrous; calyx-lobes ovate, obtusish; styles 4-5, the terminal fl. usually without pistil; petals usually more than 5: fr. obovoid, 6-8 mm. across, purplish, ripening very late. S.T.1:t.18. (*Pyrus* H. Voss.) Cult. in Japan and China. Intr. 1863. Zone V. Graceful species with bright rosy fls. on drooping purple pedicels and with the young foliage purplish.—*M. H. Parkmanii* Rehd. Fls. semidouble. Ad.4:t.134(c). G.F.1:152. M.G. 14:457(h). Gn.89:313(h). (*Pyrus* P. Hort.)—*M. H. spontanea* (Mak.) Koidz., var. Lvs. smaller, elliptic or elliptic-obovate: fls. smaller, nearly white; pedicels shorter; styles usually 4. Asami, Crabappl. Jap. t.14,40d. (*M. s.* Mak.) Japan. Intr. 1919. Zone V.

*M. H.* × *Sieboldii* = *M. atrosanguinea* (Spaeth) Schneid. Spreading shrub with nearly glabrous serrate lvs. and rose-purple fls. similar to those of *M. floribunda*, but not fading to white and calyx-lobes shorter, acute. (*Pyrus floribunda* var. *a.* Bean, *P. a.* Spaeth.) Orig. before 1905.—*M. a.* × *pumila Niedzwetzkyana*; see under No. 1.—*M. H.* × *baccata* = *M. Hartwigii* Koehne. Intermediate between the parents: fls. pink, changing to white; pedicels and calyx red. Cult. 1906.

8. *M. floribunda* Sieb. Shrub or tree to 10 m., with wide-spreading brs.; young brts. pubescent, becoming glabrous: lvs. elliptic-ovate or ovate to oblong-ovate, acuminate, usually cuneate, 4-8 cm. long, sharply serrate, on shoots larger and incisely serrate, pubescent beneath or finally nearly glabrous; petioles 1.5-2.5 cm. long: fls. deep carmine in bud, changing to pale pink or finally nearly white, 2.5-3 cm. across; pedicels pubescent, purple, 2.5-3.5 cm. long; calyx pubescent, purple, its lobes acuminate, petals obovate-oblong; styles usually 4: fr. globose, 6-8 mm. across, red. F.S.15:t.1585(c). R.H.1866:311,t(c); 1871:591,t(c). F.E.9:573(h). Gn.83:22(h); 86:538(h). Gn. M.30:22(h). (*Pyrus* f. Kirchn., not Lindl., *P. pulcherrima* Aschers. & Graebn.) Japan? Intr. 1862. Zone IV. One of the handsomest crab-apples with the fls. changing from carmine to white; extremely floriferous.

*M. f.* × *baccata* = *M. arnoldiana* (Rehd.) Sarg. Lvs. larger, ovate: fls. larger, of lighter color: fr. about 1 cm. across, yellow. M.G.24:27(h).28. Gn.M. 30:22(h). (*M. floribunda* var. *a.* Rehd., *Pyrus* f. var. *a.* Bailey.) Orig. before 1883. A very handsome and showy hybrid.—*M. f.* × *prunifolia* = *M. Scheideckeri* (Spaeth) Zab. Small tree of upright habit; young brts. pubescent: lvs. ovate, 5-10 cm. long, sharply and coarsely serrate, pubescent beneath, at least on midrib: fls. pale pink, usually semidouble, 3-3.5 cm. across; pedicels and calyx pubescent: fr. yellow, 1.5 cm. across, with usually persistent calyx. Gt.53:t.1529(c). Gn.17:526,t(c); 86:538(h). G.C.73:185. Gg.6:308(h). (*Pyrus* S. Spaeth, *P. pulcherrima* var. *S.* (Spaeth) Bailey.) Orig. before 1888.—*M. Scheideckeri* × *pumila Niedzwetzkyana* = *M. gloriosa* Lemoine. Young lvs. bronzy-purple: fls. large, purplish rose. Orig. before 1931.

Related species or hybrid: *M. brevipes* (Rehd.) Rehd. Of lower and denser habit: lvs. smaller, more closely serrate with shorter spreading teeth: fls. nearly white, on glabrous pedicels about 1 cm. long; petals oval: fr. subglobose, about 1 cm. across, slightly ribbed, not pulpy at maturity, on stiff upright or spreading stalks. (*M. floribunda* var. *b.* Rehd.) Orig. unknown. Cult. 1883. Zone V.

9. × *M. Zumi* (Mats.) Rehd. (*M. baccata mandshurica* × *Sieboldii*). Tree of pyramidal habit; young brts. slightly pubescent: lvs. ovate to ovate-oblong or oblong, acuminate, 4-9 cm. long, those of flowering brts. entire or crenate-serrulate, of shoots serrate or occasionally slightly lobed, pubescent beneath when young, becoming glabrous: fls. pink in bud, becoming white, 2.5-3 cm. across; calyx slightly villous outside, its lobes acuminate; petals elliptic; styles 4-5: fr. about 1.2 cm. across, red. S.T.1:t.91. (*Pyrus* Z. Mats., *M. Sieboldii* var. *Z.* Asami.) Japan. Intr. 1892. Zone V. Similar to *M. Sieboldii* var. *arborescens*, but of more upright habit and lvs. scarcely lobed.—*M. Z. calocarpa* (Rehd.) Rehd., var. Habit spreading; only smaller lvs.

of flowering brts. entire, those of shoots more deeply lobed: fls. somewhat smaller; styles 3-4. (*M. Sieboldii* var. *c.* Rehd.) Japan. Intr. 1905.

10. *M. Sieboldii* (Reg.) Rehd. TORINGO CRAB. Shrub with spreading brs.; young brts. pubescent: lvs. ovate or elliptic, acuminate, 2.5-6 cm. long, sharply serrate, those of shoots broad-ovate, coarsely serrate and partly 3- or sometimes 5-lobed, pubescent on both sides, later glabrous or glabrescent above; petioles pubescent, 6-18 mm. long; fls. pink or deep rose in bud, finally nearly white, about 2 cm. across; pedicels 2-2.5 cm. long, like the calyx pubescent; petals obovate-oblong; styles 3-4: fr. globose, 6-8 mm. across, red or brownish yellow. R.H.1870:451,t(c); 1881:296. M.G.14:456(h). N.K. 6:t.10. S.L.235(h). (*Pyrus Sieboldii* Reg., *M. Toringo* Nakai, *Pyrus Toringo* Sieb.) Japan (the cult. dwarf mountain form). Intr. 1856.—*M. S. arborés-cens* Rehd. Tree to 10 m.: lvs. larger, less deeply lobed and less pubescent; fls. often nearly white. W.A.38,t(h). Japan, Korea (the wild form). Intr. 1892. Zone V. Graceful and handsome tree showy in bloom.

*M. S. × prunifolia* = *M. sublobata* (Zab.) Rehd. Tree, usually pyramidal; young brts. tomentose; lvs. narrow-elliptic to elliptic-oblong, those of shoots broader, partly with 2 or only 1 short lobe, tomentose when young, pubescent beneath at maturity, 3.5-8 cm. long: fls. bluish; pedicels and calyx villous; styles 4-5, rarely 3: fr. subglobose, 1.5-2 cm. across, yellow, usually with calyx, sometimes without. Gs.4:181,t(c). Orig. or intr. from Japan about 1892.—*M. S. × Halliana*; see under No. 7.

11. *M. Sargentii* Rehd. Low shrub to 2 m., with horizontally spreading brs., often spinescent; young brts. tomentose: lvs. ovate, acuminate, rounded or subcordate at base, acuminate, 5-8 cm. long, sharply serrate, villous when young, finally nearly glabrous, those of shoots usually broad-ovate, mostly 3-lobed; petioles 2-3 cm. long, pubescent: fls. pure white, 2.5 cm. across; pedicels 2-3 cm. long, like the calyx glabrous; petals oval, broad at base, overlapping; styles usually 4 (3-5): fr. subglobose, about 1 cm. across, dark red, slightly bloomy. B.M.8757(c). S.T.1:t.36. G.C.57:291; 58:308; 98:363, t(h). Gn.M.30:22(h). S.L.235(h). (*M. Sieboldii* var. *S.* (Rehd.) Asami, *Pyrus S.* Bean.) Japan. Intr. 1892. Zone V. Low shrub of distinct habit, with abundant white fls. and attractive fr.; the lvs. turning orange and yellow in autumn.

12. *M. florentina* (Zuccagni) Schneid. Small round-headed tree with upright brs.: young brts. villous: lvs. broad-ovate, usually truncate at base, 3-6 cm. long, all incisely lobed and serrate with several lobes on each side, tomentose beneath; petioles 1-2.5 cm. long, pubescent: fls. 6-8, white, 1.5-2 cm. across; pedicels 2-3 cm. long, villous; calyx tomentose; stamens 30; styles 5: fr. broad-ellipsoid, 1-1.2 cm. long, red. B.M.7423(c). G.C.59:7. (*Pyrus f.* Targ., *P. crataegifolia* Savi.) Italy. Cult. 1877. Zone V. Handsome small tree; the lvs. turning orange and scarlet.

13. *M. fúscá* (Raf.) Schneid. Shrub or small tree to 12 m.; young brts. pubescent: lvs. ovate to oblong-lanceolate, acute or acuminate, 3-10 cm. long, sharply serrate, often 3-lobed; pubescent on both sides, later glabrous above; petioles 2-3.5 cm. long, pubescent: fls. 6-12, white or pinkish, 2-2.5 cm. across; pedicels slender, like the calyx pubescent; styles 3-4: fr. ellipsoid, about 1.5 cm. long, red or yellow. B.M.8798(c). S.S.4:t.170. (*Pyrus f.* Raf., *P. rivularis* Dougl., *P. diversifolia* Bong.) Alaska to Calif. Intr. 1836. Zone V. Of little ornamental value.—*M. f. levipes* (Nutt.) Schneid., var. Pedicels and calyx glabrous or nearly so.

*M. f. × pumila* = *M. Dawsoniana* Rehd. Lvs. elliptic to elliptic-oblong, 4-9 cm. long, not lobed: fls. slender-stalked, with 3-5 glabrous styles: fr. elliptic-

oblong, 2.5–3 cm. long, yellow, with small calyx. S.T.2:t.111. G.C.74:377. Orig. 1881. Zone V.

14. *M. toringoides* (Rehd.) Hughes. Shrub or small tree to 8 m.; brts. slightly villous at first, soon glabrous: lvs. ovate to elliptic-oblong, 3–8 cm. long, with usually 2 pairs of crenate-serrate or appressed-serrate lobes, occasionally undivided and lanceolate-oblong to lanceolate, at maturity pubescent only on the veins beneath: fls. 2–2.5 cm. across, 3–6 in subsessile umbels; pedicels to 2 cm. long, slightly villous; calyx tomentulose, its lobes narrow-triangular; petals orbicular-obovate, hairy above; styles 4–5, rarely 3, glabrous: fr. globose-obovoid or obovoid-ellipsoid, 1–1.2 cm. long, yellow, usually with red cheek. B.M.8948(c). G.C.73:89. K.B.1920:207. W.A.102,t. (*M. transitoria* var. *t.* Rehd.) W. China. Intr. 1904. Zone V. In fr. one of the handsomest of the crab-apples.

Closely related species: *M. transitoria* (Batal.) Schneid. Smaller and slenderer; young brts. tomentulose: lvs. 2–3 cm. long, more deeply lobed, with narrower lobes and more pubescent: fls. 1.5–2 cm. across; sepals shorter; petals broad-oblong: fr. 6–8 mm. long. Gn.86:585. K.B.1920:207. (*Pyrus t.* Batal.) N. W. China. Intr. 1911. Zone V. Less handsome than the preceding species.

15. *M. kansuensis* (Batal.) Schneid. Small tree to 8 m.; young brts. pubescent: lvs. ovate, truncate, rounded or broad-cuneate at base, 5–8 cm. long, 3- or sometimes 5-lobed, with triangular-ovate acute closely and partly doubly serrate lobes, pubescent beneath, at least on the veins; petioles 1.5–4 cm. long: fls. 4–10, white, 1.5 cm. across; pedicels 1.5–2.5 cm. long, like the calyx villous, sepals narrowly triangular-ovate, acuminate, as long as tube; styles 3, glabrous: fr. ellipsoid, about 1 cm. long, yellow or red. S.H.1:f. 403d-d', 404d-e. (*Pyrus k.* Batal.) N. W. China. Intr. 1904. Zone V.—*M. k. calva* Rehd., f. Lvs. beneath, calyx and pedicels glabrous, even when young.

Related species: *M. honanensis* Rehd. Lvs. broad-ovate, rarely oblong-ovate, with 2–5 pairs of broad-ovate serrulate lobes, pubescent beneath: infl. glabrous; styles 3–4: fr. subglobose, about 8 mm. across, dotted. N. E. China. Intr. 1921. Zone V.

16. *M. Práttii* (Hemsl.) Schneid. Tree to 10 m.; young brts. pubescent at first, soon glabrous: lvs. ovate or elliptic to ovate-oblong, acuminate, usually rounded at base, 6–15 cm. long, and 3.5–7.5 cm. broad, finely and doubly serrate, with callous-pointed teeth and with 8–10 pairs of veins sparingly pubescent beneath; petioles 1.5–3 cm. long: fls. white, 2 cm. across, in many-fl. clusters; pedicels 1.5–3 cm. long, pubescent or glabrous like the calyx; petals suborbicular; styles 5, glabrous: fr. globose-ovoid or subglobose, 1–1.5 cm. across, red or yellow, punctate, on stout stalks; calyx persistent. (*Pyrus P.* Hemsl.) C. & W. China. Intr. 1909. Zone V.

17. *M. yunnanensis* (Franch.) Schneid. Tree to 10 m.; young brts. tomentose: lvs. ovate to oblong-ovate, rounded or subcordate at base, short-acuminate, 6–12 cm. long, sharply and doubly serrate, partly with 3–5 pairs of broad short lobes and partly or mostly without, tomentose beneath; petioles 2–3.5 cm. long, tomentose: infl. many-fl., 4–5 cm. across, rather dense; fls. white, 1.5 cm. across; pedicels 1–2 cm. long, like the calyx tomentose or villous; sepals triangular-ovate, acuminate, about as long as tube; petals suborbicular; styles 5, nearly glabrous: fr. subglobose, 1–1.5 cm. across, red, punctate; calyx reflexed. G.M.56:897. S.H.1:403e-g, 404b-c. G.C.78:227. (*Pyrus y.* Franch.) W. China. Intr. 1908. Zone V. The lvs. turning orange and scarlet in fall.—*M. y. Veitchii* (Veitch) Rehd., var. Lvs. cordate, ovate, all distinctly lobulate with short acuminate lobes, finally glabrescent beneath: fr. bright red, white-dotted. B.M.8629(c). (*Pyrus V.* Veitch, *P. yunnanensis* Bean, in part.) C. China. Intr. 1901.

18. *M. platycarpa* Rehd. Tree to 6 m. with spreading unarmed brs.; young brts. thinly tomentose, becoming glabrous: lvs. ovate to elliptic, rounded at base and at apex, but with short acute point, sharply and usually doubly serrate, those of shoots usually broad-ovate with several pairs of short triangular lobes and pubescent on veins beneath: fls. 3-4 cm. across; pedicels and calyx glabrous: fr. depressed-globose, deeply impressed at ends, about 5 cm. across. S.T.2:t.189. S.M.384. (*Pyrus p.* Bailey.) N. C. to Ga. Intr. 1912. Zone V. Fr. used for preserves.—*M. p.* Hoopèsii Rehd., var. Lvs. slightly or not lobed: calyx and pedicels pubescent. Intr. 1876.

19. *M. glaucescens* Rehd. Shrub or small tree, with sometimes spiny brs. forming a broad twiggy head; brts. glabrous or glabrescent: lvs. broad-ovate or triangular-ovate, acute or short-acuminate, truncate or subcordate, 5-8 cm. long, with short triangular lobes; those of shoots more deeply lobed, thinly tomentose when young, quite glabrous at maturity, dark green above, glaucous beneath; petioles slender, soon glabrous: fls. about 3.5-4 cm. across; pedicels glabrous; calyx thinly villous or sometimes glabrous; styles slightly shorter than stamens: fr. depressed-globose, 3-4 cm. across, yellow and waxy, fragrant. S.T.2:t.157. B.C.5:2876,2877. S.M.381. Ad.10:t.348(c). (*Pyrus g.* (Rehd.) Bailey.) N. Y. to N. C. and Ala. Cult. 1902. Zone V. Lvs. turning yellow and dark purple in autumn.

Related species: *M. glabrata* Rehd. with the lowest pair of veins springing directly from the cordate base, glabrous and purplish when young, green beneath, calyx glabrous and purplish; style longer than stamens. S.T.2:t.188. S.M.380. (*Pyrus g.* Bailey.) N. C. to Ala. Intr. 1912.

20. *M. coronaria* (L.) Mill. Tree to 10 m.; brts. tomentose at first: lvs. ovate to ovate-oblong, acute, usually rounded at base, 5-10 cm. long, irregularly serrate and usually slightly lobed, those of shoots with short broad lobes, floccose-tomentose when young, finally glabrous, green beneath, or those at end of shoots pubescent on the veins, rather thin: fls. 3-4 cm. across; pedicels glabrous: fr. depressed-globose, about 3 cm. across, ribbed at apex, greenish. B.M.2009(c). B.R.651(c). S.S.4:t.167. Gn.29:395;34:206. S.L. 233(h). (*M. fragrans* Rehd., *Pyrus c.* L.) N. Y. to Ala., w. to Mo. Intr. 1724. Zone IV.—*M. c. elongata* Rehd., var. Lvs. narrowly triangular-ovate or oblong-ovate, more deeply lobed and incisely serrate, sometimes cuneate. N. Y. to N. C. and Ala. Intr. 1912.—*M. c. dasycalyx* Rehd., var. Lvs. paler beneath, those of shoots sometimes pubescent on the veins: calyx villous. Ont. to Ohio and Ind. Intr. 1920.—*M. c. Charlottae* Rehd., f. A form of the preceding var. with semidouble large fls. Intr. about 1900.—*M. c. Nieuwlandiana* Slavin, f. Similar to *f. Charlottae*, but fls. brighter; pedicels 3-5.5 cm. long: fr. 4-5 cm. across.

*M. c.* × *pumila* = *M. heterophylla* Spach. Here belongs "Matthew's Crab" and some forms cult. as *M. Soulardii*. Differs from *M. Soulardii* chiefly in the broader less pubescent lvs. and slightly pubescent pedicels.

Related species: *M. bracteata* Rehd. Lvs. less lobed, on flowering brts. elliptic-ovate to oblong, abruptly acute or obtusish, sparingly serrate or sometimes entire, on shoots slightly lobed, pubescent when young, soon glabrous, green or pale beneath. S.M.387. (*Pyrus b.* Bailey.) Mo. to Ga. and Ala. Intr. 1912. Zone V.

21. *M. lancifolia* Rehd. Tree to 8 m., with spreading often spiny brs.; young brts. slightly pubescent or nearly glabrous: lvs. ovate-lanceolate to oblong-lanceolate, acute or acuminate, rounded or broad-cuneate, 4-8 cm. long, those of flowering brts. finely or sometimes coarsely serrate, those of shoots oblong-ovate, incisely serrate and slightly lobed, pubescent when young, glabrous at maturity and rather thin: fls. 3-3.5 cm. across; pedicels

and calyx glabrous: fr. subglobose, about 2.5 cm. across, green and waxy. S.T.2:t.158. S.M.385. B.C.5:2876. (*Pyrus l.* Bailey.) Pa. to Va. and Mo. Intr. 1912. Zone V.

22. *M. angustifolia* (Ait.) Michx. Shrub or tree to 10 m., with slender brs.; brts. glabrous or slightly pubescent at first: lvs. ovate-oblong, oblong or lance-oblong, obtuse or acutish, usually broad-cuneate, 3-7 cm. long, coarsely crenate-serrate or sometimes nearly entire, rarely more sharply serrate, glabrous and light green beneath, usually turning brown in drying, those of shoots broader, coarsely serrate and often lobed, usually slightly tomentose below, subcoriaceous at maturity and under favorable conditions half-evergreen: fls. 2.5 cm. across; pedicels and calyx glabrous or sometimes slightly villous; style villous only at base: fr. subglobose or sometimes higher than broad, 1.5-2.5 cm. across. B.R.1207(c). L.D.3:154(c). S.S.4:t.169. (*M. coronaria* Brit., not Mill., *M. sempervirens* Desf., *Pyrus a.* Ait.) Va. to Fla. and Miss. Intr. 1750. Zone (V).—*M. a. péndula* Rehd., f. With slender pendulous brs.

23. *M. ioënsis* (Wood) Brit. Tree to 10 m.; brts. tomentose: lvs. ovate-oblong or elliptic-obovate, acute or short-acuminate, broad-cuneate or rounded, 5-10 cm. long, coarsely or incisely serrate or shallowly lobed, tomentose beneath, sometimes glabrescent at maturity except the veins, those of shoots more deeply lobed, at maturity of firm texture with strong veins; petioles stout, tomentose: fls. about 4 cm. across; pedicels stout, 2-3.5 cm. long, like the calyx tomentose: fr. subglobose or broad-ellipsoid, 2.5-3 cm. across sometimes angular, greenish, waxy. B.M.8488(c). S.S.4:t.168. (*Pyrus i.* Bailey, *M. coronaria* var. *i.* Schneid.) Minn. and Wisc. to Neb., Kans. and Mo. Intr. 1885. Zone II. The double-flowered form is often cult. as an ornamental tree and is very handsome in bloom.—*M. i. plèna* (Schneid.) Rehd., f. "BECHTEL'S CRAB." With double fls. G.C.III.25:397;65:229. B.A. 1931:31. R.H.1910:60,t.(c). (*Pyrus angustifolia fl. pleno* Hort., *P. angustifolia Bechtelii* Hort.) Orig. before 1840, intr. 1888.—*M. i. fimbriata* Slavin, f. Lvs. narrower: fls. double, with fimbriate petals.—*M. i. Palmeri* Rehd., var. Shrub or small tree to 6 m.: lvs. smaller, oblong, usually obtuse or obtusish, thinly pubescent, those of flowering shoots usually crenate-serrate. Mo. Intr. 1910.—*M. i. texana* Rehd., var. Similar to the preceding: lvs. smaller and much broader, not or only slightly lobed and densely villous. Texas. Intr. ?

*M. i. × pumila* = *M. Soulardii* (Bailey) Brit. Lvs. broad-ovate to elliptic-ovate, often obtuse at apex, irregularly crenate-serrate, occasionally slightly lobed, thickish and rugose, densely pubescent beneath: fls. on short and stout tomentose pedicels: fr. depressed-globose, often 5 cm. across or more, yellow and often with reddish cheek. Proc. Iowa Acad. Sci. 7:130,t. B.C.5:2871. B.A. 1934:50. (*Pyrus s.* Bailey.) Orig. before 1868. Occasionally wild from Minn. to Tex.—A form with red-purple fls. and red young lvs. is "Red Tip Crab" (*M. i. × pumila Niedzwetzkyana*).

24. *M. trilobata* (Poir.) Schneid. Shrub or tree to 6 m., of upright habit; young brts. pubescent: lvs. deeply 3-lobed and serrulate, 5-8 cm. long, the middle lobe with one or two smaller lobes on each side, the lateral lobes usually with a basal lobe, pubescent beneath when young, later nearly glabrous and light green, lustrous and bright green above; petioles slender, 3-7 cm. long: fls. 6-8, white, 3.5 cm. across; pedicels about 2 cm. long, villous; calyx tomentose; sepals lanceolate, longer than tube: fr. ellipsoid, red. G.C. 72:341. B.M.9305(c). (*Pyrus t.* DC., *Eriolobus t.* Roem.) W. Asia. Cult. 1877. Zone V.

25. **M. Tschonoskii** (Maxim.) Schneid. Tree to 12 m.: brts. tomentose: lvs. elliptic-ovate to ovate-oblong, acuminate, rounded or subcordate at base, 7-12 cm. long, irregularly serrate or doubly serrate, sometimes slightly lobulate, tomentose when young, finally glabrous above, thinly tomentose beneath; petioles 2-3 cm. long: fls. white, 3 cm. across; pedicels 2-2.5 cm. long, tomentose like the calyx; sepals triangular-ovate, shorter than tube: fr. globose, 2-3 cm. across, yellowish green with purple cheek. B.M.8179(c). S.T.1:t.37. (*Pyrus T.* Maxim., *Eriolobus T.* Rehd.) Japan. Intr. 1892. Zone V. Tree of pyramidal habit; the lvs. turning orange and scarlet in fall.

27. **DOCYNIA** Dcne. Evergreen or half-evergreen trees: lvs. entire or serrate, sometimes slightly lobed, stipulate: fls. short-stalked, 2-5 in umbels, before or with the lvs.; calyx densely tomentose, with lanceolate lobes; stamens 30-50; styles 5, connate at base, villous; ovary 5-celled, each cell with 3-10 ovules: fr. subglobose to ovoid or pyriform, 2-3 cm. across; calyx persistent. (Anagram of Cydonia.) Five species in China, Himal. and Annam.

**D. ruffolia** (Lévl.) Rehd. Half-evergreen or nearly deciduous tree: lvs. elliptic to oblong-lanceolate, acute or acuminate, rarely abruptly acuminate, broad-cuneate or nearly rounded at base, 5-8 cm. long, 2-4 cm. broad, serrate or serrulate toward the apex or entire, lustrous above, green and thinly pubescent or glabrescent at maturity beneath, chartaceous; petioles 5-20 mm. long: fls. about 2.5 cm. across, nearly sessile; stamens about 30; fr. subglobose or ellipsoid, 2-3 cm. across. S.L.165(h, as *D. Delavayi*). (*D. docynioides* (Schneid.) Rehd., *Malus docynioides* Schneid.) S. W. China. Intr. 1903. Zone VII.

The closely related *D. Delavayi* (Franch.) Schneid. differs chiefly in its evergreen entire lvs. white-tomentose beneath. R.H.1918:133. (*Pyrus D.* Franch., *Eriolobus D.* Schneid., *Cydonia D.* Cardot.) S. W. China. Cult. 1890. Zone VII?

28. **CHAENOMÈLES** Lindl. Deciduous or half-evergreen shrubs or small trees, with sometimes spiny brs.; buds small, with about 2 outer scales: lvs. short petioled, serrate or crenate, stipulate, of firm texture: fls. solitary or fascicled, before or after the lvs., sometimes partly staminate; calyx lobes 5, entire or serrulate; petals 5, large; stamens 20 or more; styles 5, connate at base; ovary 5-celled, each cell with many ovules: fr. a large, many-seeded pome; seeds brown. (Greek *chainein*, to split and *meles*, apple; the fruit was supposed by Thunberg to split into 5 valves.) Including *Pseudocydonia* Schneid. Three species in E. Asia.

A. Fls. in leafless clusters, before or with the lvs.: calyx-lobes upright, entire; stipules large ..... Sect. I. **EUCHAENOMÈLES** Schneid.

B. Lvs. sharply serrate, acute: brts. smooth ..... 1. *C. lagenaria*

BB. Lvs. coarsely crenate-serrate, acutish or obtuse: brts. scabrous ..... 2. *C. japonica*

AA. Fls. solitary on leafy shoots; calyx-lobes serrulate, reflexed: stipules small.

Sect. II. **PSEUDOCYDONIA** Schneid.

3. *C. sinensis*

1. **C. lagenaria** (Loisel.) Koidz. JAPAN QUINCE. Shrub to 2 m. with spreading spiny glabrous brs.: lvs. ovate to oblong, acute, 3-8 cm. long, sharply serrate, lustrous above, glabrous: fls. 3.5-5 cm. across, scarlet-red in the type, varying to pink and white; style usually glabrous: fr. globose to ovoid, 3-7 cm. high, yellow or yellowish green, fragrant. FL.III-IV; fr.x. L.B. 1594(c). G.O.t.70(c). G.C.34:434. R.H.1876:330,t.(fr). Gn.40:126,t.(c);71:262(h). (*Pyrus japonica* Sims, not Thunb., *Cydonia Japonica* Pers., *Cydonia lagenaria* Loisel.) China, cult. in Japan. Intr. before 1800. Zone IV. Much

planted for its early conspicuous fls. and the dark green lustrous and long persisting lvs.; sometimes used for hedges.—Many garden forms with fls. varying from dark scarlet to pink and white and some with double or semi-double fls. are in cult.—*C. l. cathayensis* (Hemsl.) Rehd., var. Shrub to 3 m.: lvs. elliptic-lanceolate to lanceolate, finely and sharply serrate, 3–11 cm. long and 1–3.5 cm. broad, pubescent on the midrib beneath when young: styles usually villous at base: fr. ovoid or conic-ovoid. H.I.2657–8. R.H. 1924:64(fr). (*C. c.* Schneid., *Cydonia c.* Hemsl.) C. China. Intr. before 1900. Zone VI.—*C. l. Wilsonii* Rehd., var. Shrub to 6 m.: lvs. fulvous-tomentose beneath: fls. salmon-pink: fr. ovoid, 10–15 cm. long. G.C.66:21, 22(h). J.L.41:f.122(h). W. China. Intr. 1910. Zone VI.

2. *C. japonica* (Thunb.) Lindl. Low shrub to 1 m.; brs. spiny, with short scabrous tomentum when young, verruculose the second year: lvs. broad-ovate to obovate, obtuse or acutish, 3–5 cm. long, coarsely crenate-serrate, glabrous: fls. brick-red, 2.5–3.5 cm. across: fr. subglobose, about 3 cm. across, yellow. Fl. III–IV; fr. X. B.M.6780(c). G.C.34:435. R.H.1875:195,t(c). (*Pyrus j.* Thunb., *P. Maulei* Mast., *Cydonia Maulei* T. Moore, *C. Maulei* Schneid.) Japan. Cult. 1874. Zone IV.—*C. j. tricolor* (Parsons) Rehd., var. Lvs. variegated with pink and white.—*C. j. alpina* Maxim., var. Dwarf shrub with procumbent stems and ascending brts.; lvs. orbicular-oval, 1–2.5 cm. long. R.H.1911:204,t(c). (*C. Maulei* var. *a.* Schneid., *Cydonia Sargentii* Lemoine.)

*C. j. × lagenaria* = *C. superba* (Frahm) Rehd. It differs from *C. japonica* in the larger, but comparatively narrower, more sharply serrate lvs., and in the larger fls. of deep blood-red color; from *C. lagenaria* in the pubescent brts. when young, slightly verruculose the second year, in the smaller, generally obovate-oblong lvs., the smaller fascicled ones usually crenate-serrate, and in the lower habit with more upright brs. (*Cydonia Maulei s.* Frahm.)—*C. s. alba* (Froebel) Rehd., f., has white fls., *C. s. rosea* (Froebel) Rehd., f. (*Cydonia Maulei grandiflora rosea* Froebel) has light rose-colored fls. and *C. s. perfecta* (Froebel) Rehd., f. (*Cydonia M. grandiflora perfecta* Froebel) has scarlet fl. with usually 6–8 petals and larger and broader lvs.

3. *C. sinensis* (Thouin) Koehne. Shrub or small tree; trunk with flaky bark; brts. spineless, villous when young: lvs. elliptic-ovate or elliptic-oblong, acute at ends, 5–8 cm. long, sharply and finely serrate, villous beneath while young; stipules lanceolate, glandular-ciliate: fls. 2.5–3 cm. across, light pink: fr. oblong, 10–15 cm. long, dark yellow, woody. Fl. V; fr. X. B.M.7988(c). B.R. 905(c). R.H.1889:228,t(c). U. S. Inv. 55:t.5(h). (*Cydonia s.* Thouin, *Pseudocydonia s.* Schneid.) China. Intr. about 1800. Zone (V). Lvs. turning scarlet in autumn.

29. **CYDONIA** Mill. Deciduous unarmed shrub or small tree; buds small, pubescent, with few scales: lvs. petioled, entire, stipulate: fls. white or light pink, terminal, solitary at the end of leafy shoots; sepals 5, entire, reflexed; petals 5, obovate; stamens 20; styles 5, free, pubescent below; ovary inferior, 5-celled, each cell with numerous ovules: fr. a many-seeded pome. (Greek Cydon, now Canea in Crete.) One species from Persia to Turkestan.

*C. oblonga* Mill. QUINCE. Shrub or tree to 8 m.; young brts. tomentose: lvs. ovate to oblong, acute, rounded or subcordate at base, 5–10 cm. long, dull green above, densely villous below; petioles 1–1.8 cm. long, tomentose; fls. 4–5 cm. across; pedicels and calyx tomentose; fr. pear-shaped, fragrant, yellow, villous. Fl. V; fr. X. G.H.t.81(c). N.D.4:t.36(c). F.D.25:t.2532(c). Gn.33:491. (*C. vulgaris* Pers., *Pyrus C. L.*) C. Asia. Cult. since ancient times. Zone IV. Grown chiefly for its fr. which is used for preserves; the

lvs. turn yellow late in fall.—*C. o. marmorata* (Dipp.) Schneid., f. Lvs. yellow and white variegated.—*C. o. pyriformis* (Kirchn.) Rehd., var. This is the typical form with pear-shaped fr.—*C. o. maliformis* (Mill.) Schneid., var. Fr. apple-shaped.—*C. o. lusitânica* (Mill.) Schneid., var. Fr. pear-shaped and ribbed: lvs. large; a more vigorous form.—*C. o. pyramidalis* (Dipp.) Schneid., var. Of pyramidal habit.

*C. o.* × *Pyrus communis* = *Pyronia Veitchii*; see below.—*C. o.* × *Malus* reported to have been obtained by I. V. Michurin.

× **PYRONIA** Veitch. Hybrids between *Cydonia* and *Pyrus*, known in several forms intermediate between the parents and representing sexual hybrids and graft-hybrids. Syn. *Pirocydonia* Hans Winkl.

**P. Daniëli** (Winkl.) Rehd. (*Cydonia oblonga* + *Pyrus communis*, graft-hybrid.) Similar to *Cydonia*: lvs. ovate, 4–6 cm. long, rounded at base, irregularly serrate with setose teeth, less pubescent, involute in bud. Rev. Gén. Bot. 16:7,f.5,6. B.D.1925:63,t.f.4. Orig. 1902.—**P. D. Winkleri** (Daniel) Rehd., var. Lvs. elliptic-ovate, 1–4.5 cm. long, acuminate, broad-cuneate, more pubescent, conduplicate in bud. R.H.1914:28,29. B.D.1925:63,t.f.5. (*Pirocydonia Winkleri* Daniel.) Orig. 1913.

**P. Veitchii** (Trabut) Guillaumin. (*C. oblonga* × *P. communis*.) Lvs. elliptic, 5–6 cm. long, acute at ends, entire, pubescent when young; petiole 1.5–2 cm. long: fls. 3 at end of brts., short-stalked, 5 cm. across; sepals glandular-dentate; stamens 20; anthers violet; ovules 6 in each cell: fr. ellipsoid, 7–8 cm. long. Jour. Hered. 7:417,418. (*P. V.* var. *John Seden* Guillaumin.) Orig. before 1913.—**P. V. luxemburgiâna** Guillaumin. Lvs. about 9 cm. long, acute or obtuse, rounded at base: fls. 3.5 cm. across; ovules 4–6 in each cell: fr. pear-shaped. B.D.1925:65,t. Orig. before 1913.

**30. PYRUS L. PEAR.** Deciduous, rarely half-evergreen trees or rarely shrubs, sometimes thorny; lvs. serrate or entire, rarely lobed, involute in bud, petiolate, stipulate; buds with imbricate scales: fls. with or before the lvs., in umbel-like racemes, white, rarely pinkish; sepals usually reflexed or spreading; petals clawed, suborbicular to broad-oblong; stamens 20–30; anthers usually red; styles 2–5, free, closely constricted at base by the disk; ovules 2 in each locule: fr. a usually pyriform pome; flesh with copious grit-cells; walls of locules cartilaginous; seeds black or nearly black. (Ancient Latin name of the pear tree; spelled *Pirus* in classical Latin.) About 20 species from Eu. to E. Asia, south to N. Afr., Persia and Himal.—Fruit- and ornamental trees with conspicuous white fls. with or just before the lvs. which usually turn red or scarlet in autumn.

Fr. with persistent calyx.

- A. Lvs. entire or crenate-serrulate, undivided.
  - B. Lvs. usually oblong and obtusish, papillose beneath, entire or slightly crenulate toward the apex, glabrescent.....1. *P. amygdaliformis*
  - BB. Lvs. not papillose beneath.
  - C. Lvs. entire, cuneate, usually pubescent beneath.
  - D. Lvs. linear-lanceolate to lanceolate, lustrous above.....2. *P. salicifolia*
  - DD. Lvs. broader.
  - E. Lvs. lanceolate to narrow-elliptic.....3. *P. elaeagnifolia*
  - EE. Lvs. elliptic to obovate.....4. *P. nivalis*
  - CC. Lvs. crenate-serrulate all around, orbicular-ovate to oblong-ovate.....5. *P. communis*
  - AA. Lvs. at least partly pinnatifid.....6. *P. Regelia*
  - AAA. Lvs. setosely serrate, generally ovate, glabrous.....7. *P. ussuriensis*
- Fr. with deciduous or partly deciduous calyx, brown (yellow in No. 8).
- A. Lvs. dentate or sharply serrate.
  - B. Lvs. sharply serrate or serrulate, often with appressed teeth; 6–12 cm. long.
  - C. Fr. yellow: lvs. broad-cuneate at base; styles 4.....8. *P. Bretschneideri*
  - CC. Fr. brown: lvs. usually rounded or subcordate.
  - D. Styles 5: lvs. setosely serrate or with appressed acuminate teeth.....9. *P. pyrifolia*

DD. Styles 3-4; calyx occasionally partly persistent: lvs. serrulate with acute teeth.

10. *P. serrulata*

BB. Lvs. dentate-serrate with more or less spreading teeth: styles 2-4.

c. Lvs. glabrous, 6-10 cm. long: styles 3-4, rarely 2: fr. subglobose or pyriform, 1.5-2.5 cm. long.....11. *P. phaeocarpa*

cc. Lvs. pubescent, 4-7.5 cm. long: styles 2 or 3: fr. subglobose, about 1 cm. diam.

12. *P. betulaeifolia*

AA. Lvs. crenate or crenulate-serrulate.

B. Lvs. crenate-serrulate, orbicular-ovate to ovate, about 5 cm. long; styles 5.

13. *P. longipes*

BB. Lvs. crenate.

c. Styles 3-5; stamens 25-30: lvs. ovate to oblong.....14. *P. Pashia*

cc. Styles 2-3; stamens 20: lvs. orbicular-ovate to oblong-ovate.....15. *P. Calleryana*

1. *P. amygdalifórmis* Vill. Shrub or small tree to 6 m., with spreading sometimes thorny brs.; young brts. slightly villous, soon glabrous, lustrous, brown: lvs. oval to obovate or oblong, acutish or obtuse, cuneate or sometimes rounded at base, 2.5-7 cm. long, slightly crenate or entire, slightly tomentose when young, soon glabrous and lustrous above, glabrescent and glaucescent beneath, thickish; petioles slender, 1-3 cm. long: infl. 8-12-fld., grayish tomentose, rarely calyx glabrous outside; fls. 2-2.5 cm. across: fr. subglobose, 2-3 cm. across, yellowish brown, on a stout stalk about as long as fr. B.R.1484 (c, as *P. nivalis*). H.W.3:77. B.S.2:273. Decne., Jard. Fruit. 1:t.13. (*P. parviflora* Desf., *P. Boveana* Decne.) S. Eu., W. Asia. Intr. 1810. Zone V.—*P. a. lobata* (Decne.) Koehne., var. Lvs. small, usually with few round lobes. S.H.1:f.361h(1). (*P. collivaga* Velen., *P. a. var. heterophylla* Dipp.)—*P. a. cuneifolia* (Guss.) Bean, var. Lvs. smaller and narrower, attenuate at base. Gussone, Pl. Rar. t.39. (*P. c. Guss.*, ? *P. pyramus* Raf.)—*P. a. oblongifolia* (Spach) Bean, var. Lvs. oval to oblong, obtuse, rounded at base: fr. larger. Decne., Jard. Fruit. 1:t.14. S.H.1:f.361g. (*P. o. Spach.*)—*P. a. persica* (Pers.) Bornm., var. Lvs. oblong, 3-7 cm. long, slightly crenulate: fr. slightly depressed-globose, 3 cm. diam., on a stalk 2 cm. long. Decne., Jard. Fruit. 1:t.15. S.L.321(h). (*P. p. Pers.*, *P. sinaica* Dum.-Cours.) W. Asia. Intr. before 1810.

*P. a. × nivalis* = *P. Michauxii* Bosc. Lvs. ornate or elliptic-oblong, obtuse or abruptly pointed, 3-7 cm. long, entire, villous-tomentose when young, later glabrous and lustrous above, pubescent or glabrous beneath: infl. dense, tomentose: fr. globose or turbinate, greenish yellow. Decne., Jard. Fruit. 1:t.16. Cult. before 1816.

2. *P. salicifolia* Pall. Tree to 8 m., with slender more or less pendulous brs.; brts. densely villous the first year: lvs. narrow-lanceolate, attenuate at ends, 3-9 cm. long, 7-20 mm. wide, entire, white-tomentose when young, later glabrous and lustrous above; petioles 3-15 mm. long: infl. tomentose, dense, many-fld.; fls. 2 cm. across; pedicels about 1 cm. long: fr. pear-shaped, 2-3 cm. long, short-stalked. L.B.1120(c). B.R.514(c). G.O.125(c). Decne., Jard. Fruit. 1:t.12. S.L.284. S. E. Eu., W. Asia. Intr. 1780. Zone IV.

*P. s. × nivalis*; see under No. 4.

Related species: *P. glabra* Boiss. Young brts. villous at first: lvs. narrow-lanceolate, 4-10 cm. long, sometimes obscurely crenulate, glabrous from the very first; petiole 8-35 mm. long; styles 3-4: fr. subglobose, small. Decne., Jard. Fruit. 1:t.11. S.H.1:f.360a-a<sup>2</sup>, 361a. Persia. Cult. ?

3. *P. elaeagnifolia* Pall. Small tree, usually thorny; young brts. tomentose: lvs. lanceolate to obovate-lanceolate or narrow-elliptic, obtusish or short-acuminate, cuneate, 4-7 cm. long, 1.2-2.5 cm. broad, entire, grayish or whitish tomentose on both sides, often glabrescent above; petioles 1-4 cm. long: infl. white-tomentose; fls. 2.5-3 cm. across; pedicels 1-2 cm. long: fr. globose-turbinate or subglobose, 2-2.5 cm. across, green, short-stalked. Decne., Jard. Fruit. 1:t.17. (*P. nivalis* var. *e. Schneid.*) Asia Minor. Intr. 1800. Zone IV.—*P. e. Kotschyana* (Decne.) Boiss., var. Usually thornless:

lvs. broader, 6-9 cm. long. Decne., Jard. Fruit. 1:t.18. G.C.98:405(h). (*P. nivalis* var. *K.* Schneid.) Asia Minor.

4. *P. nivalis* Jacq. SNOW P. Thornless tree, to 16 m.: young brts. tomentose: lvs. elliptic to obovate, acute, cuneate, 5-8 cm. long, 2-4 cm. broad, entire, white-tomentose when young, finally glabrous above; petioles 1-3 cm. long: infl. white-tomentose: fls. 2-3 cm. across: fr. subglobose, to 5 cm. across, yellowish green; stalk as long or longer than fr. G.H.t.77(c). H.C.t.79(c). Decne., Jard. Fruit. 1:t.21. S. Eu. Cult. 1800. Zone V.—*P. n. austriaca* (Kern.) Schneid., var. Lvs. elliptic, glabrescent. (*P. a.* Kern.)

*P. n.* × *salicifolia* = *P. canescens* Spach. Lvs. lanceolate to narrow-elliptic, crenate-serrulate toward the apex, lustrous above at maturity: fr. pale green, short-stalked. Decne., Jard. Fruit. 1:t.19. Orig. before 1830.—*P. n.* × *communis* = *P. salicifolia* DC. Lvs. elliptic to ovate, acute to acuminate, broad-cuneate or nearly rounded at base, usually crenulate, pubescent when young, finally glabrescent, long-petioled: infl. glabrescent: fr. pyriform, long-stalked. G.O.127(c). B.R.1482. S.H.1:f.361(l). Cult. before 1800.—*P. n.* × *amygdaliformis*; see under No. 1.

5. *P. communis* L. COMMON P. Broad-pyramidal tree to 15, rarely to 20 m.; sometimes spiny; young brts. glabrous or slightly pubescent: lvs. orbicular-ovate to elliptic, acute or short-acuminate, subcordate to broad-cuneate, 2-8 cm. long, crenate-serrulate, glabrous or villous when young; petioles slender, 1.5-5 cm. long: infl. villous or nearly glabrous; pedicels 1.5-3 cm. long; fls. about 3 cm. across: fr. turbinate or subglobose, on slender stalk to 5 cm. long. S.E.3:t.488. H.W.3:76(h);t.50(c). M.A.t.42(h). G.W. 16:368(h). Eu., W. Asia. Long cult. and often escaped and naturalized. Zone IV.—*P. c.* Pyraster L., var. Usually thorny: fls. 2-2.5 cm. across: fr. 1.5-2 cm. across. (*P. P.* Borkh., *P. c.* var. *achras* Wallr.)—*P. c. cordata* (Desv.) Schneid., var. Lvs. suborbicular to ovate, subcordate, 2-3 cm. across: fls. smaller: fr. about 1.5 cm. across. Decne., Jard. Fruit. 1:t.3. Jour. Bot. 14:t. 180. (*P. c.* Desv., *P. com.* var. *Briggsii* Syme.)—*P. c. sativa* DC., var. Thornless tree: lvs. larger: fls. 2.5-3.5 cm. across: fr. large and juicy. Used as a collective name for the cult. varieties which, however, may be partly hybrids.—*P. c. sabauda* Decne., var., is possibly a hybrid with *P. amygdaliformis*.

*P. c.* × *nivalis*; see under No. 4.—*P. c.* × *pyrifolia*; see under No. 9.—*P. c.* × *Crataegus Oxyacantha* = *Pyrocrataegus Willei*; see p. 372.—*P. c.* × *Sorbus Aria* = *Sorbopyrus auricularis*; see p. 382.—*P. c.* × *Cydonia oblonga* = *Pyronia Veitchii*; see p. 401.

Related species: *P. Balansae* Dene. Lvs. ovate to oblong-ovate, long-acuminate, rounded at base, 5-10 cm. long, entire or crenate, sharply serrulate on young plants: fr. turbinate, about 2.5 cm. across, long-stalked. Decne., Jard. Fruit. 1:t.6. S.H.1:f.361p(l). W. Asia. Intr. 1866. Zone V?—*P. syriaca* Boiss. Small tree, often thorny: lvs. oblong to oblong-lanceolate, 2-5, rarely to 10 cm. long, crenate-serrulate, glabrous or nearly so; petioles 2-5 cm. long: infl. tomentose: fr. pyriform, 3-3.5 cm. across. Decne., Jard. Fruit. 1:t.9. S.H.1:f.361o, 362e-f. M.D.1924:t.22(h). W. Asia, Cyprus. Intr. before 1874. Zone V?—*P. Korshinskyi* Litv. Tree; young brts. tomentose: lvs. oblong-lanceolate to ovate-oblong, acuminate, 5-8 cm. long, crenate-serrulate, villous-tomentose when young; petioles 1.5-3 cm. long: infl. villous; pedicels 2-3 cm. long; disk pubescent; style villous at base: fr. subglobose, 2 cm. across, on a stout stalk. S.H.1:f.359a-b. (*P. bucharica* Litv.) Turkest. Intr. 1890. Zone V.

6. *P. Regéliei* Rehd. Shrub or tree to 10 m.; brts. glabrous or slightly pubescent at first, purple-brown the second year: lvs. very variable, ovate to ovate-oblong, rounded at base, partly undivided and crenate-serrulate, partly pinnatifid or lobed, 2-6 cm. long, with 5-7, usually narrow serrulate lobes, tomentose when young, soon glabrous; petioles 2-6 cm. long: infl. villous, few-fl.; fls. 2-2.5 cm. across; pedicels 1-1.5 cm. long: fr. pyriform or depressed-subglobose, 2-3 cm. across. B.S.2:284. G.C.III.7:115. S.H.1:f.

359e-f, 361b. (*P. heterophylla* Reg. & Schmalh., not Pott, nor Steud.) Turkestan. Intr. 1891. Zone V.

7. *P. ussuriensis* Maxim. Tree; brts. glabrous or nearly so, yellow-gray to purple brown the 2d year, older brs. usually yellow-gray or yellowish brown; lvs. orbicular-ovate to ovate, acuminate, rounded or subcordate at base, 5-10 cm. long, setosely serrate, glabrous or nearly so; petiole 2-5 cm. long; infl. dense, hemispherical, glabrous, pedicels 1-2 cm. long; fls. 3-3.5 cm. across; petals obovate, gradually narrowed toward the base; styles pilose near base; fr. subglobose, short-stalked, greenish yellow, 3-4 cm. across. R.H. 1872:28. B.C.5:2868. N.K.6:t.19. Gt.10:t.345. U.S.Im.131:213,214(h). Gn.M.31:263(h). (*P. Simonii* Carr., *P. sinensis* Dcne., not Lindl., nor Poir.) N. E. Asia. Intr. 1855. Zone IV.—*P. u. ovoidea* (Rehd.) Rehd., var. With spreading brs.; brts. brown: lvs. ovate to oblong-ovate: fr. ovoid to subglobose or ellipsoid; pedicels longer. N.K.6:t.17. B.C.5:2868. M.G.31:102. (*P. o.* Rehd., *P. Simonii* Hort., not Carr.) N. China, Korea. Intr. about 1865. Zone V.—*P. u. hondoensis* (Kikuchi & Nakai) Rehd., var. Lvs. ovate to ovate-oblong, with finer more appressed and less aristate serration, at first like the young brts. often with ferruginous floccose tomentum: pedicels longer. (*P. h.* Kikuchi & Nak.) C. Japan. Intr. 1917. Zone V?

Related species: *P. Lindleyi* Rehd. Lvs. serrate or denticulate, ovate, abruptly acuminate: fr. broad-ellipsoid, long-stalked, with persistent calyx. B.R.1248(c). M.G.31:111(1). (*P. sinensis* Lindl., not Poir.) China. Intr. 1820.

8. *P. Bretschneideri* Rehd. Tree; brts. glabrous or nearly so, purple-brown the 2d year: lvs. ovate or elliptic-ovate, acuminate, broad-cuneate, rarely rounded, 5-11 cm. long, sharply serrate with acuminate setose teeth usually slightly appressed, floccose at first, soon glabrous; petioles 2.5-7 cm. long; infl. sparingly floccose at first, soon glabrous; pedicels 1.5-3 cm. long; fls. 2.5-3 cm. across: fr. globose-ovoid or subglobose, 2.5-3 cm. long, yellow; flesh soft and juicy; pedicels 3-4 cm. long. Hedrick, Pears N. Y. 74,t(c). M.G.31:103. N. China. Intr. 1882. Zone V.

9. *P. pyrifolia* (Burm.) Nakai. SAND P. Tree; brts. glabrous or floccose while young, purplish brown or dark brown the 2d year: lvs. ovate-oblong, rarely ovate, long-acuminate, rounded or rarely subcordate at base, 7-12 cm. long, sharply setose-serrate with usually slightly appressed teeth, glabrous or slightly floccose while young; petioles 3-4.5 cm. long; infl. glabrous or floccose at first; fls. 3-3.5 cm. across, pedicels 3.5-5 cm. long; sepals long-acuminate, almost twice as long as tube; petals ovate; styles 5, rarely 4, glabrous: fr. subglobose, about 3 cm. across, brown with pale dots; flesh rather hard. N.K.6:t.23. B.C.5:2868. M.G.31:104. (*P. serotina* Rehd., *P. sinensis* auth., not Lindl. nor Poir., *P. montana* Nak.) C. and W. China. Intr. 1909. Zone V.—*P. p. stapfiana* (Rehd.) Rehd., f. With pyriform fr. B.M.8226(c). China. Cult. 1875.—*P. p. culta* (Mak.) Nakai, var. Lvs. larger and broader, to 15 cm. long: fr. larger, apple- or pear-shaped, brown or yellow. R.H.1879:170,t(c); 1880:110,t(c). (*P. montana* var. *Rehderi* Nak.) Cult. in China and Japan. Intr. before 1850 to Am. Here belong most of the forms known as Chinese or Japanese pears.

*P. p. × communis* = *P. Lecontei* Rehd. With serrulate or crenate-serrulate lvs. and yellow fr. with persistent calyx. Here belong Kieffer, LeConte, etc. B.C. 5:f.2809,2810. Hedrick, Pears N. Y. 180,187,tt(c). Orig. before 1850.

10. *P. serrulata* Rehd. Tree; brts. woolly when young, soon glabrous, purple-brown the 2d year: lvs. ovate to ovate-oblong, abruptly or gradually acuminate, broad-cuneate or rounded at base, 5-11 cm. long, serrulate with

acute not setose teeth, floccose beneath at first, soon glabrous; petioles 3.5-7 cm. long: infl. slightly woolly; fls. 2.5 cm. across; pedicels 1.5-2 cm. long; sepals acute or acuminate, about as long as tube; styles 3-4, rarely 5: fr. subglobose, 1.5-1.8 cm. long, brown, with pale dots; calyx sometimes partly or wholly persistent. M.G.31:112. C. China. Intr. 1917. Zone V.

11. *P. phaeocarpa* Rehd. Tree; young brts. tomentose, glabrous and purple-brown the 2d year: lvs. elliptic-ovate to oblong-ovate, long-acuminate, usually broad-cuneate, 6-10 cm. long, dentate-serrate, with spreading teeth, loosely villous at first, soon quite glabrous; petioles 2-6 cm. long: infl. woolly, rarely nearly glabrous; pedicels 2-2.5 cm. long; fls. about 3 cm. broad; styles 3-4, rarely 2; fr. pyriform, 2-2.5 cm. long, brown with pale dots, soon becoming soft. B.C.5:f.3282. M.G.31:112. Monatschr. Ver. Gart. Preuss. 22:t.4(fr.). N. China. Intr. 1870. Zone V.—*P. p. globosa* Rehd., f. Lvs. often ovate and rounded at base: fr. subglobose, 1.5-2 cm. across. Intr. 1882.

12. *P. betulaeifolia* Bge. Tree to 10 m.; young brts. tomentose until the 2d year: lvs. rhombic- to oblong-ovate, acuminate, broad-cuneate, 5-8 cm. long, sharply and rather coarsely serrate, finally bright green and lustrous above, tomentose beneath or finally glabrescent; petioles tomentose, 2-3 cm. long: infl. tomentose, 8-10-fld.; fls. 1.5-2 cm. across; pedicels 2-2.5 cm. long; styles 2-3: fr. subglobose, 1-1.5 cm. across, brown, dotted. G.F.7:225. Hedrick, Pears N. Y. 80,t(c). R.H.1879:318,319. Gng.6:309(h). N. China. Intr. about 1865. Zone IV. Brs. spreading and slightly pendulous.

13. *P. longipes* Coss. & Dur. Small tree with few thorns: lvs. ovate to orbicular-ovate, short-acuminate or obtusish, rounded at base, about 5 cm. long, crenate-serrulate, floccose beneath at first, soon glabrous; petioles slender, 1-3.5 cm. long: infl. floccose-tomentose, soon glabrous; fls. about 3 cm. across; pedicels slender: fr. globose, about 1.5 cm. across, brown, dotted, on slender stalks about 3 cm. long. Decne., Jard. Fruit. 1:t.4. S.H.1:f.365f. (*P. communis* var. *l.* Henry.) Algeria. Intr. before 1875. Zone VII.

Closely related species: *P. Boissieri* Boiss. & Buhse. Lvs. ovate, rounded or subcordate, 2-3.5 cm. long; petioles usually longer than limb. S.H.1:f.363g, 364b. Persia. Intr. ?—Both species are probably closely related to *P. communis*, but differ in the deciduous calyx of the small fr.

14. *P. Pashia* D. Don. Tree to 12 m., mostly spiny; young brts. woolly, later glabrous: lvs. ovate to oblong-ovate or oblong, acuminate, usually rounded at base, 6-12 cm. long, crenate or crenate-serrulate, on young plants or suckers often lobed and sharply serrate, tomentose while young, finally glabrous or nearly so; petioles 1.5-4 cm. long: infl. tomentose; fls. 2-2.5 cm. across; pedicels short; calyx-lobes triangular, acute; stamens 25-30; styles 3-5: fr. subglobose, about 2 cm. across, brown; pedicels 2-3 cm. long. Decne., Jard. Fruit. 1:t.7. Collett, Fl. Siml. f.47. S.H.1:f.363h,364e-g. M.G.31:113. (*P. variolosa* Wall.) Himal., W. China. Intr. 1908. Zone V.—*P. P. kumaoni* Stapf, var. Lvs. and infl. glabrous or nearly so; calyx-lobes ovate, often obtuse. B.M.8256(c). B.S.2:290. Himal. Intr. 1825. Zone VI?

15. *P. Calleryana* Dene. Tree: brts. glabrous; winter-buds finely pubescent: lvs. broad-ovate to ovate, rarely elliptic-ovate, short-acuminate, rounded or broad-cuneate at base, 4-8 cm. long, crenate, usually quite glabrous; petioles 2-4 cm. long: infl. glabrous; fls. 2-2.5 cm. across; pedicels 1.5-3 cm. long; stamens 20; styles 2, rarely 3: fr. globular, about 1 cm. across, slender-stalked, brown, dotted. N.K.6:t.25. M.I.4:t.242. S.H.1:363p,364q-s. M.G.31:113. U.S.Im.160:t.243(h). China. Intr. 1908. Zone V.—*P. C. graciliflora* Rehd., f. Brts. tomentose toward the apex: fls. smaller; pedicels slender; anthers pink.—*P. C. tomentella* Rehd., f. Brts. densely tomentose,

glabrous the 2d year: lvs. floccose at first, later glabrous except the midrib; those of shoots often serrulate: infl. villous.—This and the preceding form intr. with the type.—*P. C. dimorphophylla* (Mak.) Koidz., var. Smaller lvs. 3–5 cm. long and mostly orbicular-ovate, rounded or subcordate at base, those at end of shoots ovate-lanceolate, on young plants deeply 3–5-lobed. Japan. Intr. 1918.—*P. C. Fauriei* (Schneid.) Rehd., var. Often shrubby and spiny; smaller in every part: lvs. 2.5–5 cm. long, often elliptic-ovate and broad-cuneate at base. N.K.6:t.24. (*P. F. Schneid.*) Korea. Intr. 1918. Zone V.

Subfam. III. ROSOMEAE Focke. Herbaceous or woody plants usually shrubby, rarely trees: lvs. often compound, stipulate, sometimes evergreen: infl. variable: carpels distinct, usually numerous, forming a head on a torus, rarely solitary; style often lateral: fr. never dehiscent.

31. *NEVIÛSIA* Gray. Deciduous shrub: lvs. alternate, petioled, doubly serrate, stipulate: fls. perfect, apetalous, solitary or in cymes; calyx-tube flattish; sepals 5, petaloid, serrate, persistent, spreading; stamens numerous, longer than sepals; carpels 2–4, with slender styles shorter than stamens, becoming drupe-like achenes. (After its discoverer, Reuben Denton Nevius; 1827–1913.) One species in Alabama.

*N. alabamensis* Gray. Upright shrub, 1–2 m. high: brts. terete: lvs. ovate to ovate-oblong, acute or acuminate, 3–7 cm. long, doubly serrate, those of shoots slightly lobed, nearly glabrous: fls. 3–8, rarely solitary, about 2.5 cm. across; pedicels 1.5–2 cm. long. B.M.6806(c). G.C.35:229;41:41. S.L.239(h). G.M.53:315. Fl.vi–vii. Intr. about 1860. Zone V. Cult. chiefly for its white feathery fls.

32. *KÉRRIA* DC. Deciduous shrub; buds small, with several scales: lvs. alternate, doubly serrate, stipulate: fls. yellow, solitary, perfect; sepals short, entire, calyx-tube flattish; petals 5; stamens numerous, half as long as petals; carpels 5–8, becoming dry achenes. (After William Kerr of Kew; d. 1814.) One species in China.

*K. japónica* (L.) DC. Shrub to 1.5 or 2 m.; brts. green, striped, glabrous: lvs. oblong-ovate, acuminate, 2–5 cm. long, doubly serrate, bright green and glabrous above, paler and slightly pubescent below; petioles 5–15 mm. long: fls. terminal on lateral brts., 3–4.5 cm. across; petals oval; stamens about half as long as petals; styles about as long as stamens: achenes brownish black. S.Z.1:t.98(c). B.R.1873(c). R.H.1869:293. F.E.9:593. A.G.18:425. (*Rubus japonicus* L.) C. & W. China; cult. in Japan. Intr. 1834. Zone IV. Planted for its bright green foliage and showy yellow fls. in spring; conspicuous in winter by its green brs.—*K. j. aureo-vittata* Hartw. & Ruempl., var. Brts. striped green and yellow. (*K. j. var. vittato-ramosa* Zab., var. *ramulis variegatis aureis* Hort.) Intr. before 1864.—*K. j. picta* Sieb., var. Lvs. edged white. I.H.9:336(c). F.M.5:296(c). (*K. j. var. variegata* T. Moore, var. *argenteo-variegata* Wyman.) Intr. 1844.—*K. j. aureo-variegata* Rehd., var. Lvs. edged yellow. (*K. j. var. aurea variegata* Bean.)—*K. j. pleniflora* Witte., var. Fls. double. B.M.1296(c). G.M.5:210. G.Z.9:48. Intr. 1805.

33. *RHODÓTYPOS* Sieb. & Zucc. Deciduous shrub; buds with several imbricate scales: lvs. opposite, short-petioled, doubly serrate, stipulate: fls. solitary, white; calyx-tube flattish; sepals 4, ovate, serrate, with 4 alternate small bracts at base; petals 4, suborbicular; stamens numerous; carpels usually 4, developing into black dry drupes surrounded by the large persistent

calyx. (Greek *rhodon*, rose, and *typos*, type; alluding to the resemblance of the fl. to a single rose.) One species in E. Asia.

**R. scandens** (Thunb.) Mak. Upright spreading shrub to 2 m. or in Japan to 5 m.: lvs. ovate to ovate-oblong, acuminate, rounded at base, 4-8 cm. long, sharply and doubly serrate, dark green and glabrous above, lighter green and silky beneath when young; petioles 3-5 mm. long; fls. pure white, 3-5 cm. across; stamens half as long as petals, drupes obliquely short-ellipsoid, about 8 mm. long, shining black. Fl.v-vi; fr.x. B.M.5805(c). S.Z.1:t.99(c). Gt.15: t.505. Gn.43:138. B.C.5:2949. (*R. kerrioides* Sieb. & Zucc., *R. tetrapetala* Mak.) Japan and C. China. Intr. 1866. Zone IV. With showy white fls.; the black fr. conspicuous in winter.

**34. RÚBUS** L. Deciduous or evergreen shrubs or suffrutescent or herbaceous plants, with erect to trailing mostly prickly and usually short-lived stems: lvs. alternate, simple, 3-foliate or pinnately or pedately compound, stipulate: fls. perfect, rarely dioecious, white to pink, in racemes, panicles or corymbs, or solitary, terminal or rarely axillary; calyx 5-parted, rarely 3-7-parted, with persistent lobes; petals 5, sometimes wanting; stamens many; pistils many, sometimes few, on a convex torus; styles nearly terminal; mature carpels usually drupelets, sometimes dry. (Ancient Latin name.) Including *Bossekia* Neck., *Batidea* Greene, *Melanobatus* Greene, *Oreobatus* Rydb. and *Rubacer* Rydb. More than 400 species chiefly in the colder and temp. regions of the n. hemisphere, few in the tropics and the s. hemisphere. Latest monograph by Focke in Biblioth. Bot. parts 72 and 83 (1910-14).—Shrubby or suffrutescent plants cult. for their foliage or handsome fls. or for their edible fr.; the fls. appear in spring or early summer and the frs. ripen in summer and early autumn.

The species of the subgenus *Eubatus* widely distributed in Europe and N. America are exceedingly polymorphous and hybridize readily which makes it almost impossible to define well marked species. In the following enumeration only the most important species are described; for other forms which may be found occasionally in special collections see Rydberg in N. Am. Fl. vol. XXII. 428-480 (1913) for American species and (including also cult. species and varieties) Bailey, Gent. Herb. 1:139-200; 2:271-423, 443-471; 3:119-148, 247-271; il. (1923-34); for European species see: Focke in Ascherson & Graebner, Syn. Mitteleur. Fl. VI. 440-648 (1902), Sudre Rubi Europae with 215 pl. (1908-13) and Rogers, Handb. Brit. Rubi (1900).

#### KEY TO THE SUBGENERA

- a. Stipules broad, often dissected, free: lvs. simple or compound.
  - B. Stipules persistent: lvs. simple; stems unarmed.....I. DALIBARDASTRUM
  - BB. Stipules caducous, often dissected: calyx-tube usually campanulate: stems usually prickly: lvs. simple or compound.....II. MALACHOBATUS
- AA. Stipules lanceolate to filiform, adnate to the petiole.
  - B. Stems unarmed, upright, with flaky bark: lvs. simple, palmately lobed.
    - III. ANOPOLOBATUS
  - BB. Stems prickly, rarely unarmed, usually biennial, upright, arching or trailing: lvs. usually compound.
    - c. Fr. separating from the torus, therefore hollow: lvs. pinnate, ternate or rarely simple.
      - IV. IDAEOBATUS
    - cc. Fr. separating with the torus from the calyx, therefore not hollow: lvs. usually ternate or digitately compound.....V. EUBATUS

#### KEY TO THE SPECIES

- I. DALIBARDASTRUM
  - A. Lvs. ternate .....1. *R. nutans*
  - AA. Lvs. simple, cordate-ovate.....2. *R. tricolor*
- II. MALACHOBATUS
  - A. Lvs. ternate or quinate or partly simple and deeply lobed.
    - B. Stipules and bracts entire or dentate.....3. *R. Henryi*
    - BB. Stipules and bracts fimbriate-pinnate.....4. *R. Playfairianus*

- AA. Lvs. simple.  
 B. Fls. in terminal racemes.  
 c. Infl. glandular ..... 5. *R. hupehensis*  
 cc. Infl. glandless ..... 6. *R. malifolius*  
 BB. Fls. in a compound infl.  
 C. Lvs. not or slightly lobed.  
 D. Lvs. suborbicular or broad-ovate, long-petioled.  
 E. Lvs. reniform, rounded at apex: fls. in terminal clusters and below 1 or 2 axillary fls. .... 7. *R. trenaicus*  
 EE. Lvs. broad-ovate, abruptly acuminate: fls. in a large terminal panicle. .... 8. *R. chroosepalus*  
 DD. Lvs. ovate to lanceolate.  
 E. Infl. terminal, paniculate.  
 F. Lvs. nearly glabrous, deeply cordate. .... 9. *R. ichangensis*  
 FF. Lvs. pubescent or tomentose beneath.  
 G. Petioles 2-5 cm. long; lvs. pilose on the veins beneath. .... 10. *R. Lambertianus*  
 GG. Petioles 1-2.5 cm. long; lvs. tomentose beneath, oblong-lanceolate. .... 11. *R. Parkeri*  
 EE. Infl. fasciculate, in the axils of old lvs. .... 12. *R. flagelliflorus*  
 CC. Lvs. deeply lobed, mallow-like, with obtuse lobes. .... 13. *R. setchuenensis*

### III. ANOPILOBATUS

- A. Lvs. large with acute lobes.  
 B. Lobes broadly triangular: fls. in corymbs.  
 c. Infl. many-fld.; fls. purple. .... 14. *R. odoratus*  
 cc. Infl. few-fld.; fls. white. .... 15. *R. parviflorus*  
 BB. Lobes ovate to oblong-ovate; calyx villous, glandless. .... 16. *R. trifidus*  
 AA. Lvs. 3-8 cm. across, with rounded incised lobes: fls. white, solitary. .... 17. *R. deliciosus*

### IV. IDAEOBATUS

- A. Lvs. simple.  
 B. Fls. solitary; lvs. tomentose beneath (glabrous in var.): petals spreading. .... 18. *R. corchorifolius*  
 BB. Fls. several: lvs. glabrous beneath or pubescent only on the veins.  
 C. Lvs. 5-lobed, green beneath: petals spreading. .... 19. *R. crataegifolius*  
 CC. Lvs. of flowering brts. not lobed, glaucous beneath: fls. usually 3; petals and stamens upright ..... 20. *R. trianthus*  
 AA. Lvs. compound.  
 B. Fls. solitary or few, rarely forming a loose, 2-8-fld. infl.  
 C. Lvs. always ternate, nearly glabrous: fls. solitary. .... 21. *R. spectabilis*  
 CC. Lvs. pinnate, with 3-11 lfts.  
 D. Carpels more than 100 forming an ovoid fr.: fls. solitary or few: lfts. 5-7, lanceolate, firm, pilose only on veins beneath. .... 22. *R. illecebrosus*  
 DD. Carpels 10-60, forming a hemispherical fr.  
 E. Fls. solitary: lfts. 7-9. .... 23. *R. amabilis*  
 EE. Fls. in 2-8-fld. loose infl.: lfts. 3-5; stems white-pruinose.  
 F. Lfts. 3-5; stems glabrous, white-pruinose.  
 G. Styles glabrous; fls. white. .... 24. *R. biflorus*  
 GG. Styles pubescent; fls. reddish, small. .... 25. *R. lastostylus*  
 FF. Lfts. 3; stems pubescent or glabrous. .... 26. *R. stans*  
 BB. Fls. in many-fld. usually dense infl.  
 C. Terminal lft. elongated, pinnately lobed. .... 27. *R. thibetanus*  
 CC. Terminal lft. not elongated, serrate.  
 D. Petals incumbent, adpressed to the stamens.  
 E. Lvs. of flowering brts. 5-7-foliolate. .... 28. *R. coreanus*  
 EE. Lvs. of flowering brts. ternate or occasionally quinate.  
 F. Plant not setose, nor stipitate-glandular.  
 G. Terminal lft. lobed or incised, broad. .... 29. *R. parvifolius*  
 GG. Terminal lft. coarsely serrate, long-acuminate. .... 30. *R. gracilis*  
 FF. Plant densely glandular and setose. .... 31. *R. phoenicolasius*  
 DD. Petals erect or spreading.  
 E. Infl. paniculate, elongated, only at base leafy.  
 F. Lvs. 5-7-foliolate.  
 G. Lfts. white-tomentose beneath; sepals tomentose. .... 32. *R. flosculosus*  
 GG. Lfts. grayish tomentose beneath: sepals pubescent at apex: stems white-pruinose ..... 33. *R. Cockburnianus*  
 FF. Lvs. of flowering brts. ternate, occasionally quinate.  
 G. Lfts. white-tomentose beneath. .... 34. *R. innominatus*  
 GG. Lfts. green and villous beneath: infl. glandular. .... 35. *R. adenophorus*  
 EE. Terminal infl. short, often augmented by lateral infls.  
 F. Infl. loose and corymbose: stems pruinose: plant neither setose nor glandular.  
 G. Prickles of infl. straight, scarcely flattened: lfts. dark green above. .... 36. *R. occidentalis*  
 GG. Prickles of infl. recurved, flattened: lfts. yellowish green above, often 5. .... 37. *R. leucodermis*

- ff. Infl. dense or with lateral brts.  
 g. Lvs. often quinate: infl. consisting of terminal and axillary racemes: fr. tomentulose ..... 33. *R. idaeus*  
 gg. Lvs. all ternate: infl. without or few lateral brts.: fr. glabrous. .... 39. *R. mesogaeus*

V. EUBATUS

- a. Fls. dioecious: lvs. ternate or pinnately quinately ..... 40. *R. ursinus*  
 aa. Fls. unisexual: lvs. ternate or digitately quinately.  
 b. Stems erect or ascending and arching. BLACKBERRIES.  
 c. Lfts. white-tomentose beneath.  
 d. Stem green, with hooked prickles: fls. white..... 41. *R. Linkianus*  
 dd. Stem pruinose, with nearly straight prickles: fls. pink or pinkish. 42. *R. ulmifolius*  
 cc. Lvs. green beneath, pubescent or nearly glabrous.  
 d. Infl. densely glandular with long-stipitate glands; lvs. pubescent beneath. .... 43. *R. allegheniensis*  
 dd. Infl. not or slightly glandular; glands, if present, sessile or short-stipitate.  
 e. Lfts. densely pubescent beneath (slightly so in *R. nessensis* under No. 44).  
 f. Infl. racemose or paniculate.  
 g. Stem with recurved prickles.  
 h. Lfts. not dissected ..... 44. *R. fruticosus*  
 hh. Lfts. dissected ..... 45. *R. laciniatus*  
 gg. Stems with numerous long and straight prickles ..... 46. *R. ostryifolius*  
 ff. Infl. short, corymbose ..... 47. *R. frondosus*  
 ee. Lvs. glabrous beneath or only sparingly pubescent on the veins: infl. racemose. .... 48. *R. canadensis*  
 bb. Stems prostrate, only the flowering brts. upright. DEWEERRIES.  
 c. Stipules filiform: stem prickly or setose, not pruinose.  
 d. Infl. with flattened prickles: lvs. persistent ..... 49. *R. trivialis*  
 dd. Infl. not prickly.  
 e. Stem very bristly ..... 50. *R. hispidus*  
 ee. Stem prickly: the prickles confined to the angles of the stem. 51. *R. flagellaris*  
 cc. Stipules lanceolate: stems pruinose with sparse weak prickles ..... 52. *R. caesius*

Subgen. I. DALIBARDASTRUM Focke. Prostrate unarmed shrubs or subshrubs, bristly; lvs. simple or ternate; stipules broad, free; calyx setose.

1. *R. nūtans* Wall. Evergreen shrub; stems rooting, densely covered with purplish bristles; petioles bristly, 3-5 cm. long: lfts. short-stalked, rhombic or obovate, obtusish, sharply serrate and lobulate, the terminal one 3-6 cm. long, dark green and lustrous above, bristly on the veins beneath: fls. 1-3, white, about 3 cm. across, on slender bristly stalks 3-6 cm. long: fr. globose, dark purple, edible. B.M.5023(c). Himal. Cult. 1860. Zone VII?

2. *R. tricolor* Focke. Deciduous shrub; stems densely clothed with yellow-brown bristles; stipules laciniate: lvs. suborbicular to ovate, short-acuminate, cordate, 6-10 cm. long, irregularly and sharply toothed and sometimes lobulate, dark green above, white-tomentose beneath and bristly on the veins; petioles 2-3.5 cm. long, bristly: fls. white, 2-2.5 cm. across, in short terminal bristly racemes: fr. bright red, edible. Fl.vii-viii: fr.ix. B.M.9534 (c). (*R. polytrichus* Franch., not Progel.) W. China. Intr. 1908. Zone VI?

Related species: *R. Treutleri* Hook. f. Stems villous and bristly; stipules finely dissected: lvs. orbicular-ovate, pubescent on both sides, sometimes tomentose beneath, 5-lobed, middle lobe acuminate: fls. in terminal villous clusters; calyx setose, outer sepals laciniate. Himal., W. China. Cult. 1933. Zone VII?

To the subgen. CHAMAEMORUS belongs *R. Chamaemorus* L. CLOUDBERRY. Herb with creeping root-stock and simple short stems: lvs. simple, long-petioled, reniform, 4-10 cm. across, with 3-5 short rounded crenate-serrate lobes; fls. solitary, 2.5-3 cm. across: fr. orange, edible. B.B.2:276. B.C.3022. Circumpolar, s. to Me. and N. H. Cult. 1789. Zone II.

Subgen. II. MALACHOBATUS Focke. Evergreen or deciduous, creeping or scandent, usually prickly shrubs, rarely herbaceous: lvs. usually simple, often lobed or digitate-compound; stipules free, broad, usually cleft into narrow lobes: infl. racemose or paniculate, rarely few-fl.; fls. small; sepals unequal, erect after anthesis: fr. separating from the torus.

3. *R. Hénryi* Hemsl. Evergreen scandent shrub to 6 m. long; stems tomentose-floccose when young, with few reflexed prickles: lvs. deeply 3-lobed, rarely 5-lobed, rounded at base, 10-15 cm. long, the lobes 2-2.5 cm.

wide, acuminate, remotely serrulate, white-tomentose beneath: fls. pink, nearly 2 cm. across, in terminal and axillary, glandular racemes; sepals caudate: fr. 1-1.5 cm. across, black, lustrous. Fl.vi; fr.viii. H.I.1705. Focke, Sp.Rub.44. M.G.30:7(h). C. and W. China. Intr. 1900. Zone VI?—*R. H. bambusarum* (Focke) Rehd., var. Lvs. ternate; lfts. lanceolate or narrow lanceolate, very short-petiolate, 4-10 cm. long. G.C.42:251. S.L.328(h). (*R. b.* Focke.) C. China. Intr. 1900.

Related species: *R. Andersöni* Hook f. Upright; brts. like petioles minutely prickly; stipules ovate, entire: lfts. 3, rarely 5, elliptic, acuminate, 6-12 cm. long, silky beneath, with 25-35 close parallel veins: infl. terminal, paniculate; calyx setose. Himal. Cult. 1933. Zone VII?

4. *R. Playfairianus* Focke. Half-evergreen sarmentose shrub, stems dark-colored, with small hooked prickles, floccose-tomentose when young: lfts. 3-5, stalked, oblong-lanceolate, acute, rounded at base, serrate, the terminal one 6-14 cm. long, dark green above, gray-tomentose beneath: fls. 1-1.5 cm. across, in small terminal and axillary racemes; calyx densely villous, not glandular: fr. black. Fl.v-vi; fr.vii-viii. G.C.51:165(h),166. (*R. Playfairii* Bean, not Hemsl.) C. and W. China. Intr. 1907. Zone VI?

5. *R. hupehensis* Oliv. Deciduous or half-evergreen shrub; stems dark-colored, thinly floccose-tomentose when young, with few curved spines: lvs. oblong-lanceolate, acuminate, rounded at base, 7-11 cm. long, unequally serrulate, gray-tomentose beneath; petiole about 1 cm. long: fls. rather small in 3-7-fld. very glandular racemes; calyx gray-tomentose: fr. purple-black, austere. Fl.vi; fr.vii-viii. G.C.51:166. H.I.1816. (*R. Swinhoei* Bean, not Hance.) C. China. Intr. 1907. Zone VI?

6. *R. malifolius* Focke. Deciduous prostrate or climbing shrub; stems with short recurved prickles: lvs. elliptic to oblong-elliptic, acuminate, rounded at base, 5-12 cm. long, remotely mucronulate-serrulate, glabrous above, puberulous on the veins beneath; petiole 5-15 mm. long: fls. about 2.5 cm. across, in terminal racemes 5-10 cm. long; calyx tomentose; petals suborbicular: fr. black, of unpleasant flavor. Fl.vi; fr.vii. H.I.1947 C. and W. China. Intr. 1904. Zone VI?

7. *R. irenaeus* Focke. Evergreen prostrate shrub; stems tomentose, with small prickles or unarmed: lvs. suborbicular, acuminate or rarely rounded, broad-cordate or subcordate, 10-15 cm. across, mucronate-denticulate and usually slightly lobulate, dark green and glabrous above, whitish tomentose beneath; petioles 4-8 cm. long; stipules large, incisely dentate: fls. 1.5-2 cm. across, 1 or 2 in the axils or in several-fld. clusters; calyx tomentose: fr. red, large. Fl.vii. Focke, Sp. Rub. 115. C. and W. China. Intr. 1900. Zone VI?

8. *R. chroosépalus* Focke. Half-evergreen straggling shrub; stems with short curved prickles, puberulous when young: lvs. broad-ovate, abruptly acuminate, cordate, 7-12 cm. long, sharply and unequally serrate and often shallowly lobulate, glabrous above, white-tomentose beneath; petioles 3-6 cm. long, prickly, glabrous like the veins beneath: fls. apetalous, 1-1.5 cm. across, in large terminal panicles 12-20 cm. long; sepals tomentose outside, purple inside: fr. black, small. Fl.vii. H.I.1952. Focke, Sp. Rub. 51. G.C.51:166. C. China. Intr. 1900. Zone VI? Lvs. resembling those of *Tilia tomentosa*.

9. *R. ichangensis* Hemsl. & Ktze. Deciduous scandent or prostrate shrub; stems slender, with stipitate glands and scattered hooked prickles: lvs. ovate-lanceolate, acuminate, deeply cordate, 8-15 cm. long, remotely mucronate-serrulate and usually slightly lobulate toward the base, glabrous; petioles

2-3 cm. long, prickly like midrib beneath: fls. 6-8 mm. across, white, in slender panicles 15-25 cm. long or more; sepals erect: fr. red, small, of good flavor. Fl.vii; fr.x. Focke, Sp. Rub. 55. G.C.48:275(h). C. and W. China. Intr. 1900. Zone VI?

10. *R. Lambertiæ* Ser. Half-evergreen straggling shrub; stem angled, with scattered recurved prickles, tomentulose when young or nearly glabrous: lvs. ovate to oblong-ovate, acuminate, cordate, 7-12 cm. long, crenate-dentate and sinuate-lobulate or sometimes slightly 3-lobed, slightly pilose above, pilose beneath; petioles 2-4 cm. long: fls. white, 8 mm. across, in panicles 8-14 cm. long; calyx tomentulose or nearly glabrous, often glandular; petals scarcely exceeding the sepals: fr. red, small. Fl.viii-ix; fr.x-xi. G.C.48:276 (h); 51:166. C. China. Intr. 1907. Zone VI?—*R. L. hakonensis* (Franch. & Sav.) Focke, var. Lvs. nearly glabrous. (*R. L. var. glaber* Bean, *R. h. Fr. & Sav.*) Japan, C. China. Intr. 1907.

11. *R. Parkeri* Hance. Deciduous climbing shrub; stems grayish tomentulose, with scattered curved prickles: lvs. oblong-ovate, acuminate, cordate, 10-16 cm. long, crenate-dentate and sinuate-lobate, hirsute above, grayish or brownish tomentulose beneath; petioles 5-20 mm. long, pubescent and prickly: fls. white, about 8 mm. across, in large densely villous and glandular-setose panicles; calyx with reddish glandular hairs: fr. black with few drupelets. Fl.vi; fr.vii-viii. Focke, Sp. Rub. 66. G.C.51:166. C. China. Intr. 1907. Zone VI?

12. *R. flagelliflorus* Focke. Evergreen climbing or creeping shrub; stems with very small recurved prickles, tomentulose when young: lvs. ovate to ovate-lanceolate, acute or acuminate, deeply cordate, 8-16 cm. long, crenate-serrulate, often obscurely lobulate and sinuate-pilose above, yellowish tomentulose beneath; petioles 3-6 cm. long, slightly bristly: fls. small, in short axillary fascicle-like racemes or clusters; sepals purple inside; petals white, quickly caducous: fr. black, edible. Fl.vi. Focke, Sp. Rub. 113. S.L.327(h). R.B.33:360,t(h). C. and W. China. Intr. 1901. Zone VII?

13. *R. setchuenensis* Bur. & Fr. Deciduous straggling shrub; stems terete, velutinous, unarmed: lvs. suborbicular, 5- or obscurely 7-lobed, cordate, 7-16 cm. wide, lobes broad, obtuse, irregularly dentate, rugulose above, grayish tomentulose and somewhat reticulate beneath; petioles 5-7 cm. long: fls. 1-1.5 cm. across, in many-fld. panicles or partly in dense axillary clusters; calyx tomentulose; sepals triangular, acute; petals purple: fr. black, of good flavor. Fl.vii-viii; fr.ix. (*R. omeiensis* Rolfe, *R. clemens* Focke, *R. pacatus* Focke.) W. China. Cult. 1898. Zone VI?

Subgen. III. *ANOPLOBATUS* Focke. Stems upright, rarely decumbent, with exfoliating bark, unarmed; stipules lanceolate, slightly adnate to petiole: lvs. simple, palmately lobed: fls. large, with spreading petals; styles club-shaped; torus flat.

14. *R. odoratus* L. Deciduous upright shrub, to 3 m.; young shoots, petioles and peduncles villous and glandular: lvs. cordate, 5-lobed, 10-30 cm. broad, lobes broad-triangular, abruptly acuminate, irregularly dentate, green and pilose on both sides; petiole 2-8 cm. long, villous: fls. purple, fragrant, 3-5 cm. across, in short many-fld. panicles; sepals broad-ovate, abruptly caudate, acuminate, glandular outside; petals suborbicular: fr. red, flat, 1.5-2 cm. broad. Fl.vi-viii. B.M.323(c). N.D.6,t.24(c). Gn.34:230. B.B.2:276. F.E.22:557(h). (*Rubacer odoratum* Rydb.) N. S. to Mich., Tenn. and Ga. Intr. 1635. Zone III. Shrub with large lvs. and large purple fls.; likes shady position and humid soil.—*R. o. albus* Schneid., f. With whitish fls. and lighter-colored bark. (*R. o. albidus* Bailey.)

*R. o. × parviflorus* = *R. Fraseri* Rehd. Brts. and petioles less glandular-hairy: lobes of lvs. acuminate: fls. pink fading to pale purple. G.C.73:50(h). (*R. robustus* G. Fraser, not Presl.) Orig. 1918.—*R. o. × idaeus*; see under No. 38.

15. *R. parviflorus* Nutt. Deciduous upright shrub, to 2 m.; young brts., petioles and infl. puberulous and more or less glandular: lvs. reniform, 3-5-lobed, 6-20 cm. across, lobes triangular, short-acuminate or acute, dentate, sparingly pilose on both sides; petioles 5-12 cm. long: fls. white, 3-6 cm. across, in 3-10-fld. rather dense corymbs; sepals broad-ovate, abruptly caudate-acuminate, densely glandular outside; petals broad-oval or ovate: fr. convex, red, 1.5-2 cm. across. Fl.v-vii. B.R.1368(c). B.M.3453(c). B.B.2:276. Gn.81:31;84:339. (*R. nutkanus* Ser., *Rubacer parviflorum* Rydb.) W. Ont. and Mich. to N. Mex. and n. Mex., w. to s. Alaska and Calif. Intr. 1827. Zone III. Similar to the preceding, but fls. white.—*R. p. Fraserianus* J. K. Henry, var. Petals incisely dentate: lvs. rather densely pilose beneath. Gn.82:277. Torreya, 18:55. B. C. Intr. 1918.

16. *R. trifidus* Thunb. Half-evergreen upright shrub, to 2 m.; brts. glandular-pubescent at first, soon glabrous: lvs. suborbicular, cordate, deeply 5-7-lobed, 10-20 cm. across: lvs. oblong-lanceolate, coarsely double-serrate, slightly hairy on the veins on both sides; petioles 3-6 cm. long: fls. rosy-white, 2.5-3 cm. across, solitary in the axils and in a few-fld. terminal corymb; calyx tomentose: fr. red, edible. Fl.iv-v. R.H.1908:298. S.L.326(h). (*R. aceroides* Miq.) Japan. Intr. 1888. Zone V.

17. *R. deliciosus* Torr. Deciduous shrub to 3 m., with spreading or arching brs.; young brts. puberulous: lvs. reniform to orbicular-ovate, truncate or cordate at base, 3-7 cm. long, with 3 or sometimes 5 broad obtuse lobes, or acute on shoots, irregularly dentate, glandular beneath and sparingly pilose on the veins; petioles 2-3.5 cm. long, puberulous: fls. mostly solitary, about 5 cm. across; sepals ovate, caudate-acuminate; petals oval: fr. hemispheric, dark purple, 1-1.5 cm. across. Fl.v. B.M.6062(c). Gt.24:t.837. R.H. 1882:356. B.S.2:457. Gn.80:286(h);86:37. J.L.35:362(h). (*Oreobatus d.* Rydb.) Colo. Intr. 1870. Zone V. Graceful shrub with large white fls.—*R. d. neomexicanus* Kear., var. Lvs. with at least the terminal lobe acute, pubescent on both sides, reticulate-veined beneath, usually larger; petioles villous. S.H.1:t.307b(1). Card, Bush Fr. f.51. N. Mex., Ariz. and n. Mex. Intr? Probably tenderer.

Subgen. IV. *IDAEOBATUS* Focke. Shrubs with deciduous upright or scandent or procumbent stems usually prickly, setose or glandular, usually biennial: lvs. usually ternate or pinnate, rarely digitate, sometimes simple; stipules linear, adnate: fr. of many carpels at maturity separating from the torus. RASPBERRIES.

18. *R. corchorifolius* L. f. Upright shrub, suckering; stems prickly, tomentulose when young: lvs. ovate-lanceolate, acuminate, cordate, 8-16 cm. long, 3-nerved at base, with several short obtuse lobes near the base or without lobes, or 3-lobed on shoots with elongated middle lobe, irregularly serrulate, pubescent on veins above, gray-tomentose beneath; petioles 5-20 mm. long: fls. white, about 3 cm. across, usually solitary or few on short lateral prickly brts.; petals oblong, little longer than the ovate, mucronate sepals: fr. bright, red, large, edible. Fl.iv; fr.vi. G.C.51:149. N.K.7:t.20. Japan, China. Intr. 1907. Zone VI?—*R. c. Oliveri* (Miq.) Focke, var. Shoots glabrous: lvs. pubescent only on the veins beneath. (*R. O.* Miq.) China, Japan. Intr. 1907.

Related species: *R. palmatus* Thunb. Stems glabrous, prickly: lvs. palmately 3-5-lobed, 5-nerved at base, 3-8 cm. long, lobes unequally and coarsely dentate

and lobulate, nerves beneath puberulous and midrib prickly: fr. yellow, edible B.M.7801(c). Focke, Sp. Rub. 133. Japan, China. Cult. 1899. Zone VII?

19. *R. crataegifolius* Bge. Upright shrub to 3 m., suckering; stem prickly, grooved, brownish red, pubescent when young, branching near apex: lvs. palmately 3-5-lobed, cordate or truncate, 5-12 cm. long, those of flowering brts. smaller, 3-lobed, lobes ovate to ovate-lanceolate, acute, rarely acuminate or obtusish, unequally coarsely serrate, pubescent beneath on the veins; petioles 2-5 cm. long, prickly: fls. white, about 2 cm. across, in few- or several-fl. clusters; sepals ovate, acuminate, much recurved; petals elliptic: fr. red. Fl.vi; fr.vii. Gt.17:t.591;27:t.924. N.K.7:t.21. S.H.f.307g,309r. Japan, Korea, N. China. Intr. 1875. Zone V. Lvs. turning red and yellow in fall.

20. *R. trianthus* Focke. Shrub with upright arching stems; stems slender glabrous, often bloomy, prickly: lvs. oblong-lanceolate, acuminate, subcordate or truncate, 5-8 cm. long, incisely serrate, those of shoots 3-lobed and larger, the terminal lobe ovate-lanceolate, glabrous, pale or whitish beneath, with 8-12 pairs of veins; petioles 1-4 cm. long, glabrous, prickly like the veins beneath: fls. usually 3, white, 1 cm. across, on pedicels 1-2 cm. long; sepals triangular, caudate-acuminate, glabrous outside, tomentose inside: fr. small, red. Fl.v; fr.vii. Focke, Sp. Rub. 139. (*R. conduplicatus* Rolfe.) China. Intr. 1907. Zone (V).

Closely related species: *R. Koehneanus* Focke. Stems upright, sparingly and minutely prickly: lvs. ovate, 3- or rarely 5-lobed, 4-12 cm. long, the terminal lobe usually ovate and acuminate; petioles often nearly as long as blade; fls. nearly 2 cm. across: fr. orange, small. B.M.8246(c). Focke, Sp. Rub. 141. Gt. 53:555. (*R. incisus* Spaeth, not Thunb., *R. morifolius* Hort., not Sieb.) Japan. Intr. 1890. Zone V?

21. *R. spectabilis* Pursh. Stems upright, to 2 m., glabrous, with numerous fine prickles below: lfts. 3, ovate, 10-15 cm. long, incisely serrate, nearly glabrous, the terminal lft. the largest, rhombic-ovate, stalked, lateral lfts. nearly sessile: fls. solitary, purplish-red, 2.5 cm. across, nodding, fragrant, on short lateral brts.; calyx pubescent; sepals triangular-ovate, half as long as petals: fr. orange, large, edible. Fl.iv-vi. B.R.1424(c). L.B.1602(c). Proc. Iowa Acad. Sci.23:t.26. W. N. Am. Intr. 1827. Zone V.

22. *R. illecebratus* Focke. STRAWBERRY-RASPBERRY. Suffrutescent or nearly herbaceous; stems upright, to 1 m., angular, glabrous, prickly: lvs. pinnate; lfts. 5-7, 3 at end of brts., oblong-lanceolate, acuminate, 4-8 cm. long, doubly serrate, glabrous except pilose on veins beneath; petiole and rachis prickly: fls. solitary or few, bracted, white, 4 cm. across; pedicels prickly, glabrous: fr. scarlet, large. Fl.vii-x. G.C.III.20:82. Gn.64:412. Gt.47:27. G.W.4:233. (*R. sorbifolius* Hort., not Maxim.) Japan. Cult. 1895. Zone (V). Particularly handsome with its large scarlet fr.

Closely related species: *R. rosaeifolius* Sm. Stems taller, pubescent: lfts. 5-11, pubescent below: fls. larger, sometimes double (var. *coronarius* Ser. B.M.1783): fr. smaller. H.I.349. B.M.6970(c). Himal., S. Asia. Cult. 1816. Zone VII.—A species similar in habit, though belonging to subgen. *CYLACTIS* is *R. xanthocarpus* Bur. & Franch. Herbaceous: lateral lfts. several times smaller than terminal lft. and obtusish: fls. smaller, 1-3: fr. yellow. W. China. Intr. 1885. Zone IV.

23. *R. amabilis* Focke. Stems to 2 m., slightly prickly, unarmed above: lvs. pinnate; petiole and rachis with subulate prickles; lfts. 7-9, ovate to ovate-lanceolate, incisely double-serrate, pubescent on the veins and usually prickly beneath, terminal lft. 2.5-6 cm. long, acuminate, lateral lfts. smaller, usually acute: fls. solitary, white, 4-5 cm. across, nodding: pedicels silky-pubescent and prickly; sepals broad-ovate, cuspidate; petals suborbicular,

overlapping: fr. large, red, edible. Fl.vi-vii; fr.viii. Focke, Sp. Rub. 164. W. China. Intr. 1908. Zone VI? With conspicuous white fls. and comparatively small lfts.

Closely related species: *R. púngens* Cambess. Lfts. 5-7, rarely 9, somewhat smaller: petiole and rachis with hooked prickles: fls. 1-3, smaller, sepals ovate to ovate-lanceolate, acuminate; petals obovate to oblong, 1-1.2 cm. long: fr. smaller. Jacquemont, Voy. Indé, 4:t.59. Himal., China, Japan. Intr. 1907. Zone VI?

24. *R. biflorus* Buch.-Ham. Stems to 3 m., with straight prickles, glaucous-white like the upper brts.: lfts. 3-5, ovate or elliptic, acute or acuminate, 4-10 cm. long or the lateral ones smaller, incisely and irregularly serrate, white-tomentose beneath; petiole and rachis prickly: fls. 1-3, white, 2 cm. across: fr. yellow, roundish, 2 cm. across, edible. Fl.v-vi. B.M.4678(c). R.H. 1855,t.5(c). Gn.54:456. Himal. Intr. 1818. Zone VII? Striking plant with conspicuous white stems.—*R. b. quinqueflorus* Focke, var. Taller and more vigorous: fls. usually 5, or sometimes to 8. G.C.66:212;73:23. Gn.76:624(h); 83:594;89:329(h). W. China. Intr. 1908. Zone VI?

25. *R. lasiostylus* Focke. Stems upright, to 2 m., with bristle-like prickles, glaucous-white: lfts. 3-5, the lateral acute, 5-10 cm. long, the terminal one much larger, acuminate, rounded or subcordate at base, often 3-lobed, unequally double-serrate, white-tomentose beneath: fls. 1-5, nodding, rather small; pedicels bristly; bracts large; petals reddish, shorter than the ovate-lanceolate cuspidate sepals: fr. subglobose, red, tomentulose. Fl.vi; fr.viii. B.M.7426(c). H.I.1951. G.C.51:167. Focke, Sp. Rub.168. G.28:631. S.L. 330(h). C. China. Intr. 1889. Zone (V). Conspicuous with its white stems; harder than the preceding species.

26. *R. stans* Focke. Stems upright, to 1 m., with scattered slender prickles, like the brts. pilose and glandular: lfts. 3, on shoots sometimes 5, on fertile brts. sometimes 1, suborbicular to ovate or oval, 2-4 cm. long, rounded or acute at apex, broad-cuneate, the terminal one sometimes 3-lobed and rounded at base, doubly or unequally serrate, glandular-ciliate, pubescent on both sides and glandular, green beneath: fls. 1-3, 2-2.5 cm. across; calyx purplish, like the usually short pedicels villous and glandular; sepals lanceolate, longer than the obovate white or purplish petals: fr. orange, edible. Fl.vi; fr.viii-ix. Not. Bot. Gard. Edinb. 5:t.68. W. China. Intr. 1914. Zone VII?

Related species: *R. alexetèrius* Focke. Stems arching, to 2 m., glabrous, slightly bloomy, with curved prickles; lfts. elliptic to elliptic-oblong, 2.5-5 cm. long, acute to acuminate, coarsely doubly serrate, pubescent above, whitish-tomentose beneath: fls. 1-4; calyx aculeate: fr. yellow, large, edible. Focke, Sp. Rub. 265. W. China. Intr. 1914 or 1906. Zone VII?—*R. trullisatus* Focke. Stems to 2.5, glabrous, with short prickles: lfts. ovate to ovate-lanceolate, acuminate, 4-6 cm. long, appressed crenate-serrulate, glabrous above, white-tomentose beneath: fls. usually 3: fr. subglobose, white-woolly. C. China. Intr. 1907. Zone VI?—*R. macilentus* Cambess. Stems glabrous, with stout straight or slightly curved prickles: lvs. often simple; lfts. ovate to ovate-oblong, 1.5-5 cm. long, obtuse to acuminate, glabrous, midrib beneath and petiole prickly: fls. 1-3, white, on short brts., 1.5-2 cm. across; calyx slightly pubescent: fr. orange. Jacquemont, Voy. 4:t.60. Himal., W. China. Intr. 1908. Zone VII?

27. *R. thibetanus* Franch. Stems upright, with straight slender prickles: lfts. 7-13, incisely serrate, silky above, white or grayish-tomentose beneath, lateral lfts. elliptic to oblong, cuneate, 2-5 cm. long, terminal lft. longer, lanceolate, pinnatifid below; fls. 3-8 and sometimes some solitary ones in the axis below, 1-1.5 cm. across, purple; rachis and pedicels villous: fr. subglobose, black, bloomy. Fl.vi; fr.viii. Focke, Sp. Rub. 180. G.C.51:149. (*R.*

*Veitchii* Rolfe.) W. China. Intr. 1904. Zone VI? Distinct and attractive shrub.

28. *R. coreanus* Miq. Stems upright or arching, to 3 m. long, angled, with stout prickles, bloomy: lfts. 5-7, ovate or elliptic, acute, broad-cuneate or rounded at base, 3-7 cm. long, unequally and sharply serrate, pubescent on the veins beneath or white-tomentose; petiole and rachis prickly: fls. rather small, in corymbs 3-7 cm. across; petals pink, shorter than the ovate-lanceolate pubescent sepals: fr. small, red or black. Fl.v-vi; fr.vii-viii. N.K. 7:t.29. G.C.51:149. Korea, Japan, China. Cult. 1906. Zone V?

Related species: *R. niveus* Thunb. Stems to 2 m., terete, tomentulose when young or glabrous and bloomy, with hooked prickles: lfts. 5-7, usually elliptic or elliptic-ovate, 3-6 cm. long, acute or acuminate, broad-cuneate, the terminal usually ovate and rounded at base, usually simply and rather coarsely serrate, white-tomentose beneath: fls. small, rosy-purple, in terminal panicle, many-fld. corymbs; pedicels and calyx white-tomentose: fr. dark red, becoming black. (*R. lasiocarpus* Sm.) India, W. China. Cult. 1934. Zone VII?—*R. inopertus* Focke. Lfts. 7-9, ovate to oblong-ovate, usually long-acuminate, glabrous or slightly pubescent: fls. in dense fascicles; calyx glabrous: fr. red. C. & W. China. Intr. 1908.—*R. Wilsonii* Duthie. Stems very prickly, the angles below the nodes nearly winged: lfts. 3-5, coarsely double-serrate, glabrous, terminal lft. broad-ovate, rounded or subcordate at base: fls. purple, in axillary fascicles and a dense terminal panicle; calyx purple-brown outside. C. China. Intr. 1901.

29. *R. parvifolius* L. Stems rather low, arching, short-villous; prickly: lfts. 3, on shoots occasionally 5, usually broadly obovate or suborbicular, obtusish, rarely ovate and acute, lateral lfts. often elliptic, 2-5 cm. long, unequally dentate, terminal lft. often lobulate, strigose-pilose above, white-tomentose beneath: fls. rather small, in prickly and pubescent small corymbs or short racemes, partly axillary; calyx green outside; sepals spreading, later recurved; petals upright, pink or purplish: fr. roundish, red, edible. Fl.vi; fr.vii-viii. B.R.496(c). N.K.7:t.31. (*R. triphyllus* Thunb.) China, Japan. Intr. 1818. Zone V.

Related species: *R. telédaos* Focke. Lfts. usually ovate or oblong-ovate, acuminate, terminal lft. often nearly 3-lobed: infl. elongated: fr. dark red. W. China. Intr. 1908.

30. *R. gracilis* Roxb. Stems stout, erect, to 5 m. tall, sometimes sarmentose, densely velvety when young, with few minute prickles: lfts. 3-5, coarsely double-serrate, strigose-pilose above at first, later glabrescent, white-tomentose beneath, terminal lft. broad-ovate to oblong-ovate, acuminate, rounded or subcordate, 8-12 cm. long, lateral lfts. much smaller, obliquely ovate, nearly sessile: fls. white or pale pink, 1-1.5 cm. across, in few-fld. corymbs; petals obovate, shorter than the lanceolate sepals: fr. blue-black, small. Fl.vi-vii. (*R. niveus* Wall., not Thunb., *R. euleucus* Focke.) Himal., China. Intr. 1901 from China. Zone VII? The most robust of all Rubus.

31. *R. phoenicolasius* Maxim. Stems upright, to 3 m. high, densely covered with reddish gland-tipped bristles and a few slender prickles: lfts. 3, rarely 5, broad-ovate, acuminate, 4-10 cm. long, coarsely and unequally mucronate-serrate, slightly pilose above, white-tomentose beneath: fls. in densely pilose and glandular short racemes and partly axillary; petals pink, shorter than the pilose sepals: fr. semiglobose, red, small, acid or insipid, with enlarged spreading bristly calyx. Fl.vi-vii. B.M.6479(c). G.C.III.11:269; 28:137. Gt.52:564. N.K.7:t.28. Gng.3:263. Korea, Japan, N. China; occasionally escaped in E. U. S. Intr. 1876. Zone V. Handsome shrub conspicuous on account of the dense bristly pubescence of its stems.

*R. p. × idaeus* = *R. Páxii* Focke. Lfts. often 5, narrower, acute, less deeply serrate. Cult. 1906.

32. *R. flosculôsus* Focke. Stems usually arching, to 3 m. long, with few prickles, puberulous or glabrous, usually purplish brown, often bloomy: lfts. 5-7, usually ovate-oblong, acuminate, 3-5 cm. long, subequally serrate, terminal lft. often rhombic-lanceolate, to 7 cm. long and doubly serrate above the middle, white-tomentose beneath: fls. small, pink, 6-8 mm. across, in narrow panicles 5-10 cm. long; calyx tomentose; petals slightly longer than sepals: fr. small, dark red or black. Fl.vi; fr.viii. Focke, Sp. Rub. 193. C. China. Intr. 1907. Zone V-VI. With slender arching stems rooting at the tips in autumn.—*R. f. parvifolius* Focke, f. Lfts. 1-2 cm. long.

33. *R. Cockburnianus* Hemsl. Stems upright, to 3 m. long, branching and curving above, white-glaucous, sparingly prickly: lfts. 7-9, oblong-lanceolate, unequally coarsely serrate, white-tomentose beneath, terminal lft. rhombic or ovate-lanceolate, often lobulate, acuminate; petiole and rachis prickly: fls. small, rose-purple, in terminal panicles 10-12 cm. long; fr. black. Fl.vi; fr.viii-ix. Focke, Sp. Rub. 194. G.C.51:147;65:248(h). Gn.76:624(h). J.L. 40:218(h). (*R. Giral dianus* Focke.) N. and C. China. Intr. 1907. Zone V. Conspicuous with its white stems.

34. *R. innominatus* S. Moore. Stems upright, to 3 m., densely glandular-villous and prickly: lfts. 3-5, irregularly coarsely serrate, slightly pilose above, grayish white-tomentose beneath; lateral lfts. obliquely oblong-ovate, rounded at base, 5-10 cm. long, terminal lft. ovate, acuminate, subcordate, larger; petiole villous and prickly: fls. pink, about 1 cm. across, in glandular-villous racemes or panicles 10-35 cm. long; fr. orange-red, about 1.5 cm. wide, edible. Fl.vii-viii; fr.ix. G.C.38:290. R.B.33:360(h). S. E. and W. China. Intr. 1901. Zone VI? Remarkable for its large infl.; may be valuable for its fr.—*R. i. Kuntzeanus* (Hemsl.) Bailey, var. Stems and infl. glandless. S.L. 332(h). (*R. K. Hemsl.*) C. China. Cult. 1887.

35. *R. adenôphorus* Rolfe. Stems upright, to 3 m., stout, densely villous and stipitate-glandular like the petioles, with stout broad-based prickles: lfts. 3, often 5 on shoots, ovate, acuminate, rounded at base, 5-12 cm. long, the terminal lft. subcordate, doubly serrate, dull and pubescent above, more densely pubescent and grayish green beneath: fls. pink, small, in villous and stipitate-glandular panicles 10-12 cm. long; fr. black, edible. Fl.vii; fr.viii. Focke Sp. Rub. 197. (*R. sagatus* Focke.) C. China. Intr. 1907. Zone VI? Remarkable for its conspicuous glandular pubescence on stem and infl.

36. *R. occidentalis* L. Stems to 3 m., very glaucous and often purplish, with short prickles: lfts. 3, sometimes 5 on shoots, ovate, abruptly acuminate, rounded or cordate at base, 5-8 cm. long, doubly serrate, white-tomentose beneath; petiole sparingly prickly: fls. white, 1-1.5 cm. across, in tomentose and prickly few-fld. corymbs; petals elliptic, shorter than the ovate-lanceolate sepals: fr. hemispherical, purple-black, bloomy. Fl.v-vi; fr.vii-viii. B.B.2:277. B.C.5:f.3495,3496. Jour. Hered. 11:178. N. B. to Minn. and s. to Ga. and Colo. Cult. 1696. Zone III. Sometimes cult. in several vars. for its fr.—*R. o. pallidus* Bailey, var. Fr. amber-yellow. Gt.19:t.670(c).

*R. o. × idaeus* var. *strigosus* = *R. neglectus* Peck. Similar to the preceding, but petioles and infl. more or less glandular-hispid. B.B.2:277. B.C.5:f.3494. Occurs naturally; sometimes cult. with purple to yellow fr., e.g. "Royal," "Columbia Purple Raspberry" (Jour. Hered. 11:182).

37. *R. leucodermis* Torr. & Gr. Stems upright, to 2 m., glaucous, armed with flattened recurved prickles: lfts. 3, on shoots often 5, coarsely double-serrate, white-tomentose beneath, terminal lft. broad-ovate, acute, often subcordate, 6-10 cm. long, lateral lfts. narrower, rounded at base; petiole and midrib beneath prickly: fls. white, in few-fld. tomentose and prickly corymbs;

petals shorter than the lanceolate sepals: fr. hemispheric, purple-black, bloomy, edible. Fl.v-vi. Card, Bush Fr. f.59. S.H.1:f.307n. M.G.16:429(h). (*R. occidentalis* var. *l.* Focke.) B. C. to Mont., Utah and C. Cal. Intr. 1829. Zone V. Horticultural varieties are grown for their fr.

38. *R. idaeus* L. Stems upright, to 2 m., finely tomentose when young and sometimes with a few prickles broad at base: lfts. 3, on shoots usually 5, coarsely double-serrate, finely pubescent or glabrescent above, white-tomentose beneath, terminal lft. broad-ovate, short-acuminate, often subcordate, 5-10 cm. long, lateral lfts. smaller, rounded at base; fls. white, small, in tomentose glandless and usually slightly prickly short racemes, usually with smaller axillary infl. beneath; petals shorter than the long-acuminate sepals: fr. red. Fl.v-vi; fr.vii-viii. S.E.3:t.442(c). F.D.25:t.2575(c). Circumpolar. Zone III. Very variable species, of which the following varieties are cult.—*R. i. vulgatus* Arrhen., var. The typical form described above with the infl. without glands or bristles: fr. thimble-shaped. Eu., rare in N. Am. Much cult. in various horticultural forms and often escaped from cult.—*R. i. aculeatissimus* Reg. & Tiling, var. Young stems glabrous and often glaucous, bristly and usually with strong prickles broad at base. III. Monatsh. Gartenb. 1894: t.(c). (*R. melanolasius* Focke, *R. i.* var. *m.* Focke.) B. C. to Mich., s. to Ore. and Colo., also in E. Asia. Intr. before 1894.—*R. i. strigosus* (Michx.) Maxim., var. Young shoots glabrous and often glaucous, densely bristly and often glandular, with or without bristle-like prickles: infl. glandular and prickly: fr. hemispherical. B.B.2:277. Card, Bush Fr. f.58. (*R. s.* Michx.) Nfd. to B. C., s. to Va. and Wyo.; also in E. Asia. Some horticultural forms cult. for their fr.—*R. i. albus* (Bailey) Fern., f. Form of the preceding var. with amber-white fr. (*R. strigosus* var. *a.* Bailey.)—*R. i. tonsus* Fern., f. A form with smooth not bristly shoots. Que. to Vt.—*R. i. canadensis* Richards., var. Young shoots cinereous-tomentulose, with bristle-like prickles. (*R. subarcticus* Rydb., *R. carolinianus* Rydb.) Lab. to Alaska, s. to N. C. and Colo., also in E. Asia.

*R. i. × odoratus* = *R. nobilis* Reg. Resembles in habit and fl. *R. odoratus*, but the lvs. are 3-foliolate, large, pubescent on both surfaces. Orig. about 1855.—*R. i. × phoenicolasius*; see under No. 31.—*R. i. × occidentalis*; see under No. 36.—*R. i. × ? ursinus*; see under No. 40.—A hybrid with an unknown English Blackberry is shown in G.C.III.22:236. B.C.5:3021.

39. *R. mesogaëus* Focke. Stems long and slender, terete, densely tomentose, with small prickles: lfts. 3, unequally coarsely serrate, lobulate, pubescent above at first, finally glabrescent, grayish or whitish tomentose beneath, terminal lft. elliptic or rhombic-ovate, acuminate, rounded or subcordate, 5-8 or on shoots to 16 cm. long, lateral lfts. smaller, obliquely elliptic, very short-stalked; petioles 2-4 cm. long, prickly; stipules on shoots dissected: fls. white or pinkish, small, in rather loose or sometimes compact corymbs; petals obovate, 6-8 mm. long; sepals lanceolate: fr. small, globose, black. Fl.v-vi; fr.viii. Focke, Sp. Rub. 205. C. China. Intr. 1907. Zone VI.

Subgen. V. *EUBATUS* Focke. Stems usually angled, rarely terete, prickly, usually biennial: lvs. ternate, or digitately 5-foliolate, rarely 7-foliolate (pin-nate in No. 40); stipules adnate to petiole; petals always present; fr. falling off together with the torus, usually black or dark purple. BLACKBERRIES.

40. *R. ursinus* Cham. & Schlecht. "Californian Dewberry." Evergreen; stems trailing, sometimes upright, pubescent when young, with straight prickles: lfts. 3 or sometimes 5, the upper ones simple; lfts. broad-ovate, acute, rounded at base, 3-6 cm. long, coarsely double-serrate, pubescent above, villous or white-tomentose beneath: fls. dioecious, white, in tomentose

and prickly corymbs; sepals ovate, abruptly caudate-acuminate; petals of male fls. about 1 cm. long, of female 6-8 mm. long; fr. black, usually oblong, pubescent. Calif. Cult. 1900. Zone V.—*R. u. vitifolius* (Cham. & Schlecht.) Focke, var. Lvs. of flowering brts. usually simple, 3-lobed, green and sparingly pubescent on both sides or finally glabrate. (*R. v.* Cham. & Schlecht.) Calif. Cult. ?

*R. ? u. × idaeus* = *R. loganobaccus* Bailey. LOGANBERRY. Lvs. on shoots mostly 5-pinnate; lfts. larger, densely pubescent or tomentose beneath; fls. large; fr. purplish red, separating from the calyx with the torus. Orig. 1881.—A hybrid of *R. u.* with a Blackberry is the "Mammoth Blackberry" with very large black fr. Orig. about 1890.

Closely related species: *R. macropetalus* Hook. Lfts. 3, sparsely appressed-hirsute, incisely dentate; fls. large, white; fr. glabrous. Hooker, Fl. Bor. Am. 1:t.59. B. C. to Calif. and Idaho.—Several horticultural vars. cult. for the fr.

41. *R. Linkianus* Ser. Stems robust, grooved, glabrous or glabrescent, with scattered reflexed prickles; lfts. 5, coarsely doubly serrate, glabrous above, white-tomentose beneath; terminal lft. ovate or broad-ovate, rounded or subcordate at base, acute or short-acuminate, on a stalk 3-4 cm. long; lateral lfts. elliptic, the outer ones nearly sessile; petiole and petiolules villous and beset with strong reflexed prickles; fls. white or pinkish, double, about 2.5 cm. across, in villous and prickly panicles sometimes to 18 cm. long; sepals ovate, acuminate, tomentose outside; fr. rarely developed. Fl.vii. G.W.17:553. (*R. fruticosus plenus* West., *R. fruticosus fl. pleno* hort., *R. hedycarpus* Zabel.) Cult. before 1770. Zone V.

Closely related species: *R. cándicans* Weihe. Prickles slenderer; lfts. narrower; fls. white or pinkish, single; fr. subglobose, purplish black. Sudre, Rub. Eur. t.95. (*R. thyrsoides* Wimm.) Eu.—This is perhaps not specifically different from *R. Linkianus*; also *R. thyrsanthus* Focke belongs here.—Another related species is *R. procérus* P. J. Muell. Vigorous plant with very prickly shoots tomentose when young, becoming glabrous; lfts. 5, broad-elliptic-ovate, tomentose beneath; fls. about 2.5 cm. across in white-tomentose panicles; stamens very large. Sudre, Rub. Eur. t.91. (*R. macrostemon* Focke.) Eu. Here probably belongs the Himalaya-berry, intr. about 1890 to Am.

42. *R. ulmifolius* Schott. Half-evergreen; stems arching, robust, grooved, pruinose and stellate-pubescent toward the apex, with broad-based prickles, straight on the stems, curved on the brts.: lfts. 3-5, stalked, sharply and toward the apex doubly serrate, dark green and glabrous or slightly pubescent above, white-tomentose beneath, terminal lft. broad-ovate or obovate, 3-8 cm. long; petioles with hooked prickles; fls. rosy-red in long thyrsoid tomentose panicles with hooked prickles; petals obovate to suborbicular; sepals reflexed; fr. ovoid or subglobose, small. Fl.vi-vii; fr.viii. Sudre, Rub. Eur. t.77. (*R. rusticus* Merc.) Eu. Zone V.—*R. u. bellidiflorus* (Kirchn.) Voss, f. Fls. double, in long and slender panicles; petals narrow-oblong to linear-oblong, very numerous. Fl.vii-viii. N.V.12:134,t. (*R. b.* Kirchn.) Cult. 1864. Very handsome form.—*R. u. inermis* (Willd.) Focke, l. Without prickles; lfts. usually 3; fls. normal. (*R. i.* Willd., ? *R. fruticosus i.* West.) Cult. 1770. "Burbank's Thornless" belongs here.—*R. u. variegatus* Rehd., var. Lfts. variegated with bright yellow along the veins. (*R. u. foliis variegatis* Bean, ? *R. fruticosus v.* West.)

43. *R. allegheniensis* Porter. Stems erect, glandular-pubescent, with stout usually straight prickles; lfts. 5, on flowering shoots 3, ovate, abruptly acuminate, rounded or subcordate at base, 4-20 cm. long, doubly serrate, slightly pilose above, soft-pubescent beneath, with 10-14 pairs of veins; midrib beneath and petiole villous, glandular-hispid and prickly; fls. white, in villous and glandular-hispid racemes 10-20 cm. long; sepals ovate; petals

elliptic, 1-1.5 cm. long; fr. hemispheric to elongate, 1-1.5 cm. long, black, sweet. B.B.2:280. B.C.5:f.3500. Brainerd & Peitersen, Blackb. N. N. Eng. t.7-9. N. S. to N. C. and Ark. Cult. 1905. Zone III.

Here may be mentioned: *R. platyphyllos* K. Koch. Stems procumbent, thick, densely glandular-setose and prickly: lfts. 3, rarely 5, broad-ovate, 12-14 cm. long, subcordate, unequally serrate, pilose on both sides, green beneath: fls. in lax glandular-setose panicles leafy below: fr. oblong, up to 3 cm. long, dark violet-purple, edible. R.H.1906:570,t(c). Cauc. Cult. 1904.—*R. caucasicus* Focke. Similar to the preceding; lfts. glabrous or nearly so above, whitish tomentulose beneath: infl. narrow-paniculate: fr. small, black. Cauc. Cult. 1918. Zone V.—*R. Bellardii* Weihe & Nees. Stems arching and prostrate: lfts. 3, rarely 5, elliptic, 12-15 cm. long, caudate, acuminate, unequally serrate, rounded or truncate at base, pubescent on both sides: infl. paniculate: fr. small, black. Sudre, Rub. Eur. t.198. Eur. Cult. 1900. Zone V.

44. *R. fruticosus* L. Stems upright, glabrous, with hooked prickles: lfts. plicate, green and pubescent on both sides, later glabrate above, soft-pubescent beneath, terminal lfts. broad-ovate, cordate, lateral lfts. narrower, smaller: fls. white or pink, in pubescent and sparingly prickly, rather few-fl. racemose corymbs; petals obovate or suborbicular; fr. hemispherical, black. Fl.vii; fr.viii. F.D.t.2580(c). Weihe & Nees, Rub. Germ. t.1. Sudre, Rub. Eur. t.4. (*R. plicatus* Weihe & Nees.) Eu.. Zone IV. Linnaeus included in *R. fruticosus* almost all European Blackberries, but *R. plicatus* is generally considered as representing the type of Linnaeus' species.

Related species: *R. vulgaris* Weihe & Nees. Stems glandular above: lfts. coarsely or doubly serrate, soft-pubescent or grayish tomentose beneath, terminal lft. rhombic-elliptic to obovate-oblong, 8-10 cm. long, long-stalked, lateral lfts. often obovate and cuneate; fls. white or pinkish white, in panicles; petals oblong; fr. globose. Focke, Sp. Rub. 357. Sudre, Rub. Eur. t.12. (*R. Lindleyanus* Lees.) Eu.—*R. macrophyllus* Weihe & Nees. Stems arching and prostrate at ends or scandent, angled, villous when young, with short prickles: lfts. not plicate, large, cuspidate, pubescent beneath chiefly on veins: infl. usually large, paniculate, densely villous: fls. white, sometimes tinged pink. Weihe & Nees, Rub. Germ. t.12. Eu.—*R. m. amplificatus* Bab., var. Lfts. pubescent only on veins beneath, the terminal one orbicular-obovate, sometimes subcordate: panicle leafy, large. Eu. Cult. 1922.—*R. nessensis* W. Hall. Stems upright, arching at apex; prickles small straight: lfts. 5-7, rarely 3, sharply serrate, glabrous and lustrous above, sparingly pilose beneath, terminal lft. long-acuminate, cordate: fls. white or pinkish, in few-fl. usually unarmed racemes; sepals green; petals elliptic, 1.2 cm. long; fr. dark red. Focke, Sp. Rub. 97,98. Sudre, Rub. Eur. t.1. (*R. suberectus* G. Anders.) Eu.

45. *R. laciniatus* (West.) Willd. Stems arching or scandent, angled, soon glabrous, with hooked prickles: lfts. usually 5, pinnately lobed, with incisely toothed lobes, pubescent beneath; petiole and midrib beneath prickly: fls. pinkish white, in large villous and prickly panicles; petals obovate, sometimes lobed, 1 cm. long; fr. subglobose, 1.2-1.5 cm. long, black, sweet. Fl.vi-vii; fr.viii-ix. G.O.t.41(c). B.C.5:3030. Gn.21:57. (*R. fruticosus* var. *l.* West., *R. vulgaris* var. *l.* Dipp.) Orig. before 1770; often escaped from cult. Zone V.—*R. l. elegans* Bean, var. Lfts. smaller, more hairy above. (*R. laciniatus minor* hort.)

46. *R. ostryifolius* Rydb. Stems upright and recurving, strongly angled and curved, glabrous, copiously armed with stout flattened prickles: lfts. 5, on flowering brts. 3, ovate to oblong-ovate, short-acuminate, rounded, terminal lft. usually subcordate at base, 6-10 cm. long and long-stalked, the outer lfts. subsessile, sharply and doubly serrate, glabrous or sparingly pubescent above, soft-pubescent beneath; petiole and midrib beneath with curved prickles: fls. white, in short prickly racemes sometimes corymbiform; petals oblong-obovate; sepals ovate, abruptly acuminate: fr. thimble-shaped or globose, 1-1.2 cm. long, black, glabrous. Fl.vi; fr.vii. Bailey, Evol. Nat. Fr. f.64.

Brainerd & Peetersen, t.10. B.C.ed.1,4;f.2208. (*R. Andrewsianus* Blanch., *R. argutus* auth., not Link.) N. S. to N. C., Kans. and Mich. Cult. 1822. Zone III.

Related species: *R. pergratus* Blanch. Stems recurving, with smaller prickles: lfts. often oblong-ovate: infl. not prickly. Brainerd & Peetersen, Blackberr. N. Eng. t.11. (*R. amnicolus* Blanch.) N. Eng.—*R. laudatus* Berger. Stems upright, moderately prickly: lfts. ovate to oblong-ovate: infl. not prickly, with large simple lvs., lower pedicels long and spreading. Bailey, Gent. Herb. 3:266. Mo., Kans. Here belongs "Bundy" and "Early Harvest."

47. *R. frondosus* Bigel. Stems erect or recurved, glabrous, with rather stout straight or slightly recurved prickles: lfts. usually 5, thickish, sharply double-serrate, abruptly acuminate, sparingly hairy or nearly glabrous above, soft-pubescent beneath, terminal lft. suborbicular, cordate, 8-14 cm. long, its stalk 3-5 cm. long, lateral lfts. smaller, broad-elliptic, rounded or broadly cuneate at base, their stalk 1 cm. or less: flowering brts. villous: lfts. usually 3, elliptic or obovate, 3-7 cm. long: fls. white, in leafy villous and eglandular corymbs; petals broadly oval or suborbicular, about 1 cm. long, sepals broad-ovate, short-acuminate: fr. black, 1.5 cm. long, glabrous. Fl.vi; fr. vii-viii. B.B.2:279. Brainerd & Peetersen, Blackberr. N. Eng. t.12. Ont. to Va., Kans. and Iowa. Zone IV.—Several horticultural vars. belong here.

Related species: *R. floridus* Tratt.; it differs chiefly in the flattened strongly curved prickles of the stem, in the narrower generally oblong-ovate lfts. of the shoots, glabrescent at maturity. Bailey, Evol. Nat. Fr. f.90,91. S.H.1:f.310g-g'. (*R. argutus* var. *f.* Bailey.) S. E. Va. to Mo., Tex. and Fla.

48. *R. canadensis* L. Stems upright, recurving, to 4 m. long, grooved and round-angled, finely puberulous at first, purplish, with few weak prickles or without: lfts. on shoots usually 5, thin, glabrous or pubescent on the veins beneath, ovate, or obovate, abruptly long-acuminate, rounded or subcordate, sharply serrate, terminal lft. 7-15 cm. long, on a stalk 2-8 cm. long, outer lfts. nearly sessile; petiole 5-10 cm. long, glabrous, unarmed; lfts. on brts. usually 3, acute: fls. white, in villous or hairy leafy racemes 8-15 cm. long; sepals ovate, short-acuminate; petals obovate, 1-1.5 cm. long: fr. roundish, black, sour. Fl.vi; fr.vii. B.M.8264(c). B.B.2:279. Gn.84:338(h). (*R. Millspaughii* Britt.) Nfd. to N. C. and Mich. Cult. 1727. Zone II.

49. *R. trivialis* Michx. SOUTHERN DEWBERRY. Half-evergreen; stems prostrate and trailing, hispid and with small slightly flattened prickles: lfts. 3-5, narrow-ovate to oblanceolate, acute, rounded at base, sharply serrate, 2-6 cm. long, glabrous, dark green and lustrous above; petiole and petiolules and often the midrib beneath with recurved prickles; lfts. of brts. smaller, more elliptic and obtuse: fls. usually solitary; peduncles 2-5 cm. long, tomentulose and prickly; petals obovate, 1-1.5 cm. long: fr. usually oblong, 1-1.5 cm. long, glabrous. Fl.iv-v; fr.vi. G.O.t.71(c). B.B.2:281. Card, Bush Fr. f.63. (*R. continentalis* Bailey.) Va. to Fla., Tex. and Okl. Cult. 1825. Zone VI? Sometimes cult. south for its fr.

50. *R. hispidus* L. SWAMP DEWBERRY. Half-evergreen; stems prostrate, to 1.5 m. long, densely reflexed-bristly: lfts. 3, rarely 5, firm, coarsely and doubly serrate, glabrous, dark green above, middle lft. rhombic-ovate, acute or short-acuminate, broad-cuneate, 3-6 cm. long, short-stalked, lateral lfts. oblique, broad-ovate, nearly sessile; lfts. of brts. usually rounded at apex: fls. white, in tomentulose and bristly or unarmed few-fl. corymbs; petals obovate, 8 mm. long: fr. purple, with few glabrous drupelets. Fl.vi-vii; fr. viii. B.B.2:281. B.C.5:3033. Brainerd & Peetersen, Blackberr. N. Eng. t.18. (*R. obovalis* Michx., *R. sempervirens* Bigel.—RUNNING BLACKBERRY.) N. S. to Ga., Mich. and Minn. Zone III. Sometimes used as a ground-cover.

Closely related species: *R. setosus* Bigel. Stems at first erect, later reclining or decumbent; lfts. narrower, not evergreen; fls. smaller, in elongated glandular-hispid racemes: fr. red. Brainerd & Peitersen, Blackberr. N. Eng. t.17. Mass. to Conn. and N. Y.

51. *R. flagellaris* Willd. NORTHERN DEWBERRY. Stems prostrate, to 2 m. long, glabrous, with scattered weak recurved prickles: lfts. on shoots 3-5, abruptly acuminate, rounded or broad-cuneate, 4-10 cm. long, coarsely double-serrate, sparingly hairy above, pubescent on veins beneath, terminal lft. broad-ovate or rhombic-ovate, on a stalk 1-2 cm. long; lateral lfts. ovate, subsessile; petiole 3-5 cm. long, like midrib beneath prickly; floral brts. sparingly villous, their lfts. obovate to oblanceolate, 3-5 cm. long, acute at ends: fls. solitary or rarely in 2-4-fld. cymes; pedicels sparingly villous; sepals ovate, acuminate, sparingly villous outside; petals elliptic-obovate, 1-1.5 cm. long: fr. hemispheric to thimble-shaped, 1-1.5 cm. long, black, glabrous. Fl. v-vi; fr.vii-viii. B.B.2:281. B.C.5:f.3501,3502. (*R. procumbens* Muhl., *R. trivialis* Pursh in part, not Michx., *R. canadensis* Torr. & Gr., not L., *R. villosus* Bailey, not Ait., nor Thunb.) Me. to Minn., Mo. and Va. Cult. 1809. Zone III. Some forms are cult. for their fr.—Here belongs "LUCRETIA DEWBERRY" (*R. fl.* var. *roribaccus* Bailey) with rather large fr. A.G.11:641,t. Bailey, Gent. Herb. 1:160.—*R. f. almus* Bailey, var. Spineless form. Bailey, Gent. Herb. 2:319.

Related species: *R. vëlox* Bailey. Robust plant with arching and prostrate angled stems armed with broad-based stout curved prickles: lfts. soft-pubescent beneath, the terminal one long-stalked: fls. solitary or in a forked cyme: fr. oblong, 2.5-3 cm. long. Bailey, Gent. Herb. 1:168,169. ? Tex. Several forms cult. for the fr.—*R. plicatifolius* Blanch. Stems terete, with small prickles: lvs. of shoots nearly all 5-foliolate; lfts. large, with impressed veins, as if plaited: infl. cymose. (? *R. villosus* Ait., not Thunb.) N. E. States.

52. *R. caësius* L. EUROPEAN DEWBERRY. Prostrate shrub; stems at first upright, soon procumbent and sometimes climbing, terete, glabrous or rarely slightly puberulous, pruinose, with scattered weak prickles: lfts. 3, rarely 5, coarsely and often incisely serrate, on both sides sparingly hairy, middle lft. rhombic-ovate or ovate, sometimes 3-lobed, subcordate, 3-7 cm. long, lateral lfts. nearly sessile, often 2-lobed; petioles pubescent, prickly; stipules dilated below the middle, lanceolate or linear-lanceolate above; fls. white, 3 cm. across, in few-fld. pubescent glandular and prickly corymbs; calyx pubescent often glandular; sepals ovate-lanceolate; petals broad-elliptic: fr. of few large drupelets, black, bloomy. Fl.vii-viii; fr.ix. S.E.3:t.456(c). F.D.t.2576(c). Sudre, Rub. Eur. t.207. Eu., in N. Asia to Altai Mts. Zone III.—*R. c. turkestanicus* Reg., var. Young stems slightly pruinose: terminal lft. often 3-fld: petals narrow-oblong: fr. oblong-cylindric, with numerous drupelets. Gt.41:107. Turkest. Cult. 1890.

Related species: *R. nemorosus* Hayne. Stems slender, often to 8 m. long, pruinose, below rather thickly beset with small somewhat curved prickles: lfts. usually broad-ovate, irregularly serrate, bronzy in autumn, pubescent beneath: fls. small, corymbose; calyx grayish tomentose. F.D.25:t.2577(c). H.A.3:t.10(c). Cauc., Eu. Cult. 1925. Zone V. Sometimes planted as ground cover.

35. **POTENTILLA** L. CINQUEFOIL. Herbs or small deciduous shrubs; buds with few scales: lvs. compound; stipules adnate to the petiole and sheathing: fls. in terminal cymes or solitary, white, yellow or red; sepals 5, with 5 alternate bracts at base; petals usually orbicular; stamens 10-30; pistils many, on a low conical receptacle, becoming small dry achenes; style deciduous. (Latin *potens*, powerful; referring to the medicinal properties of some species.) More than 300 species throughout the n. temperate and frigid zones; few of them woody.

A. Lfts. 3-7, entire: styles short, thickened upwards: much branched shrub....1. *P. fruticosa*  
 AA. Lfts. 5-9, serrate; styles slenderer, not thickened: sparingly branched, suffrutescent.

2. *P. Salesoviana*

1. *P. fruticosa* L. Low shrub, to 1.5 m., bark shreddy: lvs. pinnate; lfts. 3-7, usually 5, sessile, elliptic to linear-oblong, acute, 1-2.5 cm. long, with revolute margin, more or less silky: fls. usually bright yellow, 2-3 cm. across, solitary or few on slender stalks; sepals triangular-ovate, bracts usually linear. Fl.v-viii. N.K.7:t.35. S.E.3:t.436(c). B.B.2:262. (*Dasiphora* f. Raf.) N. hemisphere. Cult. 1700. Zone II.—Low rather dense shrub with conspicuous yellow or white fls. in early summer and sparingly until Sept. Very variable.—VARS. WITH BRIGHT YELLOW FLS.: *P. f. Färeri* Besant, var. Spreading low shrub: lfts. oblanceolate to obovate-oblong, 6-10 mm. long, obtusish, dark green above, glaucescent and thinly silky, later glabrescent beneath: fls. about 2 cm. across. H.B.14:349. N. W. China. Intr. 1916.—*P. f. grandiflora* Willd., var. Upright: lvs. larger, green, slightly pubescent: fls. 3-3.5 cm. across.—*P. f. micrandra* (Koehne) Schneid., var. Of lower spreading habit: lvs. rather broad: fls. rather small; stamens shorter than pistils. S.H.1:f. 313i-l. Intr. before 1890.—*P. f. tenuiloba* Ser., var. Lfts. narrow, often nearly linear, more pubescent. (*P. f. var. tenuifolia* Lehm.)—*P. f. pyrenäica* Willd., var. Dwarf alpine form of dense habit; lfts. small, lanceolate. (*P. prostrata* Lap.)—*P. f. parvifolia* (Lehm.) Th. Wolf, var. Dwarf: lfts. usually 7, the 4 lower ones whorled, elliptic-oblong, 3-8 mm. long, glabrescent; fls. sometimes pale yellow. S.H.1:f.313n(1). (*P. p.* Lehm., *P. f. var. humilis* Spæth.) C. Asia.—*P. f. pumila* Hook. f., var. Dwarf: lfts. small, usually 5, densely silky-pubescent. (*P. lanuginosa* Hort. Vilm.) Intr. before 1910. C. Asia.—*P. f. rigida* (Lehm.) Th. Wolf, var. Low, upright: lfts. 3, elliptic-oblong, silky above, glabrous beneath: sepals subequal, the outer often 2-parted. Lehm., Rev. Potent. t.1. Himal. Intr. 1906.—*P. f. albicans* Rehd. & Wils., var. Lfts. elliptic-oblong, pubescent and dull green above, white-tomentose beneath. W. China. Intr. 1909. Handsome form.—VARS. WITH PALE YELLOW OR CREAMY WHITE FLS.: *P. f. Friedrichsenii* (Spæth) Rehd., var. Lfts. rather large, pubescent, glaucous beneath: fls. light yellow. (*P. f.* Spæth.) Hybrid between the type and var. *dahurica*. Orig. 1895.—*P. f. ochroleuca* (Spæth) Bean, var. Lfts. nearly green beneath: fls. creamy white: seedling of the preceding var. (*P. Friedrichsenii* var. *o.* Spæth.) Orig. before 1909.—*P. f. Purdomii* Rehd., var. Lfts. 7-10 mm. long, acute, glaucous and glabrous beneath except midrib: fls. pale yellow. N. China. Intr. 1911.—*P. f. Vilmoriniana* Komar., var. Lfts. pubescent above, white-tomentose beneath: fls. creamy white. R.H.1910:57. W. China. Intr. 1905.—VARS. WITH PURE WHITE FLS.: *P. f. Veitchii* (Wils.) Bean, var. Shrub to 1.5 m. Lfts. pubescent, glaucous beneath, 1-2 cm. long: calyx-bracts broader than the sepals. B.M.8637(c). B.S.2:222. G.C.83:79(h). J.L.40:222(h). (*P. v.* Wils., *P. davurica* var. *v.* Jesson.) C. and W. China. Intr. 1902. Very handsome.—*P. f. Beanii* Rehd., var. Lfts. pubescent: fls. with narrow calyx-bracts: seedling of var. *Friedrichsenii*. (*P. Friedrichsenii* var. *leucantha* Spæth, *P. f.* var. *l.* Bean, not Mak.) Orig. before 1910.—*P. f. dahurica* (Nestl.) Ser., var. Dwarf compact shrub, less than 0.5 m. high: lfts. about 1 cm. long, nearly glabrous, glaucous beneath; the lustrous brown stipules with a conspicuous tuft of hairs at apex: fls. usually solitary, 2-3 cm. across, with broad calyx-bracts. L.B.914(c). (*P. davurica* Nestl.) N. China, Siber. Intr. 1822.—*P. f. mandshurica* Maxim., var. Low shrub: lfts. small, densely whitish silky-pubescent on both sides. G.C.76:233. M.G.34:233,234(h). (*P. davurica* var. *m.* Th. Wolf, *P. f.* var. *leucantha* Mak.) Manch. Cult. 1911.

Related species: *P. tridentata* Ait. Stems slender, to 25 cm. high, woody at base: lfts. 3, oblanceolate, 1-5 cm. long, 3-toothed at apex, nearly glabrous, coriaceous: fls. white, several; receptacle and achenes hairy. B.B.2:262. Lab. to mts. of Tenn., w. to Man. Cult. 1789. Zone II.

2. *P. Salesoviāna* Steph. Suffrutescent, 0.5-1 m. tall, little branched; stipules large, broadly scarious: lfts. 7-9, rarely 5, short-stalked, oblong, 2-3.5 cm. long, coarsely serrate, glabrous and dark green above, white-tomentose beneath: fls. white, rosy-tinted, 3 cm. across, in 3-7-fl. cymes; sepals lanceolate, as long as petals; bracts linear, half as long. Fl.vi-viii. B.M.7553(c). (*Comarum Salessowii* Bge.) Siberia. Intr. 1823. Zone III.

The closely related *P. palustris* Scop. with smaller purple fls. can hardly be considered suffrutescent.

36. *FALLŪGIA* Endl. Deciduous shrub: lvs. alternate, partly fascicled, 3-7-lobed, petioled, stipulate: fls. terminal, perfect or polygamous, white; calyx-tube cupular; sepals 5, ovate, imbricate, with 5 alternate, narrow bracts at base; petals 5, suborbicular, spreading; stamens numerous; pistils many on a conical torus, pubescent; style slender; achenes with long persistent plumose style. (After Virgilio Fallugi or Falugi, an Italian botanical writer, end of XVIIth century.) One species in s.w. N. Am.

*F. paradōxa* Endl. Upright shrub to 1.5 m.; brts. slender, grayish white-tomentulose: lvs. cuneate, with 3-7 narrow-oblong lobes decurrent into the linear petiole, 8-15 mm. long, revolute, white-tomentulose beneath: fls. 1-3, 2.5-3.5 cm. across; achenes with feathery tails, 2.5-3.5 cm. long. Fl.vi-viii. B.M.6660(c). E.N.III.3:37. M.G.15:207(h,f). S.L.177,178(h,f). S. Nev. and Utah to n. Mex. Intr. 1877. Zone (V). Slender shrub with conspicuous white fls. and attractive heads of feathery fr.; demands sunny position and well drained soil.

37. *COWANIA* Don. Evergreen shrub: lvs. alternate and partly fascicled, lobed or dentate, petioled, stipulate: fls. terminal on short brts., often polygamous, white or purple; calyx-tube cup-shaped; sepals 5; petals 5, spreading; stamens numerous; pistils 1-12; achenes with persistent plumose style. (After James Cowan, English merchant who intr. many Peruvian and Mexican plants.) About 4 species in the S. W. States and Mex.

*C. Stansburiāna* Torr. Much-branched shrub to 2 m., with rather short stiff pubescent brs.: lvs. 3-5-lobed, with short oblong often cleft or toothed lobes, 6-15 mm. long, with revolute margin, dark green and glandular above, white-tomentulose beneath: fls. sulphur-yellow to white, about 2 cm. across; pedicels 2-8 mm. long, stipitate-glandular; calyx-tube turbinate; achenes usually 2, 4-5 cm. long. Fl.vii-ix. Trans. Linn. Soc. 14:t.22. E.N.III.3:37. (*C. mexicana* Gray, not D. Don.) Nev. and s. Colo. to s. Calif. and n. Mex. Cult. 1904. Zone (V). Aromatic shrub with conspicuous fragrant white fls. and feathery fr.; demands sunny position and well drained soil.

38. *DRYAS* L. MOUNTAIN-AVENS. Evergreen prostrate and suffrutescent plants: lvs. alternate, dentate or entire; stipules adnate to petiole: fls. solitary, slender-pedicled, white or yellowish white; calyx-tube cup-shaped; sepals 8-10, persistent; petals 8-10, oval or obovate; stamens many; pistils many, on a flat torus: achenes with persistent plumose style. (Greek, wood-nymph.) Three species in the n. hemisphere on high mountains and in arctic regions.—Tufted creeping plants with showy white fls. from June to August and feathery fr.; suited for rockeries.

A. Lvs. usually subcordate at base: fls. white; stamens shorter or as long as sepals.

AA. Lvs. usually cuneate at base: fls. yellowish; stamens longer than sepals. 1. *D. octopetala*  
2. *D. Drummondii*

1. *D. octopétala* L. Lvs. elliptic to oblong, usually obtuse, deeply crenate, 1-2.5 cm. long, dark green and glabrous or slightly pubescent above, white-tomentose beneath; petioles 5-15 mm. long: fls. upright, 3-4 cm. across; pedicels 3-12 cm. long, pubescent; sepals linear to linear-lanceolate: achenes with style 2.5 cm. long. Fl.v-vii; fr.vii-x. B.B.2:273. Gt.9:t.286(c). S.E. 3:t.460(c). Gn.87:292. S.L.166(h). N. Am., Eu. and Asia, in Am. s. to Utah and Colo. Cult. 1750. Zone I.—*D. o. asiatica* Nakai, var. Lvs. broad-elliptic to elliptic. N.K.7:t.17. E. Asia. Intr. ?—*D. o. integrifolia* (Vahl) Hook. f., var. Lvs. oblong to oblong-lanceolate, entire or with one or two teeth at base, revolute: fls. slightly smaller. H.E.3:220(c). B.B.2:274. (*D. i.* Vahl.) N. Eu., Arct. Am. Intr. 1824.—*D. o. lanata* (Stein) Schneid., f., is scarcely different from the type.

*D. o. × Drummondii* = *D. Suendermannii* Sünderm. Fls. slightly nodding, yellow in bud, finally white. Gn.M.38:25(h). Orig. before 1920.

2. *D. Drummondii* Hook. Similar to the preceding: lvs. usually oblong, crenate-dentate, to 3 cm.; petioles longer: fls. nodding, campanulate; pedicels often longer, floccose-pubescent; sepals ovate to ovate-lanceolate, glandular-pubescent: achenes with style to 4 cm. long. B.M.2972(c). B.B.2:274. (*D. octopetala* var. *D. S.* Wats.) Arct. Am. s. to Lab., Que. and Mont. Cult. 1830.

*D. tomentosa* Farr with obovate or elliptic lvs. tomentose on both sides, with tomentose not glandular sepals and yellow fls. from the Can. Rockies is probably not in cult.

39. **CERCOCÁRPUS** Kunth. MOUNTAIN-MAHOGANY. Evergreen or half-evergreen shrubs or small trees with hard and heavy wood; buds with several scales, pubescent: lvs. alternate, mostly fascicled, short-petioled, entire or dentate; stipules adnate to petiole, lanceolate, deciduous: fls. perfect, apetalous, small, greenish white or reddish, 1-10 in the axils of fascicled lvs.; calyx-tube cylindric, elongated, abruptly expanded into a cup-shaped 5-lobed deciduous limb, bearing 15-30 stamens with short filaments; ovary 1-celled, enclosed in the calyx-tube; style exserted: fr. a 1-seeded achene wholly or partly enclosed in the calyx-tube, with long plumose style. (Greek *kerkos*, tail, and *karpos*, fruit; referring to the long plumose style of the fr.) About 20 species or perhaps less in w. N. Am. from Ore. to s. Mex.—Grown occasionally in collections; attractive in autumn with their feathery tailed fr.; they demand well-drained soil and sunny position.

A. Lvs. dentate, usually obovate, chartaceous.

B. Lvs. grayish or green beneath.

C. Lvs. glabrous above at maturity and glabrescent beneath.....1. *C. betuloides*

CC. Lvs. pubescent above and tomentulose beneath.....2. *C. montanus*

BB. Lvs. white-tomentose beneath.....3. *C. argenteus*

AA. Lvs. entire, lanceolate, coriaceous, revolute.....4. *C. ledifolius*

1. *C. betuloides* Nutt. Shrub or tree to 10 m.; bark scaly; brts. glabrous or nearly so; lvs. obovate, 1.5-5 cm. long, crenate-serrate above the middle and rounded at apex, sparingly hairy when young, dark green above, paler beneath, with 5-6 pairs of veins: calyx-tube silky-strigose, 8-10 mm. long, sepals obtuse; style in fr. 6-7 cm. long. Fl.v; fr.ix. H.I.322. B.T.f.369. S.H.1:f.318f. W.G.4:554,555. (*C. betulifolius* Nutt., *C. parvifolius* var. *b.* Sarg.) C. and S. Calif. Intr. 1877? Zone VII?

2. *C. montanus* Raf. Shrub to 2 m.; bark persistent, fissured; brts. sparingly pilose when young: lvs. broad-obovate, 2-5 cm. long, rounded at apex, coarsely serrate with ovate teeth, pilose above, finely tomentulose and paler beneath, with 5-6 pairs of veins; petioles 3-6 mm. long: calyx-tube about 1 cm. long, pilose; sepals acute: style in fr. 6-8 cm. long. Fl.v-vi; fr.viii-ix.

B.B.2:274. S.L.122(h). N.V.12:67,70(h). (*C. parvifolius* Nutt.) Mont. and S. Dak. to Utah, N. Mex. and Kans. Cult. 1913. Zone V.

Closely related species: *C. Douglasii* Rydb. Tree to 5 m.: lvs. oblong-obovate, dentate above the middle, with very short teeth, at maturity glabrate above, grayish tomentose beneath; petiole 5-10 mm. long; calyx-tube villous-tomentose. H.I.323. S.S.4:t.166. S.H.1:f.316a-e, 318d-e (as *C. betulaeifolius*). (*C. parvifolius* Nutt., in part.) S. Ore. to Calif. Intr. 1872. Zone VI?

3. *C. argenteus* Rydb. Shrub to 3 m.; young brts. white-villous: lvs. obovate to oblanceolate, 2-4 cm. long, crenate-dentate from the middle, with obtuse teeth, pilose above, white-tomentose beneath, with 4-5 pairs of veins; petioles 2-5 mm. long; calyx-tube silky: styles in fr. 6-7 cm. long. Fl.v; fr. viii. Colo., N. Mex., and Tex. Intr. 1916. Zone VI?

4. *C. ledifolius* Nutt. Tree to 12 m., with furrowed bark; brts. pubescent at first: lvs. narrow-lanceolate to elliptic-lanceolate, 1-3 cm. long, lustrous and glabrate above at maturity, resinous and tomentulose beneath, with obscure veins; petioles 3-5 mm. long; calyx-tube white-villous; sepals acute, tomentose on both sides: style in fr. 5-7 cm. long. Fl.v-vi; fr.viii. H.I.324. S.S.4:t.165. N.S.2:t.51(c). Wash. and Mont. to Calif. and Ariz. Intr. about 1879.

40. *PURSHIA* DC. Deciduous shrub; buds small, scaly: lvs. alternate, partly fascicled, cuneate, 3-lobed; stipules small: fls. perfect, yellowish, solitary and subsessile at end of short brts.; calyx-tube tubular; sepals 5, elliptic to oblong; petals 5, spatulate; stamens about 25; pistil 1, rarely 2; style short, persistent: fr. a pubescent fusiform achene, exceeding the persistent calyx. (After F. T. Pursh or Pursch; 1774-1820; born in Germany; traveled in N. Am. and wrote *Flora Americae septentrionalis*.) Syn.: *Kunzia* Spreng. One species.

*P. tridentata* DC. Spreading shrub to 3 m.; young brts. pubescent: lvs. obovate, gradually narrowed at base, 5-30 mm. long, 3-lobed at apex with obtuse lobes, revolute, slightly pubescent or glabrate above, whitish tomentulose beneath: fls. 8 mm. across; calyx villous and glandular: fr. about 1 cm. long, pubescent. Fl.v; fr.viii. B.R.1446(c). Hooker, Fl. Bor. Am. t.58. S.H. 1:f.315l-p, f.317a. S.L.283(h). Ore. and Calif. to Wyo. and N. Mex. Intr. 1826. Zone V. Distinct and interesting shrub.

Here may be mentioned *Coleogyne* Torr. of doubtful affinity, but usually placed near *Purshia*, though very distinct from it and all related genera on account of the opposite lvs. and brts. and the urceolate disk enclosing the carpel and most of the twisted style. *C. ramosissima* Torr. is a small spinescent shrub: lvs. crowded, linear-clavate, 5-15 mm. long, with 4 grooves beneath: fls. solitary, apetalous, with 4 sepals and many stamens. Torrey, Pl. Fremont. t.4. S.H.1:f. 316p-v. S. Colo. to Ariz. and s. Calif. Intr. ? Zone VII?

41. *CHAMAEBÁTIA* Benth. Half-evergreen glandular-pubescent shrub: lvs. alternate, 3-pinnatifid, stipulate: fls. white, in terminal corymbs; calyx-tube broad-campanulate; sepals lanceolate; petals 5, obovate; stamens numerous; pistil 1, with short style and decurrent stigma: fr. a small obovoid achene, enclosed by the persistent calyx. (Greek *chamaibatos*, a kind of bramble; alluding to the bramble-like fls.) Two species in Calif. and L. Calif.

*C. foliolosa* Benth. Shrub to 1 m.: lvs. nearly sessile, oval or ovate-oblong in outline, 3-7 cm. long, closely 3-pinnately dissected, ultimate segments 0.5-1 mm. long, villous and glandular: fls. 1.5-2 cm. across, in 4-8-fld. corymbs; pedicels 5-20 mm. long. Fl.vii. B.M.5171(c). E.N.III.3:f.18e-g. S.H.1:f.317 g-n. Gn.3:27. Calif. Cult. 1860. Zone VII? Shrub with finely divided aromatic lvs. and white fls.; suited for sunny rockeries.

**42. MARGYRICARPUS** Ruiz & Pav. Evergreen low shrubs: lvs. odd-pinnate with persistent spinescent rachis; stipules adnate to base of petiole, sheathing: fls. perfect, apetalous, 1-3 axillary, sessile, subtended by several bract-like lf.-bases; receptacle tubular, 4-ribbed and with a short spine under each of the 4 calyx-lobes; stamens 1-3; carpel 1 with 1 pendulous ovule; stigma penicillate: fr. berry-like or an angled or winged achene. (Greek *margaros*, pearl, and *karpos*, fruit; referring to the white berry-like fr.) Including *Tetraglochin* Poepp. About 6 species in the Andes from Ecuador to Patagonia.

**M. setosus** Ruiz & Pav. PEARL-FRUIT. Prostrate shrub to 30 cm. high, with ascending or upright yellow to brownish brs. partly covered by the sheathing bases of the petiole: lvs. 1.5-2 cm. long; lfts. 11-17, narrow-linear, revolute at the margin, glabrous except sparingly pilose at apex and on rachis: fls. solitary, inconspicuous: fr. a white berry, 4-5 mm. across, of acid flavor. Ruiz & Pav., Fl. Peruv. t.8. S.H.1:f.318n-q<sup>1</sup>. Ecuador to Patagonia. Cult. 1875. Zone VII? Interesting little shrub attractive in fr.; suited for the rock garden where it demands a well drained sunny position.

A related genus is *Acaëna* L. differing chiefly in the fr. being furnished with hooked spines and in the capitate or spicate infl. About 40 species in Am. and N. Zealand, mostly herbaceous or suffrutescent.—*A. elongata* L. Low upright or prostrate shrub: lvs. 2-6 cm. long; lfts. 9-15, obovate to oblong, 1-1.5 cm. long, crenate, glabrous above, pubescent on midrib beneath; petiole with sheathing base: fls. greenish, small, in axillary peduncled racemes: fr. 7-8 mm. long, usually pubescent between the hooked spines. Mex. to Peru.—*A. e. gracilis* Bitter, var. Lfts. smaller, oblong: racemes usually 7-fld.: fr. glabrescent. S.L.79(h). Mex. Cult. 1912. Zone VII?—The other species in cult. are scarcely woody. The best known is *A. microphylla* Hook f. Prostrate plant forming large patches: lfts. 7-11, suborbicular, 3-7 mm. long, dentate: fls. in globose stalked heads: fr. with red spines. N.L.1:7. N. Zeal. Cult. 1875. Zone VII?

**43. POTERIUM** L. Deciduous low shrub with branched spines: lvs. odd-pinnate, small, with adnate stipules: fls. monoecious, apetalous, greenish, small, in peduncled terminal spikes with pistillate fls. below and staminate above; sepals 4, rarely 3; stamens many; carpels 2, with brush-like stigmas: fr. enclosed in the fleshy globose calyx-tube. (Ancient Greek plant name, also drinking-cup in Greek.) One species.

**P. spinosum** L. Divaricate rigid shrub, to 0.3 m. high: lfts. 7-15, broad-oval, toothed at apex, 1-4 mm. long, pubescent, tomentose beneath: spikes 1.5-2.5 cm. long: fr. red, globose, 3-4 mm. across. Fl.v-v. S.F.10:t.942(c). S.H.1:f.318u-x<sup>1</sup>. (*Sanguisorba spinosa* Bert.) Cult. 1905. Zone VII?

**44. ROSA** L. ROSE. Deciduous or sometimes evergreen shrubs, with upright, climbing or trailing stems, usually prickly, rarely unarmed; lvs. alternate, odd-pinnate, rarely simple, stipulate: fls. solitary or corymbose, at the end of short brts.; sepals and petals 5, rarely 4; stamens numerous; pistils numerous, enclosed in a usually urn-shaped receptacle (hip) which becomes fleshy and berry-like at maturity, enclosing several or many bony achenes. (*Rosa*, its ancient Latin name.) One hundred to 200 species throughout the temp. and subtrop. regions of the n. hemisphere; in N. Am. to n. Mex., in Afr. to Abyssinia, in Asia to the Himal. and Philippine Isls.

The species of this genus are very variable and hybridize easily and the conception of the species varies greatly according to the views of different botanists. While Bentham & Hooker recognized only about 30 species, Gandoger enumerates from Europe and W. Asia alone 4266 species. There is no recent monograph; Crépin's *Primitiae Monographiae Rosarum* (1869-82) is the most important general treatment; for American Roses see Rydberg in N. Am. Fl. xxii: 483-533 (1918); for Asiatic Roses see Boulenger in Bull. Jard. Bot.

Bruxelles, 9:203-279;13:167-266;14:115-221 (1933-36); for European Roses see Boulenger, *Roses d'Europe*, 2 vols. (1924-31) and Keller in Ascherson & Graebner, *Syn. Mitteleur.* Fl.vi.pt.1,32-384 (1900-2). For cult. Roses see Ellen Willmott's *The Genus Rosa* (1910-14). Within the limited space of this book it has not been possible to describe all the spontaneous species which could be grown within our area nor to delve deeply into the numerous horticultural forms.—The Rose has been one of the most favorite flowers, if not the most favorite of all ages, at least in the Occidental World. The economic products of Roses are few, attar of Rose being perhaps the most important; the hips of some large-fruited species are sometimes used for culinary purposes.

Lvs. simple, without stipules: fls. yellow.

Subgen. I. HULTHEMIA

Lvs. pinnate, stipulate.

A. Receptacle smooth or bristly; urn-shaped; achenes on wall and bottom (or only on the bottom in Sect. 4).....Subgen. II. EUROSA

B. Stipules adnate about  $\frac{1}{2}$ , persistent.

C. Styles little or not exerted forming a head closing the mouth of the receptacle (more or less exerted in Nos. 7, 8, 17, 37, 38, 47).

D. Fls. solitary, without bracts, rarely several-fld.

E. Lfts. 5-9 or more, 1-4 cm. long; fls. usually white or yellow.

Sect. 1. PIMPINELLIFOLIAE

EE. Lfts. 3-5, 1-6 cm. long; fls. usually pink or crimson.....Sect. 2. GALLICANAE

DD. Fls. corymbose, with bracts if solitary: lfts. usually 5-11.

E. Stems with usually stout hooked prickles, sometimes mixed with glandular bristles: outer sepals usually pinnate.....Sect. 3. CANTINAE

EE. Stems at least at base with usually straight prickles and bristles: sepals usually entire.

F. Sepals after flowering spreading, deciduous: achenes inserted only at the bottom of receptacle.....Sect. 4. CAROLINAE

FF. Sepals after flowering upright, usually persistent: achenes inserted on wall and bottom.....Sect. 5. CINNAMOMEAE

CC. Styles exerted.

D. Styles united into a column, usually about as long as stamens.....Sect. 6. SYNSTYLAE

DD. Styles free, about half as long as stamens: lfts. usually 3-5.....Sect. 7. INDICAE

BB. Stipules free or nearly so, caducous.

C. Brts. glabrous: lfts. 3-5.

D. Pedicels and receptacle smooth: fls. small, umbellate, yellow or white: stipules subulate.....Sect. 8. BANKSIANAE

DD. Pedicels and receptacle bristly; fls. large, solitary, white: stipules denticulate.

Sect. 9. LAEVIGATAE

CC. Brts. tomentose or pubescent: lfts. 7-9; stipules pectinate: fls. 1 or few with large bracts at base.....Sect. 10. BRACTEATAE

AA. Receptacle prickly, cup-shaped; achenes only at bottom; lfts. not exceeding 2.5 cm.

B. Lfts. 7-15 on flowering brts.: achenes on a slightly raised torus.

Subgen. III. PLATYRHODON

BB. Lfts. 3-7 on flowering brts.: fls. without disk: achenes on a conical torus.

Subgen. IV. HESPERHODOS

#### Subgen. I. HULTHEMIA

#### Subgen. II. EUROSA

1. *R. persica*

#### Sect. 1. PIMPINELLIFOLIAE

Flowering brts. usually prickly and bristly, rarely unarmed; fls. white to pink, sometimes yellow; fr. black.....2. *R. spinosissima*

Flowering brts. only prickly: fr. red.

A. Fls. with 5 petals, yellow, sometimes orange or red.

B. Prickles straight.

C. Lfts. simply serrate, eglandular.

D. Shoots at least at base bristly: lfts. glabrous, rather sharply serrate.....3. *R. Hugonis*

DD. Shoots without bristles: lfts. usually villous when young, crenate-serrate.

4. *R. xanthina*

CC. Lfts. doubly glandular-serrate, glandular beneath.

D. Lfts. glabrous and glandular beneath: sepals not leafy at tip.....5. *R. Primula*

DD. Lfts. pubescent and glandular beneath: sepals leafy at tip.....6. *R. foetida*

BB. Prickles hooked: lfts. simply serrate, bluish green.....7. *R. hemisphaerica*

AA. Fls. with 4 petals, white.....8. *R. omeiensis*

#### Sect. 2. GALLICANAE

Prickles very unequal: lfts. usually doubly glandular-serrate.

A. Lfts. firm, leathery: pedicels upright.....9. *R. gallica*

AA. Lfts. thin, sometimes simply serrate: pedicels nodding.....10. *R. centifolia*

Prickles uniform: lfts. simply serrate, not glandular.

A. Receptacle glandular-hispid: lfts. ovate-oblong, often pubescent beneath.....11. *R. damascena*

AA. Receptacles usually glabrous: lfts. broad-ovate or broad-elliptic, pubescent beneath.

12. *R. alba*

## Sect. 3. CANINAE

Lfts. more or less glandular beneath or often doubly serrate with gland-tipped teeth.

- A. Prickles slender, straight or slightly curved: lfts. tomentose.  
 B. Sepals upright, persistent: fr. large, about 2 cm. across: auricles incurved, falcate.  
 BB. Sepals finally deciduous: fr. smaller: auricles short, divergent.....13. *R. pomifera*  
 AA. Prickles hooked: lfts. glabrous or pubescent beneath.  
 B. Lfts. suborbicular or broad-oval, usually obtuse, glandular on both sides: styles pubescent: sepals long-persistent.....15. *R. Eglanteria*  
 BB. Lfts. ovate or oval, acute or short-acuminate, eglandular above; styles glabrous or nearly so; sepals soon deciduous.....16. *R. micrantha*

Lfts. not glandular except sometimes on midrib; teeth usually simple.

- A. Style exserted: sepals reflexed, deciduous.....17. *R. stylosa*  
 AA. Styles not or little exserted.  
 B. Lfts. pubescent, at least beneath.....18. *R. corymbifera*  
 BB. Lfts. glabrous:  
 C. Lfts. bright or dark green, lustrous above.....19. *R. canina*  
 CC. Lfts. bluish green, tinged with red, dull above, simply serrate, 7-9: brts. bloomy, with few prickles.....20. *R. rubrifolia*

## Sect. 4. CAROLINAE

- A. Stipules more or less convolute, at least on the shoots; prickles hooked: lfts. serrulate.  
 21. *R. palustris*  
 AA. Stipules flat: lfts. rather coarsely serrate.  
 B. Lfts. 5-7: prickles slender, straight.....23. *R. carolina*  
 BB. Lfts. 7-11.  
 C. Infrastipular prickles usually curved: lfts. 7-9, usually elliptic.....22. *R. virginiana*  
 CC. Infrastipular prickles straight, slender: lfts. 7-11, elliptic-oblong to narrow-oblong.  
 D. Brts. densely bristly: pedicels 1-3 cm. long.....24. *R. nitida*  
 DD. Brts. not bristly: pedicels 5-10 mm. long.....25. *R. foliolosa*

## Sect. 5. CINNAMOMEAE

Infrastipular prickles not present.

- A. Brts. and prickles tomentose: lfts. thick, rugose above.....26. *R. rugosa*  
 AA. Brts. and prickles glabrous.  
 B. Brts. and stems bristly.  
 C. Fls. solitary or few: lfts. 3-7, rarely 9.....27. *R. acicularis*  
 CC. Fls. corymbose: lfts. 7-11: low plants.  
 D. Lfts. glabrous, acute.....28. *R. arkansana*  
 DD. Lfts. pubescent at least beneath, usually obtuse.....29. *R. suffulta*  
 BB. Brts. and stems unarmed or the latter with weak bristles when young.  
 C. Lfts. simply serrate, 5-7: fr. subglobose.....30. *R. blanda*  
 CC. Lfts. doubly serrate, 7-9: fr. usually oblong to ovoid.....31. *R. pendulina*

Infrastipular prickles present.

- A. Stipules at least on shoots more or less convolute; prickles curved.....32. *R. cinnamomea*  
 AA. Stipules flat.  
 B. Sepals persistent.  
 C. Lfts. 3-7: brts. prickly, not bristly.  
 D. Styles not exserted.  
 E. Fls. usually several, less than 5 cm. across: lvs. usually simply serrate.  
 F. Prickles straight or nearly so.  
 G. Lfts. puberulous beneath, bright green; stipules broad.....33. *R. pisocarpa*  
 CC. Lfts. glabrous, bluish green; stipules narrow.....34. *R. Woodsii*  
 FF. Prickles curved: lfts. villous beneath.....35. *R. californica*  
 EE. Fls. solitary, 5-6 cm. across: lfts. doubly glandular-serrate.....36. *R. nutkana*  
 DD. Styles exserted; infl. subumbellate: lfts. doubly serrate.....37. *R. corymbulosa*  
 CC. Lfts. 7-15 (5-9 in *R. peretosa* under No. 40, and *R. Forrestiana* under No. 46, and in No. 41).  
 D. Fls. corymbose: lfts. 2-6 cm. long.  
 E. Sepals entire.  
 F. Styles exserted: lfts. acute, 3-6 cm. long.....38. *R. Davidi*  
 FF. Styles not exserted.  
 G. Petals glabrous outside; inflorescence exceeded by the lvs.; lfts. simply serrate.....39. *R. caudata*  
 CC. Petals slightly pubescent outside; inflorescence not exceeded by the lvs.; lfts. usually doubly serrate.....40. *R. setipoda*  
 BB. Sepals pinnate.....41. *R. Hemsleyana*  
 DD. Fls. solitary, rarely several, on short lateral brts.; if corymbose, lfts. less than 2 cm. long.  
 E. Style not exserted.  
 F. Lfts. pubescent beneath, at least on the midrib (see also *R. Fedtschenkoana* under No. 45).  
 G. Brts. with prickles and bristles, lfts. usually doubly serrate, 3-5 cm. long.  
 42. *R. Sweginzowii*  
 CC. Brts. only with prickles: lfts. usually simply serrate, 1-3 cm. long.  
 43. *R. Moyesii*

- FF. Lfts. glabrous, 8-20 mm. long.  
 G. Lfts. acutish, elliptic or ovate, 1.5-2.5 cm. long.....44. *R. bella*  
 GG. Lfts. obtuse, orbicular to oblong, 6-20 mm. long.  
 H. Lfts. serrate above the middle: pedicels short.....45. *R. Webbiana*  
 HH. Lfts. sharply serrate from below the middle: pedicels 1.5-3 cm. long.  
 46. *R. serrata*  
 EE. Styles exerted, nearly as long as stamens: lfts. obtuse, 8-15 mm. long.  
 47. *R. multibracteata*  
 BB. Sepals deciduous, falling off as a whole, together with their base: fls. solitary: lfts. 5-9,  
 8-25 mm. long.  
 C. Stems without bristles: lfts. simply serrate.....48. *R. Willmottiae*  
 CC. Stems bristly and prickly.  
 D. Prickles straight: lfts. glabrous, doubly serrate.....49. *R. gymnocarpa*  
 DD. Prickles hooked: lfts. pubescent beneath, simply serrate.....50. *R. Beggeriana*
- Sect. 6. SYNSTYLAE
- Stipules pectinate; prickles usually infrastipular; styles glabrous. 51. *R. multiflora*
- Stipules entire or denticulate; prickles scattered.
- A. Habit upright, usually with arching brs.  
 B. Lfts. 3-5 on flowering brts., pubescent at least on veins beneath.  
 C. Fls. small, about 1 cm. across: lfts. linear-lanceolate.....52. *R. Watsoniana*  
 CC. Fls. about 5 cm. across: lfts. usually ovate-oblong.....53. *R. setigera*  
 BB. Lfts. 5-9 on flowering brts.  
 C. Lfts. acute or acuminate, 3-10 cm. long; stems often sarmentose.  
 D. Lfts. pubescent, at least beneath.  
 E. Fr. ovoid, 1.5 cm. long; corymb umbel-like: lfts. usually 7-9, pubescent chiefly on the veins.....54. *R. Helenae*  
 EE. Fr. about 1 cm. long; corymb not umbel-like: lfts. 3-7, pubescent beneath all over.  
 F. Lfts. usually 5, glabrous above, sharply and coarsely serrate: brts. glabrous: fr. subglobose .....55. *R. Rubus*  
 FF. Lfts. usually 7, pubescent above: brts. often puberulous: fr. ovoid. 56. *R. Brunonii*  
 DD. Lfts. glabrous or nearly so.  
 E. Lfts. 5-7, green beneath.  
 F. Styles pubescent: fl.-buds gradually acuminate.....57. *R. moschata*  
 FF. Styles glabrous; fl.-buds abruptly acuminate.....58. *R. Maximowicziana*  
 EE. Lfts. usually 5, glaucescent beneath.....59. *R. Ernesti*  
 CC. Lfts. obtuse or acutish, 1-2.5 cm. long, glaucescent: upright shrub.....60. *R. Soulieana*  
 AA. Habit trailing or prostrate.  
 B. Lvs. evergreen or half-evergreen, lustrous on both sides: fls. usually several.  
 C. Lfts. usually 9, obtuse, 8-20 mm. long; stipules dentate.....61. *R. Wichuraiana*  
 CC. Lfts. usually 5, acuminate, 2-5 cm. long; stipules entire.....62. *R. sempervirens*  
 BB. Lvs. deciduous, glaucescent beneath; lfts. usually 7: fls. often solitary.....63. *R. arvensis*

## Sect. 7. INDICAE

Stems with uniform prickles: lvs. glabrous.

- A. Lvs. persistent or semipersistent.  
 B. Fls. white, yellowish or light pink, very fragrant; sepals usually entire: fr. globose or depressed-globose; stipules without or with few marginal glands at the auricles. 64. *R. odorata*  
 BB. Fls. red or pink, rarely whitish, not or slightly fragrant; sepals usually pinnate: fr. ovoid or pyriform: stipules glandular-ciliate.....65. *R. chinensis*  
 AA. Lvs. deciduous: fls. many in a corymb.....66. *R. Noisettiana*
- Stems with prickles and bristles: lvs. slightly pubescent beneath: fls. solitary or few. 67. *R. borboniana*

## Sect. 8. BANKSIANAE

68. *R. Banksiae*

## Sect. 9. LAEVIGATAE

69. *R. laevigata*

## Sect. 10. BRACTEATAE

70. *R. bracteata*

## Subgen. III. PLATYRHODON

71. *R. Roxburghii*

## Subgen. IV. HESPERHODOS

72. *R. stellata*

Subgen. I. HULTHEMIA (Dumort.) Focke. Lvs. simple, estipulate: fls. solitary; receptacle urnshaped, constricted at the mouth by a disk, prickly. (*Hulthemia* Dumort., *Lowea* Lindl., Sect. *Simplicifoliae* Lindl.)

1. *R. persica* Michx. Low shrub, to 0.5 m., with slender yellowish brown prickly brs: lvs. short-petioled, elliptic to oblong, acute at ends, 1.5-3 cm.

long, serrate, bluish green, finely pubescent: fls. solitary, yellow with purple eye, about 2.5 cm. across: fr. globose, prickly. Fl.v-viii. B.M.7096(c). B.R. 1261(c). W.R.1(c). G.C.III.6:8,9,78. (*R. simplicifolia* Salisb., *R. berberifolia* Pall., *Lowea b.* Lindl.) Persia, Afghan. to Song. Intr. 1790. Zone VII? A very distinct and remarkable species, but difficult to grow.

*R. p. × clinophylla* = *R. Hardii* Paxt. Lfts. 1-7, oblong-obovate, glabrous, stipulate: fls. 5 cm. across, pale yellow, with orange eye: calyx-tube pubescent, with few prickles. W.R.7,t(c). P.M.10:t.195(c). G.C.II.24:469. Gn.19:473. Orig. before 1836.

Subgen. II. EUROSA Focke. Lvs. pinnate, stipulate: fls. usually corymbose, sometimes solitary; receptacle urn-shaped, constricted at apex by a disk; achenes basal and parietal: fr. smooth, glandular or setose.

Sect. 1. PIMPINELLIFOLIAE DC. Usually low shrubs; stems usually with straight prickles and bristles: lfts. small, 7-9; stipules narrow, with divergent and dilated auricles: fls. solitary, without bracts; sepals entire, erect and persistent. Eu. and Asia. (Includ. Sect. *Luteae* Crép. and *Sericeae* Crép.)

2. *R. spinosissima* L. BURNETT R. (SCOTCH R.) Low shrub, rarely exceeding 1 m., with spreading or recurving brs.; brts. usually densely prickly and bristly: lfts. 5-11, usually 7-9, orbicular to oblong-ovate, 1-2 cm. long, simply serrate, or doubly glandular-serrate, glabrous, sometimes glandular beneath; stipules entire, rarely glandular-dentate: fls. solitary, but usually very numerous on short brts. along the stems, pink, white or yellow, 2-5 cm. across; pedicels usually glandular-hispid: fr. subglobose, black or dark brown, 1-1.5 cm. across. Fl.v-vi; fr.ix. W.R.247,t(c). B.R.431(c). F.D.25:t. 2623(c). Gn.60:24:74:598;86:306. G.C.70:218. (*R. pimpinellifolia* L., *R. illinoensis* Bak.) Eu., W. Asia; occasionally naturalized in N. Am. Cult. before 1600. Zone IV.—A very variable species: *R. s. pimpinellifolia* (L.) Hook., var. Pedicels smooth.—*R. s. altáica* (Willd.) Rehd., var. More vigorous, less bristly: fls. large, white; pedicels glabrous. W.R.257,t(c). B.R. 888(c). Gn.53:t.170(c). Gng.5:307(h). W.A.104,t(h). (*R. a.* Willd., *R. grandiflora* Lindl.)—*R. s. myriacantha* (DC.) Koehne, var. Brts. very prickly: lfts. doubly glandular-serrate, very small: fls. small, white, blushed. W.R. 261,t(c). R.R.1:gr.6,7.—*R. s. inermis* (DC.) Rehd., var. Brts. almost unarmed: fls. pink. R.R.1:gr.6,6. (*R. s.* var. *mitissima* Koehne, *R. pimpinellifolia* var. *i.* DC.)—*R. s. Andrèwsii* Willm., var. With double red fls. W.R.263, t(c).—*R. s. nana* Andrews. With double white fls. Andrews, Roses, 122(c).—*R. s. hispida* (Sims) Koehne, var. Upright shrub to 2 m.: lfts. usually simply serrate; pedicels smooth: fls. sulphur-yellow, 6-7 cm. across. B.M.1570(c). W.R.259,t(c). Gn.56,t.398(c);62:17. J.L.27:508. (*R. h.* Sims, *R. lutescens* Pursh.)—*R. s. lutéola* Andr. Similar to the preceding var.: lfts. 7: fls. pale yellow, about 5 cm. across. W.R.255,t(c). G.28:281. (*R. ochroleuca* Swartz.)—*R. s. lutea* Bean, var. About 1 m. tall: lfts. broad-oval, to 2.5 cm. long, pubescent beneath: fls. bright yellow. Orig. unknown, possibly a hybrid.

*R. s. × canina* = *R. hibernica* Smith. Shrub to 3 m., with upright or arching stems, bristly and prickly: lfts. 5-9, bluish green, pubescent beneath: fls. usually 3, pink, about 3 cm. across; sepals lobed: fr. globose, red. W.R.289,t(c). Intr. 1802.—*R. s. × pendulina* = *R. reversa* Waldst. & Kit. Shrub to 1.5 m.; stems upright, with slender prickles and bristles: lfts. 5-9, 6-20 mm. long, dark green: fls. solitary, red, 4-5 cm. across; pedicels glandular-bristly: fr. ovoid, 2 cm. long, pendulous, red. F.D.25:t.2624(c). (*R. rubella* Sm.) Eu. Cult. 1820.—Possibly of similar parentage is *R. Mályi* Kern. Shrub to 2 m.: lfts. oval or suborbicular, 1.5-3 cm. long, usually doubly serrate, glabrous: fls. usually solitary, deep red, 3-4 cm. across: fr. oblong-ovoid. W.R.297,t(c). (*R. pendulina* var. *M.* Kern.) Dalmatia. Cult. 1902.—*R. s. × ? tomentosa* = *R. involuta* Smith. Shrub to 3 m.; stems with prickles and bristles: lfts. 5-9, elliptic, simply or doubly glandular-serrate, pubescent beneath: fls. pink or whitish, solitary: fr. globose, red. W.R.281,t(c). Orig. in Scotland.—*R. s. × carolina* = *R.*

*Kochiāna* Koehne. Brts. densely bristly: lfts. 9-11, small: fls. 1-3, deep rose. (*R. oxyacantha* K. Koch, not Bieb.) Orig. before 1870.—*R. s.* × *foetida*; see under No. 6.

Related species: *R. koreāna* Komar. Dense shrub to 1 m.: brts. densely bristly, dark red: lfts. 7-11, elliptic or obovate-elliptic, 1-2 cm. long, obtusish, sharply glandular-serrate, glabrous or slightly pubescent beneath: fls. 2.5-3 cm. across, white, flushed pink; pedicels stipitate-glandular; fr. ovoid, 1-1.5 cm. long, orange-red. N.K.7:t.14. Act. Hort. Petrop. 22:t.11. Korea. Intr. 1917.

3. *R. Hugōnis* Hemsl. Shrub to 2.5 m., with arching brs.; prickles straight, compressed, mixed on the shoots with bristles: lfts. 5-13, oval to obovate or elliptic, 8-20 mm. long, obtuse, sometimes acutish, finely serrate, glabrous or slightly villous on the veins when unfolding: fls. solitary on short brts., light yellow, 5 cm. across; pedicels 1.5-2 cm. long, like the receptacle glabrous: fr. depressed-globose, about 1.5 cm. across, dark scarlet to blackish red. Fl.v-vi; fr.vii-viii. B.M.8004(c). W.R.279,t(c). B.S.2:429. Gn.87:589. S.L. 324(h). Gn.M.31:373(h); 38:37(h). C. China. Intr. 1899. Zone V. Free-flowering and early Rose, one of the best single yellows.

4. *R. xānthina* Lindl. Shrub to 3 m.; brts. brown with stout and straight prickles, shoots without bristles: lfts. 7-13, broad-oval or nearly suborbicular, rarely elliptic, 8-20 mm. long, obtuse, serrate, glabrous above, slightly villous beneath, at least when young: fls. solitary, yellow, double or semidouble, 4 cm. across. Fl.v-vi; fr.vii-viii. N.K.7:t.6. (*R. xanthinoides* Nakai.) Cult. in N. China, Korea. Intr. 1906. Zone V.—*R. x. spontānea* Rehd., f. Fls. single. The wild form. Franchet, Pl. David 1:t.15. N. China, Korea. Intr. 1906. Zone V.

Related species: *R. graciliflora* Rehd. & Wils. Shrub to 4 m.; brs. with few prickles: lfts. 7-9, oval or elliptic, 1-2 cm. long, rounded or acutish at apex, doubly glandular-serrate, glabrous beneath or pubescent on midrib; stipules broad, glandular-ciliate: fls. pale pink, 3-4 cm. across; receptacle ovoid; sepals enlarged at apex and sometimes toothed: fr. red. W. China. Intr. 1932. Zone VI?—*R. Farreri* Stapf. Stem densely bristly below: lfts. 7-9, ovate to elliptic, 5-18 mm. long, acutish, glabrous; stipules narrow, ending in a short tooth: fls. pale pink to white, 2-2.5 cm. across; pedicels 1.2-2.5 cm. long, glabrous; sepals scarcely leafy at tip: fr. ovoid-oblong, coral-red. N. W. China. Intr. 1915. Zone V.—*R. F. persetosā* Stapf, f. Stems densely bristly throughout: fls. salmon-pink. B.M.8877(c). G.C.94:239.

5. *R. Primula* Boulenger. Upright shrub to 2 m.; brts. slender with numerous stout wide-based straight prickles: lfts. 9-15, rarely 7, elliptic or elliptic-obovate to elliptic-oblong, 6-20 mm. long, acute or obtuse, minutely and doubly glandular-serrulate, glabrous, glandular beneath: fls. solitary, 3-4 cm. across, pale yellow or yellowish white; pedicels short, smooth: fr. globose or obovoid, red like its stalk, about 1 cm. long, with reflexed sepals. Fl.v-vi; fr.vii, soon dropping. N.F.8:f.83; 11:f.95(h). (*R. xanthina* auth., not Lindl., *R. Ecae* Rehd., not Aitch.) Turkest. to N. China. Intr. 1910. Zone V. Valued for its early fls. and aromatic young foliage.

Closely related species: *R. Ecae* Aitch. Shrub to 1 m., densely prickly: lfts. 5-9, mostly obovate, 4-8 mm. long, rounded or truncate at apex: fls. 1.5-2 cm. across, yellow, short-stalked, often without lvs. at base. H.I.1329. B.M.7666(c). Afghan. Intr. 1880. Zone VI?

6. *R. foetida* Herrm. AUSTRIAN BRIER. Shrub to 3 m.; stems slender, often sarmentose, brown, with straight prickles: lfts. 5-9, broad-oval or obovate, 1.5-4 cm. long, usually rounded at base, doubly glandular-serrate, dark green above, glandular and slightly pubescent beneath; stipules glandular-serrate: fls. solitary or sometimes several, deep yellow, 5-7 cm. across, of unpleasant odor; pedicels and receptacle smooth; sepals leafy at tip: fr. globose, red. Fl.vi. B.M.363(c). W.R.267,t(c). F.D.25:t.2622(c). Gn.53:22, t(c). (*R. lutea* Mill., *R. Eglanteria* Mill., not L.) W. Asia. Intr. before 1600.

Zone IV.—*R. f. bicolor* (Jacq.) Willm., var. AUSTRIAN COPPER BRIER. Fls. orange-scarlet or coppery-red inside. B.M.1077(c). W.R.269,t(c). Gn.53:23; 55:425. (*R. lutea* prol. *punicea* (Mill.) Aschers. & Graebn., *R. punicea* Mill., *R. b.* Jacq.) Intr. before 1590.—*R. f. persiana* (Lem.) Rehd., var. PERSIAN YELLOW. With double fls. F.S.4:t.374(c). More floriferous than the double Sulphur Rose and fls. smaller, but more double. Intr. 1838.

*R. f. × spinosissima* = *R. Harisonii* Rivers. HARISON'S YELLOW R. Lower, with shorter brs.: fls. paler and less double than Persian Yellow; pedicels and receptacle bristly: fr. nearly black. S.B.11.4:410(c). F.E.18:6. H.B.5:t.99(c). (*R. foetida* var. *H.* Rehd., *R. lutea* var. *Hoggii* Sweet, *R. Vorbergii* Graebn.) Orig. about 1830. Hardier than Persian Yellow.—*R. f. × Eglanteria* = *R. Penzanceana* Rehd. LADY PENZANCE R. Low shrub with arching brs. and hooked prickles: lfts. 7, fragrant: fls. pink with yellow eye. Orig. about 1890.

7. *R. hemisphaerica* Herm. SULPHUR R. Shrub to 3 or 4 m.; stems slender, often sarmentose, with hooked prickles: lfts. 5-9, obovate, 1-3.5 cm. long, rounded at apex, cuneate, coarsely toothed, bluish green, glaucescent beneath and pubescent; rachis pubescent, sparingly glandular: fls. double, scentless, light yellow, 5 cm. across; pedicels glabrous or glandular-hispid; sepals with leafy toothed apex. Fl.vi. W.R.273,t(c). B.R.46(c). (*R. sulphurea* Ait., *R. glaucophylla* Ehrh.) W. Asia. Intr. before 1625. Zone VI? The wild form (*R. Rapinii* Boiss.) with single yellow flowers and globose fr. is not in cult.

8. *R. omeiensis* Rolfe. Shrub to 3 or 4 m.; stems upright, with flattened wide-based prickles, young shoots often bristly: lfts. 9-17, oblong or elliptic-oblong, 8-30 mm. long, acutish, cuneate, serrate, glabrous or puberulous on midrib beneath; petioles puberulous and prickly: fls. white, 2.5-3.5 cm. across; pedicels and receptacle smooth: fr. pear-shaped, 8-15 mm. long, bright red, on a thickened yellow stalk of about equal length. Fl.v-vi; fr.vii. B.M.8471(c). I.S.2:t.81. B.C.5:2996. W. China. Intr. 1901. Zone VI. Distinct shrub with finely divided fernlike foliage; coloring of fr. unique; the stems of *f. pteracantha* conspicuous in winter.—*R. o. chrysocarpa* Rehd., f. Fr. yellow.—*R. o. pteracantha* (Franch.) Rehd. & Wils., f. Prickles much enlarged at base, decurrent and often confluent, forming wide wings, red and translucent when young. B.M.8218(c). Gn.69:300,t(c). G.C.38:260. J.L.27:491. V.F.99(h). (*R. sericea* var. *p.* Fr.) Intr. 1890.

Closely related species: *R. sericea* Lindl. Lfts. 7-11, oval or obovate, 1-2 cm. long, serrate only near apex, silky-pubescent beneath: fr. red, on a slender, not thickened stalk. B.M.5200(c). W.R.163,t(c). R.H.1897:444,445. Himal. Intr. 1822. Zone VII?

Sect. 2. GALLICANAE DC. Upright usually low shrubs: stems usually with hooked prickles mixed with bristles; stipules narrow, adnate: lfts. 3-5, usually firm: fls. few, often with narrow bracts or solitary on a usually bractless pedicel; sepals often lobed, reflexed after flowering, deciduous; styles not exerted. Three or possibly one species in Eu. and W. Asia.

9. *R. gallica* L. FRENCH R. Upright shrub, with creeping root-stock, rarely 1.5 m. tall; stems usually densely covered with prickles and bristles: lfts. 3-5, broad-elliptic or ovate, 2-6 cm. long, obtusish or abruptly acuminate, rounded or subcordate at base, doubly or sometimes simply glandular-serrate, dark green and rugose above, paler and pubescent beneath, firm, deflexed; petiole and rachis bristly and glandular-hispid; stipules glandular-ciliate: fls. solitary, pink or crimson, 4-7 cm. across, on rather long stout pedicels glandular-hispid and bristly; receptacle glandular-hispid; sepals glandular outside: fr. subglobose or turbinate, brick-red. Fl.vi. W.R.325,t(c). F.D.25:t.2634(c). B.M.1377(c). G.H.1:t.89(c). C. and S. Eu., W. Asia; occasionally naturalized in N. Am. Long cult. Zone V.—*R. g. pumila* (Jacq.)

Reg., var. Dwarf form, with creeping root-stock: fls. red, single. R.R.2:gr. 16,12(c).—*R. g. officinalis* Thory. APOTHECARY R. (DOUBLE FRENCH R.) With double fls., otherwise like the typical form. W.R.359,t(c). (*R. g. var. plena* Reg., *R. provincialis* Mill.)—*R. g. Ágatha* Thory. With rather small double pink fls., the outer petals spreading, the inner ones concave. R.R.2:gr.17,17-21.—*R. g. versicolor* L., var. Fls. semidouble; petals striped, white and red. R.R.2:gr.16,12(c). (*R. g. var. rosa-mundi* West.) It has been confused with a similar form of *R. damascena*.

*R. g. × canina* = *R. Waitziana* Tratt. With scattered, usually slightly curved and unequal prickles: fls. rather firm, usually simply serrate, nearly glabrous or pubescent on the midrib beneath; pedicels stipitate-glandular; sepals glandular on back: fls. large, usually deep rose-pink, 6-8 cm. across, often solitary. Eu. Cult. 1874.—*R. W. macrantha* (Desportes) Rehd., var. Prickles nearly equal: fls. nearly glabrous beneath: fls. several; pedicels slightly glandular; fls. flushed rose at first, becoming nearly white. Gn.52:465,t.f.1(c). R.H.1901:541, t.f.2(c). W.R.2:403,t(c). Intr. about 1825.—*R. g. × tomentosa* = *R. Marcyana* Boullu. To 1 m. tall; stems prickly and bristly: fls. 5-7, broad-oval, 2-5 cm. long, pubescent on both sides: fls. pink to light purple, 6-7 cm. across, long-stalked. W.R.335,t(c). (? *R. therebinthina* Bess.) Spont. in S. France.—*R. g. × cinnamomea* = *R. francfortiana* Muenchh. To 2 m.; stems with straight or hooked prickles, flowering brts. nearly unarmed: fls. 5-7, elliptic, serrate, pubescent beneath; upper stipules much dilated: fls. 5-7 cm. across, single or double, purple, slightly fragrant, receptacle at base and pedicels glandular-hispid; sepals erect after flowering, entire or nearly so: fr. turbinate. Fl.vi. F.D.25:t.2628(c). R.R.3:gr.23,1(c). (*R. turbinata* Ait.) Orig. before 1770.—*R. g. × moschata*; see under No. 57.—*R. g. × arvensis*; see under No. 63.—*R. g. × corymbifera*; see No. 12.

10. *R. centifolia* L. CABBAGE R. Closely related to the preceding; taller, to 2 m.; root-stock less creeping; prickles more unequal, partly stouter: fls. usually 5, pubescent on both sides or only beneath, often simple serrate, larger and thinner; rachis not prickly: fls. usually pink, very double, nodding, on long and slender, very glandular pedicels, fragrant; petals inflexed; sepals persistent: fr. ellipsoid to subglobose. Fl.vi-vii. W.R.341,t(c). R.R.2:gr.14, 1-12. G.1:340. (*R. gallica* var. *c.* (L.) Reg.) E. Cauc. Zone V. Only the double form in cult.; known to the ancients.—*R. c. muscosa* (Mill.) Ser., var. Moss R. Fls. rose, with pedicels and calyx glandular-mossy. B.M.69(c). Gn.18:84(c). G.W.7:125.—*R. c. albo-muscosa* Willm. Like the preceding, but fls. white. B.R.102(c). W.R.349,t(c).—*R. c. cristata* Prevost, var. Similar to var. *muscosa*, but the mossy excrescences confined to the edges of the sepals. B.M.3475(c). W.R.351,t(c). G.W.7:125.—*R. c. pompônia* (DC.) Lindl., var. POMPON R. Dwarf: fls. elliptic, about 2.5 cm. long, glabrous above: fls. bright red, double, 3-3.5 cm. across; pedicels densely setose. W.R. 353,t(c). (*R. pulchella* Willd., *R. dijoniensis* Roess.)—*R. c. parvifolia* (Ehrh.) Rehd., var. BURGUNDIAN R. Similar to the preceding: fls. 1-2 cm. long: fls. about 2.5 cm. across; pedicels slightly setose. B.R.452(c). W.R.355,t(c). (*R. p.* Ehrh., *R. burgundensis* West., *R. burgundiaca* Roess., *R. gallica* var. *p.* (Ehrh.) Ser.)

Related species: *R. Richárdii* Rehd. Low shrub with unequal scattered hooked prickles: fls. 3-5, elliptic to ovate-oblong, rugose above, pubescent beneath: fls. few, pale rose, 5-7 cm. across; sepals large, pinnately lobed, leafy at apex. W.R.337,t(c). (*R. sancta* Rich., not Andrews.) Abyss. Cult. 1902. Zone VII?

11. *R. damascena* Mill. DAMASK R. Shrub to 2 m.; stems usually with numerous stout hooked prickles, sometimes mixed with glandular bristles: fls. usually 5, sometimes 7, ovate to ovate-oblong, 2-6 cm. long, simply serrate, glabrous above, more or less pubescent beneath; petioles prickly; stipules sometimes pectinate: fls. blush to red, double, in corymbs, on slender

glandular-hispid and prickly pedicels; sepals reflexed during anthesis, deciduous, glandular-hispid on back like receptacle: fr. obovoid, 2.5 cm. long, bristly, red. Fl.vi-vii. W.R.369,t(c). R.R.2:gr.16,6(c). (*R. belgica* Mill., *R. polyanthos* Roess., *R. gallica* var. *d. Voss.*) Intr. from Asia Minor in the 16th century. Zone IV.—*R. d. versicolor* West., var. YORK AND LANCASTER R. Fls. semi-double, white and striped and blotched pink, or some fls. white and some pink. Lawrance, Coll. Ros. t.10(c). (*R. d. variegata* Thory.)—*R. d. trigintapétala* Dieck, var. With semi-double red fls. Gt.33:129. G.C.III.7:45. Cult. in S. Eu. for the manufacture of attar.

*R. d. × chinensis*; see No. 67.

12. *× R. alba* L. (? *R. corymbifera* *× gallica*.) Upright shrub to 2 m.; stem with unequal hooked prickles, sometimes mixed with bristles: lfts. usually 5, broad-elliptic or ovate to oblong-ovate, 2-6 cm. long, simply serrate, pubescent beneath; upper stipules dilated: fls. more or less double, 6-8 cm. across, white or blush, fragrant, corymbose; pedicels glandular-hispid; receptacle usually smooth above; sepals glandular-bristly, deciduous: fr. oblong-ovoid, 2 cm. long, scarlet. Fl.vi. Andrews, Ros. t.10(c). Origin unknown. Intr. 1597. Zone IV.—*R. a. suaveolens* Dieck, var. Cult. in S. E. Eu. for attar of Roses.—*R. a. incarnata* (Mill.) West., var. Fls. double, white, tinged with pink. W.R.413,t(c). (*R. incarnata* Mill., *R. alba* var. *rubicunda* Roess.)

The closely related *R. collina* Jacq. with rose-colored fls. and shorter sepals is probably of the same origin and referable to *R. alba*.

Sect. 3. CANINAE. Stems upright or arching, usually with numerous hooked or rarely straight prickles; upper stipules dilated: corymbs usually many-fl., with dilated bracts; outer sepals lobed, reflexed after anthesis and deciduous or erect and persistent.

13. *R. pomifera* Herrm. Densely branched shrub to 2 m., with almost straight slender spines: lfts. usually 5-7, on shoots sometimes 9, elliptic to elliptic-oblong, acute or obtuse, 3-5 cm. long, doubly glandular-serrate, grayish green and pubescent above, tomentose beneath and glandular, rarely glabrescent; auricles of stipules spreading or converging: fls. 1-3, pink, 3-5 cm. across; pedicels bristly and stipitate-glandular: fr. usually subglobose, to 2.5 cm. across, hispid, with persistent upright sepals. Fl.vi-vii. B.M. 7241(c). W.R.435,t(c). G.H.t.88(c). F.D.25:t.2632(c). (*R. villosa* L., in part.) Eu., W. Asia. Cult. 1771. Zone V.—*R. p. duplex* (West.) Rehd., f. With semidouble fls. W.R.436,t(c).

Closely related species: *R. mollis* Smith. Low shrub; brts. purplish, bloomy: lfts. silky-tomentose beneath, less glandular, smaller: pedicels sparingly glandular: fr. smaller, not hispid, sometimes stipitate-glandular; sepals short, nearly entire. W.R.417,t(c). (*R. villosa* var. *mollissima* Rau.) Eu., W. Asia. Intr. 1818. Zone V.—*R. Sherardi* Davies. Dense shrub to 2 m.; brs. often zigzag; spines often curved: lfts. broad-oval to elliptic, pubescent above, tomentose beneath, bluish green: fls. deep pink, usually several, exceeded by the basal lvs.; sepals appendaged: fr. ovoid or pyriform, 1.2-2 cm. across, with persistent sepals. (*R. omisa* Deségl.) N. and C. Eu. Cult. 1933. Zone IV.—*R. hawraana* Kmet. Flowering brts. usually unarmed; lfts. elliptic, glabrous above, pubescent beneath: fls. pink, 5 cm. across: fr. globose, densely bristly. W.R.431,t(c). Hungary. Cult. 1914.—Other related species: *R. orientalis* Dup. Dwarf: prickles subulate; young brts. densely pubescent: lfts. 1-2 cm. long, simply serrate, pubescent on both sides: fls. solitary, pink, short-stalked; pedicels villous, glandular and bristly: fr. ellipsoid, sepals upright. S.H.1:f.321k-n.322g. S. E. Eu., W. Asia. Intr. ?—*R. Heckeliana* Tratt. Very similar, but prickles stouter, hooked, and fls. smaller. S. Eu. Intr. ?—*R. elymaifica* Boiss. & Hausskn. Shrub to 1 m., with zigzag pruinose brs.; prickles stout, curved: lfts. usually 5, 5-15 mm. long, tomentose below: fls. pink, small; styles exserted, tomentose; pedicels and receptacle stipitate-glandular: fr. globose, about 1 cm. across; sepals reflexed. S.H.1:f.322g(1). N. Persia. Intr. 1900. Zone VII?

14. *R. tomentosa* Smith. Shrub to 2 m.; brts. often zigzag; young brts. often bloomy; prickles stout, curved or straight: lfts. 5-7, elliptic or ovate, acute or short-acuminate, 2-4 cm. long, doubly serrate, finely pubescent above, tomentose and glandular beneath; stipules with short triangular spreading auricles: fls. pale pink or nearly white, about 4 cm. across; pedicels often glandular-hispid; sepals lobed: fr. subglobose, 1-2 cm. across, stipitate-glandular; sepals usually deciduous before maturity. Fl.vi. W.R.421,t(c). S.E.3:t.467(c). F.D.25:t.2631(c). Gn.77:511. Eu. Cult. 1820; occasionally escaped in the e. states. Zone V.

*R. t.* × *gallica*; see under No. 9.—*R. t.* × *spinosissima*; see under No. 2.

15. *R. Eglanteria* L. SWEET-BRIER. (EGLANTINE.) Much branched shrub to 2 m.; prickles strong, hooked, sometimes mixed with bristles: lfts. 5-7, orbicular to oval, 1-3 cm. long, obtuse or acutish, dark green and glabrous above, pubescent beneath, glandular on both sides, fragrant: fls. 1-3, bright pink, 3-5 cm. across, on short glandular-hispid pedicels; receptacle glandular-hispid: fr. subglobose or ovoid, orange to scarlet, with more or less spreading, tardily deciduous sepals. S.E.3:468(c). D.F.25:t.2630(c). N.D.7:t.7(c). (*R. rubiginosa* L.) Eu.; often naturalized in N. Am. Zone IV. Planted for its aromatic foliage.—*R. E. duplex* West., var. With double fls. W.R.449,t(c).

*R. e.* × *foetida*; see under No. 6.

Closely related species: *R. inodora* Fries. Dense shrub to 2 m.: lfts. elliptic to obovate-oblong, 1.5-3 cm. long, cuneate, pubescent beneath: fls. pinkish or white; pedicels short, usually eglandular. S.H.1:f.323h-i. W.R.469,t(c). (*R. elliptica* Tausch, *R. caryophyllacea* Bess.) Eu. Cult. 1875. Zone V.—*R. sicula* Tratt. Low shrub with slender, nearly straight, subequal prickles: lfts. 5-9, orbicular to elliptic, glabrous and glandular, 6-12 mm. long: fls. usually solitary, 2.5-3 cm. across: fr. small, globose. B.M.7761(c) and G.W.8:17(h), as *R. Seraphinii*. S. Eu., Afr. Intr. before 1894. Zone VII?—*R. glutinosa* Sibth. & Sm. Dwarf; prickles unequal, partly scattered, straight, to 1 cm. long, and partly bristly, gland-tipped and very numerous: lfts. elliptic to obovate, 1-3 cm. long, densely glandular: fls. small, pink: fr. globose, small. S.F.5:t.482(c). W.R.467,t(c). (? *R. tuschetica* Boiss.) S. E. Eu., W. Asia. Intr. 1821.—*R. g. dalmatica* (Kern.) Borh., var. Fr. ellipsoid, 2-2.8 cm. long. B.M.8826(c). (*R. d. Kern.*) Cult. 1882.

16. *R. micrantha* Sm. Much-branched shrub, to 2 m., with arching brs. armed with uniform curved prickles, without bristles: lfts. 5-7, broad-ovate, 1.5-3 cm. long, short-acuminate, doubly glandular-serrate, glabrous or pubescent above, pubescent and glandular beneath: fls. 1-4, pink to white, about 3 cm. across; styles glabrous, somewhat exserted; pedicels glandular-hispid: fr. ovoid or subglobose, with spreading or reflexed deciduous sepals. Fl.vi. W.R.461,t(c). S.E.3:t.469(c). D.F.25:t.2630,mb(c). B.B.2:f.2316(as *R. rubiginosa*). Eu., Mediterr.; often escaped throughout N. Am. Zone V.

Related species: *R. hordida* Fisch. Dwarf, with unequal prickles: lfts. broad-ovate to elliptic, 1-1.5 cm. long, glandular beneath and often above: fls. white, usually 3 cm. across; pedicels short; styles short. W.R.477,t(c). S.H.1:f.323 n-o.324e. (*R. ferow* Bieb., not Lawrance.) S. E. Eu., Cauc., Asia Minor. Intr. 1796.—*R. agrestis* Savi. Shrub to 3 m. with elongated brs.; prickles subequal: lfts. oblong to oblong-obovate, 1.5-5 cm. long, usually cuneate, pubescent or nearly glabrous: fls. whitish or pinkish; pedicels eglandular; style somewhat exserted. W.R.457,t(c). S.E.3:t.470(c). (*R. sepium* Thuill.) Eu., N. Afr. Cult. 1878.—*R. Seraphinii* Viv. Low shrub with copious, unequal, partly hooked prickles: lfts. orbicular-ovate, 5-12 mm. long, glandular beneath, glabrous: fls. solitary, pink, on very short eglandular pedicels; sepals lobed, reflexed after anthesis, finally deciduous. W.R.475,t(c). (*R. Seraphinii* Viv.) Mediterr. Cult. 1914.

17. *R. stylôsa* Desv. Shrub to 3 m., with arching brs.; prickles stout, hooked: lfts. 5-7, elliptic to elliptic-oblong, 1.5-5 cm. long, acute, serrate, lustrous above, pubescent beneath, rarely glabrous, eglandular; rachis pubes-

cent, usually prickly: fls. 1-18, white or light pink, 3-5 cm. across; pedicels glandular; styles usually shorter than stamens: fr. ovoid, outer sepals with many lobes. W.R.47,t(c). S.E.3:t.475(c). S.H.1:f.323s-s\*,324i-k. (*R. systyla* Bast.) Eu. Cult. 1838. Zone V.

18. *R. corymbifera* Borkh. Upright shrub to 3 m., with spreading or arching brs.; prickles stout, hooked: lfts. 5-7, closely set, orbicular-oval to elliptic, 2.5-4 cm. long, rounded or subcordate, usually simply serrate, pubescent on both sides or only below on the veins: fls. 1 to many, 4-5 cm. across; pedicels usually long, glabrous or glandular; sepals soon reflexed, deciduous: fr. ovoid or subglobose, 1.5-2 cm. long, orange-red, usually smooth. Fl.vi. W.R.397,t(c). S.E.3:t.491(c). Gs.3:134(h). (*R. dumetorum* Thuill.) Eu., W. Asia, Afr. Cult. 1838; rarely escaped. Zone V.

*R. c. × gallica*; see No. 12.

Closely related species: *R. coriifolia* Fries. Lower: lfts. usually cuneate at base: fls. short-stalked; bracts large; sepals upright, long-persistent. W.R.391,t(c). S.E.3:t.472(c). Eu., W. Asia. Cult. 1878.—*R. c. Froebellii* (Christ) Rehd., var. Of more vigorous habit: lfts. simply or doubly serrate, bluish green: fls. small, white. (*R. canina* var. *F.* Christ, *R. lawa* Froeb., not Retz.) Cult. 1890.

19. *R. canina* L. Dog R. Shrub to 3 m., with often arching brs.; prickles stout, hooked: lfts. 5-7, oval or elliptic, 2-4 cm. long, doubly or simply serrate, glabrous or slightly pubescent beneath; upper stipules dilated: fls. 1-3, light pink or white, 4-5 cm. across; pedicels usually glabrous, 1-3 cm. long; receptacle ellipsoid, usually smooth; sepals usually lobed, later reflexed and finally deciduous: fr. scarlet, ellipsoid, 1.5-2 cm. long. Fl.vi. W.R.379,t(c). S.E.3:t.474(c). D.F.25:2629(c). N.D.7:t.11(c). B.B.2:f.2312. Eu.; occasionally naturalized in N. Am. Zone III. Much used as stock for grafting.—*R. c. exilis* (Crép.) Keller, var. Low form: lfts. small, 6-10 mm. long: fls. pink, 2.5 cm. across. W.R.385,t(c). (*R. e.* Crép.)

*R. c. × gallica*; see under No. 9.—*R. c. × spinosissima*; see under No. 2.—*R. c. × rubrifolia*; see under No. 20.

Related species: *R. dumalis* Bechst. Brts. often pruinose, very prickly: lfts. close-set, ovate to oblong-ovate, sharply and doubly serrate, bluish green, glaucous beneath: fls. rose-red; pedicels short; sepals lobed, upright, long-persistent. S.H.1:f.324p,325a. (*R. glauca* Vill., not Pourr., *R. Reuteri* God.) Eur., W. Asia. Cult. 1872.—*R. britzensis* Koehne. Prickles slender: lfts. 7-11, elliptic, 2.5-3.5 cm. long, usually simply serrate: fls. 1-2, pale pink, changing to white, 3-4 cm. across: fr. brown, with upright sepals. M.D.1910:94. Gs.4:102. S.H.2:f.593a-e. Kurdistan. Intr. 1901.—*R. montana* Chaix. Prickles nearly straight: lfts. broad-ovate, cuneate, obtuse, often tinged bluish violet: fls. pink; pedicels with purplish black stalked glands and bristles: fr. large, oblong-ellipsoid, with persistent lobed sepals. S.H.1:f.325c-c\*,326b. S. Eu., N. Afr. Cult. 1872.—*R. marginata* Wallr. Prickles straight or nearly straight, rather slender: lfts. 3-7, ovate to elliptic, doubly glandular-serrate, nearly glabrous, usually glandular beneath: fls. pink, 5-7 cm. across; pedicels long, glandular and bristly: fr. subglobose to ellipsoid, smooth; sepals deciduous. W.R.463,t(c). S.H.1:f.321e-f,322f. (*R. Jundzillii* Bess.) Eu., W. Asia. Cult. 1870. Has some resemblance to *R. gallica*.

20. *R. rubrifolia* Vill. Upright shrub to 2 m., with slender purplish bloomy brts.; prickles few, hooked or straight, rather small: lfts. 7-9, elliptic to ovate-lanceolate, 2-3.5 cm. long, simply serrate, bluish green and more or less tinged with purplish red, glabrous: fls. few, deep red, 3-3.5 cm. across; pedicels glabrous or with few bristles; sepals usually entire, longer than petals, deciduous; fr. subglobose, about 1.5 cm. across, bright red, smooth. Fl.vi-vii. W.R.399,t(c). B.R.430(c). G.W.7:139(h). F.D.25:2627(c). (*R. ferruginea* Déségl., not Vill., *R. glauca* Pourr.) Mts. of C. and S. Eu. Intr. 1814. Zone II.—Distinct with its purplish lvs. and purplish stems: fls. rather inconspicuous.

*R. r.* × *canina* = *R. Pokornýana* Borbas. Stems with scattered prickles, purplish when young: lfts. usually 7, elliptic or oval, slightly doubly serrate, bluish green, tinged purple when young: fls. 1-3, deep red, 3.5-4 cm. across; sepals slender, with a few narrow appendages. Hungary. Cult. 1916.—*R. r.* × *rugosa*; see under No. 26.

Sect. 4. *CAROLINAE* Crép. Upright, mostly low shrubs; stems slender, with usually straight paired prickles and often with bristles; upper stipules usually narrow: corymbs usually few-fl.; sepals spreading after flowering, soon deciduous, the outer entire or with few erect lobes; pedicels and receptacle glandular-hispid, rarely smooth; achenes inserted only at the bottom of the usually depressed-globose receptacle.

21. *R. palustris* Marsh. Upright shrub to 2 m., with slender glabrous, sometimes reddish stems: lfts. 7, rarely 9, elliptic to narrow-oblong, acute at ends, 2-5 cm. long, finely serrate, usually pubescent beneath at least on the veins; stipules narrow, involute: fls. usually corymbose, pink, about 5 cm. across; bracts leafy; pedicels short, usually glandular-hispid: fr. about 8 mm. high. Fl.vi-viii. W.R.211,t(c). Em.2:488,t(c). M.N.1:t.43(c). B.B.2:285. (*R. carolina* L. 1762 partly, not 1753, *R. pennsylvanica* Michx.) N. S., Minn., Miss. and Fla. Intr. 1726. Zone IV.

*R. p.* × *virginiana* = *R. Mariae-Graebnerae* Aschers. Lfts. more shining, broader, more coarsely toothed. Fl.vi-rx. Gt.51:t.1504,t.4(c). Orig. about 1880. Also found wild with the parents.—*R. p.* × *rugosa*; see under No. 26.

22. *R. virginiana* Mill. Shrub to 2 m., with few or no suckers; prickles often hooked, only young shoots bristly: lfts. 7-9, elliptic to obovate-elliptic, 2-6 cm. long, usually acute at ends, serrate with ascending teeth, dark green and lustrous above, glabrous or pubescent on veins beneath; upper stipules dilated: fls. usually few, sometimes solitary, 5-6 cm. across; pedicels and receptacle glandular-hispid: fr. 1-1.5 cm. across. Fl.vi-vii. W.R.197,t(c),199, t.308,t(c). N.D.7:t.7,f.2(c). Gt.56:t.1564,f.2(c). Gn.55:428;71:493. B.B.2:285. K.S.175. (*R. lucida* Ehrh., *R. humilis* var. *l.* (Ehrh.) Best, *R. blanda* var. *Willmottiana* Bak.) Nfd. to Va., Ala. and Mo. Intr. before 1807. Zone III. Handsome Rose with lustrous lvs. and bright pink fls.—*R. v. plena* Rehd., var. Fls. double. Andrews, Ros. t.102(c). R.R.2:t,opp.p.7(c). (*R. rapa* Bosc.) Intr. before 1820.—*R. v. lamprophylla* Rehd., var. Of very dense habit, usually lower than 1 m.: lvs. of shoots usually 9-foliolate; lfts. elliptic to obovate, acute or sometimes obtuse, cuneate, very lustrous above; petioles usually reddish. Me. to Conn. Intr. 1881.

*R. v.* × *palustris* = *R. Mariae-Graebnerae*; see under No. 21.

23. *R. carolina* L. Shrub to 1 m., suckering; stems with slender straight prickles, usually very bristly when young; brts. sometimes unarmed: lfts. usually 5, rarely 7, elliptic to lance-elliptic, rarely oblanceolate, 1-3 cm. long, acute or obtuse, sharply serrate with ascending teeth, glabrous, not or slightly lustrous above, paler beneath, pubescent on veins or nearly glabrous; stipules narrow: fls. usually solitary, rose, about 5 cm. across; pedicels and receptacle glandular-hispid; outer sepals lobed: fr. about 8 mm. across. Fl. vi-vii. W.R.201,t(c). M.N.2:t.9(c, as *R. lucida*). B.B.2:f.2314. (*R. humilis* Marsh., *R. parviflora* Ehrh., *R. virginiana* var. *humilis* Schneid.) Me. to Wis., Kans., Tex. and Fla. Intr. 1826. Zone IV. Handsome Rose well suited for borders of shrubberies.—*R. c. grandiflora* (Bak.) Rehd., var. Lfts. usually 7, obovate or oval; fls. about 6 cm. across: W.R.207,t(c). Lindl., Ros. Mon. t.3(c). (*R. obovata* Raf., *R. humilis* var. *g.* Bak., *R. virginiana* var. *g.* Bean.) Me. to Mich., Del. and Mo.—*R. c. glandulosa* (Crép.) Rehd., var. Lfts. doubly glandular-serrate and rachis glandular-hispid or stipitate-glandular. Ont. and Mass. to Fla. and n. Mex. K.S.174(as *R. humilis*). (*R. serrulata* Raf., *R. parviflora* var. *g.* Crép.) Cult. 1902.—*R. c. villosa* (Best) Rehd.,

var. Lfts. 5-7, pubescent beneath: fls. 1-4. House, Wild Fl. N. Y. t.102(c). (*R. humilis* var. *villosa* Best, *R. Lyonii* Pursh.) Mass. to Minn., s. to Ga. and Kans. Cult. 1887.—*R. c. alba* (Rehd.) Rehd., f. A form of the preceding with white fls. W.R.198,t.(c). A.F.12:1098. Gg.5:306. Intr. about 1870.

*R. c. × spinosissima*; see under No. 2.

24. *R. nitida* Willd. Shrub to 0.5 m.; stems densely bristly and with slender prickles 3-5 mm. long: lfts. 7-9, close-set, elliptic to oblong, 1-3 cm. long, finely serrate, lustrous above, slightly pubescent or glabrous beneath; stipules, particularly the upper ones, dilated: fls. solitary or few, rose, 4-5 cm. across; pedicels and receptacle glandular-hispid; sepals usually entire: fr. about 1 cm. across. Fl.vi-vii. W.R.215,t.(c), 217,t. B.B.2:285. Nfd. to Conn. Cult. 1807. Zone III. Handsome dwarf Rose.

*R. n. × californica* = *R. Scharkeana* Graebn. Low shrub; stem with slender prickles, often bristly: lfts. 7-9, oblong, cuneate: fls. 1-5, rose-purple. Gt.51:t.1504,f.2(c). Orig. before 1900.

Related species: *R. rudiocula* Greene. Stems to 1 m., densely bristly: lfts. 5-9, subcoriaceous, elliptic, acute at ends, densely pubescent and pale beneath: fls. few; pedicels usually glandular-hispid. Iowa and Mo. to Okla. Intr. 1917. Zone V.

25. *R. foliolosa* Nutt. Low shrub to 0.5 m.; stem with short, straight, slightly reflexed prickles or nearly unarmed, rarely bristly; lfts. 7-9, rarely 11, narrow- to linear-oblong, 1-3 cm. long, acute, finely serrate, glabrous and lustrous above, glabrous or pubescent on the veins beneath; stipules usually narrow: fls. solitary or few, rose, sometimes white, about 4 cm. across; pedicels and receptacle sparingly glandular-hispid or the latter sometimes smooth: fr. subglobose, about 8 mm. across. Fl.vi-viii. B.M.8513(c). W.R.219,t.(c). G.F.3:101. B.C.5:f.3445. Ark. and Okla. to Tex. Cult. 1880. Zone V.—*R. f. alba* Bridwell, var. Fls. white. Cult. 1919.

Sect. 5. CINNAMOMEAE DC. Upright shrubs; prickles usually straight, in infrastipular pairs or scattered; stems often bristly: lfts. 5-11: infl. usually many-fld. with dilated bracts; sepals usually entire, upright after flowering and persistent, rarely deciduous; receptacle usually smooth.

26. *R. rugosa* Thunb. Upright shrub to 2 m.; stems stout, tomentose, densely bristly and prickly: lfts. 5-9, elliptic to elliptic-obovate, 2-5 cm. long, acute or obtusish, serrate, lustrous and dark green, rugose and glabrous above, glaucescent, reticulate and pubescent beneath, thick and firm; petioles tomentose and bristly: fls. solitary or few, 6-8 cm. across, purple to white; pedicels short, bristly; receptacle smooth: fr. depressed-globose, smooth, brick-red, 2-2.5 cm. across. Fl.vi-viii. W.R.181,t.(c). S.Z.1:t.28(c). B.R.420(c). Gt.30:t.1049;42:537. Gn.52:384,t.(c). G.C.II.14:372. C.L.A.2:76;7:624. (*R. ferox* Ait., *R. Regeliana* André & Lind.) N. China, Korea, Japan; escaped in the N. E. States. Intr. about 1845. Zone II.—Forms of typical *R. rugosa* (*R. r.* var. *Thunbergiana* C. A. Mey.) are: *R. r. typica* Reg., var. With purple fls.; the typical form. (*R. r. rubra* Hort.)—*R. r. rosea* Rehd., var. With rose-colored fls.—*R. r. alba* W. Robins. With white fls. Gn.9:452,t.(c). G.8:261. (*R. r.* var. *albiflora* Koidz.)—*R. r. albo-plena* Rehd., var. With double white fls.—Geographical varieties are: *R. r. Chamissoniana* C. A. Mey., var. Bristles almost absent from the brs.: lfts. narrower and smaller, less rugose. (*R. pubescens* Bak., not Roxb.)—A form with double purple fls. is *R. r. plena* Reg., var. Gt.24:t.846. (*R. r. f. rubroplena* Rehd.)—*R. r. kamtchatica* (Vent.) Reg., var. With slenderer, less densely armed brs., thinner and less rugose lfts. and smaller fls. and fr. B.M.3149(c). B.R.419(c). N.K.7:t.8. (*R. k.* Vent.) Intr. about 1770.—*R. rugosa* is one of the most ornamental and at the same time most vigorous and hardy of the wild Roses,

much planted for its dark green lustrous foliage turning orange and scarlet in autumn, for its large fls. appearing during the whole summer and its large red fruits. Many hybrids have been raised.

*R. r. × arvensis* = *R. Paulii* Rehd. Procumbent shrub with large white fls. in corymbs. Gn.86:286(h). (*R. rugosa repens alba* Paul.) Orig. before 1903.—*R. r. × chinensis* = *R. calocarpa* Willm. With single rose-colored fls. and handsome, abundantly produced fr. W.R.189,t(c),199,t. R.H.1895:446,447. Gn.46:548;52:384. Orig. before 1891.—*R. r. × odorata* (or *dilecta*) = *R. Bruntii* Rehd. Here belongs "Mad. Georges Bruant" (B.C.5:2992) and "Blanc Double de Coubert." Orig. before 1887.—*R. r. × borboniana* = *R. arnoldiana* Sarg. Large semidouble deep crimson fls. Orig. before 1914. The typical form is a cross between *R. r.* and "Général Jacqueminot." The same cross is represented by "Mrs. Anthony Waterer." Orig. before 1900.—*R. r. × palustris* = *R. Spaethiana* Graebn. Fls. corymbose, large, purple. Gt.51:t.1504,f.3(c). Cult. 1902.—*R. r. × blanda* = *R. warleyensis* Willm. Lfts. 5-7, small: fls. pink. W.R.185,t(c). Orig. before 1910.—*R. r. × carolina*. Procumbent shrub with purple fls. W.R.203,t(c). (*R. humilis* × *r. Koehne*.) Orig. before 1893.—*R. r. × Rowburghii* = *R. micrugosa* Henkel. Upright, very prickly shrub: lfts. small, pubescent. Gt.59:t.1581(c). R.H.1905:144. (*R. Vilmorinii* Bean.)—*R. r. × multiflora*; see under No. 51.—*R. r. × Wichuraiana*; see under No. 61.—*R. r. × rubrifolia* = *R. rubrosa* Preston. Brts. less densely spiny and pubescent: lfts. leathery, glabrous and glaucescent beneath; rachis glabrous: fls. large pink. G.C.80:329(h). Cult. 1903; also raised in Ottawa 1920.

27. *R. aciculāris* Lindl. Low shrub, to 1 m.; stems densely bristly with weak prickles; brts. sometimes unarmed: lfts. 3-7, broad-elliptic to oblong, 1.5-5 cm. long, usually acute at ends, simply serrate, dull and glabrous above, pubescent beneath; stipules usually broad: fls. solitary, deep rose, 4-5 cm. across, fragrant; pedicels glabrous, rarely slightly glandular-hispid: fr. usually pear-shaped with distinct neck, 1.5-2 cm. long. Fl.v-vi. W.R.147,149,235,t(c, as *R. Woodsii*). D.L.3:f.244. N.K.7:t.10. (*R. Sayi* Schwein.) Alaska to Wyo., Mich. and N. Y.; N. E. Asia. Intr. 1805. Zone IV.—*R. a. Engelmannii* (S. Wats.) Crép., var. Flowering brts. usually bristly: lfts. doubly glandular-serrate, glabrous and glandular beneath: fr. ellipsoid or pear-shaped, smaller. G.F.2:377. B.C.5:2995. D.L.3:f.245. (*R. E. S. Wats.*) N. D. and Mont. to Colo. Intr. 1891.—*R. a. Bourgeauiana* (Crép.) Crép., var. Lfts. broad-elliptic, usually obtuse, more or less doubly glandular-serrate, slightly pubescent and glandular beneath: fr. subglobose with very short neck. B.C. 5:2994. B.B.2:f.2309(as *R. acicularis*). (*R. B. Crép.*) Ont. to Colo., Mont. and Mackenzie.—*R. a. nipponensis* (Crép.) Koehne, var. Lfts. 7-9, 1-3 cm. long, simply serrate, glabrous; petioles bristly: pedicels glandular-bristly: fr. ovoid, 1.5-2 cm. long. B.M.7646(c). W.R.151,t(c). (*R. n. Crép.*) E. Asia. Intr. 1894.

28. *R. arkansana* Porter. Shrub to 0.5 m.; stems very prickly and bristly: lfts. 9-11, elliptic, 2-6 cm. long, acute, coarsely and sharply serrate, glabrous and lustrous above, glabrous or sparingly pilose on the veins beneath; stipules dilated, glandular-dentate: fls. corymbose, pink, about 4 cm. across; pedicels glabrous: fr. subglobose, 1-1.5 cm. across. Fl.vi-vii. Wisc. and Minn. to Kans. and Colo. Cult. 1917. Zone IV.

29. *R. suffulta* Greene. Low shrub to 0.5 m.; stems densely prickly and bristly, usually green; lfts., 7-11, broadly elliptic to obovate-oblong, 1.5-4 cm. long, usually obtuse, cuneate, simply serrate, finely pubescent on both sides or finally glabrous above; stipules dilated, glandular-dentate; petiole and rachis finely pubescent: fls. corymbose, pink, about 3 cm. across; pedicels and receptacle glabrous; sepals sometimes lobed: fr. globose, about 1 cm. across. Fl.vi. B.B.2:284. (*R. pratincola* Greene, not H. Br., *R. heliophila* Greene.) Alb. and Man. to Ill. and w. Tex. Cult. 1880. Zone III.—*R. s. alba* Rehd., f. Fls. white. Intr. 1901.

30. *R. blanda* Ait. Shrub to 2 m. with slender stems, unarmed or with scattered bristles when young, brown: lfts. 5-7, rarely 9, elliptic to obovate oblong, 2-6 cm. long, usually acute, coarsely serrate, dull and glabrous above, paler and finely pubescent or glabrous beneath: stipules dilated: fls. solitary or few, pink, 5-6 cm. across; pedicels and receptacle smooth: fr. subglobose, about 1.2 cm. across, sometimes ellipsoid. Fl.v-vi. W.R.307,t(c). Miller & Whiting, Wild Fl. 152. B.B.2:233. (*R. Solandri* Tratt., *R. subblanda* Rydb.) Nfd. to Pa., Mo., N. D. and Man. Intr. 1773. Zone II?

*R. b. × chinensis* = *R. Aschersoniana* Graebn. Stems with hooked prickles: fls. very numerous, small, bright light purple; styles usually exserted. Gt.51:t. 1504,f.1(c). Orig. about 1880.—*R. b. × rugosa*; see under No. 26.

31. *R. pendulina* L. Stems slender, to 1 m., usually nearly unarmed, rarely bristly and prickly: lfts. 5-13, oblong-ovate or oblong-elliptic, 2-6 cm. long, obtuse, doubly glandular-serrate, usually pubescent, rarely pubescent on both sides, more densely so beneath; stipules dilated: fls. usually solitary or 2-5, about 4 cm. across, rose or purple; pedicels and receptacle smooth or glandular-bristly: fr. oblong, with neck, usually nodding, 2-2.5 cm. long, bright red. Fl.v-vi. B.R.424(c). W.R.2:293,t(c). F.D.25:t.2625(c). (*R. alpina* L., *R. cinnamomea* L. 1753, not 1759.) Mts. of S. and C. Eu. Cult. 1789. Zone V. Handsome Rose with conspicuous large fr.—*R. p. pyrenaica* (Gouan) R. Keller, var. Dwarf with glaucous brts. and glandular-bristly pedicels and receptacle. B.M.6724(c). G.H.t.93(c). Gn.27:t.544. (*R. p.* Gouan.) Cult. 1815.—*R. p. oxyodon* (Boiss.) Rehd., var. Lfts. 5-9, usually glabrous, teeth acuminate, sometimes simple: fls. 2-7; receptacle smooth; pedicels glandular-bristly. (*R. o.* Boiss., *R. alpina* var. *o.* Boulenger.) Cauc. Cult. 1896. Zone V.

*R. p. × chinensis* = *R. Lheritierana* Thory. BOURSALT R. Climbing to 4 m., sparingly prickly: lfts. 3-7, oblong-ovate, simply serrate, glabrous: fls. in corymbs, light or dark purple, double or semidouble: fr. subglobose, smooth. R.R.3:gr.26,3. W.R.301,t(c). (*R. reclinata* Thory, *R. Boursaultii* Hort.) Orig. before 1820.—*R. p. × spinosissima*; see under No. 2.

32. *R. cinnamomea* L. CINNAMON R. Shrub to 2 m.; stems slender with short curved prickles, often unarmed: lfts. 5-7, rarely 3, elliptic to oblong, obtuse or short-acuminate, 1.5-4 cm. long, simply serrate, dull green and pubescent above, densely pubescent beneath: stipules dilated, more or less convolute: fls. solitary or few, purple, about 5 cm. across; pedicels 2-3 cm. long, like the receptacle smooth: fr. depressed-globose, 1.2-1.5 cm. thick, scarlet. Fl.v-vi. W.R.141,t(c). D.F.25:t.2626(c). A.G.13:343. (*R. spinosissima* L. partly.) Eu., N. and W. Asia, occasionally escaped in N. Am. Cult. 1596. Zone IV.—*R. c. plena* West., var. With double fls. W.R.143,t(c). R.R.1:gr.9,1(c). B.C.5:2993. (*R. majalis* Herrm., *R. foecundissima* Muenchh.) Cult. before 1770. Sometimes escaped in the E. States.

*R. c. × gallica*; see under No. 9.

Closely related species: *R. davurica* Pall. Prickles straight and slender: lfts., doubly serrate, glandular; stipules narrow: pedicels longer, glandular: fr. ovoid. N.K.7:t.9. S.H.1:f.327c.328b-b<sup>1</sup>. (*R. cinnamomea* var. *d.* C. A. Mey.) N. China, N. E. Asia. Intr. 1910. Zone V.—*R. laxa* Retz. Prickles hooked or straight: lfts. 7-9, glabrous or pubescent beneath: fls. several, white; pedicels glandular: fr. ovoid. S.H.1:f.325l-l<sup>2</sup>. Turkest., Song. Cult. about 1800.—*R. amblyotis* C. A. Mey. Prickles slender, straight, pointing upward; lfts. rarely 9, elliptic-oblong or oblong-ovate, 3-5 cm. long, usually acute, sharply serrate, puberulous beneath at least on midrib: pedicels slender, to 2 cm. long, glabrous; fls. 5 cm. across, red; sepals caudate: fr. depressed-globose or pyriform. Kamchatka. Cult. 1917. Zone II?—*R. Marréti* Lévl. Brts. dark purple; prickles slender, straight: lfts. usually 7, oblong, 2-4 cm. long, obtusish to acute, thinly pubescent beneath: fls. 1-3, pink; pedicels and calyx-tube smooth; sepals

caudate, entire, stipitate-glandular on back: fr. subglobose. W.R.2:495,t. Saghalin. Cult. 1908. Zone II?

33. *R. pisocarpa* A. Gr. Shrub to 2 m.; stems slender, with weak slender usually ascending prickles 2-5 mm. long: lfts. 5-7, elliptic-oblong to oblong-obovate, 1-4 cm. long, acutish or obtuse, coarsely serrate, green and finely pubescent beneath, short-petioluled; upper stipules dilated, slightly glandular-dentate: fls. corymbose with leafy bracts, pink, about 3 cm. across; sepals glandular-hispid on back: fr. globose, sometimes with short neck, 8 mm. across. Fl.vi-viii. B.M.6857(c). W.R.227,t(c). B. C. to Calif. and Idaho. Intr. about 1882. Zone V.

34. *R. Woodsii* Lindl. Shrub to 2 m.; stem with numerous straight or slightly curved prickles: lfts. 5-7, obovate to oblong-obovate, petioluled, 1-3 cm. long, simply serrate, glaucous and glabrous or nearly glabrous beneath; stipules entire or slightly toothed, like the petiole usually glandless, rather narrow: fls. 1-3, pink, rarely white, 3-4.5 cm. across; pedicels and receptacle glabrous: fr. globose, rarely ellipsoid and with distinct neck, 8-10 mm. thick. Fl.vi-viii. W.R.236,t(c). (*R. Maximiliani* Nees, *R. Sandbergii* Greene.) Sask. and B. C. to Kans. and Utah. Cult. 1880. Zone III.—*R. W. Fendleri* (Crép.) Rydb. Lower, with straight slender prickles; stipules and petioles glandular; lfts. usually doubly glandular-serrate. W.R.175,t(c),177,t. B.B. 2:f.2311 (as *R. Woodsii*). (*R. F. Crép.*) B. C. and Minn. to Ariz. and Chihuahua. Cult. 1888.

Closely related species: *R. Macounii* Greene. Stems with straight prickles, bristly when young: lfts. obovate, pale or glaucous and finely puberulent beneath. B.R.926 (c, as *R. Woodsii*). (*R. Woodsii* Lindl. 1826, not 1820.) B. C. to Sask., Ore., Neb. and W. Tex. Intr. before 1826.

35. *R. californica* Cham. & Schlecht. Shrub to 3 m., with stout flattened, recurved prickles 5-8 mm. long; young shoots sometimes bristly; flowering brts. usually prickly: lfts. 5-7, broad-elliptic to oblong-obovate, 1-3 cm. long, usually obtuse, usually simply serrate, not glandular, dull and appressed-pubescent above, villous beneath: fls. in leafy-bracted corymbs, pink, about 4 cm. across; sepals villous outside; pedicels glabrous or slightly villous: fr. globose, with a distinct neck, 1-1.5 cm. across. Fl.vi-viii. Armstrong, Field Book Wild Fl. 221,f. Ore. to L. Calif. Cult. 1878. Zone V.—*R. c. plena* Rehd., f. With double or semidouble fls. W.R.223,t(c).—*R. c. nana* Bean., var. Dwarf form.

*R. c. × nitida*; see under No. 24.

36. *R. nutkana* Presl. Shrub to 1.5 m.; stems usually dark brown, upright, with rather large straight prickles; young stems sometimes bristly: lfts. 5-9, broad-elliptic or oblong-ovate, 1.5-5 cm. long, acute or obtuse, doubly glandular-serrate, dark green and glabrous above, somewhat glandular-puberulous beneath, rarely slightly pubescent on veins; upper stipules dilated, glandular-dentate, glabrous; fls. usually solitary, 5-6 cm. across, rose, rarely white; pedicels 2-3 cm. long, usually slightly glandular-hispid; receptacle glabrous: fr. globose, without neck, 1.5-1.8 cm. across. Fl.vi-vii. W.R.231,t(c). G.F. 1:449. B.C.5:2993. Alaska to Wyo. and Calif. Intr. about 1876. Zone V.—*R. n. hispida* Fern., var. Lfts. coarsely serrate; receptacle glandular-hispid. (*R. MacDougalii* Holz.) B. C. to Utah.

Related species: *R. Spaldingii* Crép. Lfts. 5-7, oval, usually obtuse, with simple scarcely glandular teeth, puberulent beneath; pedicels glabrous. B. C. to Ore. and Utah. Cult. 1915. Zone V.—*R. oreophila* Rydb. Stems usually with weak curved prickles: lfts. 5-7, oval or ovate, 2-3.5 cm. long, simply serrate, finely pubescent beneath; pedicels glabrous. Colo. Intr. 1898. Zone V.

37. *R. corymbulosa* Rolfe. Shrub to 2 m.; stems upright or sarmentose: brs. with few slender straight paired prickles or unarmed: lfts. 3-5, ovate-oblong, 2-4 cm. long, acute, finely doubly serrate, dull green and slightly pubescent above at first, glaucescent and pubescent beneath; rachis puberulous and sparingly glandular; stipules narrow and glandular-ciliate: fls. red with white eye, 2-2.5 cm. across, in umbel-like many-fl. corymbs; pedicels slender, about 2 cm. long, like the receptacle glandular-bristly; styles pubescent, exserted; fr. subglobose or ovoid 1-1.3 cm. long, scarlet. Fl.vi-vii. B.M. 8566(c). G.C.79:23. W. China. Intr. 1908. Zone V. Handsome Rose with numerous small fls.

38. *R. Davidi* Crép. Shrub to 3 m.; stems with straight stout scattered prickles 4-6 mm. long, much enlarged at base: lfts. 7-9, rarely 11, elliptic to ovate-oblong, 2-4, rarely 6 cm. long, simply serrate, glabrous above, glaucescent and puberulous beneath; rachis puberulous, sparingly prickly: fls. pink, 3.5-5 cm. across, corymbose; pedicels like the oblong receptacle glandular-bristly or sometimes only puberulous; styles exserted about 3 mm.: fr. ovoid or oblong-ovoid, 1.5-2 cm. long, with long neck, scarlet. Fl.vi-vii. B.M.8679 (c). G.C.78:423. W. China. Intr. 1908. Zone V.—*R. D. elongata* Rehd. & Wils., var. Lfts. 5-7 cm. long: fls. fewer: fr. 2-2.5 cm. long. Gs.16:1(c). Intr. 1908. Handsome in fr.

39. *R. caudata* Bak. Shrub to 4 m.; stems with scattered straight stout prickles to 8 mm. long, broad at base: lfts. 7-9, elliptic-ovate or ovate to oblong-ovate, 2.5-5 cm. long, acute, simply serrate, glabrous and glaucescent beneath: rachis smooth or sparingly prickly and glandular-bristly; stipules rather broad, glandular-ciliate; fls. red, 3.5-5 cm. across, in few-fl. corymbs; pedicels and receptacle glandular-bristly, rarely nearly smooth; sepals entire, long-caudate, with leafy apex: fr. oblong-ovoid, with long neck, 2-2.5 cm. long, orange or coral-red; sepals upright. Fl.vi. W. China. Intr. about 1896. Zone V.

Related species: *R. banksiopsis* Bak. Prickles few or stems unarmed above: lfts. 7-9, oblong, usually pubescent beneath: fls. 2-3 cm. across; pedicels and receptacle glabrous. W.R.505(fr). W. China. Intr. 1907 or 1909.—*R. macrophylla* Lindl. Large shrub, with few prickles or unarmed: lfts. 9-11, elliptic-ovate to elliptic-oblong, 2.5-6 cm. long, acute, pubescent beneath: fls. 1-3, red, about 5 cm. across; pedicels and receptacle glandular-setose or smooth: fr. oblong-ovoid, 2.5-3 cm. long. W.R.157,t(c).159,t. Himal. Intr. 1818. Zone VI.

40. *R. setipoda* Hemsl. & Wils. Shrub to 3 m.; stem with infra-stipular, straight wide-based prickles to 8 mm. long: lfts. 7-9, elliptic or ovate, 3-6 cm. long, obtuse or acutish, usually doubly serrate, dark green and glabrous above, glaucous and usually glandular beneath and puberulous on the veins or sometimes glabrous; stipules broad, densely glandular-ciliate; rachis sparingly prickly and stipitate-glandular: fls. pale pink to rose-purple, about 5 cm. across, in loose corymbs; pedicels and receptacle copiously glandular-setose; sepals long-caudate, with foliaceous serrate tips; petals slightly pubescent outside: fr. oblong-ovoid, with narrow neck, about 2.5 cm. long, deep red. Fl.vi. J.L.27:486. (*R. macrophylla* var. *crasse-aculeata* Vilm.) C. China. Intr. 1895. Zone (V).—Conspicuous in June with its large pink fls. and in fall with its nodding clusters of red hips.

*R. s.* × *Moyesii*; see under No. 43.

Related species: *R. persetosia* Rolfe. Stems densely bristly; lfts. 5-9, 2-5 cm. long, simply serrate, puberulous beneath; rachis puberulous: fls. deep pink, 2-3 cm. across, in large corymbs; pedicels and receptacle glabrous; sepals entire. J.L.27:487,488. (*R. Davidi* var. *p.* Boulenger.) W. China. Intr. 1895. Zone V.

41. *R. Hemsleyana* Täckholm. Shrub to 2 m.; stem with few mostly infrastipular prickles: lfts. 7-9, rarely 5, oval or elliptic, 2-5 cm. long, acute or obtuse, slightly doubly glandular-serrate, glabrous beneath or pubescent on the veins; stipules broad, glandular-ciliate; rachis stipitate-glandular and with few small prickles: fls. 3-11, pink, 3-5 cm. across; pedicels 1-3 cm. long, densely glandular-setose; sepals caudate with broad serrate tip and lateral appendages: fr. ovoid-oblong, with long neck, about 2.5 cm. long. Fl.vi; fr.ix-xi. B.M.8569(c). C. China. Intr. 1904. Zone V?

42. *R. Sweginzówii* Koehne. Shrub to 5 m.; stems with large compressed prickles, sometimes mixed with smaller prickles: lfts. 7-11, elliptic to ovate-oblong, acute, 2-5 cm. long, doubly serrate, glabrous above, pubescent beneath, more densely on the veins; rachis prickly and glandular; stipules wide, glandular-ciliate: fls. 1-3, rose, about 4 cm. across; pedicels and receptacle glandular-hispid; sepals sparsely lobed and serrate at apex: fr. oblong, about 2.5 cm. long, bright red. Fl.vi. I.S.2:t.80. M.D.1910:96. G.C.72:135. Gn.87:588. N. W. China. Cult. 1910. Zone V.

Related species: *R. Murielae* Rehd. & Wils. Shrub to 2.5 m.; stems with slender prickles and bristles: lfts. 9-15, elliptic to elliptic-oblong, 1-4 cm. long, acutish, pubescent on midrib beneath: fls. white, in 3-7-fl. corymbs; sepals entire: fr. ellipsoid, 1-2 cm. long. W. China. Intr. 1904. Zone (V).

43. *R. Moyesii* Hemsl. & Wils. Shrub to 3 m.; stems with scattered and paired short straight prickles: lfts. 7-13, ovate or elliptic to oblong-ovate, 1-4 cm. long, acute, closely serrulate; glabrous except pubescent on midrib beneath; rachis puberulous, glandular and bristly; stipules wide, glandular-ciliate: fls. 1-2, deep blood-red, 4-6 cm. across; pedicels short, stipitate-glandular; receptacle stipitate-glandular or smooth; sepals ovate, long-caudate; fr. oblong-ovoid, narrowed into a neck, 5-6 cm. long, deep orange-red. Fl.vi. B.M.8338(c). W.R.229,t(c),230,t. J.L.27:489. B.S.2:435. G.C.70:219. Gn.72:313. V.F.95(h). (*R. macrophylla* var. *rubrostaminea* Vilm.) W. China. Intr. 1894 and 1903. Zone (V). Handsome Rose, particularly the type with dark red fls.—*R. M. Fargèsii* Rolfe, var. Lfts. broad-oval to suborbicular, 1.2-2 cm. long, obtuse. G.C.65:19. Gn.86:543;87:590. Cult. 1900?—*R. M. rósea* Rehd. & Wils., f. Lfts. more coarsely serrate; fls. light pink. B.M.9248(c). (*R. holodonta* Stapf.) Intr. 1908.

*R. M.* × *Willmottiae*; see under No. 48.—Other hybrids of *R. Moyesii* are: *R. wintoniensis* Hillier (*R. M.* × *setipoda*) and *R. highdownensis* Hillier (*R. M.* × ?) Gs.18:166.

Related species: *R. saturata* Bak. Stems unarmed or with few small prickles: lfts. usually 7, ovate to ovate-lanceolate, 2.5-6 cm. long, acute or short-acuminate, sharply serrate, pubescent on the veins beneath or nearly glabrous: fls. solitary, dark red, 5 cm. across; anthers purple; pedicels glabrous: fr. globose-ovoid, 1.5-2 cm. long, coral-red. C. China. Intr. 1907. Zone (V).

44. *R. bélla* Rehd. & Wils. Shrub to 3 m.; stems with slender straight prickles, bristly near base: lfts. 7-9, elliptic or ovate, 1-2.5 cm. long, acutish, rarely obtusish, simply serrate, glaucescent beneath, glabrous except stipitate-glandular on midrib; upper stipules broad, glandular-ciliate: fls. 1-3, bright rose, 4-5 cm. across; pedicels 5-10 mm. long, like the receptacle stipitate-glandular; sepals caudate, leafy and entire at apex: fr. ellipsoid, attenuate into the neck, 1.5-2 cm. long, scarlet. Fl.vi. I.S.2:t.79. N. China. Intr. 1910. Zone V.—*R. b. pállens* Rehd. & Wils., f. Fls. light rose-colored. Intr. 1910.

45. *R. Webbiána* Royle. Slender shrub to 2 m.; brs. slender, often pruinose when young, with straight yellow prickles about 1 cm. long: lfts. 5-9, orbicular to obovate or broad-elliptic, 6-20 mm. long, rounded at apex,

rarely acutish, serrate, entire toward the base, glabrous or sometimes slightly pubescent beneath; petiole prickly: fls. pale pink, 4-5 cm. across; pedicels short, glabrous or slightly glandular; sepals lanceolate, entire, glandular outside: fr. ovoid, 1.5-2 cm. long, bright red. Fl.vi. W.R.233,t(c). Himal. to Afghan. and Turkest. Intr. 1879. Zone (V).

Related species: *R. Fedtschenkoana* Reg. Stems with prickles and bristles: lfts. 7-9, oblong, 2-3 cm. long, pubescent beneath: fls. 1-4, white; pedicels and receptacle hispid. B.M.7770(c). W.R.155,t(c). Turkest. Intr. 1876?

46. *R. sertata* Rolfe. Slender shrub to 2 m.; brs. glaucous, with straight slender prickles: lfts. 7-11, oval to narrow-elliptic, 6-20 mm. long, obtuse or acutish, sharply serrate, glabrous, glaucescent beneath; stipules glandular-ciliate: fls. 1 or few, rose or rose-purple, 5-6 cm. across; pedicels 1.5-3 cm. long, glandular or glabrous; sepals caudate, entire: fr. ovoid, 1.5-2 cm. long, deep red. Fl.vi. B.M.8473(c). W.R.153,t(c). G.C.54:166. C. and W. China. Intr. 1904. Zone V. Handsome graceful Rose.

Related species: *R. Giraldii* Crép. Brts. with slender prickles: lfts. usually 7, suborbicular to ovate or elliptic, serrate, pubescent: fls. pink, 2.5 cm. across; pedicels short, like the receptacle glandular-setose: fr. ovoid, about 1 cm. long, scarlet. C. China. Intr. ?1897.—*R. G. venulosa* Rehd. & Wils., var. Lfts. firmer, reticulate beneath, often glabrous or nearly glabrous above. Intr. 1907. Zone V?—*R. Pratii* Hemsl. Stems prickly and bristly or without bristles: lfts. 7-15, elliptic to oblong, 6-15 mm. long, obtusish, serrate, pubescent on the veins beneath; rachis puberulous: fls. 1 or several, 2 cm. across, pink, sepals ovate, abruptly acuminate; pedicels and receptacle glandular-bristly: fr. subglobose to ovoid, 6-10 mm. long; sepals finally deciduous. W. China. Intr. 1903 or 1908. Zone V.—*R. elegantula* Rolfe. Shrub to 2 m.; brts. usually densely bristly: lfts. 7-9, elliptic or elliptic-ovate, 1-2 cm. long, obtuse, usually simply serrate, glaucous: fls. deep pink, 2.5-3 cm. across; pedicels and the ovoid-oblong receptacle smooth. W. China. Cult. 1900. Zone V.—*R. Forrestiana* Boulenger. Shrub to 2 m.; lfts. 5-7, rarely 9, oval to obovate, 1-2 cm. long, rounded at apex, glabrous or pubescent on midrib beneath, teeth simple or nearly so: fls. 1 or few, with large bracts at base, rose, 2-3.5 cm. across; styles exserted; pedicels 8-15 mm. long, stipitate-glandular. Bull. Jard. Bot. Bruxelles, 14:127. W. China. Cult. 1922. Zone VII?

47. *R. multibracteata* Hemsl. & Wils. Shrub to 2 m.; brts. slender, glabrous, with slender straight paired prickles: lfts. 7-9, broad-oval to suborbicular, 6-15 mm. long, obtuse, doubly serrulate, glabrous or pubescent on midrib beneath; rachis glandular and often with few small prickles: fls. pink, 3 cm. across, paniculate or corymbose, with many crowded bracts; pedicels and receptacle glandular-bristly; sepals ovate, abruptly acuminate, entire; styles villous, exserted about 4 mm.: fr. ovoid, 1-1.5 cm. long, orange-red. Fl.vi. G.C.100:23. Gt.81:253. W. China. Intr. 1910. Zone VI.

48. *R. Willmottiae* Hemsl. Densely branched shrub to 3 m.; stems with straight paired prickles, glaucous when young: lfts. 7-9, elliptic to obovate or nearly orbicular, 6-15 mm. long, usually rounded at apex, closely and often doubly serrate, glabrous: fls. usually solitary, rose-purple, about 3 cm. across; pedicels about 1 cm. long, glabrous; sepals lanceolate, caudate, smooth: fr. subglobose, about 1 cm. long, orange-red. Fl.vi. B.M.8186(c). Gn.87:588. S.L.323(h). W. China. Intr. 1904. Zone V?

*R. W. × Moyesii* = *R. pruhoniciana* Zeman. Dense shrub with bright pink fls. (*R. Hillieri* Hillier.) Orig. about 1920.

49. *R. gymnocarpa* Nutt. Shrub to 3 m.; stems with paired very slender prickles and bristles: lfts. 5-9, broad-elliptic to elliptic-oblong, 1-3.5 cm. long, doubly glandular-serrate, glabrous; stipules glandular-ciliate and dentate: fls. usually solitary, rose, about 3 cm. across; pedicels glabrous or glandular-hispid: fr. ellipsoid or subglobose, 6-8 mm. across. Fl.vi-vii. W.R.221,t(c). B. C. to Calif. and Mont. Intr. 1893. Zone V.

Related species: *R. Albérta* Reg. Shrub to 1 m.; stems densely prickly and bristly: lfts. orbicular to obovate or ovate, 6–30 mm. long, often doubly serrate, appressed-pubescent beneath: fls. white, about 3 cm. across; pedicels glandular; receptacle smooth: fr. pear-shaped, 1.5–2 cm. long. Turkest. Intr. 1877. Zone V.

50. *R. Beggeriāna* Schrenk. Much-branched shrub to 2.5 m.; stems with hooked paired and scattered prickles: lfts. 5–9, oval or elliptic-obovate, 8–25 mm. long, simply serrate, pubescent beneath or glabrous, bluish or grayish green; fls. in several- or many-fl. corymbs, rarely solitary, white, rarely pink, 2–3 cm. across; pedicels and receptacle glandular or smooth; fr. subglobose, 6–8 mm. across, red, finally dark purple. Fl.vi; fr.viii–ix. W.R.171,t(c). I.T. 5:t.122. S.H.1:f.325i-k, 326k-l. N. Persia to Altai and Song. Intr. 1881. Zone III.

Sect. 6. *SYNSTYLAE* DC. Stems climbing, trailing or sarmentose, rarely upright, with hooked prickles: fls. in corymbs, outer sepals pinnate, rarely entire, caducous; style connate into a slender exerted column.

51. *R. multiflora* Thunb. Vigorous shrub with long reclining or climbing brs.: lfts. usually 9, obovate to oblong, 1.5–3 cm. long, acute or obtuse, serrate, pubescent: fls. in many-fl. pyramidal corymbs, 1.5–2 cm. across, usually white; sepals ovate, abruptly acuminate; styles glabrous: fr. small, globular. Fl.vi–vii. B.M.7119(c). G.F.3:405,4:535(h). Gt.67:185(h). Gg.5:120(h), 121. (*R. polyantha* Sieb. & Zucc., *R. intermedia* Carr., *R. Wichurae* Koch.) Japan, Korea. Intr. before 1868. Zone V.—*R. m. Thunbergiana* Thory is the typical form described above, with small white fls. and pubescent pedicels.—*R. m. calva* Franch. & Sav., var. Lfts. pubescent beneath only on midrib: fls. small, white or pinkish; pedicels glabrous. (*R. c. Boulenger*.) Japan. N. and C. China.—*R. m. cathayensis* Rehd. and Wils. Fls. pink, 2–4 cm. across, in few- to many-fl. rather flat corymbs; pedicels glabrous, sometimes glandular. Gn.89:35(h). (*R. calva* var. *c. Boulenger*, *R. c. Bailey*, *R. Gentiliana* Lévl. & Vant.) China. Intr. 1907.—*R. m. carnea* Thory. A form of the preceding with double light pink fls. B.M.1059(c). B.R.425(c). (*R. m. var. plena* Reg., *R. florida* Poir.) Intr. 1804.—*R. m. platyphylla* Thory. SEVEN SISTERS ROSE. Similar to the preceding, but lvs. larger and fls. deep pink. B.R.1372(c). Intr. 1817. Closely related to this form is the well known "Crimson Rambler." A.G.16:233.

*R. m. × rugosa* = *R. Iwara* Sieb. with single, rather small white fls. W.R. 193,t(c). (*R. yedoensis* Mak.)—*R. m. × chinensis*. Here belong the Polyantha Roses (*R. polyantha* Hort., not Sieb. & Zucc. nor Roessig.) Upright low shrubs with numerous, rather small double fls. Gn.29:118,t. R.H.1884:501(h). Also "Baby Rambler" (*R. m. × chinensis minima*) belongs here.—*R. m. × moschata*. Here probably belongs the Rose known as *R. polyantha grandiflora*. W.R.34, t(c).—*R. m. × borboniana* "Général Jacqueminot." Here belongs the "Dawson Rose" (*R. Dawsoniana* Hort., not Ellw. & Barry which is typical *R. multiflora*.) G.F.6:316(h), 317. G.W.7:125(h).—*R. multiflora* × *Wichuriana*; see under No. 61.

52. *R. Watsoniana* Crép. Shrub with sarmentose or recurving brs.: lfts. 3–5, linear-lanceolate, with entire wavy margin, 2.5–6 cm. long, pubescent beneath: fls. about 1 cm. across, white or pink in many-fl. pyramidal corymbs; style glabrous. Fl.vi. W.R.53,t(c). G.F.3:477. R.B.14:183. (*R. multiflora* var. *W. Matsum.*) Cult. in Japan. Intr. 1870. Zone VI. Possibly a mutation of *R. multiflora*; peculiar rather than ornamental.

53. *R. setigera* Michx. PRAIRIE R. Shrub with glabrous climbing or recurving stems to 5 m. long: lfts. 3, rarely 5, ovate to oblong-ovate, 3–9 cm. long, short-acuminate, serrate, pubescent on the veins beneath: fls. about 5 cm. across, rose, fading to whitish, nearly scentless, in rather few-fl. corymbs; pedicels and receptacle glandular-hispid; styles glabrous: fr. glo-

bose, about 8 mm. across. Fl.vi-viii. W.R.71,t.(c). Mn.8:t.5(c). G.F.10:323. Gng.1:325. C.L.A.4:339;7:473. S.L.320(h). Ont. to Neb., Tex. and Fla. Intr. 1810. Zone IV.—*R. s. inermis* Palm. & Steyerl., f. Stems unarmed or with few weak spines: lvs. glabrous. Intr. 1923.—*R. s. serena* Palm. & Steyerl., var. Stems unarmed: lvs. pubescent beneath. Intr. 1924.—*R. s. tomentosa* Torr. & Gr., var. Lvs. tomentose beneath, dull above: fls. smaller, more numerous. R.R.1:gr.5,3(c). L.A.2:f.516. (*R. rubifolia* Ait.) Intr. 1800.—There are several double-fl. forms as "Baltimore Belle" (B.C.5:f.3439) which are probably hybrids with *R. Noisettiana*, *R. gallica*, *R. multiflora* and others.

Related species: *R. triphylla* Roxb. Climbing; prickles few, small, recurved: lfts. 3, rarely 5, ovate-lanceolate, acuminate, glabrous, glaucous beneath; stipules narrow, dentate: fls. corymbose, small, white, double, the inner petals shorter and narrower than the outer ones; pedicels and calyx-tube glabrous. R.H.1842:281,t(c). W.R.67:t(c). (*R. anemoneflora* Fort.) E. China. Intr. 1844. Zone VII.

54. *R. Hélenae* Rehd. & Wils. Sarmentose shrub to 5 m., with stout hooked prickles: lfts. 7-9, rarely 5, oblong-ovate to ovate-lanceolate, 2.5-5 cm. long, short-acuminate, rounded or broad-cuneate at base, sharply serrate, grayish green beneath and pubescent on the veins: fls. white, fragrant, 3 cm. across, in many-fl. umbel-like corymbs 7-15 cm. across; pedicels slender, 2-3 cm. long, stipitate-glandular like the receptacle; sepals lanceolate, sparingly pinnate; styles pubescent: fr. ovoid or oblong-ovoid, 1-1.5 cm. long, scarlet. Fl.vi. IS.2:t.77. J.L.47:195. Gn.89:35(h). Gs.6:108(h). (*R. floribunda* Bak., not Stev.) C. China. Intr. 1907. Zone (V).

55. *R. Rùbus* Lévl. & Vant. Sarmentose shrub to 6 m., with small hooked prickles: lfts. usually 5, ovate-elliptic to obovate, 3-8 cm. long, abruptly acuminate, sharply or coarsely serrate, pubescent beneath, rarely nearly glabrous: fls. white, fragrant, 2.5-3 cm. across, in dense corymbs; pedicels 1-2 cm. long, tomentose, glandular: fr. subglobose, 8 mm. across, scarlet. Fl.vi. W.R.2:507,t. (*R. Ernesti* Bean.) C. and W. China. Intr. 1907. Zone VI?

Related species: *R. Mulligani* Boulenger. Prickles strongly dilated at base: lfts. 5-7, elliptic, to 6 cm. long, acute or acuminate, pubescent beneath on the veins: fls. 4.5-5.5 cm. across; pedicels 2.5-3.5 cm. long; sepals 12-15 mm. long, long-pinnate: fr. 10-13 mm. high. W. China. Intr. 1917-19. Zone VI?—*R. glomerata* Rehd. & Wils. Lfts. usually 5-7, oblong to oblong-obovate, 3-10 cm. long, serrulate, rugose above, reticulate beneath and pubescent on the veins: fr. orange-red. W. China. Intr. 1908. Zone VI?

56. *R. Brunonii* Lindl. HIMALAYAN MUSK-R. Tall shrub with arching or sarmentose brs., glabrous or thinly villous while young; prickles hooked, short and stout: lfts. 5-7, elliptic-oblong to oblong-lanceolate, 3-6 cm. long, acute or acuminate, serrulate, slightly pubescent or glabrous above, soft-pubescent beneath; petioles and rachis pubescent, usually with scattered prickles: fls. white, 3-5 cm. across, fragrant, in many-fl. corymbs; sepals lanceolate, acuminate, much longer than the receptacle; pedicels slender, glandular-pubescent; styles pubescent: fr. ovoid, about 1 cm. long, glabrous. Fl.vi-vii. B.M. 4030(c). B.R.829(c). W.R.37,t(c). G.C.36:152,153. Gn.77:511;79:113(h), 519(h);86:363(h; as *R. moschata*). (*R. Brownii* Tratt.) Himal. Intr. 1822. Zone VII? Usually cult. as *R. moschata*.

57. *R. moschata* Herrm. MUSK-R. Shrub with arching or sarmentose glabrous brs.; prickles straight or slightly curved; lfts. 5-7, elliptic-ovate to oblong-ovate, 2.5-5 cm. long, acute or acuminate, serrulate, glabrous or nearly so beneath, except pubescent on the midrib; petioles and rachis nearly glabrous, usually prickly: fls. white, 3-5 cm. across, in usually 7-fl. corymbs, of musky fragrance; pedicels slender, slightly pubescent and glandular; styles

pubescent: fr. ovoid, small. Fl.vi. W.R.33.t(c). (*R. ruscinonensis* Déségl.) S. Eu., N. Afr., W. Asia. Long cult. Zone VII?—*R. m. plèna* West., var. With double fls. R.R.1:99,t(c).—*R. m. nastaràna* Christ, var. More robust: lfts. nearly glabrous beneath: fls. over 5 cm. across, tinged pinkish, more numerous. W.R.39,t(c). R.H.1880:314,315. (*R. Pissardi* Carr.) Persia. Intr. 1879. Zone VI?

*R. m. × gallica* = *R. Dupontii* Déségl. Stems prickly and bristly: lfts. fewer and broader; fls. larger; styles shorter; pedicels glandular. B.R.861(c). W.R. 43,t(c). Gn.67:254;77:510. Orig. before 1817.—Here belongs also *R. Freundiana* Graebn. Gt.57:471. G.25:311.

Related species: *R. longicuspis* Bertol. Sarmentose and climbing: lfts. coriaceous, lustrous, ovate or elliptic to ovate-oblong, 5–10 cm. long, acuminate or long-acuminate, usually rounded at base, reticulate beneath and usually quite glabrous; stipules finely denticulate: fls. in many-fld. corymbs; petals silky outside; pedicels pubescent. Bertoloni, Misc. Bot. t.3. (*R. lucens* Rolfe.) Himal., W. China. Cult. 1915. Zone VII?—*R. Sinowilsoni* Hemsl. Similar to the preceding: lfts. glabrous or slightly pubescent beneath; stipules very narrow, glandular-denticulate: fls. subumbellate or paniculate, in bud obtuse or abruptly pointed; pedicels glabrous, not or slightly glandular. W. China. Intr. 1904. Zone VI?—*R. cerasocarpa* Rolfe. Lfts. subcoriaceous, 5, sometimes 3, ovate or elliptic-ovate, acute or acuminate, glabrous; stipules narrow, entire: fls. 2.5–3 cm. across, paniculate, pedicels and receptacle glabrous, glandular; bud abruptly pointed: fr. globose, 1 cm. diam. B.M.8688(c). C. China. Cult. 1914. Zone VI?

58. *R. Maximowicziana* Regel. Shrub with sarmentose or arching brs.; young stems with scattered hooked prickles and bristles: lfts. 7–9, elliptic-ovate to oblong, 3–6 cm. long, acute or acuminate, finely serrate, paler beneath, glabrous; stipules glandular-serrulate: fls. white, 3–3.5 cm. across, in many-fld. corymbs with persistent bracts; sepals ovate, abruptly caudate-acuminate; pedicels stipitate-glandular or glabrous; styles glabrous: fr. subglobose or broad-ovoid, about 1 cm. across. Fl.vi–vii. N.K.7:t.1. (*R. Fauriei* Lévl.) Manch., Korea. Intr. ?—*R. M. Jackii* (Rehd.) Rehd., var. Stems without bristles. N.K.7:t.3. (*R. J. Rehd.*, *R. Kellersi* Bak., not Dalla Torre & Sarnth.) Korea. Intr. 1905. Zone V.

59. *R. Hénryi* Boulenger. Sarmentose shrub; brs. with hooked prickles, often purplish; floral brts. unarmed: lfts. usually 5, elliptic to elliptic-ovate, 4.5–8 cm. long, acuminate, rounded or broad-cuneate at base, simply serrate, glabrous and glaucescent beneath; stipules narrow, entire: fls. white, fragrant, 3–3.5 cm. across, in umbel-like corymbs; bud gradually acuminate; pedicels 1.2–2 cm. long, pubescent and stipitate-glandular; receptacle pubescent; sepals pubescent and slightly glandular, with a few appendages; styles pubescent: fr. globose, 8–10 mm. across, dark red. Fl.vi–vii. J.L.27:483. (*R. Gentiliana* Rehd. & Wils., not Lévl. & Vant., *R. moschata* var. *densa* Vilm.) C. and E. China. Intr. 1907. Zone VI.

Closely related species: *R. filipes* Rehd. & Wils. Lfts. usually 5–7, oblong-ovate to lanceolate, 3.5–7 cm. long, acuminate, pale beneath and glabrous, but glandular: pedicels glabrous and stipitate-glandular, 2–3.5 cm. long; fls. 2–2.5 cm. across: fr. globose, about 1 cm. across, scarlet. W. China. Intr. 1908. Zone (V).—*R. crocacintha* Boulenger. Shrub to 2.5 m.; prickles orange-yellow: lfts. 5–7, elliptic, to 5 cm. long, doubly serrate, glabrous or pubescent beneath: fls. very numerous, 1–1.5 cm. across; pedicels 1–1.8 cm. long; styles glabrous. W. China. Intr. 1917–19. Zone VI?—Another related species is *R. phoenicea* Boiss. Lfts. usually 5, acute or obtuse; corymbs pyramidal, usually many-fld.; styles glabrous. Asia Minor. Intr. about 1885. Zone VI?

60. *R. Soulieana* Crép. Upright shrub to 4 m. with spreading brs.; prickles stout, hooked: lfts. usually 7, elliptic or obovate to ovate-oblong, 1–3 cm. long, acute or obtuse, serrulate, glabrous beneath: fls. white, 3–3.5 cm. across, in many-fld. corymbs 10–15 cm. across: pedicels and receptacle glandular;

sepals ovate, acuminate: fr. ovoid, about 1 cm. long, orange-red. Fl.vi. B.M. 8158(c). W.R.57,t(c). Gn.89:35(h). W. China. Intr. 1896. Zone VI.

61. *R. Wichuraiana* Crép. MEMORIAL R. Half-evergreen, with long prostrate or trailing brs.; prickles strong, curved: lfts. 7-9, suborbicular to broad-ovate or obovate, 1-2.5 cm. long, usually obtuse, coarsely serrate, dark green and lustrous above, lighter green and lustrous beneath, glabrous; stipules dentate: fls. 4-5 cm. across, white, fragrant, in few- to many-fl. pyramidal corymbs; styles pubescent; pedicels slightly glandular-hispid: fr. ovoid, about 1 cm. long. Fl.vii-ix. B.M.7421(c). W.R.59,t(c). R.H.1898:105,t(c),106. G.F.4:569;6:337. G.C.II.22:99. M.G.13:580-5(h). (*R. Luciae* var. *W. Koidz.*, *R. bracteata* Hort., not Wendl.) Japan, Korea, Formosa, E. China. Intr. 1891. Zone V. Adapted for covering banks and rocky slopes. Many hybrids have been raised.

*R. W. × rugosa* = *R. Jacksónii* Willm. Lfts. larger, rugose above; fls. bright crimson. R.W.63,t(c). Here belongs "Lady Duncan."—*R. W. × multiflora* "Crimson Rambler" = *R. Barbierana* Rehd. Lfts. 5-7, larger: fls. single, carmine, 4-5 cm. across; petals whitish at the base. R.H.1901:20,t(c). (*R. Wichuraiana rubra* André.) Orig. before 1900.—There are also numerous hybrids of *R. W.* with Hybrid Teas and Hybrid Perpetuals (G.F.8:337. Mn.8:27,156).

Closely related species: *R. Luciae* Franch. & Rochebr. Of more upright habit: lfts. usually 7, narrower and thinner: fls. smaller. E. China, Korea, Japan. Intr. ?

62. *R. sempervirens* L. Evergreen or half-evergreen shrub with trailing or climbing stems: lfts. 5-7, ovate-lanceolate, 2-5 cm. long, acuminate, serrulate, lustrous above and beneath, glabrous: fls. 3-5 cm. across, in few-, rarely many-fl. corymbs, slightly fragrant; pedicels glandular-hispid; styles usually pubescent: fr. subglobose or ovoid, about 1 cm. long, orange-red. Fl.vi-vii. B.R.465(c). W.R.19,t(c). S. Eu., N. Afr. Zone VI?—*R. s. prostrata* (DC.) Desv. Lfts. elliptic, acute, smaller: styles glabrous; fr. ovoid. (*R. p.* DC.)—*R. s. scandens* (Mill.) Nichols. Lfts. elliptic to oblong, obtuse: fr. subglobose. (*R. s.* Mill.)—Some double-fl. forms like "Felicité perpetuelle" are probably hybrids with *R. chinensis*.

63. *R. arvensis* Huds. Deciduous shrub with trailing stems: lfts. usually 7, ovate to elliptic-ovate, 1-3.5 cm. long, acute, serrate, dull above, glabrous or slightly pubescent beneath, rather thin: fls. 3-5 cm. across, scentless, in few-fl. corymbs or solitary; styles glabrous: fr. ovoid. Fl.vi-vii. B.M. 2054(c). W.R.11,t(c). S.E.3,t.476(c). F.D.25:t.2633(c). Gn.60:233;77:510. (*R. repens* Scop., *R. silvestris* Herrm.) Eu. Cult. 1750. Zone V.—*R. a. Ayre-shirea* Ser., var. AYRSHIRE R. More vigorous: lvs. green on both sides, remaining longer on the brs. B.M.2054(c). (*R. capreolata* Neill, *R. a.* var. *scandens* Sweet, *R. a.* var. *c. Bean.*)—The forms with double fls. often called Ayrshire Roses are probably hybrids with other Roses.

*R. a. × chinensis* = *R. ruga* Lindl. Trailing: fls. large, pink, double, fragrant, in several-fl. corymbs. B.R.1389(c). W.R.55,t(c). Orig. before 1830.—*R. a. × gallica* = *R. Polliniana* Spreng. Upright or sarmentose: lfts. usually 5, of firmer texture, slightly pubescent beneath: fls. long-stalked, large, white to pink. W.R.333,t(c). Eu. Cult. 1820.—*R. a. × rugosa*; see under No. 26.

SECT. 7. INDICAE Thory. Stems upright or procumbent, with sparse, hooked prickles: lfts. 3-5, rarely 7, glabrous; stipules and bracts narrow: infl. 1-many-fl.; sepals entire or sparingly lobed, reflexed after flowering: styles exserted, free. Two Chinese species.

64. *R. odorata* Sweet. TEA R. Evergreen or half-evergreen, with long, sarmentose, often climbing brs.; prickles scattered, hooked: lfts. 5-7, elliptic or ovate to oblong-ovate, 2-7 cm. long, acute or acuminate, sharply serrate, lustrous above, glabrous: fls. solitary or 2-3, pink, on rather short, often glandular stalks, 5-8 cm. across. Fl.vi-ix. B.R.804(c). R.R.3:gr.25,19(c).

(*R. Thea* Savi, *R. chinensis* var. *fragrans* (Thory) Rehd., *R. indica fragrans* Thory, *R. indica* var. *odoratissima* Lindl.) China. First intr. in the double blush form in 1810. Zone VII.—*R. o. ochroleuca* (Lindl.) Rehd., f. With pale yellow double fls. R.R.3:gr.25,20(c). Andrews, Ros.2:t,77(c). Intr. 1824.—*R. o. pseudindica* (Lindl.) Rehd., var. FORTUNE'S DOUBLE YELLOW. (Beauty of Glazenwood, Gold of Ophir.) Fls. salmon-yellow, outside tinged with red, double, 7–10 cm. across. B.M.4679(c). W.R.85,t(c). F.S.8:t.769(c).—*R. o. gigantea* (Coll.) Rehd. & Wils., var. Very vigorous, climbing to 10 m.: fls. creamy white, single, 10–15 cm. across; pedicels and receptacle smooth. B.M.7972(c). W.R.34(c). G.C.III.6:13;37:136;51:314. Gn.67:179;71:67. (*R. g.* Collett.) S.W. China, Burma. Intr. 1889. Zone VII.—*R. o. erubescens* Rehd. & Wils., f. A form of the preceding var. with blush or pale pink fls., often smaller. W. China. Intr. ? This form or the preceding var. is probably the phylogenetic type of the Tea Rose.

*R. o. gigantea* × *Brunonii*. Here belongs "Madelaine," "Lemoine," "Montanosa," "Montecito," with paniculate fls.—*R. o.* × *borboniana* = *R. dilecta* Rehd. Here belong the hybrid Tea Roses which are hybrids between the Tea Rose and the Hybrid Perpetuals and of which "La France" may be considered a typical representative.—*R. o.* (or *dilecta*) × *rugosa*; see under No. 26.—*R. o.* × *laevigata*; see under No. 69.

65. *R. chinensis* Jacq. CHINA R. Low upright shrub with stout more or less hooked prickles, sometimes nearly unarmed: lfts. 3–5, broad-ovate to ovate-oblong, 2.5–6 cm. long, acuminate, serrate, lustrous and dark green above, pale beneath, glabrous: fls. usually several, rarely solitary, on long, usually glandular stalks, rarely short-stalked, about 5 cm. across, crimson to pink or nearly white: fr. 1.5–2 cm. long. Fl.vi-ix. W.R.79,t(c). Jacquin, Obs. Bot. 3:t.55(c). (*R. indica* Lindl., not L., *R. sinica* L.—BENGAL R.) China. Cult. 1768. Zone VII?—*R. c. semperflorans* (Curtis) Koehne., var. CRIMSON CHINA R. (CHINESE MONTHLY R.). Stems slender, prickly or nearly unarmed; lfts. rather thin, mostly stained with purple: fls. usually solitary on long slender pedicels, crimson or deep pink. B.M.284(c). W.R.89, t(c).—*R. c. minima* (Sims.) Voss, var. FAIRY R. Dwarf shrub, rarely exceeding 25 cm., with small rose-red fls., about 3 cm. across, single or double. B.M.1762(c). B.R.538(c). R.R.3:gr.25,6,7(c). Gs.14:138. H.B.11:117. (*R. Lawranciana* Sweet, *R. Roulettii* Corr.) Hybrids of this var. with *R. multiflora* forms are the "Baby Ramblers."—*R. c. viridiflora* (Lav.) Dipp., var. With monstrous green fls.; the petals transformed into small green lvs. F.S. 11:1136(c). Orig. about 1855.—*R. c. mutabilis* (Corr.) Rehd., f. Fls. simple, first sulphur-yellow, changing to orange, red and finally crimson, 4.5–6 cm. across. R.H.1934:60,t(c). (*R. m.* Corr.) Cult. 1934.

*R. c.* × *arvensis*; see under No. 63.—*R. c.* × *moschata*; see No. 66.—*R. c.* × *rugosa*; see under No. 26.—*R. c.* × *blanda*; see under No. 30.—*R. c.* × *pendulina*; see under No. 31.—*R. c.* × *damascena*; see No. 67.

66. × *R. Noisettiana* Thory (*R. chinensis* × *moschata*.) NOISETTE R. (CHAMPNEY R.) Shrub to 3 m. with upright or spreading stems; prickles reddish: lfts. 5–7, usually oblong-ovate to oblong-lanceolate, glabrous: fls. usually in many-fl. corymbs, white to pink or red, sometimes yellow; styles exserted, pubescent, loosely cohering. W.R.32(c). Gn.71:335. B.S.2:437. Orig. about 1816.—Here belongs the Manetti Rose (*R. Manetti* Crivelli, *R. chinensis* var. *M.* Dipp.), a vigorous shrub with semidouble or single fls. (B.C.5:2988), often used as stock for Tea and China Roses.

67. × *R. borboniana* Desp. (*R. chinensis* × *damascena*.) BOURBON R. Upright shrub with prickly and often glandular-hispid stems: lfts. usually 7, ovate to lance-ovate, acute, lustrous above, slightly pubescent beneath: fls.

solitary or few in a corymb, on glandular pedicels, double or semidouble, usually purple. W.R.339,t(c). (*R. borbonica* Morr.) Fl.vii-ix. Orig. before 1819. By crossing this hybrid with the different Roses of the Gallicae group, the Hybrid Bourbon Roses have originated and these crossed with *R. chinensis* and its vars. have produced the Hybrid Perpetuals or Remontant Roses. All these hybrids may be included in *R. borboniana* in an enlarged sense.

*R. b.* × *odorata*; see under No. 64.—*R. b.* × *rugosa*; see under No. 26.

Sect. 8. BANKSIANAE Lindl. Evergreen climbing shrubs with slender glabrous brs. armed with hooked prickles or unarmed: lfts. 3-7; stipules free, subulate, caducous: fls. in corymbs, white or yellow; sepals entire, reflexed after flowering, deciduous. Two species in China.

68. *R. Banksiae* Ait. BANKS' R. Climbing to 6 m., with sparingly prickly or unarmed brs.: lfts. 3-5, rarely 7, elliptic-ovate to oblong-lanceolate, 2-6 cm. long, acute or obtusish, serrulate, glabrous except at base of midrib beneath; rachis pubescent: fls. white or yellow, 2.5 cm. across, slightly fragrant, on slender smooth stalks in many-fl. umbels: fr. small globose. Fl.vi-viii. Gn.83:107(h). China.—*R. B. normalis* Reg., var. Fls. single, white. G.C. 31:539. J.L.27:501. Cult. 1877.—*R. B. albo-plena* Rehd., var. Fls. double, white, fragrant. B.M.1954(c). Intr. 1807. The typical form.—*R. B. lutea* Lindl., var. Fls. double, yellow, scentless. B.R.1105(c). (*R. B. f. luteo-plena* Rehd.) Intr. 1824.—*R. B. lutescens* Voss., f. Fls. single, yellow. B.M.7171(c). Intr. about 1870. Zone VII.

*R. B. × laevigata*? = *R. Fortuneana* Lindl. Climbing shrub with sparingly prickly stems: lfts. 3-5, ovate-lanceolate, lustrous: fls. solitary, large, double, white; pedicels hispid. W.R.36,t(c). F.S.7:256(c). J.F.2:27. Intr. 1850. Zone VII?

Related species: *R. cymosa* Tratt. Brts. slender, with hooked prickles: lfts. 3-7, elliptic to ovate-lanceolate, glabrous: fls. small, white, in many-fl. corymbs; styles exserted, pubescent: fr. small, globose. G.C.37:227. (*R. indica* L., in part, *R. microcarpa* Lindl., not Bess., nor Retz., *R. sorbiflora* Pocke.) China. Intr. ? 1904. Zone VII?

Sect. 9. LAEVIGATAE Thory. Evergreen shrubs with scattered hooked prickles: lfts. usually 3; stipules free or adnate at base, caducous: fls. solitary, large, without bracts; sepals erect, entire, persistent; pedicels and receptacles densely bristly.

69. *R. laevigata* Michx. CHEROKEE R. To 5 m. high: lfts. 3, rarely 5, elliptic-ovate to lance-ovate, 3-6 m. long, acute or acuminate, sharply and finely serrate, glabrous and lustrous, reticulate beneath: fls. white, rarely rose-colored, 6-8 cm. across, fragrant: fr. pyriform, bristly, 3.5-4 cm. long. Fl.v. B.M.2847(c). B.R.1922(c). W.R.117,t(c). G.C.III.6:497. Gn.68:206(h);71:225(h). M.G.21:397. Gn.M.38:174(h). (*R. cherokeensis* Donn, *R. sinica* Murr., *R. ternata* Poir., *R. Camellia* Hort.) China; naturalized from Ga. to Fla. and Tex. Intr. before 1780 to Am. Zone VII.

*R. l.* × ? *odorata* = *R. anemonoides* Rehd. ("Anemone Rose"). With large single light pink fls. R.H.1901:548,t(c). W.R.41,t(c). M.G.11:345. Gn.62:413;77:340;80:309. Orig. before 1896.—*R. l.* × *dilecta*. Here belongs "Silver Moon."—*R. l.* × *Banksiae*; see under No. 68.—*R. l.* × *bracteata*; see under No. 70.

Sect. 10. BRACTEATAE Thory. Evergreen shrubs with erect or sarmentose, tomentose or pubescent brs.; prickles in pairs; stipules slightly adnate and pectinate: infl. with large bracts; sepals entire, reflexed after flowering; receptacle tomentose. Two Asiatic species.

70. *R. bracteata* Wendl. MACARTNEY R. Stems sarmentose or procumbent, tomentose, with stout hooked prickles: lfts. 5-9, elliptic to obovate, 1.5-5 cm. long, obtuse or acutish, crenate-serrulate, lustrous above, glabrous or pubescent on midrib beneath; rachis glabrous: fls. usually solitary, white, 5-7 cm. across, short-stalked, with large lacinated pubescent bracts at base: fr. globose, 3-3.5 cm. across, orange-red, woolly. Fl.viii. B.M.1377(c). B.B.

2:268. Gn.70:192. W.R.125,t(c). (*R. Macartnea* Dum.-Cours.) China; naturalized from Va. to Fla. and Tex. Intr. 1793. Zone VII.

*R. b. × laevigata*. Here belongs *Marie Leonida* (*R. alba odorata*) with creamy white double fls. W.R.1:127,t(c). Cult. 1832.

Closely related species: *R. clinophylla* Thory, with straight prickles and acute lfts. often pubescent beneath; rachis pubescent. B.R.739(c). R.R.3,gr. 24.2. (*R. involucrata* Roxb., *R. Lyellii* Lindl.) India. Intr. before 1817; probably not hardy.—*R. c. × persica*; see under No. 1.

Subgen. III. *PLATYRHODON* (Hurst) Rehd. Lvs. pinnate: stipules adnate, very narrow with subulate divergent auricles: fls. 1 or 2, with small caducous bracts: receptacle prickly, cup-shaped, achenes on a slightly elevated torus: stamens 150–175; sepals broad, erect, persistent, pinnate. (Sect. *Microphyllae* Crép., *Saintpierreia* Germ. de St. Pierre, *Platyrrhodon* Dcne. ex Hurst.).

71. *R. Roxbúrgii* Tratt. Spreading shrub to 2.5 m.; bark gray, peeling: lfts. elliptic to elliptic-oblong, 1–2 cm. long, acute, sharply serrate, glabrous beneath: fls. pale pink, 5–6 cm. across; pedicels and receptacle prickly: fr. depressed-globose, 3–4 cm. across, very prickly. (*R. microphylla* Roxb., not Desf.) China, Japan.—*R. R. plèna* Rehd., var. With double fls. Fl.vi. B.R. 919(c). B.M.3490(c). W.R.135,t(c). G.C.103:87. Gn.81:484,548. S.L.325(h). Intr. 1828. Zone VI? The type of the species.—*R. R. normalis* Rehd. & Wils., f. The wild form with single fls. China. Intr. 1908.—*R. R. hirtula* (Reg.) Rehd. & Wils., var. Lfts. elliptic to ovate-oblong, 1–2.5 cm. long, pubescent beneath. B.M.6548(c). Japan. Intr. before 1880.

*R. R. × rugosa* = *R. micrugosa*, see under No. 26.

Subgen. IV. *HESPERHODOS* Cockerell. Lvs. pinnate; stipules adnate, with divergent dilated auricles: fls. solitary, without bracts; receptacle prickly, cup-shaped, without disk; achenes on a conical elongated torus; sepals pinnate, erect, persistent: fr. not fleshy. (Sect. *Minutifoliae* Crép., *Hesperhodos* Boulenger.)

72. *R. stellata* Woot. Shrub to 0.6 m.; brs. with numerous slender yellowish white prickles and closely stellate-pubescent when young: lfts. 3, sometimes 5, broad-cuneate-obovate, 5–10 mm. long, incisedly dentate, pubescent on both sides: fls. solitary, deep rose-purple, 3.5–5.5 cm. across: fr. broad-turbinate, 1–1.5 cm. across, dull reddish. Fl.vi–viii. W.R.305,t(c). J.L.27:456. Bull. Torr. Bot. Club 25:t.335,f.1–5.9. (*Hesperhodos stellatus* Boulenger.) W. Tex. to Ariz. Intr. 1902. Zone (V).—*R. s. mirifica* (Greene) Cockerell, var. More vigorous, to 1.2 m. high; brts. without stellate pubescence: lfts. usually 5, sometimes nearly glabrous: fls. 3.5–6 cm. across. B.M.9070(c). Gs.20:179. (*R. m.* Greene.) N. Mex. Intr. 1916. Zone (V).

Related species: *R. minutifolia* Engelm. Brts. pubescent, with slender brown prickles: lfts. 5–7, ovate to elliptic, 3–10 mm. long, pubescent: fls. pink or white, 2.5 cm. across. G.F.1:102. B.C.5:2996. J.L.27:456. L. Calif. Cult. 1910. Zone VII?

Subfam. IV. *PRUNOIDEAE* Focke. Trees or shrubs, sometimes spiny: lvs. simple, stipulate: fls. white to pink, solitary, umbellate or racemose; petals rarely wanting; stamens 10 to many; carpels usually 1, rarely 2–5, free, 2-ovuled, developing into a 1-, rarely 2-seeded drupe sometimes dehiscent; stone with usually bony endocarp. (*Drupaceae* DC., *Amygdalaceae* Reichenb.)

45. **MADDENIA** Hook. f. & Thoms. Deciduous trees or shrubs; winterbuds with many scales: lvs. alternate, serrate, stipulate: fls. appearing with the lvs., dioecious, apetalous, short-pedicelled, in racemes; sepals 10, very small; stamens 25–40; pistil with a long style and 2 ovules; in the staminate fl. sometimes 2 abortive pistils with sessile stigmas: fr. a 1-seeded drupe. (After Major E. Madden, plant collector in India; d.1856.) Five species in Himal., C. and W. China.

*M. hypoleuca* Koehne. Shrub or small tree to 6 m.; young brts. glabrous or sparingly pubescent: lvs. ovate-oblong to oblong, 4–6.5, on shoots to 16

cm. long, acuminate, rounded or subcordate at base, doubly serrate with acuminate teeth, glabrous, glaucous beneath, with 14-18 pairs of veins: racemes dense, 3-5 cm. long on leafy peduncles; calyx-tube 4 mm. long; sepals slightly shorter, unequal; stamens to 6 mm. long: drupe black, ellipsoid, about 8 mm. long. Fl. iv-v; fr. vi. C. and W. China. Intr. 1907. Zone (V).

**46. PRUNUS L.** Deciduous or evergreen trees or shrubs; winter-buds with many imbricate scales: lvs. alternate, serrate, rarely entire, stipulate: fls. perfect, solitary or in fascicles or racemes; sepals 5; petals 5, usually white, sometimes pink or red; stamens numerous, perigynous; pistil 1, with elongated style, 2-ovuled: fr. a drupe, usually 1-seeded. (Ancient Latin name.) Nearly 200 species, mostly in the temperate zone, a few in the Andes of S. Am.—Many species are in cult. for their edible fr. and a few for their edible seeds; a large number are highly ornamental on account of their showy fls. appearing before or with the lvs.

Fr. sulcate, usually bloomy, sometimes pubescent: lvs. convolute or conduplicate.

- A. Axillary buds solitary; terminal bud wanting.....Subgen. I. PRUNOPHORA
- B. Ovary and fr. glabrous; fls. pedicelled.
- C. Fls. 1-2, rarely 3; stone often sculptured: lvs. convolute.....Sect. 1. EUPRUNUS
- CC. Fls. 3 or more, rarely solitary; stone usually smooth: lvs. conduplicate, rarely convolute.....Sect. 2. PRUNOCERASUS
- BB. Ovary and fr. pubescent (glabrous in *P. brigantina*): fls. sessile (stalked in *P. dasycarpa*): lvs. convolute.....Sect. 3. ARMENIACA
- AA. Axillary buds 3, the lateral ones fl.-buds; terminal bud present: fls. 1-2, sessile, rarely stalked: ovary and fr. pubescent, very rarely glabrous: lvs. conduplicate.

Subgen. II. AMYGDALUS

Fr. not sulcate, not bloomy; stone turgid, or subglobose; lvs. conduplicate: terminal bud present.

- A. Fls. solitary or few, sometimes in short, few-fl. racemes, usually with conspicuous bracts. Subgen. III. CERASUS
- B. Buds 3 in each leaf-axil: pedicels usually short.....Sect. 1. MICRO CERASUS
- BB. Buds solitary.
- C. Sepals upright or spreading: lvs. with sharp teeth.....Sect. 2. PSEUDOCERASUS
- CC. Sepals reflexed.
- D. Petals emarginate: lvs. with sharp teeth.....Sect. 3. LOBOPETALUM
- DD. Petals not emarginate.
- E. Involucre persistent; fls. in umbels: lvs. with short obtuse teeth. Sect. 4. EUCERASUS
- EE. Involucre deciduous; fls. often racemose.
- F. Bracts small, deciduous; sepals shorter than tube, entire: lvs. with obtuse teeth.....Sect. 5. MAHALE
- FF. Bracts leafy, persistent: lvs. with sharp teeth.
- G. Fls. 2-3.....Sect. 6. PHYLLO CERASUS
- GG. Fls. 5-6, racemose.....Sect. 7. PHYLLOMAHALE
- AA. Fls. in elongated racemes of 12 or more fls.; bracts small.
- B. Lvs. deciduous; peduncle usually leafy.....Subgen. IV. PADUS
- BB. Lvs. persistent: peduncle leafless.....Subgen. V. LAUROCERASUS

#### Subgen. I. PRUNOPHORA

##### Sect. 1. EUPRUNUS

Young brts. tomentose or pubescent; pedicels usually pubescent (glabrous in No. 1): fr. subglobose.

- A. Fls. usually solitary: fr. upright; stone more or less pitted.....1. *P. spinosa*
- AA. Fls. usually 2; stone nearly smooth: fr. pendulous.....2. *P. insititia*

Young brts. glabrous or glabrescent; pedicels glabrous, rarely pubescent.

- A. Fr. subglobose to oblong; lvs. spreading or drooping; veins diverging at an angle of about 45°.
- B. Lvs. pubescent beneath, to 10 cm. long: fr. generally ellipsoid, usually bluish black. 3. *P. domestica*
- BB. Lvs. glabrous beneath except along the midrib: fr. usually subglobose, yellow or red.
- C. Fls. usually solitary: lvs. 2-7 cm. long.....4. *P. cerasifera*
- CC. Fls. usually 3: lvs. oblong-obovate, 6-10 cm. long.....5. *P. salicina*
- AA. Fr. depressed-globose, very short-stalked: lvs. upright, narrow, with few veins diverging at a very acute angle.....6. *P. Simonii*

## 2. PRUNOCERASUS

Lvs. round-ovate, obtuse or obtusish, incisely serrate, convolute in bud ..7. *P. subcordata*  
 Lvs. ovate to lanceolate, conduplicate in bud (convolute in No. 18, 19, slightly so in 9 and 17).

- A. Lvs. with acute or acuminate teeth, dull above, usually pubescent.  
 B. Lvs. acute or gradually acuminate: brts. usually pubescent: calyx-lobes eglandular: fr. subglobose, usually dark purple, rarely yellow, 1-2 cm. across.  
 C. Lvs. acute or obtusish, ovate to elliptic; petioles often glandular: low shrub.  
 CC. Lvs. acuminate, elliptic to elliptic-oblong; petioles eglandular: trees, sometimes shrubby.  
 D. Calyx pubescent or puberulous outside; petals turning pink; petioles 7-12 mm. long .....9. *P. alleghaniensis*  
 DD. Calyx glabrous or puberulous outside; petals white: petioles 5-9 mm. long.  
 10. *P. umbellata*  
 BB. Lvs. abruptly acuminate, usually obovate-oblong; fr. red or yellow, 2-3 cm. across: trees.  
 C. Lvs. pubescent beneath and young brts. usually pubescent.  
 D. Lvs. usually rounded or subcordate at base, thickish at maturity; petiole usually glandular at apex: not sprouting from the root .....11. *P. mexicana*  
 DD. Lvs. usually cuneate, rather thin; petiole usually eglandular: sprouting from the root .....12. *P. lanata*  
 CC. Lvs. glabrous or nearly so and young brts. glabrous: sprouting from the root.  
 13. *P. americana*  
 AA. Lvs. with obtuse or obtusish teeth (sometimes acute in *P. orthosepala*, under No. 18); calyx-lobes usually glandular: fr. red or yellow.  
 B. Lvs. elliptic or slightly obovate, 8-12 cm. long, coarsely or often doubly serrate, usually pubescent beneath: calyx and pedicel reddish; petals fading to pink: fr. 2.5-3 cm. across .....14. *P. nigra*  
 BB. Lvs. ovate to lanceolate, rarely obovate-oblong, lustrous above, usually finely crenate-serrate, usually smaller: calyx and pedicels green; petals white.  
 C. Lvs. 6-11 cm. long, pubescent along the midrib below: fr. 2-3 cm. across.  
 D. Lvs. oblong-obovate or elliptic-oblong, obtusely serrate, rather thick.  
 15. *P. hortulana*  
 DD. Lvs. usually oblong-lanceolate, finely glandular-serrate, rather thin.  
 16. *P. Munsoniana*  
 CC. Lvs. 2-7 cm. long: fr. smaller.  
 D. Young brts. glabrous: lvs. glabrous below, trough-shaped, lanceolate or lance-ovate.  
 E. Calyx-lobes usually pubescent within: lvs. usually ovate-lanceolate and acuminate .....17. *P. Reverchonii*  
 EE. Calyx-lobes glabrous within except at base or sparsely pubescent: lvs. usually elliptic-lanceolate, acute .....18. *P. angustifolia*  
 DD. Young brts. pubescent: lvs. oval or ovate, pubescent below .....19. *P. gracilis*

## Sect. 3. ARMENTIACA

Fr. yellow or red: fls. short-stalked.

- A. Lvs. rather sharply and nearly doubly serrate, the teeth longer than broad.  
 B. Ovary and fr. glabrous; pedicels glabrous, about as long as calyx-tube. 20. *P. brigantina*  
 BB. Ovary and fr. pubescent; pedicel shorter .....21. *P. mandshurica*  
 AA. Lvs. finely and simply serrate: fls. subsessile.  
 B. Stone smooth: lvs. usually rounded at base.  
 C. Lvs. ovate, long-acuminate: fr. about 2 cm. across .....22. *P. sibirica*  
 CC. Lvs. round-ovate, short-acuminate: fr. about 3 cm. across .....23. *P. Armeniaca*  
 BB. Stone pitted: lvs. usually broad-cuneate at base, often pubescent beneath; mature brts. green or greenish, slender .....24. *P. Mume*  
 Fr. dark purple: fls. long-stalked .....25. *P. dasycarpa*

## Subgen. II. AMYGDALUS

Calyx-tube cup-shaped to campanulate, as long or little longer than lobes.

## Sect. 1. EUAMYGDALUS Schneid.

- A. Lvs. crenate or closely serrate: sepals erect-spreading: ovary tomentose except in var. of No. 27.  
 B. Lvs. acuminate, 6-15 cm. long.  
 C. Stone sulcate and usually pitted; petiole usually glandular.  
 D. Sepals villous outside, at least on the margin.  
 E. Fr. becoming dry and splitting at maturity: lvs. serrulate, broadest below the middle; petiole 1.5-2.5 cm. long .....26. *P. Amygdalus*  
 EE. Fr. fleshy, not splitting: lvs. serrate, broadest above the middle; petiole 1-1.5 cm. long .....27. *P. Persica*  
 DD. Sepals quite glabrous; petiole rarely glandular, 1-2 cm. long .....28. *P. Davidiana*  
 CC. Stone smooth, ovate: lvs. lanceolate, villous beneath along the midrib .....29. *P. mira*  
 BB. Lvs. acute or obtusish, 1-3 cm. long: fr. dehiscent; stone rugose .....30. *P. tangutica*

- AA. Lvs. deeply serrate or doubly serrate, broadly elliptic to obovate, 3-6 cm. long. 31. *P. triloba*  
 Calyx-tube tubular, much longer than sepals; lvs. usually elliptic-oblong, 3-7 cm. long.  
 Sect. 2. CHAMAEAMYGDALUS Focke. 32. *P. tenella*

Subgen. III. CERASUS  
 Sect. 1. MICRO CERASUS

- Fls. sessile or nearly so; calyx-tube tubular.  
 A. Lvs. pubescent, usually on both sides.  
 B. Fls. white; lvs. broad-elliptic to obovate, green and pubescent beneath. 33. *P. tomentosa*  
 BB. Fls. rose-colored; lvs. elliptic to oblong-lanceolate, white-tomentose beneath. 34. *P. incana*  
 AA. Lvs. glabrous, elliptic-oblong; fls. rose-colored..... 35. *P. Jacquemontii*  
 Fls. and fr. distinctly pedicelled; calyx-tube cup-shaped; sepals serrulate.  
 A. Lvs. green beneath, finely serrate or serrulate from near the base; petiole 5-8 mm. long; fr. red.  
 B. Lvs. ovate, rarely ovate-lanceolate, acuminate, broadest below the middle and rounded or subcordate, sharply doubly serrate..... 36. *P. japonica*  
 BB. Lvs. obovate-oblong to lance-oblong, rarely elliptic, acute, finely serrulate or crenulate, broad-cuneate.  
 C. Lvs. broadest about or below the middle; style glabrous or pilose at base. 37. *P. glandulosa*  
 CC. Lvs. broadest above the middle; style glabrous..... 38. *P. humilis*  
 AA. Lvs. glaucous beneath, entire toward the base; petiole 8-18 mm. long; fr. purple-black.  
 B. Lvs. oblanceolate to obovate, ascending; fr. small, astringent..... 39. *P. pumila*  
 BB. Lvs. elliptic to elliptic-lanceolate, spreading; fr. about 1.5 cm. across, sweet. 40. *P. Besseyi*

Sect. 2. PSEUDOCERASUS

- Lvs. incised and doubly serrate or lobulate; fls. white or pinkish, rather small.  
 A. Lvs. densely grayish pubescent beneath; fr. red; infl. with leafy bracts. 41. *P. canescens*  
 AA. Lvs. glabrous or hairy only on veins beneath; infl. without leafy bracts.  
 B. Fr. purple-black; style glabrous; sepals entire or irregularly dentate, usually as long as tube.  
 C. Petioles pubescent; pedicels usually short; fls. about 1 cm. across..... 42. *P. incisa*  
 CC. Petioles glabrous; pedicels 1.5-2.5 cm. long; fls. 2-2.5 cm. across..... 43. *P. nipponica*  
 BB. Fr. red, about 1 cm. across; style pilose at base; sepals glandular-serrulate, shorter than tube..... 44. *P. lobulata*  
 Lvs. simply or only slightly doubly serrate.  
 A. Fruiting pedicels conspicuously thickened; fls. pink or red.  
 B. Young shoots glabrous..... 46. *P. campanulata*  
 BB. Young shoots rufous-tomentose..... 47. *P. rufa*  
 AA. Fruiting pedicels not thickened.  
 B. Fls. before the lvs. in sessile umbels.  
 C. Calyx-tube pubescent, narrowed at base; lvs. pubescent beneath at least on midrib, with about 10 pairs of veins or more; involucre small, deciduous..... 45. *P. subhirtella*  
 CC. Calyx-tube glabrous; lvs. glabrous beneath at maturity or sometimes pubescent on vigorous shoots; involucre persistent.  
 D. Lvs. 3-6 cm. broad, with more than 10 pairs of veins; calyx-tube abruptly contracted at base; fr. red..... 50. *P. Conradinae*  
 DD. Lvs. 1.5-2.5 cm. broad with 8-10 pairs of veins; calyx-tube narrowed at base; fr. black..... 49. *P. conchina*  
 BB. Fls. with the lvs., often racemose.  
 C. Lvs. closely serrulate, lance-oblong or lanceolate; fls. white, rather small, 1-3 in subsessile umbels; fr. red..... 48. *P. serrula*  
 CC. Lvs. rather coarsely serrate or doubly serrate; fls. large, usually in racemes; fr. black or purple-black.  
 D. Lvs. and brts. glabrous or slightly pubescent.  
 E. Calyx-tube cylindric, usually pubescent; lvs. pubescent on the veins beneath. 51. *P. yedoensis*  
 EE. Calyx-tube campanulate, glabrous; lvs. glabrous, rarely sparingly pubescent beneath.  
 F. Fls. in 2-4-fld. sessile umbels; lvs. with acuminate teeth..... 52. *P. Sargentii*  
 FF. Fls. in 2-5-fld. bracted racemes; lvs. with aristate teeth..... 53. *P. serrulata*  
 DD. Lvs. beneath and brts. pubescent..... 54. *P. Sieboldii*

Sect. 3. LOBOPETALUM

- Sepals shorter than calyx-tube..... 55. *P. cantabrigiensis*  
 Sepals longer than calyx-tube..... 56. *P. Dielsiana*

Sect. 4. EUCERASUS

- Lvs. obtusely serrate, 4-15 cm. long; petiole 1.5-5 cm. long; sepals about as long as calyx-tube.  
 A. Lvs. pubescent beneath at least on veins, to 15 cm. long; inner bud-scales reflexed; infl. without leafy bracts; fr. sweet..... 57. *P. avium*

- AA. Lvs. glabrous, to 7 cm. long; inner bud-scales upright; infl. usually with a few leafy bracts at base: fr. sour.....58. *P. Cerasus*  
 Lvs. crenate, 2-5 cm. long; petioles 8-15 mm. long; sepals about half as long as calyx-tube .....59. *P. fruticosa*

## Sect. 5. MAHALEB

- Lvs. suborbicular or broad-ovate: fls. racemose .....60. *P. Mahaleb*  
 Lvs. narrower.....

- A. Lvs. acute to acuminate, serrulate, rhombic-ovate to ovate-lanceolate, soon glabrous: fls. subumbellate .....61. *P. pennsylvanica*  
 AA. Lvs. obtuse to acute, usually oblong, indistinctly crenulate.....62. *P. emarginata*

## Sect. 6. PHYLLOCERASUS

- Fls. few in a small short-stalked umbel.....63. *P. pilosiuscula*

## Sect. 7. PHYLLOMAHALEB

- Fls. 5-6 in a raceme.....64. *P. Mazimowiczii*

## Subgen. IV. PADUS

## Peduncle leafy.

- A. Calyx persistent in fr.  
 B. Rachis of infl. and brts. glabrous.....65. *P. serotina*  
 BB. Rachis and young brts. pubescent.....66. *P. alabamensis*  
 AA. Calyx deciduous in fr.  
 B. Pedicels thickened in fr. and lenticellate.....67. *P. sericea*  
 BB. Pedicel not thickened and not lenticellate.  
 c. Style shorter than stamens.  
 D. Calyx-tube pubescent inside.  
 E. Stone sculptured; petals 6-8 mm. long, twice as long as stamens.....68. *P. Padus*  
 EE. Stone smooth; petals 3-5 mm. long, about as long as stamens.....69. *P. pubigera*  
 DD. Calyx-tube glabrous inside; stone smooth or slightly rugose; petals as long or only  $\frac{1}{2}$  longer than stamens.  
 E. Lvs. acute or short-acuminate.  
 F. Lvs. 10-20 cm. long.....70. *P. cornuta*  
 FF. Lvs. shorter .....71. *P. virginiana*  
 EE. Lvs. long-acuminate .....72. *P. Siori*  
 CC. Style longer than stamens: lvs. long-acuminate.....73. *P. Grayana*

## Peduncle naked.

- A. Style about as long as stamens: lvs. gland-dotted beneath: calyx deciduous in fr.  
 AA. Style shorter than stamens: lvs. not glandular beneath: calyx persistent in fr.  
 74. *P. Maackii*  
 75. *P. Buergeriana*

## Subgen. V. LAUROCERASUS

- Lvs. serrate, shorter than racemes .....76. *P. lusitanica*  
 Lvs. usually entire, longer than racemes.....77. *P. Laurocerasus*

Subgen I. PRUNOPHORA Focke. Fr. sulcate, glabrous and usually bloomy; stone compressed, usually longer than broad and smooth or nearly so: fls. solitary or in umbel-like cluster, before or rarely with the lvs.: stalk usually remaining with the fr. (except in No. 6). PLUM.

Sect. 1. EUPRUNUS Koehne. Fs. 1-2, rarely to 3, stalked, usually with the lvs.; lvs. convolute in bud.

1. *P. spinosa* L. BLACKTHORN (SLOE.) Much-branched spiny shrub, rarely small tree to 4 m.; young brts. pubescent; buds small, globose-ovoid: lvs. elliptic-ovate to oblong-obovate, 2-4 cm. long, obtuse, finely or crenately serrate, pubescent while young, finally glabrous or sometimes pubescent: fls. before the lvs., usually solitary, 1-1.5 cm. across; pedicels glabrous, rarely pubescent: fr. globose, 1-1.5 cm. across, blue-black, bloomy, of astringent taste; stone turgid. R.I.25:t.80(c). S.E.3:t.408(c). F.D.25:t.2554(c). H.W. 3:89. G.C.42:308. Eu., N. Afr., W. Asia. Long. cult. Zone IV.—*P. s. plena* West., var. With double white fls. Gn.59:76;61:363;88:107(h). G.M.44:165. (*P. s. fl. pleno* Kirchn.)—*P. s. purpurea* André. Less spiny: lvs. purplish, larger: fls. pink. Orig. before 1903. ?Hybrid.

? *P. s. × insititia* = *P. fruticans* Weihe. Usually thornless; lvs. often acutish, 4-5 cm. long: fls. larger: fr. 1.4-1.8 cm. across. R.I.25:t.81(c). Occasionally found wild in Eu.

Closely related species: *P. cürdica* Fenzl & Fritsch. Lower, more spreading and less spiny: lvs. elliptic, acute, to 9 cm. long, pubescent while young: fls. with

the lvs., about 2 cm. across, usually solitary: fr. bluish black; pedicel to 1.4 cm. long, upright. S.H.1:f.346e,347p-q. Armenia. Intr. before 1892.

2. *P. insititia* L. BULLACE (DAMSON). Shrub or small tree to 6 m., sometimes slightly spiny: young brts. tomentose: lvs. elliptic to obovate, 4-8 cm. long, coarsely crenate-serrate, pubescent while young, at maturity usually glabrous and dull above; sparingly pubescent beneath, reticulate; petiole 1-2 cm. long: fls. white, 2-2.5 cm. across; pedicels pubescent; sepals glabrous or pubescent: fr. subglobose to ovoid, bluish black, sweet; stone little compressed; flesh clinging. R.I.25:t.82(c). S.E.3:t.409(c). D.F.25:2555(c). Hedrick, Plums N. Y. 34,t.(c). (*P. domestica* var. *i.* Fiori & Paol.) W. Asia, Eu. Cult. since prehistoric times. Zone IV.—*P. i. subsylvéstris* Boutigny. Spiny; sepals glabrous. The wild form.—*P. i. syriaca* (Borkh.) Koehne, var. *MIRABELLE*. Fr. subglobose, yellow. (*P. s.* Borkh.)—*P. i. itálica* (Borkh.) Aschers. & Graebn., prol. GREEN-GAGE (Reine Claude). Brts. thinly pubescent: fr. greenish often rather large. (*P. i.* Borkh., *P. Claudiana* Poir., *P. domestica* var. *i.* Schneid.)

*P. i.* × *spinosa*; see under No. 1.

3. *P. doméstica* L. GARDEN PLUM. Usually small tree to 10 or 12 m.: young brts. glabrous or slightly pubescent when young, becoming glabrous: lvs. elliptic or obovate, 5-10 cm. long, coarsely crenate-serrate, pubescent while young, at maturity glabrous and dull above, pubescent beneath and reticulate; petioles 1.5-2.5 cm. long: fls. greenish white, 1.5-2 cm. across; sepals pubescent inside: fr. usually ovoid to oblong, rarely subglobose, sweet; stone free, nearly smooth. R.I.25:t.83(c). S.E.3:t.410(c). D.F.25:t.2556(c). Hedrick, Plums N. Y. 12,t(c). (*P. communis* Huds., *P. oeconomica* Borkh., *P. damascena* Dierb., *P. pyramidalis* DC.) W. Asia, Eu. Long cult. in many forms for its fr. Zone IV.—*P. d. plantiérii* Carr. Fls. double, white. Gt.73:59. (*P. plantiériensis* Simon-Louis.)

4. *P. cerasífera* Ehrh. CHERRY PLUM. Slender-branched tree to 8 m., sometimes thorny; brts. glabrous: lvs. elliptic or ovate to obovate, 3-6 cm. long, finely obtuse-serrate, acute, broad-cuneate to rounded at base, light green, glabrous, except usually pubescent along the midrib beneath, with usually less than 6 pairs of veins: fls. usually solitary, 2-2.5 cm. across, white; stamens 25-30; pedicels glabrous, 5-15 mm. long: fr. subglobose, red, 2-3 cm. across, slightly bloomy. B.M.5934(c). R.I.25:t.84(c). Gn.33:252;87:109(h). (*P. domestica* var. *myrobalan* L., *P. myrobalana* Loisel. *P. Korolkowi* Vilm.) W. Asia, Caucas. Intr. about or before the 16th cent. Zone III.—*P. c. pendula* Bailey, var. With pendulous brs.—*P. c. elegans* Bean, var. Lvs. narrow, edged with white. R.H.1899:460. Orig. before 1899.—*P. c. atropurpurea* Jaeg. Lvs. purple, larger: fls. pink; pedicel 1.5-2 cm. long: fr. dark wine-red. R.H.1881:190,t(c);1884:396,t(c). G.C.III.1:416;67:194(h). Gn. 32:224,t(c);55:315. S.L.278(h). (*P. Pissardi* Carr., *P. c.* var. *Pissardii* Bailey.) Intr. before 1881.—*P. c. Woodii* Spaeth. Lvs. dark purple, remaining so all summer. G.W.17:470,t(c). (*P. c. Spaethi* Wood ex Spaeth.)—*P. c. nigra* Bailey, f. Lvs. very dark purple.—*P. c. Purpusii* Bailey, f. Lvs. dark red, variegated with yellow and bright rose.—*P. c. divaricata* (Ledeb.) Bailey, var. Brs. slenderer: lvs. more often rounded at base: fls. smaller, with the lvs.: fr. yellow, not impressed at base, 1.6-2 cm. across. B.M.6519(c). (*P. d.* Ledeb.) The wild form. Intr. 1820.

*P. c. atropurpurea* × *Mume* = *P. blireiana* André. Lvs. purple: differs from *P. c. atrop.* chiefly in its broader ovate acuminate lvs. rounded at base, semi-double pink fls. on pedicels 1-1.5 cm. long and pubescent ovary. R.H.1905:392,

t(c). Gn.78:240;85:109. J.L.40:f.37. M.D.1917:67,f.D. (*P. Pissardii* b. Lemoine, *P. cerasifera* var. b. Bean.) Orig. 1895.—*P. b. Moseri* (Moser) Koehne, f. Lvs. less purple; petiole and midrib above glabrous (pubescent at first in *P. b.*): fls. slightly smaller and paler. G.C.53:190. G.M.55:819. (*P. Pissardii* M. fl. pleno Moser, *P. cerasifera purpurea* M. Spaeth.) Orig. 1894.—Of similar origin is possibly *P. Boehmeri* Koehne. M.D.1917:67,f.C.—*P. c. × Amygdalo-persica* = *P. gigantea* Koehne. Lvs. elliptic-oblong to elliptic-lanceolate, 7–12 cm. long; petiole usually with 2 glands: fls. subsessile, sterile; calyx-tube semiglobose; sepals roundish, slightly villous or subglabrous; petals obovate, very concave, pale pink. R.H.1908:65. M.D.1917:67,f.B. Cult. 1877.—*P. c. × Munsoniana* or *angustifolia*, “Marianna.” Lvs. narrow-elliptic to oblong-obovate, 3.5–7 cm. long, slightly pubescent along the midrib beneath: fr. subglobose or globose-ovoid, 2.5–3 cm. across, red. R.H.1894:278,t(c). A.G. 1886:109. Hedrick, Plums N. Y. 274,t(c). Orig. about 1880.—*P. c. × salicina*. “Motley Plum.” With early dark red fr. U.S.Im.193:t.305(h),360(fr). Cult. 1910. Here belongs also “Purple-leaved Kelsey” (*P. c. atropurpurea × salicina* “Kelsey”). Burbank, Cat.1893:16,f.—*P. c. × Armeniaca*; see No. 25.—*P. c. × triloba*; see under No. 31.—*P. c. atropurpurea × pumila*; see under No. 39.

Related species: *P. monticola* K. Koch. Close to No. 4: shrub to 4 m.: lvs. glabrous, with more than 6 pairs of veins; petioles short: fls. usually 2; stamens 30 or more: fr. red. S.H.1:f.348a-c,349k. Asia Minor. Intr. 1854. Zone V.—*P. Cocomilia* Ten. Shrub or small tree with thorny brs.: lvs. elliptic to broad-obovate, 3–5 cm. long, finely serrate: fls. usually 2, about 1 cm. across, white or greenish white; pedicels short, about as long as calyx-tube; sepals erect-spreading: fr. yellow, subglobose or ellipsoid, 3 cm. long. S.H.346m-n, 348l-n. Tenore, Fl. Nap. t.144(c). Decaisne, Jard. Fruit. 8,t(c). Italy. Intr. 1824. Zone VI?—*P. Pseudoarmeniaca* Heldr. & Sart. Close to the preceding: lvs. 1–3 cm. long, acute to acutish: fr. about 2 cm. long, purple-blue. S.H.1:f.346o(l). Greece. Cult. 1934. Zone VI?—*P. ursina* Kotschy. Shrub to 3.5 m., sometimes spinescent: brts. pubescent or glabrescent; lvs. oval or obovate, 2–5 cm. long, acute to obtuse, crenate-serrulate, villous or glabrescent beneath: fls. 1.5–2 cm. across; the short stalk and calyx villous: fr. about 2 cm. across. S.H.1:f.346s-t, 348o. Asia Minor, Syria. Cult. 1926. Zone VI?

5. *P. salicina* Lindl. Small tree to 10 m.; brts. glabrous, becoming lustrous red-brown: lvs. usually oblong-obovate or elliptic-obovate, 6–10 cm. long, abruptly acuminate, cuneate, doubly obtuse-serrate, bright green and lustrous above, light green and glabrous beneath except the bearded axils; petioles 1–2 cm. long, with several glands: fls. usually 3, white, 1.5–2 cm. across; pedicels 1–1.5 cm. long, glabrous; sepals oblong-ovate, glabrous, slightly toothed: fr. globose-ovoid, with a deep depression at base, 5–7 cm. across, yellow or light red, sometimes green, with deep suture and often pointed at apex. N.K.5:t.26. R.H.1895:160,t(c). Gn.78:195. S.H.1:f.346c, 347d. (*P. triflora* Roxb., *P. ichangana* Schneid., *P. masu* hort., *P. botan* hort.) China, cult. in Japan. Intr. 1870. Zone III.—*P. s. pubipes* (Koehne) Bailey, var. Pedicels densely pubescent, rarely glabrescent; calyx pubescent toward base.

*P. s. × Armeniaca*. “Plumcot.” Lvs. ovate, acuminate, broad-cuneate or nearly rounded at base. J.L.1906:472,t.130. Orig. before 1906; also cult. in China.—*P. s. × Persica*. “Hybrid Plum-Peach.” Lvs. oblong, broad-cuneate at base: fls. pink, stalked; style longer than stamens; ovary rudimentary, hairy. G.C.41:256,257. J.L.1906:t.131. Orig. before 1906.—*P. s. × cerasifera*; see under No. 4.—*P. s. × Simonii*; see under No. 6.—Also *P. s. × maritima*, *P. s. × mexicana*, *P. s. × lanata*, *P. s. × americana*, *P. s. × Munsoniana*, *P. s. × hortulana* and *P. s. × angustifolia* have been recorded.

Related species: *P. bokhariensis* Schneid. Close to No. 5: lvs. oblong-elliptic or oblong-obovate, acuminate, midrib beneath woolly, closely crenate-serrulate. Kashmir? Cult. 1929. Zone VI?—*P. consociiflora* Schneid. Small tree: lvs. conduplicate in bud, oblanceolate to obovate, 3–7 cm. long, acuminate, narrowly cuneate, finely glandular-serrate, glabrous except villous along midrib beneath; petiole 4–7 mm. long: fls. 2–5, precocious, 1.2 cm. across; pedicels about 1 cm. long. C. China. Intr. 1900. Zone VI?—*P. gymnodonta* Koehne. Lvs. 4–7.5 cm. long, with glandless teeth, conduplicate in bud: fls. 1–2, coetaneous, 1.5 cm. across; pedicels 1.5–3 mm. long. Manch. Intr. before 1910. Zone V.

6. *P. Simòni* Carr. APRICOT PLUM. Narrow-pyramidal tree with upright brs.; brts. glabrous; lvs. oblong-lanceolate to oblong-obovate, 7-10 cm. long, acuminate, finely and obtusely serrate, glabrous, dull green above, reticulate beneath; petiole short and stout, with 2-4 large glands; fls. 1-3, short-stalked, 2-2.5 cm. across; fr. much depressed, with a deep suture, 3-5 cm. wide, very short-stalked, maroon-red, with yellow flesh; stone small, suborbicular, rough, clinging. R.H.1872:110,t(c). Gn.70:225. N. China. Intr. 1863. Zone V. Sometimes cult. for its fr.

*P. S. × salicina* = *P. sultana* Voss. Here belongs "Wickson." Hedrick, Plums N. Y. 376,t(c). M.G.14:544(h).

Sect. 2. PRUNOCERASUS Koehne. Fls. in clusters of 2-5; lvs. usually conduplicate (convolute in Nos. 7, 18 and 19, slightly so in 9 and 17).

7. *P. subcordata* Benth. PACIFIC PLUM. Shrub or sometimes small tree to 8 m., with almost horizontal brs.; bark grayish brown; young brts. glabrous or pubescent, bright red; lvs. broad-ovate to suborbicular, 3-7 cm. long, obtuse or acutish, usually subcordate at base, sharply and often doubly serrate, pubescent below when young, at maturity glabrous or puberulous; petiole 1-2 cm. long, glandular; fls. 2-4, white fading to rose, about 1.5 cm. across, on pubescent or glabrous stalks 1 cm. or less long; calyx-lobes oblong, obtuse, pubescent on both sides; fr. red or sometimes yellow, bloomy, ellipsoid, 1.5-3 cm. long. S.S.4:t.154. Ore. to Calif. Intr. about 1850. Zone VI.—*P. s. Kellöggii* Lemm., var. Sisson PLUM. Bark ashy gray; lvs. usually not cordate at base, nearly glabrous; fr. large.

8. *P. maritima* Marsh. BEACH PLUM. Straggling shrub to 2 m., the lower brs. often decumbent; young brts. pubescent; lvs. ovate or elliptic, rarely obovate, 4-6.5 cm. long, acute at ends, sharply serrate, dull green and glabrous above, paler and soft-pubescent beneath; petioles pubescent, rather stout, 4-6 mm. long, often glandular; fls. 2-3, white, 1.2-1.5 cm. across; pedicels 5-7 mm. long; calyx pubescent, lobes obtuse, oblong, entire or dentate at apex, pubescent within; petals oblong-ovate; fr. globose, about 1.5 cm. across, dull purple, bloomy, sometimes crimson; stone ovoid and turgid, truncate at base. B.M.8289(c). Gg.4:287. S.L.279(h). (*P. sphaerocarpa* Michx., *P. acuminata* Michx., *P. pubescens* Pursh.) Me. to Va., near the coast. Intr. 1818. Zone III. Rarely cult. for its fr.; sometimes for the early profuse white fls.—*P. m. flava* G. S. Torrey, f. Fr. yellow.

*P. m. × americana* = *P. Dunbării* Rehd. Brts. glabrous at maturity; lvs. larger, acuminate, more sharply serrate, less pubescent; pedicels and calyx glabrescent; fr. purple, larger; stone more compressed. Orig. about 1900.

Related species: *P. Grävèsii* Small. Lvs. suborbicular, obtuse or apiculate; stone pointed at base. Conn. Intr. 1902. Zone V.

9. *P. alleghaniensis* Porter. ALLEGHANY PLUM. Straggling shrub or tree to 5 m., often forming thickets; young brts. pubescent or glabrous, soon reddish brown; lvs. narrow-elliptic to oblong-lanceolate, 6-9 cm. long, acuminate, cuneate, sharply and finely serrate, glabrous or sparingly pubescent above, pubescent beneath at least when young; petioles 7-12 mm. long, pubescent, rarely glandular; fls. 2-4, 1-1.2 cm. across; pedicels slender; calyx-tube pubescent, rarely glabrous; sepals oblong-ovate, sparingly hairy or glabrous within; petals round-obovate, turning pinkish; fr. subglobose, about 1 cm. across, dark purple and bloomy; stone turgid, slightly obovoid and obtusish at apex. S.S.4:t.153. F.G.3:429. B.C.5:2831. M.G.19:54(h). Conn. to Pa. Intr. 1889. Zone V.—*P. a. Davisii* W. F. Wight. Shrub; lvs. broader, less acuminate, pubescent beneath only at the midrib. Mich. Intr. 1912.

10. *P. umbellata* Ell. Small tree to 6 m. with compact head and slender brs.; bark dark brown; brts. glabrous or slightly pubescent at first; lvs. ellip-

tic to lanceolate, 4-7 cm. long, acute, rounded at base or broad-cuneate, finely serrate with acute teeth, glabrous above, usually pubescent beneath along the midrib, rather firm at maturity; petioles 5-7 mm. long, pubescent: fls. 2-4, white, 1-1.8 cm. across; the slender pedicels and calyx glabrous; sepals ovate, obtuse, shorter than tube, slightly hairy without, pubescent within: fr. subglobose, 1-2 cm. across, red, yellow or dark purple, bloomy; stone oval or subglobose, obtuse, smooth or reticulate. S.S.4:155. S. C. to Fla. Intr.? Zone VII?—*P. u. injucunda* (Small) Sarg., var. Lvs. elliptic to elliptic-oblong, acute or acuminate, broad-cuneate, pubescent beneath, slightly so above: stone usually pointed. N. C. and Ga. to Ala. and Miss. (*P. i.* Small.) Intr. 1900. Zone VI?—*P. u. tarda* (Sarg.) W. F. Wight. Bark light reddish brown: lvs. elliptic-oblong or sometimes obovate, acute or short-acuminate, cuneate, finely pubescent or glabrous above, tomentulose beneath; petioles tomentose. Fl. iv; fr. x-xi. S.M.560. Miss., Tex. to S. Ark. Intr. 1903.

11. *P. mexicana* S. Wats. BIG-TREE PLUM. Tree to 12 m., not sprouting from the root; brts. pubescent or glabrous: lvs. obovate to oblong-obovate, 6-12 cm. long, abruptly acuminate, usually subcordate, sharply and often doubly serrate, short-pubescent above, at least when young, and rugose, pubescent and somewhat reticulate beneath, thickish at maturity; petioles glandular: fls. 2-4, white, 1.5-2 cm. across, pedicels usually glabrous; calyxlobes dentate at apex or sometimes entire, slightly glandular, pubescent within: fr. globose, sometimes ellipsoid, 2-3 cm. long, purplish red, bloomy; stone obovoid or subglobose, turgid. S.M.565. S.T.2:t.165. (*P. arkansana* Sarg., *P. australis* Munson.) S. W. Ky. and Tenn. to Okl. and Mex. Intr. 1910. Zone V. Used occasionally as stock.

*P. m.* × *salicina* and *P. m.* × *Reverchonii* have been recorded.

12. *P. lanata* (Sudw.) Mack. & Bush. Small tree sprouting from the root and forming thickets; bark red-brown; brs. spreading, forming a broad round head; brts. glabrous or pubescent: lvs. obovate to oblong-obovate, 6-12 cm. long, acuminate, broad-cuneate, rarely rounded, sharply and often doubly serrate, pubescent beneath; petioles usually glandless: fls. 2-5, white, 2-3 cm. across, pedicels and calyx outside pubescent; lobes acuminate, entire: fr. usually subglobose, 2-3 cm. across, red or yellowish; stone flattened. Hedrick, Plums N. Y. 380,t(c). S.M.563. (*P. americana* var. *mollis* Torr. & Gr., in part, *P. americana* var. *l.* Sudw., *P. Palmeri* Sarg.) Ill., Iowa and Mo. to Tex. Intr. 1903. Zone V. Cult. occasionally for its fr.

13. *P. americana* Marsh. Tree, much like the preceding; young brts. glabrous: lvs. obovate to oblong-obovate, 6-10 cm. long, acuminate, broad-cuneate, sharply and often doubly serrate, glabrous or slightly pubescent along the midrib beneath; petioles glandless: fls. 2-5, white, 2-3 cm. across; calyx outside and pedicels glabrous, lobes acuminate, entire: fr. usually subglobose, 2-3 cm. across, red, rarely yellowish; stone compressed. S.S.4:t.150. B.C.5:2827,2828. Hedrick, Plums N. Y. 56,t(c),382,t(c). S.L.278(h). Mass. to Man., s. to Ga., N. Mex. and Utah. Cult. 1768. Zone III.—Many pomological varieties are grown; sometimes planted for its fls.

*P. a.* × *maritima*; see under No. 8.—*P. a.* × *angustifolia*; see under No. 18.—*P. a.* × *salicina*, *P. a.* × *hortulana*, *P. a.* × *Munsoniana*, *P. a.* × *utahensis* and *P. a.* × *pumila* have been recorded.

14. *P. nigra* Ait. CANADA PLUM. Small tree to 6 m.; rarely 10 m. tall, with upright brs. forming a narrow head; bark red brown to gray brown; young brts. glabrous or pubescent: lvs. elliptic to obovate, 6-10 cm. long, acuminate, broad-cuneate to subcordate, coarsely and doubly obtuse-serrate,

glabrous above, pubescent or nearly glabrous beneath; petioles 1.5–2.5 cm. long, biglandular: fls. 3–4, white fading to pink, 2–3 cm. across; calyx like the slender stalks reddish and glabrous, lobes acute, glandular-serrate, becoming reflexed; petals broad-ovate: fr. ellipsoid, 2–3 cm. long, red or yellowish red; stone compressed. S.S.4:t.149. B.M.1117(c). Em.2:511,t(c). S.L.279 (h). (*P. americana* var. *n.* Waugh, *P. borealis* Poir., *P. mollis* Torr.) N. B. to Assin., s. to N. Y., Ohio and Wisc. Intr. 1773. Zone II.

15. *P. hortulana* Bailey. Tree to 10 m., not sprouting from the root; bark brown, thin, scaly; young brts. glabrous becoming dark red-brown: lvs. oblong-ovate to oblong-obovate, rarely oblong-lanceolate, 7–11 cm. long, glabrous and lustrous above, slightly pubescent beneath at least along the midrib and veins, rather thick at maturity; petioles slender, 1.5–2.5 cm. long, usually with 1 or more glands, pubescent above: fls. 2–4, white, 1.2–1.5 cm. across; pedicels slender, like the calyx glabrous, lobes oblong-ovate, glandular-ciliate, as long or nearly as long as tube, acute or obtuse, sometimes slightly pubescent outside, pubescent inside, usually finally reflexed: fr. globose or short-ellipsoid, 1.8–3 cm. long, red or yellow, slightly or not bloomy; stone subglobose to ellipsoid, reticulate. S.M.568. B.C.5:2828. Hedrick, Plums N. Y. 384,t(c). (*P. hortulana* var. *Waylandii* Bailey.) Ky. and Tenn. to Iowa and Okl. Cult. 1890. Zone V. Often cult. for its fr.—*P. h. Mineri* Bailey, var. Lvs. thicker and duller, more veiny beneath. Hedrick, Plums N. Y. 209,t(c), 272,t(c).—*P. h. pubens* Sarg., var. Young brts. and lvs. beneath pubescent.

*P. h.* × *salicina*, *P. h.* × *americana* and *P. h.* × *Munsoniana* have been recorded.

16. *P. Munsoniana* Wight & Hedr. WILD GOOSE PLUM. Tree to 8 m.; brts. glabrous, soon chestnut-brown: lvs. oblong-lanceolate to lanceolate, rarely obovate-oblong, 6–10 cm. long, acute or acuminate, rounded at base, finely glandular-serrate, bright green and lustrous above, paler beneath and rather sparingly pubescent along the midrib and veins, sometimes pubescent all over when young, rarely quite glabrous, rather thin at maturity; petioles 1.5–2 cm. long, usually biglandular, pubescent above: fls. 2–4, 1.2–1.5 cm. across; pedicels slender, glabrous; calyx-lobes ovate-oblong, as long as the glabrous tube, glandular-ciliate, glabrous or slightly pubescent outside, pubescent inside near base; petals obovate to oblong-obovate: fr. globose to short-ellipsoid, 1.5–2.5 cm. long, red, rarely yellow, slightly bloomy; stone oval, usually truncate at base. Fl.iv–v; fr.vii–viii. S.M.569. B.C.5:2830. Hedrick, Plums N. Y. 378,t(c). Ky. and Tenn. to Kans. and n. Tex.—Cult. occasionally for its fr. in many pomological vars. Zone V.

*P. M.* × *cerasifera*; see under No. 4.—*P. M.* × *salicina*, *P. M.* × *sultana*, *P. M.* × *americana*, *P. M.* × *hortulana*, *P. M.* × *angustifolia* and *P. M.* × *Persica* have been recorded.

17. *P. Reverchonii* Sarg. HOG PLUM. Shrub to 2 m., forming dense thickets; bark gray; young brts. glabrous, chestnut-brown: lvs. lanceolate or lance-ovate, 5–7 cm. long, acuminate, cuneate or rounded at base, crenately glandular-serrate, strongly trough-shaped, green and glabrous above, paler beneath and slightly pubescent, rarely densely so while young; petioles 7–12 mm. long, with 2–4 glands at apex, pubescent above: fls. 2–4, about 1 cm. broad; pedicels glabrous, 6–10 mm. long; calyx sparingly hairy outside, lobes oblong or oblong-ovate, glandular-ciliate, shorter than tube, pubescent within; erect or spreading; petals obovate or oblong-obovate: fr. globose or subglobose, 1.5–2 cm. across, usually yellow with crimson cheek, rarely red; stone oblong, pointed at ends, smooth or slightly reticulate. Fl.iii–iv; fr.

vii-viii. U. S. Dept. Agr. Bull. 179:t.3,f.2,t.10,f.13-22. (*P. pygma* Munson, not *P. pygmaea* Willd.) Okl., Tex. Intr. 1916. Zone V.

*P. R. × mexicana* has been recorded.

Closely related species: *P. rivularis* Scheele. CREEK PLUM. Lvs. ovate to oblong-ovate, or slightly obovate, not strongly trough-shaped; petioles glandless or with 1 or 2 glands: sepals finally reflexed: fr. subglobose, 1.5 cm. diam., red, slightly bloomy; stone subglobose or oval. U. S. Dept. Agr. Bull. 179:t.3,f.3;t.10,f.23,24. (*P. texana* Scheele, not Dietr.) Tex. Intr. 1917. Zone V.

18. *P. angustifolia* Marsh. CHICKASAW PLUM. Twiggy shrub forming thickets, or small tree to 4 m.; brts. slender, zigzag, glabrous, reddish: lvs. lanceolate to oblong-lanceolate, strongly trough-shaped, 2-5 cm. long, acute or short-acuminate, broadly cuneate or rounded at base, finely glandular, serrate, glabrous and lustrous above, paler beneath and glabrous or pubescent along the midrib toward the base; petioles glandular or glandless: fls. 2-4, 8-9 mm. across; pedicels 3-6 mm. long, glabrous; calyx glabrous, the lobes ovate, shorter than tube, glandless, glabrous inside except near base: fr. subglobose, 1-2 cm. across, red or yellow, with thin skin; stone oval, obtuse at ends or acute at apex. Fls. iii-iv; fr. vii-viii. S.S.4:152. (*P. chicasa* Michx.) Md. and s. Del. to Fla., w. to Ark. and Tex. Intr. 1874? Zone V.—*P. a. Watsonii* (Sarg.) Waugh. SAND PLUM. Lvs. smaller, elliptic to elliptic-oblong, acute, less conspicuously serrulate: fls. smaller; fr. with thicker skin. G.F.7:135. B.C.5:2829. M.G.19:55(h). (*P. W.* Sarg.) Kans. to Tex. and N. Mex. Cult. 1879.—*P. a. varians* Wight & Hedr. Rather larger and more robust: lvs. larger; pedicels longer: stone usually more pointed at apex. Okla., Tex. Cult. for its fr.

*P. a. Watsonii × americana* = *P. orthosépala* Koehne. Spreading shrub to 2 m.; it differs from *P. angustifolia* chiefly in its oblong-lanceolate to obovate-lanceolate, slightly larger and broader and more sharply serrate lvs., the larger fls. and larger frs. about 2.5 cm. across. G.F.7:187. B.C.5:2830. Orig. in Kans. Intr. 1880. Zone V.—*P. a. Watsonii × Besseyi*; see under No. 40.—*P. a. varians × gracilis* = *P. Slavinii* E. J. Palm. Spinescent shrub to 2.5 m.: lvs. lanceolate to lance-ovate, 3.5-7 cm. long, paler and pubescent beneath: fls. 2-6; pedicels pubescent or nearly glabrous; calyx-lobes ovate-lanceolate, usually entire, slightly pubescent or glabrous outside. Okl. and Kans. Intr. 1916.—Also *P. a. × salicina* and *P. a. varians × Munsoniana* have been recorded.

19. *P. grácilis* Engelm. & Gr. OKLAHOMA PLUM. Straggling shrub to 1.5 m., forming thickets; young brts. pubescent, later reddish brown: lvs. elliptic to ovate, 2.5-5 cm. long, acute at ends, rarely obtuse, finely serrate with acute or obtuse teeth, finely and slightly pubescent above, reticulate and densely pubescent below; petioles pubescent, glandless: fls. 2-4, about 1 cm. broad; pedicels and calyx finely pubescent; calyx-lobes ovate, acute, entire or denticulate, pubescent on both sides: fr. subglobose, about 1.5 cm. thick, usually red, slightly bloomy; stone oval, obtusish at ends. S.H.1:f. 345i(1). (*P. normalis* Small.) W. Ark., Okl. and N. Tex. Intr. 1916. Zone V.

*P. g. × angustifolia varians*; see under No. 18.

Closely related species: *P. venulosa* Sarg. Larger shrub: lvs. larger, ovate to oblong-ovate, often short-acuminate and rounded at base, strongly reticulate beneath: fls. smaller; pedicels glabrous or nearly so: fr. somewhat larger, dark red. U. S. Dept. Agr. Bull. 179:t.7,f.2;t.12,f.22-24. Tex. Intr. 1916.

Sect. 3. ARMENIACA (Lam.) Koch. Fls. usually sessile or short-stalked (long-stalked in No. 25), ovary and fr. pubescent (glabrous in No. 20): lvs. convolute, round-ovate to ovate, simply or doubly serrate: stone smooth or pitted; thornless shrubs or trees, the fls. before the lvs., except in No. 20.

20. *P. brigantina* Vill. BRIANÇON APRICOT. Shrub or small tree; young brts. glabrous: lvs. ovate, 4-7.5 cm. long, short-acuminate, often subcordate, sharply and doubly serrate, pubescent beneath, chiefly on the veins: fls. 2-5, with the lvs., white or pinkish, 1.5-2 cm. across, short-stalked: fr. yellow,

smooth, round. N.D.5:t.59(c). L.A.2:684. (*P. brigantiaca* Vill., *Armeniaca* b. Pers.) S. E. France. Long cult. Zone VI. The seeds yield a perfumed oil "l'huile de marmotte."

21. *P. mandshurica* (Maxim.) Koehne. MANCHURIAN APRICOT. Small tree to 5 m., with spreading and slightly pendulous brs.: lvs. broad-elliptic to ovate, 5-12 cm. long, acuminate, rounded or broad-cuneate at base, sharply and doubly serrate, with narrow elongated teeth, green beneath and glabrous except axillary tufts of hairs; petioles 2-3 cm. long, puberulous: fls. solitary, pinkish, about 3 cm. across; pedicels 2-5 mm. long: fr. yellow, subglobose, 2.5 cm. across; stone small, with obtuse edges. N.K.5:t.25. S.H.:f.349e,350f. (*P. Armeniaca* var. *m.* Maxim.) Manch., Korea. Cult. 1900. Zone V.

22. *P. sibirica* L. SIBERIAN APRICOT. Upright tree or shrub to 5 m., lvs. ovate, 5-8 cm. long, long-acuminate, finely serrate, reddish when young; then bright green, glabrous except axillary tufts of hairs beneath; petioles 1-3 cm. long, reddish: fls. solitary, white or pink, 3 cm. across; pedicels and calyx nearly glabrous: fr. subsessile, yellow with reddish cheek, little fleshy and scarcely edible; stone smooth with sharp nearly winged edge. L.B. 1627(c). Gs.3:74. S.H.1:f.349c,350g-h<sup>1</sup>. (*P. Armeniaca* var. *s.* K. Koch, *Armeniaca* s. Pers.) E. Siber., Manch., N. China. Intr. about 1800. Zone IV.

23. *P. Armeniaca* L. APRICOT. Round-headed tree to 10 m.; bark reddish; brts. brownish: lvs. broad-ovate or orbicular-ovate, 5-10 cm. long, abruptly acuminate, subcordate or rounded, closely and obtusely serrate, glabrous or with axillary tufts of hairs beneath; petioles 2-3 cm. long: fls. solitary, white or pinkish, about 2.5 cm. across: fr. round, 3 cm. across or more, yellowish with red cheek, nearly glabrous; stone smooth with a thickened furrowed edge. N.D.5:t.49(c). R.I.25:t.85(c). F.D.25:t.2553(c). M.A. t.23(h). Gn.M.31:259(h). (*Armeniaca vulgaris* Lam.) W. Asia. Long cult. Zone V. Cult. for its fr. in many pomological varieties.—*P. A. variegata* Schneid., f. With variegated lvs. Orig. before 1770.—*P. A. pendula* Jaeg., var. Brs. pendulous. Orig. before 1889.—*P. A. Ansu* Maxim. Lvs. broad-elliptic to broad-ovate, usually broad-cuneate or truncate at base: fls. usually 2, pink: fr. subglobose, red, tomentose; stone free, minutely reticulate and with a very sharp edge. (*P. a.* Komar.) Cult. in Japan and Korea. Cult. 1880.

*P. A.* × *salicina*; see under No. 5.—*P. A.* × *cerasifera* = *P. dasycarpa*; see No. 25.

24. *P. Mume* (Sieb.) Sieb. & Zucc. JAPANESE APRICOT. Round-headed tree to 10 m. or shrub; bark gray or greenish; brts. slender, green: lvs. broad-ovate to ovate, 4-10 cm. long, long-acuminate, usually broad-cuneate, finely and sharply serrate, pubescent on both sides or only on the veins beneath; petioles glandular: fls. 1-2, very short-stalked, light pink, fragrant; petals obovate: fr. globose, 2-3 cm. across, yellow or greenish, scarcely edible; stone pitted, the flesh adhering. R.H.1885:564,t(c). Gn.50:164,t(c). N.K.5:t.24. G.C.29:183. (*Armeniaca M.* Sieb.) Japan, China. Intr. 1844. Zone VI.—*P. M. alba* (Carr.) Rehd., f. Fls. white. R.H. 1885:564.—*P. M. Alphandii* Rehd., f. Fls. pink, double. (*P. M. fl. pleno* Bean.) R.H.1885:564,t(c).—*P. M. albo-plena* Bailey, var. Fls. white, double.—*P. M. pendula* Sieb., var. With pendulous brs. U. S. Im. 23:t.325,326(h).—*P. M. tonsa* Rehd., var. Lvs. nearly glabrous, often broad-cuneate: fls. white. China.

*P. M.* × *cerasifera* = *P. blireana*; see under No. 4.

25. *P. dasycarpa* Ehrh. PURPLE APRICOT (BLACK A.) Small tree to 6 m.; young brts. glabrous, purplish: lvs. elliptic-ovate to ovate, 3-6 cm. long,

acuminate, finely and closely serrate, dull green above, pubescent beneath on the veins; petioles 1.5–2.5 cm. long, glandular or glandless: fls. white, 2 cm. across; pedicels slender, pubescent: fr. globose, 3 cm. across, dark purple, bloomy, minutely pubescent. B.R.1243(c). N.D.5:t.51,f.1(c). L.B.1250(c). Probably *P. Armeniaca* × *cerasifera*. Orig. before 1780. Zone V. Fls. early and showy, before the lvs.; fr. rarely produced.

Subgen. II. AMYGDALUS (L.) Focke. Fls. sessile or short-stalked, before the lvs.: fr. tomentose (glabrous in a var. of *P. Persica*), usually dehiscent; stone pitted or smooth: lvs. conduplicate in bud: buds 3 in each axil, the lateral ones fl.-buds; terminal bud present.

26. *P. Amygdalus* Batsch. ALMOND. Tree to 8 m., with gray bark; brts. glabrous: lvs. ovate-lanceolate to narrow-lanceolate, broadest usually slightly below the middle, 7–12 cm. long, long-acuminate, broad-cuneate or nearly rounded at base, finely serrulate, glabrous; petioles to 2.5 cm. long, glandular: fls. 1–2, pink or nearly white, 3–5 cm. across, nearly sessile; calyx-lobes oblong, villous at the margin: fr. ellipsoidal, compressed, 3–6 cm. long, velvety, dry, splitting; stone smooth, pitted. N.D.4:t.29(c). D.F.25:t.2550(c). G.O.t.141(c). R.I.25:t.87(c). Gn.50:312,t(c);54:122,t(c). (*Amygdalus communis* L., *P. communis* Arcang., not Huds.) W. Asia, ?N. Afr. Cult. since ancient times. Zone VI.—*P. A. variegata* (Schneid.) Rehd., f. Lvs. variegated.—*P. A. albo-plena* (Schneid.) Rehd., f. Fls. double, white.—*P. A. roseo-plena* (Schneid.) Rehd., f. Fls. pink, double.—*P. A. purpurea* (Schneid.) Rehd., f. Fls. rose-purple.—*P. A. pendula* (Schneid.) Bean, var. Brs. pendulous.—*P. A. amara* (DC.) Focke, var. Fls. large, darker in centre: lvs. broadest about the middle: kernel bitter.—*P. A. dulcis* (DC.) Koehne, var. Lvs. somewhat glaucous, broadest toward the base: style exceeding the stamens: kernel sweet. (*P. A. var. sativa* Focke.)—*P. A. fragilis* (Borkh.) Focke, var. Stone with thin fragile shell: kernel sweet.

*P. A.* × *Persica* = *P. Amygdalo-persica* (West.) Rehd. Lvs. similar to *P. Amygdalus*, but more sharply serrate: fls. large, pink: fr. more peach-like, but with rather dry flesh and finally dehiscent; stone with hard shell, pitted and furrowed. R.H.1908:64(fr.) Jour. Hered. 12:328(h),329. Gt.74:477. M.A.t.20(h). (*P. persico-amygdala* Schneid., *P. persicoides* Aschers. & Graebn., *Amygdalus communis* var. *persicoides* Ser., ? *P. Pollardii* Hort.) Orig. before the 16th cent. Zone V.—*P. amygdalo-persica* × *cerasifera*; see under No. 4.

Related species: *P. Fenzliana* Fritsch. Close to No. 26: lower, sometimes spinescent: lvs. narrowly oblong-ovate, broadest near base, 6–8 cm. long, grayish or bluish green: fls. whitish: fr. scarcely fleshy; stone shorter. S.H.1:f.333a, 334d-f. Cauc. Intr. before 1890. Zone VI.—*P. scoparia* (Spach) Schneid. Up-right shrub to 6 m. with virgate, sparingly leafy brts.: lvs. linear, remotely crenulate, 2–4 cm. long: fls. about 2.5 cm. across; petals suborbicular: fr. ovoid, about 2 cm. long, glabrescent. S.H.1:f.332e-h. (*Amygdalus* s. Spach.) Persia. Cult. 1934. Zone VII?—*P. spartioides* (Spach) Schneid. Similar to the preceding: to 1.5 m.: lvs. narrow-oblong, 1–1.5 cm. long: petals oblong; ovary pubescent: fr. glabrous or nearly so. S.H.1:332a-d. (*Amygdalus* s. Spach.) W. Asia. Cult. 1933. Zone VII?

27. *P. Persica* (L.) Batsch. PEACH. Tree to 8 m.; brts. glabrous; buds pubescent: lvs. elliptic-lanceolate or oblong-lanceolate, broadest about or slightly above the middle, 8–15 cm. long, long-acuminate, broad-cuneate, serrate or serrulate, glabrous; petioles glandular, 1–1.5 cm. long: fls. usually solitary, pink, 2.5–3.5 cm. across, very short-stalked; sepals pubescent outside: fr. subglobose, 5–7 cm. across, fleshy; stone deeply pitted and furrowed, very hard. N.D.6:t.23(c). R.I.25:t.86(c). G.O.t.140(c). D.F.25:t.2552(c). (*Amygdalus* P. L., *Persica vulgaris* Mill.) China. Cult. since ancient times. Zone IV.—*P. P. atropurpurea* Schneid., f. Lvs. purple. Brs. pendulous.—The numerous forms cult. for their fr. may be classed under the following varieties: *P. P. scleropersica* (Reichb.) Voss, f. CLINGSTONE *P.* The flesh adhering to the stone.—*P. P. aganopersica* (Reichb.) Voss, f. FREESTONE *P.* Stone separating from the flesh.—*P. P. Nectarina* (Ait.) Maxim., var. NECTARINE. Lvs. usually more strongly serrate: fr. glabrous, smaller. (*Amygdalus Persica* var. *Nectarina* Ait., *Persica nucipersica* Borkh. *P. Persica* var. *laevis* Gray.) Of this var. there are two forms: *P. P. scleronucipersica* (Schuebl. & Mart.) Rehd., f., stone adhering to the flesh and *P. P. aganonucipersica* (Schuebl. & Mart.) Rehd., f., stone separating from the flesh.—*P. P. compressa* (Loud.) Bean, var. FLAT *P.* Fr. much flattened from above, broader than high; stone small, irregular. R.H.1870:111,t(c). J.1:154. L.A.2:680. B.C.5:2493. (*Persica platycarpa* Dene, *Persica vulg.* var. *compressa* Loud., *P. P.* var. *platycarpa* Bailey.) China. Cult. 1822.

*P. P. × salicina*; see under No. 5.—*P. P. × Munsoniana* has been recorded. Closely related species: *P. kansuensis* Rehd. Winter-buds glabrous: lvs. broadest below the middle, less closely serrate, villous along the midrib near base; style longer than stamens, about as long as petals; stone furrowed, but not pitted. G.C.101:119(h). (*Amygdalus k. Skeels*.) N. W. China. Intr. 1914.

28. *P. Davidiana* (Carr.) Franch. Tree to 10 m., with upright slender brs.; young brts. glabrous: lvs. narrowly ovate-lanceolate, 6-12 cm. long, broadest near base, gradually long-acuminate, broad-cuneate, finely and sharply serrate, light green, glabrous; petioles glandular: fls. solitary, light pink, about 2.5 cm. across, on very short stalks; calyx-lobes oval, glabrous: fr. globose, 3 cm. across, yellowish; stone small, pitted, free. FL. III-IV. R.H.1872:75. Gt.44:t.1412(c). G.F.10:503. G.C.III.11:529. (*Persica D.* Carr.) China. Intr. 1865. Zone III.—*P. D. alba* Bean, var. Fls. white. Gt.44:t.1412(c). Gn.50:165. (*P. D. f. albiflora* Schneid.)—*P. D. rubra* Bean, var. Fls. bright rosy red.—Ornamental tree, flowering very early.—*P. D. Potaninii* (Batal.) Rehd., var. Lvs. ovate-lanceolate, rounded at base, acute or acuminate, crenate, lustrous above, firm, 6-7.5 cm. long: fr. ellipsoid. U. S. Im. 106:858,t. (*P. Persica* var. *P. Batal.*) N. W. China. Intr. 1914. Zone V.

29. *P. mira* Koehne. Tree to 10 m., with slender brs.; brts. glabrous, green: lvs. lanceolate, 5-10 cm. long, gradually long-acuminate, rounded at base, remotely crenate-serrulate, entire near apex, villous along the midrib beneath; petioles 8-15 mm. long, with 2-4 glands: fls. solitary or 2, white, 2-2.5 cm. across, very short-stalked; sepals oval, slightly villous on margin; petals roundish-obovate: fr. subglobose, about 3 cm. across, fleshy, densely tomentose; stone ovate, compressed, smooth. B.M.9548(c). W. China. Intr. 1910. Zone VI. Differs from all other species of this group in the smooth stone.

30. *P. tangutica* Batal. Dense shrub to 4 m., with spreading spiny brs.; brts. glabrous, brown: lvs. usually fascicled, oblanceolate or oblong, 1-3 cm. long, acute or obtuse, mucronulate, cuneate, crenulate, dark green above,

pale green beneath with 5-8 pairs of veins: fls. sessile, solitary, 2.5 cm. across; sepals oval, glabrous, obscurely denticulate, about as long as tube; petals obovate; stamens about 30 in 2 series: fr. subsessile, about 2 cm. across, densely tomentose, with thin flesh, dehiscent; stone roundish, keeled on both sides, rugose. B.M.9239(c). G.C.77:200. (*P. dehiscens* Koehne.) W. China. Intr. 1910. Zone VI.

Related species: *P. mongolica* Maxim. Close to No. 30: lvs. broad-elliptic, about 1 cm. long, with usually 4 pairs of veins: fr. smaller, slightly tomentulose; stone adhering to the flesh. Mongol. Intr. 1866. Zone III.—*P. bucharica* (Korsh.) Fedtsch. Shrub to 2 m., scarcely spiny: lvs. elliptic to ovate or ovate-oblong, 2.5-4 cm. long, acute or obtusish, crenate-serrulate; petiole slender, to 1.5 cm. long: sepals with villous margin: fr. finally dehiscent; stone ovate to ovate-lanceolate, 2.5 to 3 cm. long, smooth or nearly so. (*Am. b.* Korsh.) Turkestan. Cult. 1902. Zone VI?

Into this affinity belong: *P. argentea* (Lam.) Rehd. Unarmed shrub to 3 m.; brts. whitish tomentose: lvs. elliptic or ovate, 2-3.5 cm. long, white-tomentose, obscurely serrulate, short-stalked: fls. rose, 2-2.5 cm. across: fr. ovoid, 1.5 cm. long, whitish-tomentose. L.B.1137(c). (*Amygdalus orientalis* Mill., *A. argentea* Lam., *P. orientalis* Koehne, not Walp.) W. Asia. Intr. 1756. Zone VII?—*P. fasciculata* (Torr.) Gray. Shrub to 1 m., with spreading spinescent brs: brts. puberulous: lvs. fascicled, linear-spatulate, 1-2 cm. long, entire, finely pubescent: fls. 2-5, small, greenish white: fr. globose-ovoid, about 1.5 cm. long, villous. S.H.1.f.335f-h. Torrey, Pl. Frémont. t.5. (*Emplectocladus* f. Torr., *Amygdalus* f. Greene.) Calif. to Ariz. Intr. before 1881. Zone VII.—*P. pedunculata* (Pall.) Maxim. Shrub to 2 m.; brts. tomentulose, dark brown: lvs. elliptic to oblong, irregularly dentate, 2.5-4 cm. long, pubescent at least beneath when young: fls. solitary, pinkish; pedicels as long or twice as long as calyx-tube: fr. ovoid, little over 1 cm. long, pubescent; stone smooth. S.H.1.f.335a-c. R.H.1864:370. Nov. Act. Petrop. 7:t.8.9. (*Amygdalus p.* Pall., *A. Boissieri* Carr.) Siberia. Intr. before 1860. Zone V.—*P. pilosa* (Turcz.) Maxim. Close to the preceding: much-branched shrub to 1.5 m.; brts. pilose: lvs. obovate, 1-2 cm. long, glandular-serrate, pilose on both sides: fls. subsessile. Mongol. Cult. 1933. Zone V?—*P. spinosissima* (Bge.) Franch. Rigid spiny shrub: lvs. elliptic-obovate to oblanceolate, 1-2 cm. long, glabrous: sepals villous at apex; petals oblong-obovate, 7 mm. long: fr. ovoid; stone smooth. S.H.1:336p-r. (*Amygdalus s.* Bge.) Turk. to Persia and Transcasp. Intr. 1910. Zone VII?

31. *P. triloba* Lindl. FLOWERING ALMOND. Shrub or small tree to 5 m.; young brts. glabrous or slightly pubescent: lvs. broad-elliptic to obovate, 3-6 cm. long, broad-cuneate at base, acuminate or sometimes 3-lobed at apex, coarsely and doubly serrate; slightly pubescent beneath; petiole about 5 mm. long: fls. 1-2, pinkish, 2-2.5 cm. broad; calyx-tube broad-campanulate, shorter than pedicel; sepals ovate, serrulate, glabrous or pilose outside; stamens about 30; ovary pubescent: fr. red, subglobose, 1-1.5 cm. across, hairy; stone with thick bony shell. (*P. ulmifolia* Franch., *Amygdalopsis Lindleyi* Carr., *Amygdalus t.* Ricker.) China.—*P. t. multiplex* (Bge.) Rehd., f. Fls. double, pink; sepals usually 10. F.S.15:t.1532(c). R.H.1862:91,t(c); 1883:367 (fr). I.H.8:t.308. B.S.2:256,t(h). Intr. 1855. Zone V. This is the original *P. triloba* and a favorite ornamental shrub.—*P. t. simplex* (Bge.) Rehd., f. Fls. single. B.M.8061(c). (*P. t. f. normalis* Rehd.) Intr. 1884.—*P. t. Petzoldii* (K. Koch) Bailey, var. Brts. glabrous: lvs. elliptic or ovate, broadest at the middle or below, never 3-lobed, glabrous beneath at maturity; pedicels as long as calyx-tube; sepals and petals about 10; calyx-tube, glabrous inside; petals rose. (*P. P. K. Koch*, *P. virgata* Hort.) Cult. in China. Cult. 1869.

*P. t.* × *cerastifera* = *P. arnoldiana* Rehd. Differs chiefly in the white flowers appearing with the lvs., the longer pedicels, reflexed calyx-lobes pubescent inside, in the generally elliptic less coarsely serrate lvs. and larger more succulent and less hairy fr. Orig. 1902. Zone V.

Closely related species: *P. baldschuanica* Reg. Spreading shrub: brts. glabrous; lvs. obovate to oblong-obovate, acuminate, teeth larger and more acuminate; calyx-tube campanulate, as long as broad; sepals entire; stamens 20. Gs.5:68,t(c). S.H.1:f.334n-o (as *P. Petzoldii*). Turkest. Cult. 1890. Zone V.

32. *P. tenella* Batsch. DWARF RUSSIAN ALMOND. Low shrub to 1.5 m.; brts. glabrous; lvs. lanceolate or oblanceolate to oblong-obovate, 3-7 cm. long, acute or acutish, cuneate, sharply serrate, glabrous, light green and prominently veined beneath, thickish; petioles 2-6 mm. long; fls. 1-3, rosy-red, 1-2 cm. across, sessile; sepals serrate; petals oblong-obovate; fr. ovoid, about 2 cm. long, pubescent; stone broadly ovoid, rugose. R.I.25:t.88(c). B.M.161(c). S.O.4:t.204,205(c). (*Amygdalus nana* L., *A. georgica* Desf., *P. nana* Stokes, not Du Roi.) S. E. Eu., W. Asia to E. Siber. Intr. 1683. Zone II.—*P. t. alba* (Schneid.) Rehd., f. Fls. white.—*P. t. Gessleri*ana (Kirchn.) Rehd., f. Fls. intensely red, particularly in bud, 2-2.5 cm. across. R.H.1874:370,t(c). G.C.52:390,t(c). (*P. nana* f. *G. Voss*).—*P. t. campéstris* (Bess.) Rehd., var. Lvs. elliptic or obovate-elliptic to oblong-obovate or elliptic-oblong; sepals narrower, more than half as long as tube; fr. subglobose. L.B.1599(c). R.I.25:t.88,f.6-9(c). (*Amygdalus c.* Bess., *P. nana* var. *c.* Beck.)—*P. t. albiflora* (Schneid.) Rehd., f. A form with white fls. of the preceding var. (*P. nana* f. *a.* Schneid.).

*P. t.* × *japonica* = *P. Skinneri* Rehd. Lvs. ovate-oblong, 3.5-5.5 cm. long, acuminate, slightly doubly serrulate, pubescent on midrib beneath; fls. short-stalked; pedicels and the narrow-campanulate calyx puberulous. Orig. about 1934. Zone II.

Related species: *P. Sweginzowii* Koehne. Lvs. sharply doubly serrate; stipules leaf-like, large; fls. rose; calyx-tube about 1 cm. long; sepals glandular-serrate. M.D.1910:98. S.H.2:f.596g-i. Turkest. Intr. before 1910.—*P. Petunnikovi* (Litvin.) Rehd. Lvs. narrow-lanceolate or narrow-oblanceolate, 1-3 cm. long, acute, gradually narrowed at base, sharply serrate with glandular-mucronate teeth; fr. oblong-ellipsoid, about 2 cm. long, subsessile, compressed, oblique at base; stone slightly rugulose, apiculate-rostrate at base. (*Amygdalus p.* Litvin.) Turkest. Cult. 1912. Zone V.

Subgen. III. CERASUS Pers. Lvs. conduplicate in vernation; fls. white or rose-colored, usually stalked, solitary or fascicled or racemose; calyx-tube cup-shaped, or tubular and fls. sessile; style furrowed; stigma emarginate; ovary usually glabrous; stone smooth or furrowed and pitted.

Sect. I. MICRO CERASUS Webb. Shrubs; buds on flowering brts. 3, the 2 lateral ones fl.-buds; fls. sessile or stalked; calyx-tube tubular or cup-shaped.

33. *P. tomentosa* Thunb. Spreading shrub to 3 m. or rarely small tree; young brts. tomentose; lvs. crowded, obovate to elliptic, 5-7 cm. long, abruptly acuminate, unequally serrate, rugose, dull green and pubescent above, densely villous beneath; petioles 2-4 mm. long; fls. before or with the lvs., 1-2, white, slightly pinkish, 1.5-2 cm. across; calyx-tube pubescent outside; sepals serrate; fr. subglobose, scarlet, about 1 cm. across, glabrous or slightly hairy, edible. Fl. III-IV; fr. VI-VII. B.M.8196(c). G.F.5:581. A.G.12:77. Hedrick, Cherr. N. Y. 34,t(c). Jour. Hered. 15:169-75. (*Cerasus t.* Wall., *P. trichocarpa* Bge.) N. and W. China, Japan, Himal. Cult. 1870. Zone II. Handsome free-flowering shrub, also ornamental in fr.—*P. t. leucocarpa* Rehd., f. Fr. whitish. Cult. 1930.—*P. t. endotricha* Koehne, var. Lvs. elliptic to oblong, 2.5-5 cm. long; fls. white, very abundant. C. and W. China. Intr. 1908.

*P. t.* × *Besseyi*, *P. t.* × *pumila*, *P. t.* × ?*domestica* have been recorded.

34. *P. incana* (Pall.) Batsch. Shrub to 2 m., of loose habit; brts. minutely pubescent; lvs. oblong-ovate to lanceolate, 3-6 cm. long, acute or obtusish, finely and sharply serrate, dark green and smooth above, grayish or white-

tomentose beneath; petioles about 2 mm. long: fls. with the lvs., 1-2, rose-colored, about 1 cm. across; sepals short, obtuse, entire, pubescent outside: fr. red; 6-8 mm. across. B.R.25:58(c). R.H.1853:281,t(c). Gt. 44:243. (*Cerasus* i. Spach, *Amygdalus* i. Pall.) S. E. Eu., W. Asia. Intr. 1815. Zone V.

*P. i. × pumila* = *P. Maideri* Zab. Differs in its broader less pubescent lvs., longer stamens; from *P. pumila* in its pubescent lvs. and tubular calyx-tube. S.H.1:f.338n(l). Orig. before 1888.

Related species: *P. prostrata* Labill. Low wide-spreading shrub, to 1 m.; lvs. broad-ovate, 2-3.5 cm. long, sharply serrate, pubescent beneath: fls. 1.5 cm. across, rose-colored. R.I.25:t.89(c). N.D.5:t.53,f.2(c). Medit. Reg., W. Asia. Intr. 1802. Zone V or VI. (*Cerasus* p. Lois.)—*P. microcarpa* C. A. Mey. Shrub to 1.5 m. with short stiff brs.; brts. pubescent: lvs. ovate to elliptic, acute, 1-2.5 cm. long, serrate, glabrous or slightly hairy beneath: fls. 2-3, rosy-pink; calyx smooth; pedicels pubescent, 6-8 mm. long: fr. ovoid, 1 cm. long. B.M. 8360(c). (*Cerasus* m. Boiss.) Asia Minor. Intr. 1890. Zone VI?—*P. m. tortuosa* (Boiss. & Hausskn.) Schneid., var. Brts. tortuose: lvs. pubescent. (*Cerasus* t. Boiss. & Hausskn.) S.H.1:f.337w-x<sup>1</sup>,338g-h. Intr. ?

35. *P. Jacquemontii* Hook f. Shrub to 4 m. with slender brs.: lvs. elliptic to obovate-oblong, 3-6 cm. long, acute at ends, sharply serrate, glabrous; petioles 6 mm. long: fls. usually 2, rose-colored, 1 cm. across; calyx-tube glabrous; sepals ovate, acute: fr. subglobose, red, 1.5 cm. long, juicy. B.M. 6976. (*Cerasus* J. Buser.) N. W. Himal. Intr. 1879. Zone VI?

36. *P. japonica* Thunb. Shrub to 1.5 m.: brts. thin and slender: lvs. ovate or broad-ovate, rarely lance-ovate, acuminate, rounded at base, sharply doubly serrate, 3-7 cm. long, glabrous beneath or short-pubescent on the veins; petioles 2-3 mm. long: fls. 2-3, pink or nearly white, with the lvs.; pedicels 5-10 mm. long: fr. subglobose, about 1 cm. across or broad-ellipsoid, wine-red. S.Z.1:t.90,f.1,2(c). M.D.18:179,f.1. (*P. j.* var. *eujaonica* f. *Fauriei* Koehne.) Cent. China, E. Asia. Zone II.—*P. j.* Thunb. *g. j.* Koehne, f. Lvs. cordate at base, long-acuminate, teeth longer and more pointed; glabrous beneath at maturity; pedicel 4 mm. long. (*P. j.* var. *gracillima* f. *T.* Koehne.) Cult. 1910.—*P. j.* Engleri Koehne, f. Lvs. similar to those of the preceding form, but short-pilose on veins beneath; pedicels usually 7-13 mm. long; fr. 1-1.5 cm. across. (*P. j.* var. *gracillima* f. *E.* Koehne.) Manch. Intr. 1903.—*P. j.* Nakaii (Lévl.) Rehd., var. Lvs. pubescent beneath, less or nearly glabrous above: pedicels and calyx pubescent to glabrous. N.K.5:t.22. (*P. N.* Lévl.) Korea. Intr. 1918.—*P. j.* Kerri Koehne, var. Lvs. glabrous beneath; pedicels 3 mm. long; fls. semidouble. B.R.27(c). B.M.2176(c). E. China. Intr. about 1808, probably not now in cult.

*P. j. × tenella*; see under No. 32.

37. *P. glandulosa* Thunb. DWARF FLOWERING ALMOND. Shrub to 1.5 m.: brts. glabrous, rarely puberulous: lvs. ovate-oblong or oblong to oblong-lanceolate, 3-9 cm. long, acute, rarely acuminate, broad-cuneate at base, crenate-serrulate, glabrous beneath or slightly hairy on midrib; petioles about 6 mm. long: fls. 1-2, pink or white; pedicels about 1 cm. long: fr. subglobose, 1-1.2 cm. across, red. B.M.8260(c). B.R.1801(c). (*P. japonica* auth., not Thunb., *Cerasus* g. Lois.) C. and N. China, Japan. Intr. 1835. Zone IV.—*P. g. alba* Koehne, subf. A white-fl. form of the type.—*P. g. rosea* Koehne, subf. Fls. pink. Tanaka, Usef. Pl. Jap. f.621(c). The type of the species.—*P. g. albiplena* Koehne, f. Fls. double, white. I.H.5:t.183. (*Cerasus* *jap.* var. *multiplex* Ser., in part, *P. jap.* fl. *albo-pleno* Lem.) Intr. about 1855?—*P. g. sinensis* (Pers.) Koehne, f. Lvs. lanceolate or oblong-lanceolate, short-pilose on the veins beneath or rarely glabrous; pedicels 1-1.5 cm. long, rarely very short; fls. double, pink. S.Z.1:t.90,f.3(c). (*P. jap.* fl. *roseo pleno*

Hort., *P. sinensis* Pers.) E. Asia. Cult. 1687. Zone VI. The double-flowered forms are very ornamental and often used for forcing.

38. *P. humilis* Bunge. Upright shrub to 1.5 m.; young brts. puberulous: lvs. obovate or elliptic, 2.5–5 cm. long, acute or short-acuminate, cuneate, serrulate, glabrous beneath; petioles 1–2 mm. long: fls. 1–2, with the lvs., white or slightly pinkish, 1.5 cm. across; pedicels 6–8 mm. long: fr. subglobose, 1.5 cm. across, bright red, acid. B.M.7335(c). M.D.1909:180,f.3. (*P. Bungei* Walp.) N. China. Intr. 1881. Zone V.

39. *P. pumila* L. SAND CHERRY. Shrub to 2.5 m., with upright slender shoots, old stems often procumbent: young brts. glabrous, reddish: lvs. oblanceolate, 3–5 cm. long, acuminate or acute, cuneate, closely serrate, except toward the base, glabrous, dull green above, grayish white beneath; petioles 1–1.6 cm. long: fls. 2–4, about 1 cm. across, white; pedicels about 1 cm. long: fr. subglobose, about 1 cm. across, purple-black, lustrous, scarcely edible. G.O.t.119(c). L.B.1607(c). B.C.5:2833. M.G.19:57(h). W. N. Y. to Wisc. and Ill. Intr. 1756. Zone II.—*P. p. depréssa* (Pursh) Bean, var. Prostrate shrub: lvs. less acuminate, often obtusely spatulate, thinner, more glaucous beneath, teeth more crenate, veins less prominent; stipules less fimbriate: fr. globose-ellipsoid, edible. G.W.19:215(h). (*P. d.* Pursh.) N. B. to Ont. and Mass. Cult. 1864.—*P. p. susquehænae* (Willd.) Jaeg., var. Upright shrub to 1.3 m.: lvs. obovate or elliptic, strongly serrate. B.C.5:2833. (*P. p.* var. *cuneata* Bailey, *P. c.* Raf., *P. s.* Willd.) Me. to Pa., w. to Wisc. and Minn. Intr. 1805.

*P. p.* × *cerasifera atropurpurea* = *P. cistena* N. E. Hansen. PURPLELEAF SAND-CHERRY. Lvs. slightly pubescent along the midrib beneath near base, reddish like pedicels and calyx; petiole puberulous above; fls. 1–2, white: fr. blackish purple. M.D.1917:67,f.A. Orig. before 1910.—*P. p.* × *hortulana* and *P. p.* × *tomentosa* have been recorded.

40. *P. Bésseyi* Bailey. WESTERN SAND CHERRY. Similar to the preceding; stem usually prostrate: lvs. spreading, elliptic to elliptic-lanceolate, 2–6 cm. long, acute, appressed-serrate, glabrous; petioles 4–10 mm. long: fls. 2–4, white, 1.5 cm. across; pedicels about 8 mm. long: fr. subglobose, about 1.5 cm. across, purple-black, sweet. B.M.8156(c). B.C.5:2834. B.S.2:230. (*P. pumila* var. *B.* Waugh, *P. prunella* Daniels.) Man. to Wyo., s. to Kans. and Colo. Intr. 1892. Zone III. Cult. for its fr.

*P. B.* × *angustifolia* var. *Watsonii* = *P. utahensis* Dieck. Lvs. elliptic to elliptic-oblong or oblong-obovate, 3.5–6 cm. long, finely serrulate, lustrous above, reticulate beneath: fr. slightly bloomy, dark brownish red. S.H.1:f.345m-n. Orig. about 1865. Zone III.—*P. B.* × *tomentosa* has been recorded.

SECT. 2. PSEUDOCERASTUS Koehne. Sepals upright or spreading: calyx-tube usually cylindric: fls. in fascicles or short few-fl. racemes.

41. *P. canescens* Bois. Shrub with spreading brs., to 2 m.; brts. pubescent: lvs. ovate to ovate-lanceolate, 2.5–6 cm. long, abruptly acuminate, rounded at base, doubly serrate with abruptly acuminate teeth, pubescent above, densely grayish pubescent beneath; petioles 5–10 mm. long; stipules dentate, about  $\frac{1}{2}$  as long as petiole: infl. with leafy bracts; fls. 2–5, pinkish, about 1 cm. across; pedicels 5–10 mm. long; pilose like the calyx; sepals triangular, serrate, half as long as tube; petals caducous, oblong-obovate; style pilose at base: fr. subglobose, 1–1.2 cm. across, red. F.V.66(h), 67. C. and W. China. Intr. 1898. Zone V. Distinct shrub, but of little ornamental value.

*P. c.* × *avium* = *P. Schmittii* Rehd. Small tree: lvs. elliptic-oblong, 5–8 cm. long, acuminate, glabrescent above, pubescent chiefly on the veins beneath; petiole 1–2.5 cm. long; pedicels 1–1.5 cm. long, with large involucre at base; calyx campanulate; petals broad-oval, 1 cm. long. Orig. 1923.

Related species: *P. dawyckensis* Sealy. Young brts. pilose: lvs. elliptic, cuneate or broad-cuneate, doubly and obtusely dentate, loosely pubescent above, more densely beneath: peduncle short, in fr. to 2 cm. long; calyx-tube pubescent outside; style glabrous: fr. 1.2-1.5 cm. across, crimson. B.M.9519(c). (?*P. canescens* × *Dielsiana*). ?W. China. Intr. 1907.—*P. setulosa* Batal. Shrub or small tree to 5 m.; bark flaky: lvs. ovate or elliptic-ovate, 1.5-4 cm. long, acuminate, doubly serrate, pilose beneath at least on the veins: fls. 2-3, pink, on a short peduncle, with leafy bracts: calyx villous outside; sepals entire. N. China. Cult. 1934. Zone V?

42. *P. incisa* Thunb. Shrub or sometimes tree to 10 m.; brts. glabrous: lvs. purplish when unfolding, ovate to obovate, 3-5.5 cm. long, acuminate, incisely doubly serrate, pubescent above and beneath on the veins; petioles slender, 8-10 mm. long, pubescent, fls. 1-3, nodding, white to pale pink; pedicels short or sometimes elongated with leafy bracts at base; calyx vinous-red, usually glabrous; petals fugacious: fr. ovoid, 6-8 mm. long, purple-black. S.H.1:f.339g,340o. Wilson, Cherr. Jap. t.5(h). (*Cerasus* i. Lois.) Japan. Cult. 1910. Zone V. Early flowering shrub.—*P. i. serrata* Wils., f. Lvs. less distinctly biserrate or almost simply serrate, with long-aristate teeth. Intr. 1915.—*P. i. Yamadei* Mak., var. Young lvs., pedicels and calyx green; style greenish. Intr. about 1918.

Related species: *P. stipulacea* Maxim. Lvs. oblong-lanceolate or obovate-lanceolate, 4-6.5 cm. long, glabrate except bearded in the axils beneath, with 7-10 pairs of veins; stipules about as long as petiole, coarsely serrate: fls. solitary, short-stalked; calyx glabrous; stone rugulose. N. W. China. Intr. 1873. Zone V?—*P. apétala* (Sieb. & Zucc.) Franch. & Sav. Shrub or small tree; brts. villous at first: lvs. oblong or obovate-oblong, 3-5 cm. long, long-acuminate, incisely doubly serrate, densely pubescent on both sides: fls. 1-2, with the lvs.; calyx-tube villous, purple; petals small, fugacious; pedicels pilose. S.I.2:t.28.f. 14-19. (*P. Cerasoides* Maxim.) Japan. Intr. 1915. Zone V?—*P. latidentata* Koehne. Tree to 6 m.; brts. strigose: lvs. ovate or elliptic-ovate, 2-5 cm. long, acuminate, deeply and sharply doubly serrate, minutely strigillose above, glabrous or slightly villous along the midrib beneath: fls. 1-3, white or pinkish, sometimes on a short peduncle with small bracts; pedicels and calyx glabrous; sepals sparsely denticulate: fr. red, about 1 cm. across. W. China. Intr. 1932. Zone VI?—*P. crataegifolia* Hand.-Mazz. Prostrate and ascending shrub: brts. strigose: lvs. elliptic to oblong-elliptic, 2-8 cm. long, incisely doubly serrate or lobulate, glabrous except strigillose on the veins above: fls. 1-2, white or pink, 1.5-2 cm. across; pedicels and calyx glabrous; sepals broad ovate, glandular-denticulate. W. China. Intr. 1932. Zone VII?—*P. mûgus* Hand.-Mazz. Prostrate shrub, similar to the preceding: lvs. elliptic or obovate, 1.5-6 cm. long, acute, doubly serrate, sparingly strigillose above: sepals oblong-ovate, glandular-fimbriate: fr. dark red, about 9 mm. long. W. China. Intr. 1932. Zone VII?

43. *P. nipponica* Matsum. Bushy tree to 6 m.; brts. glabrous, chestnut-brown; lvs. ovate, 4-9 cm. long, long-acuminate, usually rounded at base, incisely doubly serrate, pubescent while young, chiefly on veins, finally nearly glabrous; petioles glabrous: fls. 1-3, white or pale pink, 2-2.5 cm. across; pedicels 1.5-2.5 cm. long, glabrous; calyx-tube campanulate or funneliform, glabrous; petals elliptic-oblong to roundish-obovate, rounded or emarginate: fr. globose, about 8 mm. across, black. S.I.2:t.28(c, as *P. incisa*). (*P. iwagiensis* Koehne, *P. nikkoensis* Koehne.) Japan. Intr. 1915. Zone V. Very ornamental in bloom.—*P. n. kurilensis* (Miyabe) Wils. Petioles pubescent: fls. somewhat larger; pedicels and calyx-tube slightly pubescent. M.K.t. 54(c). (*P. k. Miyabe*.) Japan, Kurile Is. Intr. 1905. Zone V.

44. *P. lobulata* Koehne. Tree to 10 m., young brts. slightly pubescent: lvs. obovate to oblong-obovate or oblong-lanceolate, 3-8 cm. long, acuminate, cuneate to rounded at base, incisely doubly serrate with strongly acuminate teeth, nearly glabrous above, pilose on veins beneath: fls. white, 1-3; pedicels 1.5-2 cm. long, in fr. to 2.5 cm., glabrous; calyx-tube funneliform; sepals ovate-

oblong, shorter than tube, glandular-serrate, upright; petals obovate; style pilose toward base: fr. subglobose, about 1 cm. across, red; stone ovoid, ribbed, 8-10 mm. long. W. China. Intr. 1908. Zone V?

Closely related species: *P. glyptocarya* Koehne. Differs chiefly in its larger lvs. 6-11 cm. long, in its red-brown fr. with the stone roundish about 8 mm. long, reticulate-ribbed or ribbed. W. China. Intr. 1908. Possibly only var. of the preceding.—*P. pleuroptera* Koehne. Differs chiefly in its smaller lvs. 2-6 cm. long, in its black fr. with roundish foveolate stone about 7 mm. long; pedicels about 1 cm. long. W. China. Intr. 1908. Zone V.

45. *P. subhirtella* Miq. HIGAN CHERRY. Small, much-branched tree to 10 m.; young brts. pubescent: lvs. ovate to oblong-ovate, 3-7 cm. long, acuminate, sharply and often doubly serrate, pubescent on the veins beneath, with about 10 pairs of veins; petioles pubescent, about 6 mm. long: fls. 2-5, light pink, 1.8 mm. across; calyx-tube cylindric, pubescent; pedicels about 8 mm. long; petals emarginate: fr. about 8 mm. across, black. B.M.7508(c). M.D. 1917:42. M.G.15:320(h). S.L.273(h). Wilson, Cherr. Jap. t.1(h). (*P. Miqueliana* Maxim., in part.) Japan. Intr. 1894. Zone V. Handsome and free-flowering; much cult., particularly *P. s. pendula*.—*P. s. ascendens* (Mak.) Wils., var. Large tree to 20 m., rather sparingly branched: lvs. usually elliptic-oblong, 6-10 cm. long. Wilson, Cherr. Jap. t.3(h). M.D.1917:42a<sup>1</sup>-e<sup>1</sup>. (*P. aequinoctialis* Miyoshi, *P. microlepis* and *P. Herinciana* Koehne.) Japan. Cult. 1916.—*P. s. pendula* (Maxim.) Tanaka, var. Tree with slender pendulous brs.: lvs. similar to the preceding var., but broader; calyx-tube glabrescent. B.M.8034(c). L.I.35. Gn.50:454,t.(c). G.F.1:196;2:487. M.G. 15:319(h). S.L.274(h). (*P. p.* Maxim., *P. itasakura* Sieb., *P. Herinciana* Schneid.) Japan. Intr. 1862.—“Yae-shidare-higan.” Pendulous form with double fls. N.H.18:65.—*P. s. autumnalis* Mak., var. Shrub or bushy tree to 5 m.: fls. semidouble, appearing partly late in fall and partly in spring. Gn. 76:628;85:502;89:344(h). J.H.38:f.204(h). G.C.77:71(h). (*P. microlepis* var. *Smithii* Koehne, *P. microlepis* Bean, not Koehne, *P. Miqueliana* Hort., not Maxim.) Cult. in Japan. Intr. before 1909.

*P. s. × serrulata*; see No. 51.

46. *P. campanulata* Maxim. Small tree to 8 m.; young brts. glabrous: lvs. ovate to elliptic-ovate or ovate-oblong, 4-10 cm. long, acuminate, closely and doubly or nearly simply serrate, with short teeth pointing forward, glabrous; pedicels slender, about 1 cm. long, glandular: fls. pendulous, deep rose, campanulate; calyx-tube deep rose, glabrous; pedicels 5-20 mm. long: fr. ovoid, 1.5 cm. long, red; stone smooth. Gn.56:t.1244(c, as *P. pendula*). B.M.9575(c). J.C.28,1:t.2,f.6-12;34,2:264. (*P. cerasoides* var. *c.* Koidz.) S. Japan, Formosa. Cult. 1899. Zone VII? Beautiful Cherry, but probably not quite hardy.

Closely related species: *P. cerasoides* D. Don. Lvs. more coriaceous and more sharply toothed, rounded-oval: fr. apiculate. Wallich, Pl. As. Rar. 2:t.143. S.H.1:f.339a,340f. (*P. Puddum* Brandis.) Himal. Tender. Intr. ?

47. *P. rufo* Hook. f. Tree to 7 m.; young brts. rufous-tomentose: lvs. elliptic-oblong to oblong-lanceolate, 5-10 cm. long, sharply serrate with gland-tipped teeth, pubescent on the veins beneath while young; petioles 1 cm. long: fls. 1 or few, pink; pedicels 1-2.5 cm. long; calyx-tube tubular-campanulate, glabrous; sepals triangular, serrate: fr. broad-ellipsoid. S.H.1:f.339n-n<sup>1</sup>,340l.<sup>1</sup> Himal. Intr. 1897. Zone VII.

Closely related species: *P. trichantha* Koehne. Infl. pubescent. Sikkim. Intr. 1897.

48. *P. serrula* Franch. Tree to 10 m., with flaky brown bark; young brts. finely pubescent: lvs. lanceolate, 4-10 cm. long, long-acuminate, rounded at

base, slightly doubly or simply serrulate, pubescent along the midrib beneath and bearded in the axils, with 9-15 pairs of veins; petioles about 1 cm. long, with 3-4 glands: fls. 1-3, white; pedicels about 1 cm. long; calyx-tube glabrous, green; sepals ovate-triangular, glandular-denticulate; petals round-ovate, 8 mm. long, rounded or tricuspidate at apex: style finely pubescent below the middle: fr. oval, 1-1.3 cm. long, red; stone strongly reticulate-ribbed. (*P. s. var. tibetica* Koehne.) W. China. Intr. 1908. Zone V.

49. *P. concinna* Koehne. Shrub to 2 m.; young brts. sparingly pilose, soon glabrous: lvs. purplish when unfolding, narrow-elliptic to oblong-ovate or oblong-obovate, 3-6 or on shoots to 8 cm. long and lance-oblong, acuminate, rounded or cuneate at base, sharply and rather finely or sometimes doubly serrate, usually sparingly hairy above, grayish green beneath and sparingly hairy chiefly on the veins, at least at first; petioles 3-8 mm. long, sparingly pubescent: fls. 1-4, white, 2-2.5 cm. across; pedicels 8-15 mm. long; calyx-tube tubular, glabrous; sepals ovate to ovate-oblong, entire; petals narrow-obovate, often emarginate: fr. subglobose, 1-1.2 cm. long; stone ovoid, smooth or nearly so. C. China. Intr. 1907. Zone V. Flowering profusely before the lvs.

50. *P. Conradinae* Koehne. Tree to 8 m.; young brts. glabrous: lvs. obovate to obovate-oblong, rarely broad-ovate, 5-10 cm. long, abruptly acuminate, usually rounded at base, deeply or in the middle doubly serrate, glabrous above, hairy on the veins beneath at first, with 9-12 pairs of veins; petiole 1-1.5 cm. long, glabrous: fls. before the lvs., 1-4, whitish or pinkish, about 2 cm. across; pedicels 5-18 mm. long; bracts caducous; calyx-tube tubular-campanulate; sepals ovate, entire; petals emarginate: fr. oval, about 1 cm. long, red; stone smooth. Gn.87:97. C. China. Intr. 1907. Zone VI? —*P. C. semiplena* Ingram. Fls. semidouble. G.C.77:217. Orig. before 1925.

Closely related species: *P. Hélenae* Koehne. Lvs. sharply and deeply doubly serrate: petals ovate, acute, white. C. China. Intr. 1907? —*P. Sprangeri* Pamp. Calyx-tube finely pubescent; style pubescent below. C. China. Cult. 1900.

51. *P. yedoensis* Matsum. YOSHINO-ZAKURA. Tree to 16 m., with smooth, pale gray bark; young brts. slightly pubescent: lvs. elliptic-ovate to obovate, 6-12 cm. long, acuminate, strongly doubly serrate with acuminate teeth, glabrous above, pubescent on the veins beneath, light green beneath and green when unfolding; petioles pubescent: fls. white to pink, 3-3.5 cm. across, slightly fragrant, in 5-6-fld. short-peduncled racemes; calyx-tube cylindric, pubescent; sepals serrate; pedicels pubescent; style pubescent or nearly glabrous: fr. globose, black. B.M.9062(c). N.K.5:t.8. Wilson, Cherr. Jap. t.4(h). Cult. in Japan, supposed to be a hybrid between *P. serrulata* and *P. subhirtella*. Intr. 1902. Zone V. —*P. y. perpéndens* Wils., f. *Brs. pendulous*, very long: pedicels and calyx hairy. Intr. 1910 from Japan. —*P. y. nudiflora* Koehne, var. Calyx and pedicels glabrous or nearly so. —*P. y. shojo* Wils., f. Fls. double, rosy pink, large. —*P. y. Taizanfukun* Wils., f. Fls. double, pink, of medium size. Icon. Fl. Jap. 1:t.15. J.C.34,1:t.5,f.9(h),t.16, f.70(c). (*P. donarium* f. *T. Koidz.*, *P. fruticosa* Miy. f. *ambigua* Miyoshi.)

*P. y. × Sargentii*; see under No. 52.

52. *P. Sargentii* Rehd. Pyramidal to round-headed tree to 25 m.: bark smooth, chestnut-brown, with large lenticels; brts. glabrous: lvs. purplish when unfolding, elliptic-obovate to oblong-obovate, 7-12 cm. long, long-acuminate, rounded or sometimes subcordate at base, sharply serrate with acuminate teeth, glabrous and glaucescent beneath: petiole 2-3 cm. long: fls. precocious, rose-colored, 3-4 cm. across, in 2-4-fld. sessile umbels; pedicels

1.5-3 cm. long, glabrous like the tubular-campanulate calyx-tube, lobes ovate-oblong, entire; petals obovate, emarginate: fr. globose-ovoid, 1 cm. long, purple-black. Fl. iv-v; fr. vi-vii. M.K.t.53(c). B.M.8411(c). G.F.10:463. G.C.III.19:517;55:346. S.L.272(h). B.A.1937:11(h). (*P. serrulata* var. *sachalinensis* Wils., *P. sachal.* Koidz.) Japan, Saghal. Intr. 1890. Zone IV. The hardiest and most vigorous of the Japanese cherries and handsome in bloom.

*P. s.* × *yedoensis* = *P. Juddii* E. Anders. Lvs. brownish when unfolding: fls. flushed pink, 2-4 in short-peduncled racemes; pedicels and style with few hairs at base; sepals slightly glandular-serrate. Orig. 1914. Zone V.

53. *P. serrulata* Lindl. Tree to 25 m.; bark smooth, dark chestnut-brown; brts. glabrous: lvs. ovate to ovate-lanceolate, rarely obovate, 6-12 cm. long, abruptly long-acuminate, serrate or often doubly serrate with aristate teeth, glabrous, greenish brown when unfolding, glaucescent beneath; petioles 1.5-3 cm. long, usually with 2-4 glands, glabrous: fls. 3-5, white or pink, 3-4 cm. across, racemose with leafy bracts, inodorous; calyx-tube campanulate, glabrous; sepals ovate, acute, slightly serrulate; style glabrous: fr. black. (*Cerasus s.* G. Don, *P. mutabilis* Miyoshi, *P. pseudocerasus* Hort., not Lindl.) Japan, China, Korea. The original *P. serrulata* of Lindl. is a garden form with double white fls. distinguished as *P. s. albo-plena* Schneid., f. Three spontaneous vars. are known: *P. s. spontanea* (Maxim.) Wils., var. Lvs. greenish or reddish brown at first, later glaucescent beneath, teeth scarcely aristate: fls. white or pink, about 2 cm. across, in usually short-stalked, 2-3-fld. racemes. S.I.2:t.27,f.1-14(c). (*P. tenuiflora* Koehne, in part.) Japan, Korea to C. China. Intr. 1900.—*P. s. pubescens* (Koidz.) Wils., var. Similar to the preceding: lvs. pale green beneath, usually slightly pubescent; petiole hairy, often only above: pedicels usually slightly pubescent. J.C.34:2:269. Japan, Korea, China. Intr. 1907.—*P. s. Lannesiana* (Carr.) Rehd., var. Bark gray: lvs. slightly reddish or green at first, later pale green beneath, teeth long-aristate: fls. fragrant, pink. B.M.8012(c). T.M.26:117,f.10,11. G.C. III.19:466. (*Cerasus L.* Carr., *P. L.* Wils., *P. s. f. L.* Koehne.) Japan. Intr. before 1870. The original *P. L.* Carr. has pink fls., the spontaneous form *P. s. albidia* Mak., f., white fls. J.C.34:2:272,f.7. (*P. speciosa* Ingram.) Cult. 1909.

Almost all the numerous garden forms to which belong most of the Japanese flowering cherries are figured in J.C.34,1:t.1-23(c) and in Miyoshi, Jap. Cherr. t.1-50(c) (1921), many in Russell, Or. Flow. Cherr. (U. S. Dept. Agr. Circ. 313), and some habit pictures in Wilson, Cherr. Jap. (1916). The following are some of the best known; THE FIRST 8 ARE FORMS OF TYPICAL *P. serrulata*: "Kiku-shidare-zakura." Brs. spreading or pendent: fls. very double, pink, with more than 50 petals and sometimes 10 sepals. (*P. s. pendula* Bean, "Cheal's Weeping.")—"Kiku-zakura." Similar to the preceding but brs. upright. (*P. s. f. rosea* Wils.)—"Fugenzo." Fls. double, rose pink, with 2 leafy carpels in the centre. One of the most handsome forms. ("James Veitch.")—"Shirofugen." Fls. double, pink in bud, changing to white, with 2 leafy carpels. (*P. s. f. albo-rosea* Wils.)—"Hisakura." Fls. double, pale pink—"Horinji." Fls. in clusters, double or semidouble, pale pink. F.S.21: 2238(c).—"Seki-yama." Fls. rich rose-red, double, large, late—"Shogetsu." Fls. pale pink, double, very large, long-stalked. (*P. s. f. superba* Wils.)—FORMS OF VAR. *Lannesiana*: "Amanogawa." Habit fastigiate: fls. pale pink, semidouble. J.C.34,1:t.5,f.10(h). (*P. L. f. erecta* Wils.)—"Jo-nioi." Fls. pure white, single or semidouble. (*P. L. f. affinis* Wils.)—"Sirotae." Fls.

pure white, double or semidouble, large; the best of the double white cherries.—“Yaye-oshima.” Fls. double white. (*P. L. f. donarium* Wils.)—“Ukon.” Fls. greenish yellow, double or semidouble, large. *Gt.52:t.1513a(c)*. (*P. s. f. viridiflora* Mak., *P. L. f. grandiflora* Wils., *P. pseudocerasus f. virescens* Koehne.)—“Hata-zakura.” Fls. white, tinged pink, semidouble.—“Fuku-rokuju.” Fls. pale pink, fading to white, clustered at end of brts. (*P. L. f. contorta* Wils.)—“Botan-zakura.” Fls. pale pink, semidouble, very large. (*P. L. f. moutan* Wils.)—“Ochichima.” Fls. pale pink, double, large. *G.W.6:354.*—“Ojochin.” Fls. semidouble, pink, very large.

*P. s. × subhirtella*; see No. 51.

54. *P. Sieböldii* (Carr.) Wittm. Small tree, to 8 m., with smooth gray bark; young brts. glabrous; lvs. elliptic to ovate, 6–12 cm. long, abruptly long-acuminate, rounded at base, sharply and often slightly doubly serrate with small teeth, densely pubescent on both sides; petioles pubescent, usually with 1 or 2 small glands: fls. about 3 cm. across, double or sometimes single, pink or sometimes white, 2–4 on a short peduncle; pedicels pubescent; calyx-tube turbinate, or short-campanulate, pubescent, about as long as the ovate obtuse lobes; style usually hairy at base. *R.H.1866:371,t.(c)*. *Gt.51:t.1494a(c)*. *Gn.33:420*. *L.I.t.36*. *G.W.16:355*. Wilson, *Cherr. Jap. t.8 (h)*. (*P. pseudocerasus* var. *S. Maxim.*, *P. pseudocerasus f. Watereri* Koehne.) Cult. in Japan. Intr. 1864. Zone V.

Sect. 3. *LOBOPETALUM* Koehne. Lvs. with acute or acuminate teeth: fls. in sessile umbels or 2–6-fld. stalked umbel-like racemes; petals deeply emarginate or 2-lobed.

55. *P. cantabrigiënsis* Stapf. Tree; brts. sparingly pubescent at first, soon glabrous; lvs. elliptic-ovate or elliptic to elliptic-oblong, to 9 cm. long, acuminate, rounded at base or broad-cuneate, coarsely doubly serrate with glandular teeth, pubescent on both sides at first, soon glabrous except on the veins beneath; petiole 6–7 mm. long, with 2 glands: fls. pink, 2–2.5 cm. across, 3–6 in subsessile or short-stalked umbels, surrounded by a deciduous involucre; pedicels to 1.5 cm. long, like the campanulate calyx-tube pilose; sepals ovate, acutish, entire; petals suborbicular, emarginate: fr. red. *B.M. 9129(c)*. (*P. pseudocerasus* Koidz., not Lindl.) China. Cult. 1826. Zone VI?

Related species: *P. pseudocerasus* Lindl. Lvs. ovate, rather finely doubly serrate: fls. in 2–6-fld. racemes; pedicels with small gland-toothed bracts at base; involucre caducous. *B.R.t.800(c)*. *M.D.1917:7*. (*P. pauciflora* Bge.) N. China. Cult. in China and Japan. Intr. 1819. Zone V?

56. *P. Dielsiana* Schneid. Shrub or tree to 10 m.; young brts. glabrous: lvs. oblong-obovate to oblong, 8–14 cm. long, abruptly acuminate, broad-cuneate to subcordate at base, simply or doubly serrate with short-acuminate teeth, glabrous above, thinly villous beneath, more densely on veins, with 10–12 pairs of veins; petioles 8–16 mm. long, villous or nearly glabrous, with 1–3 glands: fls. before the lvs., pink or white, 3–5, umbellate, surrounded by a large involucre; bracts glandular-fimbriate; pedicels 1–3.5 cm. long, villous; calyx-tube short-campanulate, villous; sepals oblong to lanceolate, entire; petals oval, 1–1.4 cm. long; style glabrous: fr. globose, about 8 mm. across, red; stone smooth. C. China. Intr. 1907. Zone VI?

*P. D. × canescens?*; see under No. 41.

Related species: *P. cyclamina* Koehne. Close to No. 56: lvs. glabrous beneath or pilose only on the veins; petioles glabrous: fls. coetaneous, pink; calyx-tube glabrous; petals oblong. C. China. Intr. 1907. Zone (V).—*P. involucrata* Koehne. Tree to 5 m.: lvs. pubescent on the veins at first, soon glabrous, doubly serrate or nearly crenate-serrate with short broad teeth: fls. in sessile umbels, surrounded by a large involucre persistent during flowering:

pedicels 5–10 mm. long, densely pilose like the calyx. M.D.1917:7. C. China. Intr. ?

Sect. 4. *EUCERASUS* Koehne. Lvs. dentate with obtuse teeth: fls. in sessile umbels, rarely short-racemose, surrounded at base by the persistent bud-scales.

57. *P. ávium* L. MAZZARD (GEAN). Tree to 24 m., of pyramidal habit; brts. stout: lvs. oblong-ovate, 6–15 cm. long, acuminate, unequally serrate, dull and often slightly rugose above, more or less pubescent beneath, of soft texture; petioles to 4 cm. long: fls. white, in several-fld. umbels, 2.5–3.5 cm. across; scales of fl.-buds rather large, reflexed at anthesis; calyx-tube glabrous, constricted at apex; sepals usually entire: fr. subglobose or ovoid, about 2.5 cm. across. S.E.t.411(c). H.W.3:90;t.55(c). R.I.25:t.93(c). Gn. 78:242(h). M.A.t.25(h). (*Cerasus a.* Moench.) Eu., W. Asia. Cult. since ancient times; intr. to N. Am. about 1625. Zone III. Much cultivated for its fr. in many pomological vars.; some forms planted for ornament.—*P. a. aspleniifolia* (Kirchn.) Jaeg., var. Lvs. deeply incised.—*P. a. salicifolia* Dipp. Lvs. narrow.—*P. a. decumana* (Mord. de Launay) Dipp., var. Lvs. very large, to 25 cm. long. (*P. macrophylla* Poir.)—*P. a. plèna* (West.) Schneid., f. Fls. double. Hedrick, Cherr. N. Y. 30,t(c). G.W.6:329. Gn.78:242;83:94(h). S.L.275(h). (*P. a. fl. pleno* Hort., *Cerasus a.* var. *multiplex* Ser.)—*P. a. péndula* (Var.) Jaeg., var. Brs. pendulous. Gn.59:267(h).—*P. a. nana* Bean, var. Dwarf form.—*P. a. Juliàna* (L.) W. Koch, var. HEART-CHERRY (GEAN-CHERRY). Fr. ovoid, heart-shaped, with soft flesh, usually dark-colored. (*P. Cerasus* var. *J. L.*)—*P. a. duràcina* (L.) W. Koch, var. HARD-FLESHED CHERRY (BIGARREAU). Fr. with hard flesh, usually light-colored.—The wild form with small purple-black sweet fr. has been distinguished as *P. a. actiàna* (L.) Schneid., var. (*P. Cerasus* var. *a. L.*, *P. avium* var. *sylvestris* Dierb.)

*P. a. × Cerasus* = *P. effusa* (Host) Schneid. DUKE CH. Similar to the Heart-Cherry but with sour flesh. R.I.25:t.92,f.34(c). Hedrick, Cherr. N. Y. 31,t(c). (*P. avium* var. *regalis* Bailey, *P. caproniana* Zabel, *Cerasus e.* Host.)—*P. a. × Mahaleb* = *P. Fontanesiàna* Schneid. Similar to *P. avium*, with slightly pubescent brts., smaller and broader lvs. less than 10 cm. long, often rounded or subcordate at base: infl. 4–10-fld. often slightly racemose; fls. 2 cm. across: fr. small, dark red, somewhat bitter. G.W.7:497(h). S.L.276(h). (*P. graeca* Desf., *Cerasus F.* Spach.) Orig. before 1829.—*P. a. × canescens*; see under No. 41.

58. *P. Cérasus* L. SOUR CHERRY. Usually round-headed tree to 10 m., with often slender, spreading and pendulous brs., suckering; young brts. glabrous: lvs. elliptic-obovate to ovate, 5–8 cm. long, acute, finely and often doubly serrate, resinous when young, slightly pubescent beneath, of firm texture; petioles 1–2 cm. long: fls. with the lvs., about 2.5 cm. across, in dense clusters; the inner bud-scales often upright and leafy; pedicels 1–3.5 cm. long; calyx-tube obconic, sepals usually serrulate: fr. usually depressed-globose, depressed at apex. R.I.25:t.91(c). S.E.3:t.412(c). Gn.79:236;83:94(h). W. Asia, S. E. Eu. Cult. since ancient times. Zone III. Often grown for its fr. and some forms for their ornamental fls., particularly the double-fld. forms. It is one of the few fruit-trees suited for shady situations.—*P. C. plèna* L., var. Fls. semidouble. (*P. acida fl. pleno* Kirchn., f. *semitplena* Schneid., *Cerasus caproniana* var. *multiplex* Ser.)—*P. C. Rhéxii* (Kirchn.) Voss, f. With double white fls. F.S.17:t.1805(c). Gn.78:228;81:184;83:94. (*P. C. ramunculiflora* Voss.)—*P. C. persiciflora* (Ser.) Jaeg., var. Fls. double, light rose or pink. F.S.21:2238(c). (*Cerasus caproniana* var. *p.* Ser., *P. C. fl. roseo pleno* Vanh.)—*P. C. salicifolia* Jaeg., var. Lvs. 8–13 cm. long, 1.5–3 cm. wide, rather coarsely doubly serrate. Cult. 1874.—*P. C. umbraculifera* Jaeg., var. Small-lvd. form of compact roundish habit. Gn.78:209(h). (*P. C. var. dumosa* Dipp., *P. C. globosa* Spaeth.)—*P. C. frutèscens* (Neilr.)

Schneid., f. Shrubby small-fruited form. (*P. C.* var. *humilis* Bean.) Occurs wild or escaped.—*P. C. Marásca* (Reichb.) Schneid., f. Lvs. slightly serrate; stipules persistent; pedicels short, to 2.5 cm. long. (*P. M.* Reichb., *P. intermedia* M. Zab.)—*P. C. semperflòrens* (Ehrh.) W. Koch. ALL SAINTS CHERRY. Small tree or shrub: lvs. elliptic to oblong-obovate, irregularly serrate: fls. in 4-fld. racemes at the end of short leafy brts. during the summer. R.H.1877:50,t(c). B.C.5:2837. (*P. s.* Ehrh.)—*P. C. austera* L., var. MORELLO CHERRY. Frs. dark, with colored juice. Hedrick, Cherr. N. Y. 26,t(c),140,t(c), 178,t(c).—*P. C. caproniana* L., var. AMARELLE CHERRY. Fr. light-colored with uncolored juice. Hedrick, Cherr. N. Y. 24,t(c),132,t(c),170,t(c). (*P. acida* Ehrh.)

*P. C.* × *fruticosa* = *P. éminens* Beck. Intermediate between the parents. R.I.25:t.92,f.1-2(c). (*P. intermedia* Host, not Poir.)—Possibly *P. reflexa* Hort., not Walp., belongs here and may be *P. Cerasus semperflòrens* × *fruticosa*; it is similar to *P. fruticosa pendula*, but lvs. larger and more serrate than in that form.

59. *P. fruticòsa* Pall. GROUND CHERRY. Spreading shrub, to 1 m.; brts. slender, glabrous: lvs. elliptic-obovate to obovate-oblong, 2-5 cm. long, obtusish to short-acuminate, crenate-serrulate, glabrous and dark glossy green, thickish; petioles 5-12 mm. long: fls. 2-4, in usually sessile umbels, with leafy bracts, white, 1.5 cm. across; pedicels 1.5-2.5 cm. long; sepals broad, obtuse: fr. dark red, globose, about 1 cm. across. R.I.25:t.90(c). H.W.3:92. (*P. chamaecerasus* Jacq., *P. intermedia* Poir.) C. and E. Eu. to Siberia. Cult. 1587. Zone III.—*P. f. pendula* Dipp., f. With slender pendulous brts. G.W. 10:511(h). B.C.5:2836(h). S.L.277(h). (*P. chamaecerasus salicifolia* Zab.)

Sect. 5. MAHALEB Focke. Lvs. crenulate or serrulate: fls. in umbels or few-12-fld. racemes, their basal bud-scales deciduous before anthesis; bracts deciduous.

60. *P. Máhaleb* L. MAHALEB CHERRY. Tree to 10 m., with short stem and spreading brs. forming a loose head; young brts. tomentulose: lvs. orbicular to broad-ovate, 3-6 cm. long, obtusely short-acuminate, rounded or subcordate at base, callously serrulate, pubescent along the midrib beneath, otherwise glabrous; petioles 1-2 cm. long: fls. white, 1.5 cm. across, fragrant, in 6-10-fld. racemes 3-4 cm. long, with small leaf-like bracts at base; sepals ovate, entire, shorter than calyx-tube: fr. about 6 mm. across, black. H.W. 3:t.57(c). R.I.25:t.94(c). S.L.277(h). B.S.2:242(h). (*Cerasus M.* Mill.) Eu., W. Asia. Long cult. Zone V. Used as stock for grafting Cherries and for hedges, also on account of the aromatic bark for the manufacture of pipe-stems.—*P. M. xanthocárpa* (Roem.) Rehd., f. Fr. yellow. Gn.62:181(h). (*P. M. chrysocarpa* Nichols.)—*P. M. péndula* Dipp., f. Brs. pendulous. G.M.44:210(h).—*P. M. monstròsa* (Kirchn.) Jaeg. Dwarf and compact form with short thick brts. *P. M. globosa* Dieck and *P. M. compacta* Spaeth are probably scarcely different.

*P. M.* × *avium*; see under No. 57.

61. *P. pensylvànica* L. WILD RED CHERRY (PIN CHERRY). Shrub or small tree to 12 m.; brts. glabrous, slender, reddish and shining: lvs. ovate to oblong-lanceolate, 6-11 cm. long, long-pointed, finely and sharply serrulate, glabrous; petioles 1-2 cm. long: fls. white, 1.2 cm. across, in 2-5-fld. umbels or short racemes often several together; pedicels 1-1.5 cm. long, glabrous; sepals ovate, obtuse, entire, shorter than calyx-tube: fr. globose, 6 mm. across, red. B.M.8486(c). S.S.4:t.156. (*P. persicifolia* Desf., *Cerasus p.* Loisel. *Cerasus borealis* Michx.) Nfd. to B. C., south to N. C. and Colo. Intr. 1773. Zone II. Handsome in bloom and attractive with its numerous red frs. in

summer.—*P. p. saximontana* Rehd., var. Usually shrubby: lvs. elliptic-ovate to elliptic-oblong, less acuminate, pale green: umbels with fewer fls. Rocky Mtn. region. Intr. 1882.

62. *P. emarginata* (Hook.) Walp. Shrub or small tree to 4 m.; young brts. slightly pubescent, soon glabrous: lvs. obovate-oblong to oblanceolate, 3–6 cm. long, usually obtuse or emarginate, cuneate, finely crenulate-serrulate, glabrous above, slightly pubescent or finally glabrous beneath; petioles 6–10 mm. long: fls. dull white, 1 cm. across, in 5–10-flid. clusters or short racemes; pedicels 6–10 mm. long, slightly pubescent; sepals entire, rounded, shorter than calyx-tube, slightly pubescent: fr. globose, about 1 cm. across, red, finally black. Ore. and Cal. to Idaho and Ariz. Intr. 1918. Zone VI.

Closely related species: *P. prunifolia* (Greene) Shafer. Shrub or tree to 12 m.; young brts. densely pubescent: lvs. obovate or oblong, to 8 cm. long, acute to obtuse, slightly pubescent or nearly glabrous above, pubescent beneath: calyx-tube pubescent. S.S.4:t.157 (as *P. emarginata*). (*Cerasus Pattoniana* Hort., *P. mollis* Walp., not Torr.) B. C. to Calif. Intr. 1865. Zone VI?

Sect. 6. *PHYLOCERASUS* Koehne. Lvs. with acuminate or acute teeth: fls. in 1–4-flid. umbels with persistent leafy bracts at base.

63. *P. pilosiuscula* Koehne. Shrub or tree to 12 m.; young brts. glabrous or pilose: lvs. obovate to oblong-obovate, 4–8.5 cm. long, acuminate, usually rounded at base, sharply and doubly serrate, the teeth without or with small glands, sparingly strigillose above, pubescent beneath on the veins; petioles 6–12 mm. long: fls. 1–3, about 2 cm. across, coetaneous; bracts oblong or rotundate, 5–8 mm. long, glandular-serrate; pedicels 1–3 cm. long, glabrous or slightly villous; calyx-tube glabrous or pubescent; petals oval; style villous except at upper third: fr. ellipsoid, 8–9 mm. long, red. B.M.9192(c). (*P. p.* var. *media* Koehne, *P. venusta* Koehne.) C. and W. China. Intr. 1907. Zone V.

Related species: *P. litigiōsa* Schneid. Tree to 10 m.: lvs. ovate to obovate, acuminate, rather finely and sharply serrate, glabrous or sparingly hairy when young; peduncle rarely exceeding 5 mm.; pedicels and calyx glabrous, rarely pedicels slightly pubescent; petals narrow-oblong; involucre persistent during flowering. (*P. pilosiuscula* var. *barbata* Koehne, *P. Rehderiana* Koehne, *P. variabilis* Koehne.) C. China. Intr. 1907. Zone V.—*P. polytricha* Koehne. Young brts. densely villous: lvs. caudate, the teeth setosely acuminate, pubescent beneath; calyx-tube densely villous; sepals acute; styles pilose at base: fr. oval, about 8 mm. long, red. C. China. Intr. 1907.—*P. tatsienensis* Batal. Glabrous: lvs. abruptly caudate, the teeth with large terminal conical glands: bracts of infl. glandular-dentate: fr. globose, about 1 cm. across, brownish red. Only var. *stenadenia* Koehne from W. China in cult.: glands of teeth of the bracts narrow-oblong, not disciform as in the type. Intr. 1910. Zone VI.

Sect. 7. *PHYLOMAHALEB* Koehne. Lvs. with acuminate to acute teeth: fls. in 4–9-flid. stalked racemes with leafy persistent bracts.

64. *P. Maximowiczii* Rupr. Tree to 16 m., with spreading brs.; young brts. pubescent: lvs. obovate or elliptic-obovate, 4–8 cm. long, abruptly short-acuminate, rounded at base, coarsely doubly serrate, bright green with scattered hairs above, pubescent on the veins beneath; petioles 8–12 mm. long, pubescent: fls. shortly after the lvs., about 1.5 cm. across, yellowish white, in 6–10-flid. stalked racemes, with large leaf-like bracts; pedicels 1.5 cm. long, pubescent; sepals acute, serrate; style glabrous: fr. globose, about 5 mm. across, first red, then black. B.M.8641(c). S.I.2:t.30,f.1–9(c). M.K.t.52(c). N.K.5:t.5. G.F.6:195. Manch., Korea, Japan. Intr. 1892. Zone IV. Planted for its pleasing bright green foliage turning scarlet in autumn.

*P. M.* × *Maackii* = *P. Meyeri*; see under No. 74.

Related species all differing in the large glands of the teeth of the lvs. and bracts: *P. conadenia* Koehne. Tree to 10 m.; brts. glabrous: lvs. obovate, 4–9

cm. long, caudate-acuminate, subcordate or rounded at base, doubly serrate, the teeth with conical glands, glabrous or nearly so beneath: racemes 5-8-fld., glabrous: pedicels 5-15 mm. long; style villous: fr. ovoid, red; stone sculptured. W. China. Intr. 1908.—*P. pleiocerasus* Koehne. Tree to 8 m.; brts. glabrous: lvs. obovate-oblong to oblong, 4-9 cm. long, caudate-acuminate, rounded or cuneate at base, unequally serrate with conical glands, glabrous beneath; racemes 5-7-fld., glabrous; pedicels 1-2.2 cm. long; style with few hairs at base: fr. globose, red or nearly black; stone sculptured. W. China. Intr. 1908.—*P. macradenia* Koehne. Tree to 10 m.; brts. glabrous: lvs. ovate or elliptic-ovate, 4.5-6.5 cm. long, caudate, cuneate or rounded at base, simply or doubly serrate, the teeth with conical glands, pubescent beneath: racemes 3-4-fld., pubescent: fr. globose, dark red, on pedicels 6-20 mm. long; stone slightly ribbed. W. China. Intr. 1911. Zone V.—*P. discadenia* Koehne. Shrub or tree to 13 m.; brts. glabrous: lvs. obovate to oblong-obovate, 4-10 cm. long, acuminate, cordate or rounded at base, unequally serrate, the teeth with disciform glands, glabrous: racemes 3-9-fld., glabrous; pedicels 8-23 mm. long; sepals glandular-fimbriate, as long as tube: fr. subglobose, red; stone nearly smooth. C. China. Intr. 1907.

Subgen. IV. *PADUS* (Moench) Koehne. Lvs. usually deciduous, serrate or serrulate: fls. rather small, in many-fld. racemes leafy at base, rarely leafless; calyx-tube short-campanulate; style not furrowed, stigma entire. (*Padus* Moench.)

65. *P. serotina* Ehrh. BLACK CHERRY. (RUM C.) Tree to 30 m., with dark brown bark, the inner aromatic; young brts. glabrous: lvs. oblong-ovate to lance-oblong, 5-12 cm. long, acuminate, cuneate, serrulate with small incurved callous teeth, lustrous above, light green beneath and often villous along the midrib, thickish and firm at maturity; petioles 6-25 mm. long, glandular: fls. white, 8-10 mm. across, in cylindric glabrous racemes 10-14 cm. long; pedicels 3-8 mm. long; sepals oblong-ovate, often toothed: fr. globose, 8-10 mm. across, finally black. Fls. v-vi; fr. ix-x. M.D.1906:1,t(e). S.S.4:t.159. F.E.32:533(h). (*Cerasus* s. Loisel., *Padus* s. Agardh.) Ont. to N. Dak., Tex. and Fla. Intr. 1629. Zone III. Often planted for its handsome foliage; also valuable timber tree.—*P. s. pendula* Dipp., f. *Brs. pendulous*.—*P. s. asplenifolia* (Kirchn.) Jaeg., var. With deeply and irregularly cut lvs. (*Padus* s. f. a. Schneid.).—*P. s. cartilaginea* (Lehm.) Jaeg., var. With long shining lvs.—*P. s. phelloides* Schwerin, f. Lvs. lanceolate. (*P. s. var. salicifolia*, Henry, not Koehne.).—*P. s. montana* (Small) Britt. Lvs. broader-elliptic, glaucescent beneath: racemes rather few-fld. with pubescent calyx. (*P. s. neomontana* Sudw., *P. s. Smallii* Britt.) Va. to Alo. Intr. ?—*P. s. salicifolia* (Kunth) Koehne, var. Lvs. lanceolate, long-acuminate, not pubescent along the midrib beneath, subcoriaceous; racemes stouter, to 18 cm. long; fr. 1.5-2.5 cm. across, usually depressed-globose, edible. Jour. Hered. 13:51-61. L.I.t.34. (*P. capuli* Cav., *P. capollin* Koehne, *P. salicifolia* Kunth.) Mex. to Peru. Intr. 1820. Zone VII?

Closely related species: *P. virens* (Woot. & Standl.) Shreve. Small tree or shrub: lvs. smaller, usually elliptic, acute, rarely acuminate, more finely serrate; petioles eglandular: fls. smaller, in shorter racemes. N. Mex., Ariz. Intr. 1916. Zone (V).

66. *P. alabamensis* Mohr. Tree to 10 m.; young brts. tomentose: lvs. ovate or elliptic to oblong-ovate, 6-12 cm. long, short-acuminate, sometimes obtusish, rounded or slightly narrowed at base, serrate with appressed callous teeth, whitish and finely pubescent beneath; petioles 6-12 mm. long, tomentose: fls. about 8 mm. across, in pubescent racemes 8-15 cm. long; fr. subglobose, about 8 mm. across, finally nearly black. S.M.526. (*Padus* a. Small.) Ala. Intr. 1906. Zone (V).

Closely related species: *P. Cuthbertii* Small. Tree to 6 m.: lvs. elliptic to obovate, 4-9 cm. long, glaucescent beneath, tomentose on midrib and pubescent on veins: racemes 5-8 cm. long, pubescent. Ga. Intr. 1912. Zone (V).—*P. australis* Beadle. Tree to 20 m.: lvs. elliptic to obovate, 4-10 cm. long, finely

serrate, with rufous or tawny pubescence beneath, not glaucous: racemes pubescent, 7-10 cm. long. S.M.527. Ala. Intr. 1907. Zone VI?

67. *P. sericea* (Batal.) Koehne. Tree to 20 m.; young brts. glabrous: lvs. elliptic to oblong-obovate, 8-12 cm. long, acuminate, rounded or cuneate at base, serrulate, silky-pubescent beneath: fls. about 8 mm. across, in pubescent racemes 10-14 cm. long; calyx glabrous; stamens longer than petals: fr. globose-ovoid, 1.5 cm. long, black. (*P. napaulensis* var. s. Batal.) C. and W. China. Intr. 1901 or 1908. Zone VI?

Related species: *P. Wilsonii* (Schneid.) Koehne. Tree to 10 m.: lvs. beneath with white silky glossy tomentum: racemes pubescent; stamens at least 1½ times as long as petals. (*Padus* W. Schneid.) C. China. Intr. 1907. Only var. *leiobotrys* Koehne with glabrous infl. in cult.—*P. rufomicans* Koehne. Tree to 30 m.: lvs. sharply serrulate, glabrous above, densely covered beneath with rufo-ferrugineous tomentum: fruiting racemes glabrous: fr. subglobose, about 1 cm. across. W. China. Intr. 1908.

68. *P. Pádus* L. EUROPEAN BIRD CHERRY. Tree to 15 m.; young brts. finely pubescent or glabrous: lvs. elliptic to obovate or oblong-ovate, 6-12 cm. long, abruptly acuminate, rounded or subcordate at base, sharply serrate, dull green above, grayish beneath, glabrous or with axillary tufts; petioles 1-1.5 cm. long, glabrous, glandular: fls. white, 1-1.5 cm. across, fragrant, in drooping loose racemes with the peduncle 10-15 cm. long, glabrous; calyx-tube pubescent inside; fr. globose, 6-8 mm. across, black; stone rugose. H.W. 3:t.56(c). R.I.25:t.95(c). S.E.3:t.413(c). Gn.53:92. (*P. racemosa* Lam., *Padus* r. Schneid., *Cerasus* P. DC.) Eu., N. Asia to Korea and Japan. Long cult. Zone III.—*P. P. aucubaefolia* (Kirchn.) Jaeg., var. Lvs. spotted yellow.—*P. P. plèna* Schneid., f. Fls. semidouble. (*P. P. flore pleno* Bean.)—*P. P. parviflora* (Ser.) K. Koch, var. Fls. smaller, about 1 cm. across in rather dense upright racemes; pedicels 2-5 mm. long. (*Cerasus* P. var. *p.* Ser.)—*P. P. Watereri* Bean, var. Lvs. with conspicuous axillary tufts of hairs beneath: racemes to 20 cm. long.—*P. P. Spaethii* Rehd., f. Lvs. like those of the preceding var.: fls. about 2 cm. across; petals obovate.—*P. P. leucocárpos* Reichenb. Fr. yellowish white.—*P. P. chlorocárpos* Reichenb. Fr. yellowish green. (*P. Salzeri* Zdarek.)—*P. P. péndula* Dipp., var. Brs. pendulous.—*P. P. commutata* Dipp., var. Lvs. with coarser, more remote serration, rounded to broad-cuneate, nearly green beneath, unfolding much earlier than the type. M.K.t.55(c). (*P. Regeliana* Zab., *P. Grayana* hort., not Maxim.) E. Asia. Cult. 1890.—*P. P. laxa* Rehd., var. With slender pendulous brts.: lvs. usually oblong-obovate, acuminate, quite glabrous beneath and light green: racemes lax, pendulous: fr. small, with smooth or nearly smooth stone. Korea. Intr. 1906.—*P. P. pubescens* Reg., var. Young brts. and lvs. beneath more or less pubescent. N. E. Asia. Intr. 1906.

*P. P. × virginiana*; see under No. 71.

69. *P. pubígera* (Schneid.) Koehne. Tree to 20 m.: lvs. oblong-obovate or obovate, 4-11 cm. long, slightly short-acuminate to acutish, cordate or subcordate at base, minutely serrulate, whitish beneath and glabrous, reticulate: petiole 1-2.5 cm. long, usually puberulous: fls. about 1 cm. across, in puberulous or glabrous racemes, without the stalk 7-14 cm. long; calyx-tube pubescent inside below the middle; stamens about ½ shorter than petals: fr. 8 mm. across; stone slightly rugose. (*P. brachypoda* var. *p.* Schneid., *P. p.* var. *Potaninii* Koehne.) W. China.—*P. p. Práttii* Koehne, var. Lvs. of shoots oblong-obovate, broad-cuneate or rounded at base. Intr. 1908.—*P. p. obovata* Koehne, var. Lvs. of shoots obovate, scarcely subcordate; petioles glabrous. Intr. 1908. Zone V.

70. *P. cornùta* (Wall.) Steud. HIMALAYAN BIRD CHERRY. Tree to 20 m.; young brts. finely pubescent or glabrous: lvs. oblong-ovate to elliptic or obovate, 8–20 cm. long, acuminate, subcordate to broad-cuneate at base, serrulate, dark green above, paler beneath and pubescent on the nerves when young; petioles 1.5–3 cm. long, usually glandular: fls. 6–8 mm. across, white, in dense glabrous or puberulous racemes 8–16 cm. long; sepals glandular-denticulate: fr. subglobose, about 8 mm. across, red finally dark brownish purple. R.H.1869:275. Gn.6:181. S.H.1:f.351w-w<sup>2</sup>,352n. (*P. pachyclada* Zab., *Padus c. Carr.*) Himal. Cult. 1860. Zone VI.

Closely related species: *P. napaulensis* (Ser.) Steud. Lvs. more remotely serrate, cuneate at base; petioles glandless, pubescent: infl. very dense, pubescent: fr. 1.5 cm. across. S.H.1:f.351-o<sup>1</sup>-o<sup>2</sup>,352k. Himal. Intr. 1881. Zone VII?

71. *P. virginiana* L. CHERRY. Shrub or tree to 10 m.; brts. glabrous: lvs. broad-elliptic to obovate, 4–12 cm. long, abruptly acuminate, broad-cuneate to rounded at base, closely serrulate, dark green and somewhat lustrous above, glaucescent or grayish green beneath, glabrous except axillary tufts of hairs; petioles 1–2 cm. long, glandular: fls. 8–10 mm. across, white, in dense glabrous racemes, 7–15 cm. long: fr. globose, about 8 mm. across, dark purple; stone smooth. S.S.4:t.158. (*P. nana* Dur., *P. rubra* Ait., *Padus v. Roem.*) Nfd. to Sask., N. Dak. and Neb., south to N. C., Mo. and Kans. Intr. 1724. Zone II.—*P. v. leucocarpa* S. Wats., var. Fr. amber-colored. Intr. 1889.—*P. v. Duerinckii* (Martens) Zab., subsp. Lvs. broad-elliptic (*P. v. rotundifolia* Hort., in part).—*P. v. nana* Bean, var. Dwarf form.—*P. v. melanocarpa* (A. Nels.) Sarg., var. Lvs. usually smaller and thicker: fr. darker, usually nearly black; petioles glandless. (*P. m. Rydb.*, *P. demissa* var. *m.* A. Nels.) N. Dak. to B. C., s. to N. Mex., Ariz. and s. Calif. Intr. 1879.—*P. v. xanthocarpa* Sarg., f. A yellow-fruited form of var. *melanocarpa*. Intr. 1912.—*P. v. demissa* (Torr. & Gr.) Torr. Lvs. usually rounded or subcordate at base, pubescent beneath; petioles glandular: brts. and infl. glabrous or pubescent. S.M.524. (*P. d. D. Dietr.*, *Cerasus d. Torr. & Gr.*) Wash. to Calif. Intr. 1892.—*P. v. pachyrrhachis* (Koehne) Sarg., f. A form of the preceding: lvs. broad-cuneate or rounded at base; brts. and the stout rachis pubescent. (*Padus valida* Woot. & Standl. *Padus calophylla* Woot. & Standl. N. Mex. Intr. 1916. Zone (V).

*P. v.* × *Padus* ? = *P. Laucheana* Bolle. Lvs. broad-obovate, large, glaucescent beneath and with axillary tufts of hair: fls. 1.5 cm. across: stone slightly rugose. (*P. padus* var. *rotundifolia* Hort., *P. virginiana* var. *r.* Hort.) Cult. 1880.

Related species: *P. bicolor* Koehne. Young brts. densely velutinous: lvs. obovate-oblong, short-acuminate, minutely serrate, glabrous and whitish beneath; racemes velutinous: fr. 5–6 mm. across; stone slightly rugose. W. China. Intr. 1908. Zone (V).—*P. velutina* Batal. Brts. glabrous: lvs. elliptic, acuminate, serrulate, pale and thinly pilose beneath; racemes glabrous or pubescent; petals  $\frac{1}{2}$  shorter than stamens: stone smooth. S.H.1:f.352p(1). C. China. Intr. 1907.

72. *P. Ssiòri* F. Schmidt. Tree to 25 m., with pale bark; brts. glabrous: lvs. oblong to oblong-obovate, 8–14 cm. long, long-acuminate, usually cordate, sharply serrate with aristate teeth, glabrous beneath except axillary tufts of hairs; petioles 2–4 cm. long, glandular: fls. small, white in glabrous racemes without peduncle 10–16 cm. long; calyx deciduous; petals as long as stamens: fr. about 1 cm. across, black; stone slightly ribbed. S.I.2:t.23.f. 1–13(c). S.H.1:f.351i-l,352g. (*Padus* S. Schneid.) N. E. Asia, Japan. Intr. 1915. Zone V.

73. *P. Grayana* Maxim. Small tree to 10 m.; young brts. glabrous or pubescent: lvs. oblong-ovate, 7–14 cm. long, long-acuminate, usually rounded

at base, sharply serrate with aristate teeth, grayish green beneath and slightly pubescent especially on the midrib; petioles short, eglandular: fls. white, about 1 cm. across, in glabrous racemes 7-9 cm. long without peduncle; calyx persistent; petals about as long as stamens and style: fr. 8 mm. across, apiculate, black; stone ovoid, pointed, smooth. M.K.t.56(c). S.H.1:f.351 m-n<sup>2</sup>, 352b. (*P. Padus* var. *japonica* Miq., *Padus* G. Schneid.) Japan. Cult. 1900. Zone V.

74. *P. Maackii* Rupr. Tree to 15 m., with brownish yellow flaky bark; young brts. pubescent: lvs. elliptic to oblong-ovate, 6-10 cm. long, acuminate, rounded at base, finely serrulate, gland-dotted beneath and slightly hairy on the veins; petioles 1-2 cm. long, usually glandular: fls. white, about 1 cm. across, in dense pubescent racemes 5-7 cm. long, leafless at base; calyx-tube tubular-campanulate, longer than the glandular-denticulate sepals; petals oblong-obovate; style about as long as stamens, shorter than petals: fr. 5 mm. across, black; stone rugulose. S.I.2:t.30(c). N.K.5:t.2. S.H.1:f.352 h-i(1). S.L.230(bark). (*Laurocerasus* M. Schneid.) Manch., Korea. Cult. 1878. Zone II. Conspicuous by the brightly colored flaky bark.

A supposed natural hybrid with *P. Maximowiczii* is *P. Meyeri* Rehd. chiefly differing from *P. Maackii* in the darker not flaky bark, the longer and bracted peduncles and shorter style; from *P. Maximowiczii* in the lustrous orange-brown bark of the brs., in the gland-dotted lvs. and in the many-fl. racemes with smaller bracts. Korea. Intr. 1906. Zone V.

75. *P. Buergeriana* Miq. Tree to 10 m.; young brts. pubescent or glabrescent: lvs. elliptic to oblong-elliptic, acuminate, 7-11 cm. long, cuneate, appressed-serrulate, light green beneath and glabrous except axillary tufts of hairs; petioles 8-12 mm. long: fls. about 7 mm. across, in slender puberulous racemes 6-8 cm. long; calyx-tube cup-shaped; sepals short, denticulate; stamens slightly longer than petals; style short: fr. subglobose, black, with persistent calyx. N.K.5:t.1. S.H.1:f.354a-g, 355d. (*Laurocerasus* B. Schneid.) Japan, Korea. Intr. 1894 and 1915. Zone V.

Related species: *P. venosa* Koehne. Lvs. sharply serrate, reticulate beneath and glabrous except axillary tufts of hairs: infl. velutinous. C. China. Intr. 1907.—*P. stellipila* Koehne. Lvs. sharply serrate, reticulate and pubescent beneath: infl. glabrous or puberulous. C. China. Intr. 1907.—*P. perulata* Koehne. Lvs. serrulate with rather short teeth, slightly hair beneath, more densely along midrib: infl. with persistent involucre at base: rachis velutinous. W. China. Intr. 1908.

Subgen. V. *LAUROCERASUS* Koehne. Lvs. evergreen, serrate, dentate or entire: racemes leafless at base, otherwise like the preceding subgen. (*Laurocerasus* Roem.)

76. *P. lusitânica* L. PORTUGAL LAUREL. Evergreen shrub or small tree to 20 m.: brts. glabrous: lvs. oblong-ovate, 6-12 cm. long, acuminate, rounded at base, shallowly serrate, glabrous, dark lustrous green above, paler beneath; petioles 1.5-2.5 cm. long: fls. white, 8-12 mm. across, in slender glabrous racemes 15-25 cm. long; calyx-tube cup-shaped, with short denticulate lobes: fr. conic-ovoid, about 8 mm. long, dark purple. M.G.27:563(h), 569. M.D. 1914:278(h). S.L.231. (*Laurocerasus* l. Roem., *Padus* L. Mill.) Spain, Port. Intr. 1648. Zone VI-VII. Planted for its evergreen bright green and lustrous lvs.—*P. l. variegata* Bean, var. Lvs. margined with white.—*P. l. angustifolia* Dipp., f. Lvs. oblong-lanceolate, 5-8 cm. long. M.D.1907:1,t(c).—*P. l. myrtifolia* Mouillef. Compact pyramidal shrub: lvs. usually 3-5 cm. long. Bull. Soc. Ort. Tosc. 22:t.2(h).

77. *P. Laurocerasus* L. CHERRY LAUREL. Shrub or small tree to 6 m.; young brts. glabrous or puberulous: lvs. usually oblong or obovate-oblong, 5-15 cm. long, acuminate, cuneate to rounded at base, obscurely serrate to
